*Var. γ, tenellum* (D. C. l. c.) leaves oblong. Native of the Cape of Good Hope. *L. tenellum*, Thunb. fl. cap. Perhaps a proper species.

*Hyssop-leaved Purple Loosestrife*. Fl. May. Britain. Pl. 1 foot, straggling and recumbent.

7 L. TRIBRACTEATUM (Salzm. ex Schlecht. et Cham. in Linnaea. 2. p. 356.) stem branched to the apex; branches alternate; leaves lanceolate, obtuse, and as if they were roundly truncate; flowers axillary, each furnished with a pair of bractes at the base; petals 5; stamens 5; calyx 10-toothed. ☉. II. Native of the south of Europe. Barrel. icon. 773. f. 2. ? Petals purple. Less glaucous than *L. hyssopifolium*. Parts of flowers quinary.

*Three-bracteated Purple Loosestrife*. Pl. 1 foot.

8 L. LANCEOLATUM (Ell. sketch. 1. p. 544.) stem branched, suffruticose at the base, quadrangular, winged; branches diffuse, rather pubescent; leaves opposite, almost sessile, oblong-lanceolate, acutish, glabrous, rounded at the base, with the margins a little ciliated; pedicels axillary, 3-4-together; flowers verticillate, dodecandrous; style inclosed; petals 5-6-7. ☉. II. Native of Carolina, and probably of Mexico, in marshes and humid places. *L. virgatum*, Walt. car. 120. Pursh, fl. amer. sept. 1

p. 334. exclusive of the synonyme of Willd. *L. setureiaefolium*, Moc. et Sesse, fl. mex. icon. ined. *L. diffusum*, Sweet, fl. gard. 149. Flowers purple, as large as those of *L. salicaria*.  
*Lanceolate-leaved Purple-Loosestrife*. Fl. July, Aug. Clt. 1800. Pl. 2 to 3 feet.

9 *L. ALBUM* (H. B. et Kunth, nov. gen. amer. 6. p. 193.) stems suffrutescent; leaves scattered, linear, acute; flowers on short pedicels, each furnished with 2 bracteoles at the base; petals 6-7; stamens 6-7.  $\frac{1}{2}$ . G. Native of Mexico, about Salimanca. Petals white, obovate-oblong.

*White-flowered Purple-Loosestrife*. Shrub 1 to 2 feet.

10 *L. MARITIMUM* (H. B. et Kunth, l. c.) stem shrubby; leaves opposite and scattered, lanceolate, acute, obtuse at the base, glaucescent beneath; flowers on short pedicels, erect, each furnished with 2 bracteoles at the base; petals 6; stamens 6.  $\frac{1}{2}$ . G. Native of Peru, on the shores of the Pacific Ocean near Patibilea of the Sandwich islands; and of Mexico, in humid places near Jalapa, and other parts of South America. *L. lycioides*, herb. Willd. Petals purple, obovate-oblong.

*Maritime Purple-Loosestrife*. Shrub 1 to 2 feet.

\* \* *Stamens twice the number of the petals, and therefore 12 or 14 in number.*

11 *L. QUINTUPLE'RIUM* (Neuw. reis. vol. 2. ex flora, 1821. p. 302.) shrubby, much branched; leaves opposite, ovate, sessile, 5-6-nerved; flowers opposite, sessile, 5-petalled, and dodecandrous; bracteoles ovate, 3-nerved.  $\frac{1}{2}$ . S. Native of Brazil. Nees et Mart. nov. act. bonn. p. 23. Flowers pale blue. Habit of *Rhœia*.

*Quintuple-nerved-leaved Purple-Loosestrife*. Sh. 3 to 4 feet.

12 *L. PUNICIFOLIUM* (Schlecht. et Cham. in Linnæa. 2. p. 356.) plant glaucous; leaves elliptic, rather cordate at the base, obtuse at the apex, with scabrous margins; flowers on short pedicels; calyx 12-toothed; petals 6; stamens 12, alternate ones exserted.  $\frac{1}{2}$ . H. Native of Crete and Sicily. *L. thymifolium*, Sieb. fl. cret. exsicc.—Barrel. icon. t. 773. f. 1. Differs from *L. hyssopifolium* in the root being perennial, in the leaves being cordate, with scabrous edges, in the flowers being twice the size, and in the alternate stamens being exserted.

*Pomegranate-leaved Purple Loosestrife*. Pl. 1 foot?

13 *L. GRÆFFERI* (Tenore, prod. fl. nep. suppl. 2. p. 28. cat. 1819. p. 45.) herbaceous; leaves alternate, elliptic-oblong, obtuse, upper ones linear-lanceolate; stems diffuse, branched, angular; flowers solitary, axillary, on short pedicels; bracteoles small, acute; petals 6, oblong-obovate; stamens 12, twice the length of the calyx.  $\odot$ . B. H. Native of Naples, near Caresta; in the marshes of western Liguria; in the Balearic Islands; in the Island of Cos; in the bogs of Murcia; and about Tangiers. *L. acutangulum*, Lag. cat. hort. madr. 1814. p. 16. *L. hyssopifolium*, d'Urv. enum. p. 52. *L. Græfferi*, Cambess. mem. mus. 14. p. 16. Perhaps the same as *L. nummulariaefolium*, Pers. ench. 2. p. 8. ? but not of Lois. *L. Gussoni*, Presl. del. prag. p. 55.—Cup. pamph. sic. 1. t. 62. Flowers purple.

*Græffer's Purple-Loosestrife*. Fl. June, July. Clt. 1800. Pl.  $\frac{1}{2}$  foot.

14 *L. PRESLI* (Guss. pl. rar. p. 188.) stem nearly simple, erectish, quadrangular; angles winged; leaves alternate, oblong, cordate; flowers axillary, solitary, 6-petalled, dodecandrous; stamens longer than the calyx.  $\odot$ . or  $\delta$ . B. H. Native of Calabria, in boggy inundated places. *L. alatum*, Presl. del. prag. p. 55.—Barrel. obs. p. 140. icon. t. 773. f. 1. ?

*Presl's Purple-Loosestrife*. Pl. 1 ft.

15 *L. FLEXUOSUM* (Lag. cat. hort. madr. 1814. p. 16.) leaves oblong, somewhat cordate at the base; flowers pedicellate, erect, fruit horizontal; calyx striated; petals 6, ovate, somewhat cordate; stamens 12.  $\odot$ . B. H. Native of Spain, in the province

of Murcia; also of Liguria and Mauritania. Flowers rose-coloured. Branches flexuous. Perhaps sufficiently distinct from *L. Græfferi*.

*Flexuous-stemmed Purple-Loosestrife*. Pl.  $\frac{1}{2}$  to 1 foot.

SECT. III. *SALICARIA* (from *Salix*, a willow; willow-like leaves). D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 77. prod. 3. p. 82. Stamens twice the number of the petals. Flowers numerous in the axils of the upper leaves, which are degenerated into the form of small bracteas, therefore the flowers appear as if they were in whorls, and racemose spikes.

16 *L. SALICARIA* (Lin. spec. 640.) leaves opposite, lanceolate, cordate at the base; flowers in whorled leafy spikes, almost sessile.  $\frac{1}{2}$ . H. Native of Europe, in ditches and watery places, especially about the margins of ponds and rivers; plentiful in Britain. Smith, engl. bot. 1061. Curt. lond. fasc. 3. t. 28. Fl. dan. 671. Flowers of a variable crimson or purple. Leaves opposite, or 3 or even 4 in a whorl. Stamens 12-14. Petals 6-7. Plant variable with regard to smoothness or pubescence. It is astringent, and is useful in inveterate diarrhœas.

*Var.  $\beta$ , gracile* (D. C. cat. hort. monsp. 123.) spikes numerous, very slender; flowers alternate, solitary or twin; leaves, stems, and calyxes velvety.  $\frac{1}{2}$ . H. Native in humid places.

*Var.  $\gamma$ , bracteosum* (D. C. prod. 3. p. 83.) spikes elongated at the tops of the branches and stem; bracteas deflexed after flowering, longer than the flowers.  $\frac{1}{2}$ . H. Native country unknown.

*Var.  $\delta$ , pubescens* (Pursh, fl. bor. amer. 1. p. 334.)  $\frac{1}{2}$ . H. Native of North America, from Canada to New England, but according to Torrey, fl. un. st. 1. p. 471. its native country is doubtful.

*Willowy or Common Purple-Loosestrife*. Fl. July, Aug. Britain. Pl. 2 to 4 feet.

17 *L. TOMENTOSUM* (Mill. dict. no. 2.) leaves opposite, ovate, cordate at the base, clothed with white tomentum, as well as the stem and calyxes; flowers numerous, in axillary whorls, forming an interrupted leafy spike.  $\frac{1}{2}$ . H. Native of North America. Flowers fine purple. Leaves sometimes 3 in a whorl.

*Tomentose Purple-Loosestrife*. Fl. July, Aug. Clt. 1700. Pl. 1 to 2 feet.

18 *L. VIRGATUM* (Lin. spec. 642. but not of Walt.) leaves lanceolate, attenuated at the base; panicle twiggy; flowers 3 together, axillary, distinctly pedicellate.  $\frac{1}{2}$ . H. Native of Tauria, Siberia, Russia, Austria, Germany, and Belgium. Sims, bot. mag. t. 1003. Jacq. austr. 1. t. 7. *Salicaria virgata*, Moench. *L. Austriacum*, Jacq. vind. 243. Flowers purple. Plant more loose and glabrous than *L. Salicaria*.

*Var.  $\beta$ , acuminatum* (Willd. spec. 2. p. 866.) racemes terminal, elongated, crowded with flowers.  $\frac{1}{2}$ . H. Native of Iberia.

*Twiggy Purple-Loosestrife*. Fl. June, Sept. Clt. 1776. Pl. 2 to 3 feet.

† *Species not sufficiently known.*

19 *L. HUNTERI* (D. C. prod. 3. p. 83.) leaves opposite; calyx tubular, 6-lobed; petals 6, lanceolate, erect; stamens 12; style subulate; capsule 2-celled, 4-valved.  $\frac{1}{2}$ . S. Native of the East Indies, where it is called *Dhanry*. W. Hunt, asiat. res. 4. p. 42. Petals of a beautiful red. The flowers, mixed with those of *Morinda*, are used for dyeing in India.

*Hunter's Purple-Loosestrife*. Shrub.

20 *L. ? APETALUM* (Spreng. syst. 2. p. 454.) stem shrubby; leaves linear, acute, alternate; flowers in whorls, apetalous, hexandrous.  $\frac{1}{2}$ . S. Native of Brazil. Perhaps a species of *Ammannia*.

*Apetalous Purple-Loosestrife*. Pl. 1 foot.

21 *L. DIPETALUM* (Lin. fil. suppl. 250.) shrubby, hispid and clammy; leaves sessile, ovate, opposite or 3 in a whorl; flowers axillary, pedicellate, nodding. *℥. S.* Native of South America. Petals purple. Perhaps a species of *Cuphea*.

*Dipetalous Purple-Loosestrife.* Shrub.

*Cult.* The hardy perennial kinds of *Lythrum* are handsome border flowers; they grow in any common soil, and are easily increased by dividing the plants at the root. The seeds of the annual kinds require to be sown in a moist situation in spring.

VIII. CUPHEA (from *cuphos*, *cuphos*, curved; in reference to the curved form of the capsule). Jacq. hort. vind. 2. p. 83. St. Hil. mem. mus. 1. p. 29. H. B. et Kunth. nov. gen. amer. 6. p. 196. D. C. prod. 3. p. 83.—*Cuphea*, Melanidium, and Parsonsia, P. Browne, l. c.—*Melanium* and *Cuphea*, Spreng.—*Balsamona*, Vand. fasc. in Rœm. script. p. 110. t. 4.—*Melvilla*, Anders. *Banksia*, Domb. herb. but not of Lin. fil.

LIN. SYST. *Dodecandria*, *Monogynia*. Calyx tubular, gibbous at the base on the upper side; limb wide, 12-toothed, with 6 of the teeth erect, and the other 6 small or nearly obsolete, rising from the sinuses of the inner teeth. Petals 6-7, unequal. Stamens 11-14, rarely 6-7, unequal, inserted in the throat of the calyx. Gland under the ovary thick. Style filiform; stigma simple or rather bifid. Capsule membranous, covered by the calyx, 1-2-celled, at length cleft by the deflexed placenta as well as the calyx. Seeds nearly orbicular, compressed, wingless.—Herbs or subshrubs. Leaves opposite, rarely in whorls, quite entire. Peduncles interpetiolar, 1-flowered, rarely many-flowered. Flowers usually drooping. Calyx coloured. Petals violaceous or white.

§ 1. *Circœoides* (containing plants whose habit is like that of *Circœa*). D. C. prod. 3. p. 83. Stems herbaceous, erect. Racemes somewhat spicate, terminal. Flowers small.

1 *C. MICROSTACHA* (H. B. et Kunth, l. c. p. 196.) stem herbaceous, erect, branched, rather pilose; leaves on short petioles, oblong, acute, rounded at the base, scabrous on the margins, rather pilose on both surfaces; pedicels solitary or twin, upper ones disposed in spicate racemes; calyxes rather hispid; petals nearly equal. *℥. F.* Native of South America, on the banks of the river Orinoco near St. Barbara, and at San Carlos de Rio Negro. Petals small, violaceous. Stamens 11. Ovary 3-seeded.

*Small-flowered Cuphea.* Pl.  $\frac{1}{2}$  ft.

2 *C. CIRCÆOIDES* (Smith ex Sims, bot. mag. t. 2201.) stem herbaceous, erect, branched, rather pilose; leaves petiolate, ovate, acute, pubescent; racemes terminal; pedicels scattered; calyxes hispid; petals nearly equal. *℥. F.* Native of Brazil, in shady places about Pernambuco. Petals small, violaceous. Petioles nearly an inch long. Bracteoles linear.

*Circœa-like Cuphea.* Fl. Sept. Clt. 1824. Pl.  $\frac{3}{4}$  ft.

3 *C. SPICATA* (Cav. icon. 4. p. 56. t. 381.) stem herbaceous, erect, branched, rather pilose; leaves petiolate, ovate-oblong, acute at both ends, glabrous, with scabrous margins; racemes spicate, axillary, and terminal; pedicels opposite; calyxes hairy; petals unequal. *℥. F.* Native of South America, in many parts. Petals small, pale red. Stamens 12. Dorsal tooth of calyx large. Style villous. Ovary 40-75-ovulate.

*Var. α, trōpica* (Schlecht. et Cham. in Linnæa. 2. p. 358.) hind tooth of calyx large; stem hairy.

*Var. β, extratropica* (Schlecht. et Cham. l. c.) hind tooth of calyx a little larger than the rest; stem pubescent.

*Spicate-flowered Cuphea.* Pl. 1 ft.

4 *C. ORIGANIFOLIA* (Cham. et Schlecht. in Linnæa, 2. p. 372.) root creeping; stem simple, slender, beset with viscid pubescence and glandular pili; leaves ovate, petiolate, finely denticulated, with a few glandular hairs on the nerves beneath; flowers

pedicellate, interpetiolar, opposite; calyx gibbous at the base; stamens 11; style villous; ovary containing above 30 ovula. *℥. S.* Native of Brazil.

*Marjoram-leaved Cuphea.* Pl.  $1\frac{1}{2}$  ft.

5 *C. SALICIFOLIA* (Schlecht. et Cham. in Linnæa. 5. p. 569.) stem suffrutescent, erect, glabrous; leaves lanceolate, attenuated at the base, and bluntish at the apex, glabrous; calyx pilose on the inside at the insertion of the stamens; petals 6, unequal; filaments pilose. *℥. S.* Native of Mexico, on the banks of rivulets near Masantla. Petals purple.

*Willow-leaved Cuphea.* Pl. 1 ft.

§ 2. *Longifloræ* (from *longus*, long, and *flos*, a flower; in reference to the long flowers of the species). D. C. prod. 3. p. 81. Stem herbaceous or hardly suffrutescent; flowers axillary, disposed in racemose spikes; calyx long, tubular, spurred at the base, not gibbous. Petals small or wanting.

6 *C. MELVILLA* (Lindl. bot. reg. t. 852.) stem herbaceous, erect; leaves sessile, lanceolate, attenuated at both ends, scabrous; racemes terminal, simple, many-flowered; petals wanting. *℥. S.* Native of Guiana, at Essequibo. *Melvilla* speciosa, Anders. journ. sc. ex Lindl. Calyx red at the base, and green at the apex. Pollen green.

*Melville's Cuphea.* Fl. May. Clt. 1823. Pl. 2 to 3 feet.

7 *C. JORULLENSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 208.) stems herbaceous; branches compressed, clothed with clammy pubescence; leaves oblong-lanceolate, acute, on very short petioles, rounded at the base, stiff, scabrous on both surfaces; pedicels 1-3, upper, alternate, racemose at the tops of the branches; calyx clothed with clammy pubescence, 6-toothed. *℥. S.* Native of Mexico, on Mount Jorullo. Calyx red. Petals wanting. Ovary 12-14-ovulate. Stamens 11, very unequal, exserted.

*Jorullo Cuphea.* Pl. 1 to 2 feet.

8 *C. TRICOLOR* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 3. p. 81.) stem herbaceous, erect, pubescent; leaves nearly sessile, oblong, acute; pedicels axillary, disposed in a terminal raceme; calyx puberulous, 6-toothed; petals 6, reflexed. *℥. S.* Native of Mexico. *Lythrum album*, Moc. et Sesse, fl. mex. icon. ined. Pedicels 4-6 lines long, somewhat secund. Calyx red, green at the apex. Petals small, white. Stamens 11, hardly unequal, very little exserted.

*Tricolor-flowered Cuphea.* Pl. 1 to 2 feet.

9 *C. MICROPETALA* (H. B. et Kunth, l. c. p. 209. t. 551.) stem shrubby, much branched; branches and calyxes rather roughish; leaves oblong-lanceolate, acute at both ends, stiff, scabrous; flowers supra-axillary, secund; ovary strumose at the apex; petals 6, minute. *℥. S.* Native of Mexico. *C. strumosa*, Moc. et Sesse, fl. mex. icon. ined. Calyx 12-toothed, scarlet, yellowish at the apex. Petals white. Filaments red. Ovary 2-celled, many-seeded, with a thick lateral gland at the base.

*Small-petalled Cuphea.* Fl. July, Aug. Clt. 1824. Shrub 3 to 6 feet.

10 *C. VERTICILLATA* (H. B. et Kunth, l. c. p. 207. t. 552.) stem herbaceous; branches and calyxes hairy; leaves 3 or 4 in a whorl, almost sessile, oblong, acutish, rounded at the base, scabrous from strigæ above, and pilose beneath; flowers extra-axillary, solitary or twin, alternate; petals 5-8, unequal. *℥. S.* Native of Peru, in hot places. Calyx 10-16-toothed, coloured, with the limb violaceous. Petals violaceous.

*Whorled-leaved Cuphea.* Pl. 1 to 2 feet.

11 *C. LYSIMACHIOIDES* (Schlecht. et Cham. in Linnæa. vol. 2. p. 374.) stem simple, straight, rarely a little branched, scabrous like the rest of the plant, and beset with viscid glandular hairs; leaves lanceolate, acuminate, petiolate, verticillate or opposite;

flowers interpetiolar, verticillate, pedicellate; calyx with a short spur at the base; petals 6; stamens 11; style villous; ovary 3-ovulate. *U. S.* Native of Brazil. Petals rose-coloured.

*Lysimachia-like Cuphea.* Pl. 1 to 2 feet.

12 *C. SECUNDIFLORA* (Moc. et Sesse, fl. mex. icon. ined.) stem herbaceous, erect, and is, as well as the calyxes, pubescent; leaves on long petioles, ovate, long-acuminated; raceme terminal, subspicate, short; flowers secund; petals 6, rather unequal, spreading. *U. F.* Native of Mexico. Herb with the habit of the first section, but the flowers are referrible to the present. Calyx white. Petals violaceous, 2 upper ones the largest.

*Secund-flowered Cuphea.* Pl. 1 foot.

13 *C. CORDIFOLIA* (H. B. et Kunth, l. c. p. 206.) stem herbaceous; branches clothed with clammy pubescence; leaves on short petioles, ovate-oblong, acute, cordate at the base, with revolute margins, stiff, scabrous on both surfaces; peduncles interpetiolar, alternate, somewhat racemose; calyx hispid, clammy; petals unequal. *U. ? S.* Native of New Granada. Calyx 12-toothed. Petals 6, violaceous. Stamens 10-12, exserted, unequal. Ovary 18-30-ovulate.

*Heart-leaved Cuphea.* Pl.

14 *C. MIMULOIDES* (Cham. et Schlecht. Linnæa. 5. p. 570.) branches brachiate, and are, as well as the peduncles and calyxes, minutely puberulous; leaves elliptic or lanceolate; pedicels alternate and opposite the leaves, and longer than them; petals 6, minute; stamens 11. *U. F.* Native of Mexico, in humid places near Mesachica. Calyx  $\frac{1}{2}$  inch long.

*Mimulus-like Cuphea.* Pl.  $\frac{1}{2}$  foot.

15 *C. CYANÆA* (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 85.) stem herbaceous, erect; branches hispid; leaves opposite, petiolate, ovate-cordate, acuminate, villous on both surfaces; peduncles interpetiolar, alternate, subracemose; calyx rather hispid; petals 2, spatulate, unguiculate. *U. F.* Native of Mexico. Nearly allied to the preceding, but differs in the leaves being all opposite, and standing on petioles, almost an inch long. Calyx red at the base, and yellowish at the apex. Anthers and petals purplish blue. Perhaps the petals are only 2 or probably 6, 3 of which may be deciduous.

*Blue-petalled Cuphea.* Pl.  $\frac{1}{2}$  to 1 foot.

16 *C. COCCINEA* (D. C. prod. 3. p. 85.) stem shrubby, erect, pubescent at the apex; leaves petiolate, cordate, acute; peduncles many-flowered, disposed in a terminal panicle; petals oblong, acute, reflexed. *U. S.* Native of Mexico, on the mountains of Tuxtla. *Lythrum cordifolium*, Moc. et Sesse, fl. mex. icon. ined. Calyxes scarlet. Petals and genitals of the same colour.

*Scarlet-flowered Cuphea.* Shrub 1 to 2 feet.

17 *C. LLAVEA* (La Llave ex Lexarc. nov. veg. mex. 1. p. 20.) stems numerous, hispid; branches ascending; leaves almost sessile, ovate-lanceolate, strigose; pedicels interfoliateous, erect; petals 2, obovate, large, the rest abortive; stamens 11. *U. S.* Native of Mexico, on the mountains. Petals pale scarlet. Calyx with a greenish front, and with the back and throat purplish brown. Three of the stamens very long.

*La Llave's Cuphea.* Pl. 1 to 2 feet.

18 *C. LINARIOIDES* (Cham. et Schlecht. Linnæa. 2. p. 367.) stem filiform, erect, always with one side pubescent, intermixed with longer glandiferous hairs; leaves nearly sessile, ovate or ovate-lanceolate, acute, with a few glandular pili on the edges and nerves; flowers interpetiolar, solitary, alternate, pedicellate; calyx furnished with an ascending spur; stamens 11; style glabrous; ovary 3-ovulate. *U. ? S.* Native of Brazil. Petals 6, violaceous.

*Linaria-like Cuphea.* Pl. 1 foot.

19 *C. BUSTAMONTA* (La Llave ex Lexarc. l. c. p. 21.) stems herbaceous, procumbent; branches ascending; leaves ovate-cordate, on short petioles, acuminate, rather hispid; lateral nerves parallel; flower interfoliateous, pendulous; outer calycine teeth much elongated; petals 6, upper 2 the largest; stamens 9.—Native of Mexico. There are varieties of this plant with violaceous and rose-coloured petals, marked each with a longitudinal purplish line.

*Bustamont Cuphea.* Pl. procumbent.

20 *C. TUBEROSA* (Cham. et Schlecht. in Linnæa. 2. p. 372.) root woody, tuberous; stems erect, branched at the apex; branches alternate, rarely opposite; leaves ovate, petiolate, scabrous; flowers pedicellate, interpetiolar, alternate or opposite, forming terminal racemes; calyx with a short spur at the base; petals 6, unequal; stamens 11; style glabrous; ovary 11-18-ovulate. *U. S.* Native of the southern provinces of Brazil. Flowers purplish. Calyx 5 lines long.

*Tuberous-rooted Cuphea.* Pl. 1 to 3 feet.

§ 3. *Lythroideæ* (from *Lythrum*, and *idea*, like; plants resembling the genus *Lythrum* in habit). *D. C. prod. 3. p. 85.* Stems herbaceous. Pedicels interpetiolar, 1-flowered, not spicately racemose. Calyx gibbous at the base, not spurred. Petals rather large, longer than calyx. Stamens 11-12.

21 *C. VISCOSISSIMA* (Jacq. hort. vind. 2. p. 83. t. 177.) stem herbaceous, erect, branched, clothed with clammy pubescence, hispid; leaves opposite, petiolate, ovate-lanceolate, rather scabrous; flowers pedicellate, solitary, deflexed; calyx 6-toothed, clothed with clammy down; petals 6, unequal. *U. F.* Native of America, from Brazil to Pennsylvania, in humid shady places. Sweet, fl. gard. t. 60. *Lythrum petiolatum*, Lin. spec. p. 641. *L. Cuphea*, Lin. fil. suppl. 249. Flowers purple. Ovary 4-6-seeded. Stamens 12. Style pilose.

*Very-clammy Cuphea.* Fl. July, Aug. Clt. 1776. Pl. 1 foot.

22 *C. GLUTINOSA* (Cham. et Schlecht. in Linnæa. 2. p. 369.) plant clammy, pubescent, mixed with longer glandiferous hairs; stem branched at the apex; leaves lanceolate, acute, on short petioles; flowers interpetiolar, pedicellate; calyx with a short spur; petals shorter than the calyx; stamens 6; style villous; ovary 4-15-ovulate. *U. S.* Native of Brazil, common. Petals violaceous.

*Glutinous Cuphea.* Pl.  $\frac{1}{2}$  to 1 foot.

23 *C. BALSAMONA* (Schlecht. et Cham. in Linnæa. 2. p. 363.) stem erect, hispid from glandular spreading pili; leaves opposite, ovate, attenuated at both ends, petiolate, with cartilaginous finely denticulated margins, scabrous on both surfaces; flowers pedicellate; calyx short, 6-toothed, with a very short acute spur; stamens 11, inclosed; ovary 5-6-ovulate; style glabrous. *U. F.* Native of Brazil everywhere in humid places, and of Mexico near Jalapa. *Balsamona Pinto*, Vand. fl. lus. et bras. spec. p. 30. t. 4. Petals violaceous. Flowers forming leafy racemes at the tops of the stem and branches; racemes shorter than the leaves, 2-4-flowered, rarely reduced to one flower.

*Balsam Cuphea.* Pl. 1 foot.

24 *C. PROCUMBENS* (Cav. icon. 4. p. 55. t. 380.) stem herbaceous, assurgent; branches procumbent, clothed with clammy villi; leaves opposite, on short petioles, ovate-lanceolate, rather hispid; flowers pedicellate, solitary, deflexed; calyx clothed with clammy pili, 6-toothed; petals 6, obovate, 2 of which are larger than the rest; the two longest stamens are woolly beyond the anthers. *U. F.* Native of Mexico. Ker. bot. reg. t. 1981. Petals pale purple. Stamens 11, hairy. Calyx purplish, dilated, and greenish at the apex. Petals rose-coloured.

*Procumbent Cuphea.* Fl. July, Sept. Clt. 1816. Pl. proc.

25 *C. LANCEOLATA* (Ait. hort. kew. ed. 2. vol. 3. p. 150.)

stem herbaceous, erect, clothed with clammy pubescence; leaves opposite, on short petioles, lanceolate, rather pilose; flowers pedicellate, solitary, deflexed; calyx beset with clammy pili, 6-toothed; petals 6, obovate, two of which are larger than the rest; the two longer stamens woolly beyond the anthers. ☉. F. Native of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 605. Petals violaceous. Very like *C. procumbens*, but differs in being erect. Ovarium usually 18-ovulate, ex Kunth.

*Lanceolate-leaved Cuphea*. Fl. Aug. Sep. Clt. 1796. Pl. 1½ ft.

26 *C. æQUIPÉ'TALA* (Cav. icon. 4. p. 57. t. 382. f. 2.) stem herbaceous, ascending, branched, hispid from stiff bristles, as well as the calyx; leaves on short petioles, oval-oblong, attenuated at both ends, ciliated; flowers pedicellate, solitary, spreading; petals 6, obovate, nearly equal; filaments of 2 of the stamens bearded, the rest glabrous. ☉. F. Native of Mexico, between Acapulco and the town of Mexico. Calyx 7-9 lines long. Petals purplish violet. Stamens 11-12.

*Equal-petalled Cuphea*. Pl. ascending.

27 *C. VIRGATA* (Cav. icon. 4. p. 57. t. 382. f. 1.) stem herbaceous, twiggly, branched, hispid from stiff bristles, as well as the calyxes; leaves almost sessile, ovate-lanceolate, bluntish at the base, hispid; flowers pedicellate, solitary, spreading; petals 6, obovate, nearly equal; many of the filaments are bearded. ☉. F. Native of New Spain, in shady humid places, near Salvatierra, and of Mexico near Jalapa. *C. nitidula*, H. B. et Kunth, nov. gen. 6. p. 206. *C. adscendens*, Moc. et Sesse, fl. mex. icon. ined. Petals red.

*Twiggly Cuphea*. Pl. 1 foot.

§ 4. *Melaniæ*. Stems herbaceous. Pedicels axillary, very short, 1-flowered. Calyx gibbous at the base, or furnished with a short spur. Petals small. Stamens 6-9 or even 10.

28 *C. PARSONSIA* (R. Br. ex Steud. nom. p. 245.) stem herbaceous, prostrate, branched, rather scabrous; leaves opposite, on short petioles, oval, acute at both ends, glabrous, as well as the calyxes; flowers solitary, almost sessile; petals 6, oblong, nearly equal; stamens 6, 2 of which are a little longer than the rest. ♀. S. Native of Jamaica, St. Domingo, and Porto Rico, in moist rocky places. *Parsonsia herbacea*, &c. P. Browne, jam. 199. t. 21. f. 1. *Lýthrum Parsonsia*, Lin. spec. 641. Swartz, obs. 193. *Melanium scabrum*, Spreng. syst. 2. p. 455. *Parsonsia prostrata*, Bert. ined. Duvernaya, Desp. in herb. Juss. Flowers pale red.

*Parsons's Cuphea*. Pl. prostrate or creeping.

29 *C. MELANIUM* (R. Br. et Steud. nom. p. 245.) stems herbaceous, prostrate, pubescent at the apex; leaves opposite, almost sessile, elliptic, acuminate at both ends; flowers almost sessile, solitary, alternate; petals 6, oblong. ♀. S. Native of Jamaica. *Melanium*, &c. P. Browne, jam. 2. p. 217. *Lýthrum Melanium*, Lin. spec. 641. Swartz, obs. p. 103. *Melanium alliaceum*, Spreng. syst. 2. p. 454. Plant fetid when bruised. Flowers purple. Stamens 8-10, unequal, short. Stigma acute. Ovarium 6-7-ovulate, ex Swartz.

*Black Cuphea*. Pl. prostrate.

30 *C. HIRTA* (D. C. prod. 3. p. 86.) stem herbaceous, erect, branched, hairy; leaves opposite, sessile, lanceolate, scabrous on both surfaces; flowers pedicellate, usually solitary, erect; calyx hairy, striped; petals oblong. ☉. F. Native of St. Domingo. *Lýthrum Domingense*, Spreng. in herb. Balb. *Melanium hirtum*, Spreng. syst. 2. p. 454. Stamens 6, ex Spreng. Petals small, purple. Fruit few-seeded.

*Hairy Cuphea*. Pl. 1 foot.

§ 5. *Fruticossæ* (from *frutex*, a shrub; the plants contained in this section are shrubby). D. C. prod. 3. p. 86. Stems shrubby.

*Pedicels alar, 1-flowered. Calyx gibbous, or furnished with a short spur at the base. Flowers small.*

\* Stamens 10.

31 *C. SWARTZIANA* (Spreng. syst. 2. p. 455.) stem shrubby, decumbent, rather scabrous; leaves on short petioles, ovate, cordate, acute, wrinkled, scabrous on both surfaces; racemes secund, leafy; calyx pubescent, 10-toothed; petals 5; stamens 10. ♀. S. Native of St. Domingo, in woods. *Lýthrum cordifolium*, Swartz, fl. ind. occ. 2. p. 866. Petals blood-coloured, nearly equal.

*Swartzian Cuphea*. Shrub decumbent.

32 *C. DECÁNDRA* (Ait. hort. kew. 2. edit. vol. 3. p. 151.) stem shrubby, erect, much branched; branches scabrous, compressed at the apex; leaves ovate, acute, ciliated, tapering into the petiole at the base; flowers few, racemose, somewhat secund at the tops of the branches; petals 5-6; stamens 10. ♀. S. Native of Jamaica, on the tops of the mountains among rocks. *Lýthrum ciliatum*, Swartz, fl. ind. occ. 2. p. 868. *C. decándra* and *racemosa Jamaicensis*, Spreng. syst. 2. p. 455. Flowers purple.

*Decandrous Cuphea*. Fl. June, Oct. Clt. 1789. Sh. 1 foot.

33 *C. RACEMOSA* (Spreng. syst. 2. p. 455.) stems suffruticose, diffuse; leaves ovate, petiolate; racemes terminal; pedicels opposite, long, bracteate; branches and calyxes beset with viscid hairs. ♀. S. Native of South America. *Lýthrum racemosum*, Mutis in Lin. fil. suppl. p. 250. This species is not sufficiently known, but is nearly related to *C. Swartziana*.

*Racemose-flowered Cuphea*. Shrub diffuse.

\*\* Stamens 11.

34 *C. SEPPYLLIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 201. t. 550. but not of Sims.) stem shrubby, procumbent; branches elongated, clothed with hispid pubescence, viscid; leaves ovate-elliptic, acute, rounded at the base, strigose on both surfaces, and viscid; flowers interpetiolar, alternate; calyx clammy and hispid; petals 6, unequal. ♀. S. Native of Santa Fé de Bogota. Ovarium 7-ovulate. Petals elliptic, purple. Stamens 11, unequal.

*Wild-thyme-leaved Cuphea*. Shrub procumbent.

35 *C. MICROPHYLLA* (H. B. et Kunth, nov. gen. amer. 6. p. 201.) stem shrubby, much branched; branches clammy and hairy; leaves ovate-oblong, acute, rounded at the base, viscid and rather scabrous; flowers interpetiolar, alternate; calyx clammy, hispid; petals 6, rather unequal. ♀. S. Native of Peru, near Ayavaca. Calyx dark purple. Petals violaceous. Filaments 11, villous, purple. Ovarium 9-10-ovulate.

*Small-leaved Cuphea*. Shrub 3 feet.

36 *C. SCAERIDA* (H. B. et Kunth, l. c. 6. p. 203.) stems shrubby, and are, as well as the branches, bifariously pubescent; leaves oblong, acute at both ends, stiff, rather scabrous from strigæ above, glabrous beneath as well as the calyxes; flowers alternate, interpetiolar; petals 6, rather unequal; stamens 9-11. ♀. S. Native of Mexico, at Salamanca. Petals and stamens purple. Ovary 16-ovulate.

*Scabrous Cuphea*. Shrub 1 foot.

37 *C. ANTISYPHILITICA* (H. B. et Kunth, l. c. 6. p. 202.) stems shrubby, procumbent, roughish; branches pubescent; leaves ovate-oblong, acute, rounded at the base, scabrous; flowers alternate; calyx hispid; petals equal; stamens 11. ♀. S. Native of South America, where it is called *Chiagari*, and where it is used by the inhabitants in the cure of syphilitic complaints. Petals violaceous. Stamens villous. Ovarium 4-ovulate.

*Antisyphilitic Cuphea*. Shrub proc.

38 *C. STRIGULOSA* (H. B. et Kunth, l. c.) stem shrubby;

branches and calyxes clammy and hispid; leaves ovate-oblong, acute, rounded at the base, scabrous; flowers alternate; petals 6, nearly equal; stamens 11. *h. S.* Native at the bottom of the Andes near Ibaguë. Petals violaceous. Filaments villous. Ovarium 7-8-ovulate.

*Strigulose Cuphea.* Shrub 1 foot.

39 *C. DENTICULATA* (H. B. et Kunth, l. c. p. 198.) stem shrubby; branches clammy, hairy; leaves lanceolate-oblong, acute, cuneated at the base, sharply and ciliate toothletted, glabrous; flowers interpetiolar on the branches, opposite, somewhat racemose; calyxes hispid; petals 6, nearly equal; stamens 11, inclosed. *h. S.* Native of Cumana, in humid places near St. Fernando. Petals spatulate, 2 superior ones violaceous, the rest white. Filaments villous. Ovarium 10-14-ovulate.

*Denticulated-leaved Cuphea.* Shrub 1 to 3 feet.

40 *C. LOXENSIS* (H. B. et Kunth, l. c. p. 200.) stem shrubby; branches clothed with glandular hairs; leaves oblong, acute, rounded at the base, scabrous above, and pilose on the nerves beneath; flowers interpetiolar, alternate; calyx hispid; petals 6, nearly equal; stamens 11, inclosed. *h. S.* Native of Mexico near Jalapa; and at Loxa in Peru. Petals pale violet. Filaments villous. Ovary 5-6-ovulate.

*Loxa Cuphea.* Shrub 1 foot.

41 *C. HYSSOPIFOLIA* (H. B. et Kunth, l. c. p. 199.) stem shrubby; branches strigose; leaves lanceolate, acutish, obtuse at the base, glabrous above, but beset with strigose pili on the nerve and veins; flowers interpetiolar, alternate; calyx glabrous; petals 6, rather unequal; stamens 11, inclosed. *h. S.* Native of Mexico, near Jalapa. Petals pale violet. Filaments villous. Ovary 5-6-ovulate.

*Hyssop-leaved Cuphea.* Shrub 6 feet.

42 *C. GRACILIS* (H. B. et Kunth, l. c. p. 199.) stems shrubby, procumbent; branches filiform, elongated, and arc, as well as the calyxes, puberulous; leaves lanceolate, acute at both ends, 1-nerved, glabrous; flowers interpetiolar, alternate; petals 6, rather unequal; stamens 11, inclosed. *h. S.* Native on the banks of the Orinoco, near Atures in sandy places. Petals violaceous. Filaments villous. Ovarium 3-4-ovulate.

*Slender Cuphea.* Shrub procumbent.

43 *C. CORDATA* (Ruiz et Pav. fl. per. prod. p. 119. t. 11.) stem suffruticose; leaves cordate, acute; petals 6, the 2 superior ones roundish and large, the 4 lower ones small, oblong; stamens 11. *h. S.* Native of Peru, on hills. Lower leaves coriaceous, upper ones oblong. Branches, peduncles, and calyxes clammy.

*Cordate-leaved Cuphea.* Shrub 1 foot.

44 *C. TRINITATIS* (D. C. prod. 3. p. 88.) stems suffruticose; leaves ovate, acute at both ends; petals nearly equal, oblong; pedicels axillary, longer than the leaves. *h. S.* Native of the Island of Trinidad. *C. serpyllifolia*, Sims, bot. mag. 2580. but not of H. B. et Kunth. Allied to *C. Loxensis* and *C. gracilis*. Stamens probably 11.

*Trinidad Cuphea.* Fl. May. Clt. 1822. Shrub 1 foot.

45 *C. MULTIFLORA* (Lodd. bot. cab. t. 808.) stem suffruticose, branched; leaves oblong, acute at both ends; flowers alternate, interpetiolar; petals 6, nearly equal, oblong-linear. *h. S.* Native of Trinidad. Petals violaceous.

*Many-flowered Cuphea.* Fl. May, Sept. Clt. 1820. Sh. 1 ft.

46 *C. LIGUSTRINA* (Schlecht. et Cham. in Linnæa. 2. p. 360.) stem shrubby, procumbent; branches extra-axillary, obsoletely tetragonal, clothed with clammy pubescence, interspersed with long, coloured, glanduliferous hairs, as well as the peduncles and calyxes; leaves oblong-lanceolate, with rather scabrous edges; flowers interpetiolar, pedicellate, spurless; hind tooth of calyx large; style villous; ovary 18-32-ovulate; petals 6, about equal in length; filaments villous; stamens 11, length of caly-

cine teeth. *h. S.* Native of Brazil. Petals violaceous. Calyx 3-4 lines long. Branches extra-axillary.

*Privet-like Cuphea.* Shrub decumbent 1 foot.

47 *C. CALOPHYLLA* (Schlecht. et Cham. in Linnæa. 2. p. 361.) stem shrubby, sparingly branched; branches axillary, when young clothed with short down and longer purplish glanduliferous pili, as well as the branches and calyxes; leaves elliptic, acute at both ends, on short petioles, scabrous; racemes compound; flowers alternate, pedicellate, spurless; teeth of calyx nearly equal; style villous; ovary 5-6-ovulate; filaments villous; petals 6, nearly equal. *h. S.* Native of Brazil, in the province of Rio Janeiro. Petals violaceous, about the length of the calyx.

*Beautiful-leaved Cuphea.* Shrub 1 foot.

48 *C. ERICOIDES* (Schlecht. et Cham. in Linnæa. 2. p. 366.) shrub erect, branched; branches filiform, puberulous; leaves sessile, linear or acrosc, 3 in a whorl, and imbricated in 6 rows, scabrous, 3-nerved; flowers crowded at the tops of the branches, pedicellate; calyx with a short spur; style glabrous; ovarium 3-ovulate; stamens 11, inclosed. *h. S.* Native of Brazil. Petals pale purple, nearly equal. Filaments ciliated. Calyx 3 lines long.

*Heath-like Cuphea.* Shrub 1½ foot.

49 *C. THYMOIDES* (Schlecht. et Cham. in Linnæa. 2. p. 368.) smoothish, shrubby; stem filiform, branched, decumbent; branches beset with short hairs on one side; but the stem, leaves, and calyx are furnished with longer glanduliferous hairs; leaves sessile, lanceolate, obtuse, a little ciliated on the margins; flowers interpetiolar, scattered, pedicellate; calyx furnished with a short blunt spur; style glabrous; ovarium 8-ovulate; petals 6, nearly equal; stamens 11, villous. *h. S.* Native of Brazil. Petals purple. Calyx 4 lines long.

*Thyme-like Cuphea.* Shrub decumbent.

50 *C. INGRATA* (Schlecht. et Cham. in Linnæa. 2. p. 371.) shrubby, much branched; branches pubescent on one side, but every where beset with long stiff glanduliferous hairs; leaves broadly lanceolate, tapering into the short petiole, with reflexed, rather scabrous edges, rather pilose; flowers interpetiolar, alternate, pedicellate; calyx with a short spur; petals one-half shorter than the calyx; style villous; ovarium 10-12-ovulate; stamens 11, villous. *h. S.* Native of Brazil. Petals pale violet. Calyx beset with glandular pili, 4-5 lines long.

*Ungrateful Cuphea.* Shrub.

\*\*\* *Flowers with 12 stamens.*

51 *C. PARVIFLORA* (Hook. exot. fl. 151.) stem suffruticose, pubescent; leaves elliptic-lanceolate, tapering into the short petiole at the base, almost quite entire, with somewhat ciliated margins; flowers in terminal racemes; petals 6, oblong, nearly equal; stamens 12. *h. S.* Native about Demerara. Petals rose-coloured. Stamens short, inclosed. Branches clothed with glandular pubescence.

*Small-flowered Cuphea.* Fl. Oct. Clt. 1824. Shrub ½ ft.

52 *C. HERTELLA* (H. B. et Kunth, nov. gen. amer. 6. p. 197.) stem shrubby; branches hairy; leaves oblong, acute, cuneated at the base, viscid, hairy; flowers subracemose at the tops of the branches, opposite; calyx clothed with clammy hairs; petals 6, unequal; stamens 12, inclosed. *h. S.* Native of New Granada, near Guadua. Petals white. Ovarium 10-seeded.

*Hairy Cuphea.* Shrub 1 foot.

53 *C. FRUTICOSA* (Spreng. neue entd. 2. p. 156.) stem shrubby, branched, diffuse; branches and calyxes clothed with clammy pili; leaves petiolate, linear-lanceolate, glabrous; flowers in loose racemes; calyx 6-toothed; petals 6; stamens 12. *h. S.* Native of Brazil. Petals violaceous.

*Shrubby Cuphea.* Shrub 1 foot.

54 *C. FLORIBUNDA* (Lehm. sem. hort. hamb. 1831.) shrubby; branches very hispid, elongated; leaves ovate-oblong; peduncles interpetiolar; petals equal; stamens 2, elongated; style very smooth; ovary many-seeded. *h. S.* Native of Mexico.

*Bundle-flowered Cuphea.* Shrub 1 to 2 feet.

† *Species not sufficiently known.*

55 *C. BRACTEATA* (Lag. nov. gen. et spec. hort. madr. 1811. p. 16. no. 212.) stem shrubby, beset with retrograde spreading hairs; leaves ovate, acute, somewhat undulated; flowers solitary, interfoliaceous. *h. S.* Native of New Spain. Perhaps the same as *Lythrum Tuxtlense*, Moc. et Sesse, fl. mex. icon. ined.

*Bracteate Cuphea.* Shrub 1 foot.

56 *C. CILIATA* (Ruiz et Pav. fl. per. prod. p. 119. t. 11.) stem suffruticose; leaves linear, ciliated; petals 6, nearly equal. *h. S.* Native of Peru, on hills. *Banksia ciliata*, Domb. herb. *Lythrum cistifolium*, Lher. in herb. Stem much branched from the base; branches terete, villous at the apex. Leaves oblong, rather scabrous. Pedicels axillary, 1-flowered, length of the calyx. Calyx rather gibbous at the base. Flowers small, purple. Probably referrible to section *Meliniæ*.

*Ciliated-leaved Cuphea.* Shrub.

57 *C. FLAVA* (Spreng. nov. prov. 14.) stem shrubby; leaves cordate-lanceolate, revolute, quite glabrous; flowers terminal, somewhat racemose; calyx striated, 6-toothed. *h. S.* Native of Brazil. Petals yellow.

*Yellow-flowered Cuphea.* Shrub.

58 *C. FRUTICULOSA* (Schrader, ill. pl. bras. in Gœtt. anz. 1821. p. 715.) stem suffruticose, branched; leaves petiolate, elliptic-ovate, acutish, glabrous above, hairy on the margins and the veins beneath; racemes terminal, few-flowered. *h. S.* Native of Brazil. *C. fruticulosa*, Neuw. reis. bras. no. 31.

*Shrubby Cuphea.* Shrub.

59 *C. CORYMBIFERA* (Neuw. reis. bras. 1821. p. 302.) stems herbaceous, diffuse, clothed with clammy pubescence above; leaves ovate-oblong, on short petioles, roughish; flowers terminal, corymbose. *h. S.* Native of Brazil, along the banks of rivers.

*Corymb-bearing Cuphea.* Pl. diffuse.

60 *C. MEGAPOTAMICA* (Spreng. syst. append. 192.) stem herbaceous, simple, glabrous; leaves opposite, linear-lanceolate; corymbs terminal, few-flowered; calyx glabrous. *h. S.* Native of Brazil, at Rio Grande.

*Rio Grande Cuphea.* Pl. 1 foot.

61 *C. APANXALOA* (Herm. mex. 353. f. 2.) Native of Mexico. Nothing is known of this plant.

*Apanxaloe Cuphea.* Pl.

*Cult.* Some of the species of *Cuphea* are very elegant when in flower. They grow well in a mixture of loam, sand, and peat; and cuttings of the perennial-herbaceous, and shrubby kinds root freely in the same kind of earth. The seeds of annual kinds require to be raised on a hot-bed.

IX. ACISANTHERA (from *akis*, *akis*, a point, and *arōthra*, *anthera*, an anther; anthers pointed). P. Browne, jam. 217. Juss. gen. 332. D. C. prod. 3. p. 88.

LIN. SYST. *Decándria, Monogýnia*. Calyx ventricose, 5-cleft, the sinuses never drawn out into other segments. Petals 5. Stamens 10; anthers sagittate, variable. Capsule covered and crowned by the calyx, roundish, 2-celled, with 2 placentas, many seeded.—An herb, with opposite leaves. Flowers alternate, axillary, solitary. This genus differs from *Rhœxia* in the quinary parts of the flower, not quaternary, in the cells of the capsule being 2, not 3-4, and in the form of the anthers.

1 *A. QUADRATA* (Juss. in Poir. suppl. 1. p. 111.) *h. S.* Native of Jamaica, in meadows. P. Browne, l. c. t. 22. f. 1. *Rhœxia Acisanthæra*, Lin. amœn. 5. p. 396. Lam. hort. jam. 1. p. 5. Herb erect, branched at the apex; branches square. Leaves 3-nerved, ovate, crenated.

*Square-branched Acisanthera.* Fl. July, Sept. Clt. 1804. Pl. 1 to 1½ foot.

*Cult.* See *Cuphea* for culture and propagation.

X. FATIOA (this genus is dedicated to Nicolas Fatio de Duilliers, a physician of Geneva, who was one of the first who wrote on thermometers, and he was also the first who proposed inarching the branches of fruit trees. Compare Haller, bibl. bot. 2. p. 43.). D. C. prod. 3. p. 88. D. C. coll. mem. 10. t. 2.

LIN. SYST. *Icosándria, Monogýnia*. Calyx bractless at the base, campanulate, 6-cleft; lobes triangular, valvate in aestivation. Petals 6, inserted at the top of the tube of the calyx, and alternating with the calycine lobes. Stamens 24, inserted in the bottom of the calycine tube. Ovary 3-celled. Style filiform, longer than the stamens. Stigma simple. Fruit unknown. Tree or shrub. Branchlets tetragonal, glabrous, rising in fascicles from the nodes of the branches, or in whorls. Leaves opposite, oval, white beneath, quite entire. Peduncles axillary, 3-5-flowered.

1 *F. NIPAULENSIS* (D. C. l. c.) *h. F.* Native of Nipaul. Leaves glabrous and dark green above, but white from short velvety down beneath.

*Nipaul Fatioa.* Shrub.

*Cult.* See *Heimia* for culture and propagation, p. 718.

XI. PEMPHIS (from *πεμψε*, *pemphis*, a blister, which the globular form of the capsule represents). Forst. gen. t. 31. Juss. gen. 331. D. C. prod. 3. p. 89.—*Lythrum species* Lin. and Lam.

LIN. SYST. *Dodecándria, Monogýnia*. Calyx turbinate, permanent, 12-furrowed; lobes 12, the 6 inner ones erect, and the 6 outer ones or those produced from the sinuses smaller and spreading. Petals 6, obovate, inserted at the top of the calycine tube, and alternating with the larger or erect lobes of the calyx. Stamens 12, inserted in the middle of the calycine tube, alternately smaller. Ovary globose. Style short. Stigma capitate. Capsule membranous, 6-valved, 3-celled at the base, circumsised, filling the calyx. Seeds numerous, fixed to the central placenta, which is tridentate.—A canescent shrub. Leaves opposite, quite entire. Pedicels axillary, solitary, bibracteate at the base. Flowers white.

1 *P. ACIDULA* (Forst. l. c.) *h. S.* Native of Ceylon, Java, Timor, Madagascar, &c. on the sea shore. *Lythrum Pemphis*, Lin. fil. suppl. 249. Lam. ill. 408. f. 2. *Melanium fruticosum*, Spreng. syst. 2. p. 455. *Mangium porcellanicum*, Rumph. amb. 3. p. 84. *P. angustifolia*, Roxb. hort. beng. p. 91.

*Acidulous Pemphis.* Shrub.

*Cult.* See *Heimia* for culture and propagation, p. 718.

XII. HEIMIA (in honour of Dr. Heim, a celebrated Berlin physician). Link et Otto, abb. berl. 63. D. C. prod. 3. p. 89. *Chrysólige*, Willd. herb.—*Nesaea* spec. Kunth.—*Gimoria*, Moc. et Sesse, fl. mex. icon. ined. but not of Jacq.

LIN. SYST. *Dodecándria, Monogýnia*. Calyx bibracteolate at the base, campanulate, 2-toothed, the 6 inner teeth largest and erect, and the 6 outer ones, or those produced from the sinuses, small, spreading, and horn-formed. Petals 6, alternating with the erect inner lobes of the calyx. Stamens 12, nearly equal, exserted. Capsule nearly globose, covered by the calyx, 4-celled, rarely only 3-celled from abortion, 4-valved, opening at

the cells. Seeds wingless, numerous.—Smooth American shrubs. Peduncles 1-flowered. Flowers yellow.

1 *H. SALICIFOLIA* (Link et Otto, l. c. t. 28.) leaves opposite or 3 in a whorl, but the upper ones are usually alternate, on short petioles, lanceolate, acute, tapering at the base; flowers pedicellate; capsule ovoid. *h. f.* Native of Brazil; and Mexico on the declivities of the burning mount Jorullo. Sweet, fl. gard. 281. *Nesaea salicifolia*, H. B. et Kunth. *Ginoria flava*, Moc. et Sesse, fl. mex. icon. ined. *Chrysoliga salicifolia*, herb. Willd. *Lythrum flavum*, Spreng. syst. 2. p. 454. Flowers yellow. Petals roundish-obovate.

*Willow-leaved Heimia*. Fl. July, Sept. Clt. 1821. Shrub 4 to 6 feet.

2 *H. MYRTIFOLIA* (Hort. berol. ex Schlecht. *Linnaea*. 2. p. 347.) leaves nearly opposite or alternate, lanceolate, acute, smaller than those of *H. salicifolia*; flowers nearly sessile; capsule globose. *h. f.* Native of Brazil, in the Island of St. Catharine, at the entrance to Rio Janeiro. *Lythrum apetalum*, Spreng. syst. 2. p. 454. Flowers yellow.

*Myrtle-leaved Heimia*. Fl. Aug. Sept. Clt. 1826. Shrub 3 to 4 feet.

3 *H. LINARIÆFOLIA* (Hort. ex Lond. hort. brit. p. 479.) leaves linear; flowers yellow. *h. f.* Native of South America.

*Toad-flax-leaved Heimia*. Fl. Aug. Sept. Clt. 1826. Shrub 3 to 4 feet.

4 *H. SYPHILITICA* (D. C. prod. 3. p. 89.) leaves alternate, erect, crowded, linear-lanceolate, attenuated at both ends; petals obovate-oblong. *h. f.* Native of Mexico, at Yecapixtla, where it is called *Hanchinol* by the inhabitants. *Ginoria syphilitica*, Moc. et Sesse, fl. mex. icon. ined. This plant is said to possess powerful antisyphilitic properties; its expressed juice, taken in doses of 4 ounces, excites violent perspiration and secretion of urine, and is said to cure venereal disorders in an incredibly short space of time.

*Syphilitic Heimia*. Shrub 4 to 6 feet.

*Cult.* The species of *Heimia* are very pretty shrubs when in flower; they only require to be sheltered from frost in winter; this may be done by mats, if the plants are planted against a south wall in the open ground; and if in pots they should be placed in the greenhouse. Cuttings of them strike readily either in sand or mould under a hand-glass.

XIII. DIPLUSODON (from *διπλος*, *diploos*, double, and *οὄν*, *odon*, *odon*, a tooth; a double row of teeth in the calyx). Pohl. pl. bras. 1. p. 82. Friedlândia, Schlecht. et Cham. in *Linnaea*. 2. p. 348.—*Dubaia*, D. C. diss. ined. 1827.—*Nesaea* species of Kunth.

*Lin. syst.* *Dolecandria*, *Monogynia*. Calyx bilabiate at the base, hemispherically campanulate (f. 106. a.), 12-nerved; limb 12-cleft (f. 106. b.), the 6 inner segments largest and erect, and the 6 outer ones, or those from the sinuses, smaller. Petals 6 (f. 106. c.), inserted in the calycine tube, and alternating with the erect segments of the calyx. Stamens 12-36, equal, inserted in the lower part of the tube of the calyx, exserted. Capsule globose, covered by the calyx, 2-celled, 2-valved, many seeded. Seeds oval, compressed, girded by an obscure thickish wing.—Shrubs, with quite opposite decussate entire leaves, and racemously paniced inflorescence.

\* *Leaves linear, 1-nerved. Outer teeth of calyx erect.*

1 *D. HEXANDER* (D. C. prod. 3. p. 94.) glabrous; branches terete; leaves oblong-linear, with revolute edges, obtuse, on short petioles; flowers on short pedicels; bractees oblong; stamens 6? *h. s.* Native of Brazil, in the province of Minas Geraes. Friedlândia hexandra, Mart. herb. Habit nearly of

*Hypéricum angustifolium*. Floral branches short, opposite, and slender. Petals reddish-purple. Stamens probably 12.

*Hexandrous Diplusodon*. Shrub 1 to 2 feet.

2 *D. ANGUSTIFOLIUS* (D. C. l. c.) quite glabrous; branches rather tetragonal, slender; leaves linear, with revolute edges, hardly 1-nerved, obtuse, rather coriaceous; pedicels short; bractees ovate-oblong; stamens? *h. s.* Native of Brazil, in the province of Minas Geraes. Friedlândia angustifolia, Mart. herb. Habit almost of *Hibbertia angustifolia*. Stem much branched. Leaves 3-4 lines long, hardly a line broad, greyish as well as the calyxes. Petals and stamens unknown.

*Narrow-leaved Diplusodon*. Shrub 1 foot.

3 *D. CANDOLLEI* (Pohl, herb. ex D. C. l. c.) branches somewhat tetragonal; under sides of leaves as well as the calyxes clothed with adpressed villi; leaves almost sessile, linear, 1-nerved, with revolute margins; flowers on short pedicels; bractees ovate, acute, longer than the tube of the calyx; stamens 12. *h. s.* Native of Brazil, in the province of Minas Geraes. Habit of a heath. Shrub much branched. Like *D. angustifolius*, but easily distinguished from that plant by the hairs on the leaves and calyxes. Leaves 3 lines long, but hardly a line broad.

*De Candolle's Diplusodon*. Shrub 1 foot.

\* \* *Leaves 3-nerved; lateral nerves marginal, rising from the base. Outer calycine teeth erect.*

4 *D. EPILOBIODES* (D. C. prod. 3. p. 94.) smoothish; branches nearly terete; when young as well as the leaves, white from fine, short, velvety down; leaves on short petioles, oblong-linear, with somewhat revolute edges, 1-nerved, or the larger ones 3-nerved; pedicels 3-times shorter than the leaves; bractees linear; stamens 12-15. *h. s.* Native of Brazil, in the province of Minas Geraes. Friedlândia epilobioides, Mart. mss. Petals of a rose-purple colour. Habit of *Epilobium Dodonæi*.

*Willow-herb-like Diplusodon*. Shrub 1 to 2 feet.

5 *D. PUNCTATUS* (Pohl, pl. bras. 1. p. 89. t. 72.) quite glabrous, branches rather tetragonal, slender; leaves sessile, lanceolate, marginate, rather dotted, somewhat coriaceous; bractees lanceolate, glabrous; stamens 12. *h. s.* Native of Brazil, in the province of Goyaz. Corolla bluish-red. Pairs of leaves remote, 6 lines long and 2 broad. Outer calycine teeth tubercle-formed.

*Dotted-leaved Diplusodon*. Shrub 1 foot.

6 *D. THYMIFOLIUS* (D. C. prod. 1. c.) branchlets tetragonal; both surfaces of leaves and calyxes rather downy; leaves almost sessile, oblong, obtuse, 3-nerved, the lateral nerves almost marginal; pedicels shorter than the leaves; bractees oblong, obtuse, shorter than the calycine tube; stamens 12. *h. s.* Native of Brazil, in the province of Minas Geraes, in the dry fields near Tejuco, at the height of 3000 feet. Friedlândia thymifolia, Mart. herb. Petals rose-coloured. Leaves 2-3 lines long and 1 line broad.

*Thyme-leaved Diplusodon*. Shrub 1 foot.

\* \* \* *Leaves feather-nerved, rarely feather-veined.*

7 *D. VIRGATUS* (Pohl, pl. bras. 1. p. 90. t. 73.) glabrous; branches tetragonal; leaves nearly sessile, lanceolate, attenuated at the base; bractees oblong, glabrous; pedicels short; stamens 18. *h. s.* Native of Brazil, in the provinces of Minas Geraes and Goyaz. Friedlândia albiflora, Mart. herb. Leaves 8-9 lines long, and 3-4 broad. Flowers white.

*Twiggy Diplusodon*. Shrub 4 feet.

8 *D. MYRSINITES* (D. C. l. c.) quite glabrous; branches tetragonal; leaves oval or obovate, acute, narrowed at the base, with the lateral veins nearly obsolete; pedicels much shorter than the leaves; bractees oval-oblong, obtuse; stamens 12. *h. s.* Native of Brazil, in the province of Minas Geraes.

*Friedlândia myrsinthes*, Mart. herb. Branches purplish. Leaves thickish. Petals purplish-violet. Style exerted.

*Myrtle-like* Diplusodon. Shrub 1 to 2 feet.

9 *D. VACCINIFOLIUS* (D. C. l. c.) quite glabrous, much branched; branches rather tetragonal; leaves sessile, lower ones cordate, broadly ovate, upper ones oval, all 1-nerved, the lateral veins being hardly discernible; flowers nearly sessile; bractæas oval; stamens 15. *h. S.* Native of Brazil, in the province of Minas Geraes. *Friedlândia vacciniifolia*, Mart. herb. Flowers violaceous. Branches, leaves, and calyxes reddish. Leaves 4 lines long, lower ones rather ciliated.

*Whortle-berry-leaved* Diplusodon. Shrub 1 to 2 feet.

10 *D. AMŒNUS* (D. C. l. c.) glabrous; branches bluntly tetragonal; leaves petiolate, lanceolate, obtuse, with revolute, scabrous margins, with 2 nerves only on each side; flowers pedicellate; bractæas spatulate-lanceolate; lobes of calyx spreading; stamens 12. *h. S.* Native of Brazil, at Chapada and Barbacena. *Friedlândia amœna*, Cham. et Schlecht. in *Linnaea*. 2. p. 350. Flowers yellow, like those of *Heimia salicifolia*, disposed in leafy racemes.

*Pleasing* Diplusodon. Shrub 1 to 2 feet.

11 *D. BUXIFOLIUS* (D. C. l. c.) glabrous; branches acutely tetragonal; leaves nearly sessile, ovate, coriaceous, with smooth margins, having 3 nerves on each side; flowers almost sessile; bractæas elliptic-lanceolate, ciliated, shorter than the calyx; stamens 12. *h. S.* Native of Brazil. *Friedlândia buxifolia*, Cham. et Schlecht. in *Linnaea*. 2. p. 351. Inner calycine teeth erect, outer ones reflexed. Petals purplish.

*Box-leaved* Diplusodon. Shrub 1 to 2 feet.

12 *D. PARVIFOLIUS* (D. C. l. c.) branches somewhat tetragonal; leaves and calyxes hairy from stiff, short, crowded down; leaves sessile, subcordate, roundish, coriaceous, with revolute edges, having 3 nerves on each side, which are hairy beneath; flowers almost sessile; bractæas roundish, shorter than the calyx when in flower, deciduous; stamens 12. *h. S.* Native of Brazil, in the province of Bahia, at Sincora. *Friedlândia parvifolia*, Mart. herb. Leaves 3-4 lines long and 2 lines broad. Flowers small, red. Outer calycine teeth reflexed.

*Small-leaved* Diplusodon. Shrub 1 to 2 feet.

13 *D. HELIANTHEMIFOLIUS* (D. C. l. c.) branches tetragonal, rather velvety; leaves oval-oblong, attenuated at the base, on short petioles, the margins rather revolute, velvety beneath from short stellate down, having 2 or 3 nerves on each side; flowers almost sessile; bractæas ovate, rather shorter than the calycine tube; calyx glabrous; stamens 12. *h. S.* Native of Brazil, on Serro Frio. *Friedlândia helianthemifolia*, Mart. herb. Petals red. Superior leaves 7-8 lines long and 2 lines broad, standing on petioles, a line long.

*Sun-rose-leaved* Diplusodon. Shrub 1 to 2 feet.

14 *D. PEMPHOIDES* (D. C. l. c.) branches tetragonal, puberulous; leaves ovate, sessile, not attenuated at the base, rather scabrous above, but velvety from stellate down beneath, having 2 or 3 nerves on each side; flowers almost sessile; bractæas oval, deciduous; calyx glabrous; stamens 12. *h. S.* Native of Brazil, in mountain fields, at Serro Frio. Outer segments of calyx reflexed. According to Martius this plant is only a variety of the preceding, but differs especially from that species in the leaves being half stem-clasping at the base, not attenuated.

*Pemphis-like* Diplusodon. Shrub 1 to 2 feet.

15 *D. SERPYLLIFOLIUS* (D. C. l. c.) branches tetragonal, hairy; leaves oval-obovate, on short petioles, glabrous above, but villous on the margins and on the veins beneath; flowers almost sessile; bractæas elliptic-obovate, villous beneath on the margins; calyx villous; stamens 12? *h. S.* Native of Brazil, in the province of Minas Geraes. Leaves flat, 4-8 lines long.

Calyx very villous at the apex before the flowers expand, not as in *D. microphyllus*, naked. Outer calycine segments short, subulate, and somewhat spatulate. Petals elliptic, narrowed at the base, apparently white.

*Wild-thyme-leaved* Diplusodon. Shrub 1 to 2 feet.

16 *D. MICROPHYLLUS* (Pohl, pl. bras. 1. p. 93. t. 76.) leaves ovate, on short petioles, acutish, ciliated, glabrous above, but pilose on the veins beneath; bractæas oblong, bluntish, having one pilose line on the back as well as being ciliated; stamens 12. *h. S.* Native of the province of Minas Geraes. Branches tetragonal, hairy. Corolla pale yellow.

*Small-leaved* Diplusodon. Shrub 2 feet.

17 *D. HIRTELLUS*; hairy; branches tetragonal; leaves almost sessile, elliptic-spatulate, glabrous above, and hairy beneath, having 2-3 nerves on each side; bractæas elliptic-spatulate, ciliated, and with a hairy line on the back; calyx pilose; outer segments of calyx reflexed; stamens 12. *h. S.* Native of Brazil, in the province of Minas Geraes. *Friedlândia hirtella*, Cham. et Schlecht. in *Linnaea*. 2. p. 352. *Friedlândia villösula*, Mart. herb. Flowers violaceous.

*Rather-hairy* Diplusodon. Shrub 1 to 2 feet.

18 *D. HIRSU-TUS* (D. C. l. c.) plant canescent from hairs; leaves almost sessile, elliptic, or ovate, obtuse, hairy on both surfaces, rather revolute at the edges, with 4-5 nerves on each side; flowers almost sessile; bractæas elliptic; outer calycine teeth reflexed; stamens 12. *h. S.* Native of Brazil. *Friedlândia hirsuta*, Cham. et Schlecht. in *Linnaea*. 2. p. 352. *Friedlândia verbenacifolia*, Mart. herb. Petals violaceous. Stamens 12. or perhaps more.

*Hairy* Diplusodon. Shrub 1 to 2 feet.

19 *D. LANCEOLATUS* (Pohl, pl. bras. 1. p. 98. t. 81.) branches nearly terete, the whole plant scabrous from short down; leaves on short petioles, lanceolate, acute, scabrous above and rather pilose, but hairy beneath, having 5 nerves on each side; flowers sessile; bractæas oval, ciliated, pilose; stamens 36. *h. S.* Native of Brazil, in the province of Goyaz. Corolla greyish red.

*Lanceolate-leaved* Diplusodon. Shrub 2 feet.

20 *D. ALUTACEUS* (Pohl, pl. bras. 1. p. 97. t. 80.) the whole plant clothed with short stiffish down; branches nearly terete; leaves on short petioles, oblong, acute, alutaceously rough above, rather tomentose beneath, with rough ciliated edges, having 6 nerves on each side; bractæas oval tomentose; flowers sessile; outer calycine teeth erect; stamens 24. *h. S.* Native of Brazil, in the province of Goyaz. Leaves nearly 2 inches long and 10-12 lines broad. Corolla greyish red.

*Alutaceous* Diplusodon. Shrub 2 feet.

21 *D. SCABER* (Pohl, pl. bras. 1. p. 96. t. 79.) branchlets compressed, rather scabrous; branches and stems terete and glabrous; leaves on short petioles, oblong, acutish at both ends, scabrous from dots above and from hairs beneath, having 5 nerves on each side; flowers sessile; bractæas obovate, narrowed at the base, ciliated; outer calycine segments erect; stamens 24. *h. S.* Native of Brazil, in the province of Goyaz. Leaves an inch long and 5-6 lines broad. Corolla greyish-red, small.

*Scabrous* Diplusodon. Shrub 1½ foot.

22 *D. NITIDUS* (D. C. prod. 3. p. 94.) plant quite glabrous; branches acutely tetragonal; leaves petiolate, ovate, bluntish, coriaceous, having 5-6 nerves on each side; floral leaves oblong; pedicels 1-flowered, bibracteolate in the middle; bractæas linear; outer teeth of calyx short, reflexed; stamens 12. *h. S.* Native of Brazil, between the provinces of Bahia and Minas Geraes. *Friedlândia nitida*, Mart. herb. Lower leaves an inch long. Flowers reddish-purple, disposed in leafy racemes.

*Shining-leaved* Diplusodon. Shrub 1 to 2 feet.

23 *D. OVA'TUS* (Pohl, pl. bras. 1. p. 95. t. 69.) quite glabrous; branchlets compressed, at length terete; leaves sessile, ovate, acute, glabrous, feather-nerved; flowers on short pedicels; bracteas lanceolate, glabrous; outer teeth of calyx spreading; stamens 16.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Minas Geraes. Leaves broad. Corolla greyish red.

*Ovate-leaved Diplusodon.* Sh. 1 foot.

24 *D. OBLONGUS* (Pohl, pl. bras. 1. p. 95. t. 78.) quite glabrous; branches acutely tetragonal; leaves on short petioles, oblong, quite glabrous, having 4-5 veins on each side, which are reddish beneath; flowers sessile, much shorter than the floral leaves; bracteas oblong, with rather ciliated edges; stamens 12.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Goyaz, in dry fields. Corolla greyish red.

*Oblong-leaved Diplusodon.* Shrub 3 feet.

25 *D. RAMOSISSIMUS* (Pohl, pl. bras. 1. p. 94. t. 77.) glabrous, much branched; branches opposite, from compressed to terete; leaves on short petioles, coriaceous, oblong, ciliated, pilose above and glabrous beneath, having 5 veins on each side; rameal and floral leaves smaller, and almost sessile, triple-nerved; flowers on short pedicels; bracteas lanceolate, glabrous; outer calycine teeth erect; stamens 16.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Goyaz, in grassy fields. Corolla greyish red. Leaves more than 2 inches long and 1 broad.

*Much-branched Diplusodon.* Shrub 3 feet.

26 *D. STRIGOSUS* (Pohl, pl. bras. 1. p. 88. t. 71.) plant beset with hispid villi; branchlets compressed, at length terete; leaves sessile, ovate, or oblong-elliptic, acutish, rounded at the base, ciliated, strigose, having 7-8 nerves on each side; flowers almost sessile; bracteas roundish-elliptic, pilose; calycine teeth nearly equal; stamens 24-30.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Goyaz. Calycine lobes beset with scaly strigæ. Corolla bluish red. Leaves 3 inches long and 2 broad.

*Strigose Diplusodon.* Shrub 3 feet.

27 *D. VILLOsus* (Pohl, pl. bras. 1. p. 91. t. 74.) stem and branches villous; branchlets tetragonal; cauline leaves on short petioles, upper ones oblong-oval, acute, ciliated, villous above and strigose beneath, having 3-4 nerves on each side; flowers almost sessile; bracteas oblong-elliptic, villous, much shorter than the calyx, which is also villous; outer teeth of calyx reflexed; stamens 15-18.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Minas Geraes. Corolla bluish red. Leaves 9 lines long and 4 broad. Habit of *D. lythroides*.

*Villous Diplusodon.* Shrub 2 feet.

28 *D. LYTHROIDES* (D. C. prod. l. c.) stem and branches terete, beset with short spreading villi; leaves sessile, broadly ovate, acutish, villous, having 4-6 nerves on each side; flowers almost sessile, aggregate in the axils of the leaves; bracteas oval, acutish, shorter than the tube of the calyx, which is villous; outer calycine segments erect; stamens 12, rarely 15.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Minas Geraes. Friedlandia lythroides, Mart. herb. Leaves vary from opposite to 3 in a whorl. Flowers large, rose-coloured, sometimes verticillate.

*Var.  $\beta$ , glabrescens* (D. C. l. c.) branches rather hairy; leaves glabrous above, hairy beneath on the nerves and on the calyxes.  $\frac{1}{2}$  l. S. Petals deep purple.

FIG. 106.

*Lythrum-like Diplusodon.* Shrub 2 feet.

29 *D. VILLOSISSIMUS* (Pohl, pl. bras. 1. p. 94. t. 77.) stem and branches terete and villous; cauline and rameal leaves on short petioles, ovate, acutish, cordate at the base, ciliated, clothed with white villi; bracteas oblong-ovate, tomentose; stamens 18.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Minas Geraes. Corolla bluish red.

*Very villous Diplusodon.* Shrub 1  $\frac{1}{2}$  foot.

30 *D. STACHYOIDES* (D. C. l. c.) herbaceous? hairy; stem or branches tetragonal; leaves on short petioles, ovate, rather cordate, acute, having 5 nerves on each side; flowers on short pedicels; bracteas rhomboid-ovate, acute, length of calycine tube; outer teeth of calyx erect; stamens 16.  $\frac{1}{2}$  l. S. Native of Brazil. Friedlandia stachyoides, Cham. et Schlecht. in Linnaea. 2. p. 353. Flowers purplish.

*Stachys-like Diplusodon.* Pl. 1 foot.

31 *D. FLORIBUNDUS* (Pohl, pl. bras. 1. p. 87. t. 70.) branches terete, rather pilose; leaves sessile, ovate, acute, cordate at the base, pilose, having 4 nerves on each side, rising from the base of the middle nerve; flowers nearly sessile; bracteas ovate, acute, pilose; stamens 24; outer calycine teeth erect.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Goyaz. Flowers bluish-red. Leaves an inch long and 6-7 lines broad.

*Bundle-flowered Diplusodon.* Shrub 1 to 2 feet.

32 *D. DIVARICATUS* (Pohl, pl. bras. 1. p. 84. t. 67.) plant smoothish, and rather glaucescent; branches terete; leaves sessile, roundish-ovate, cordate at the base, having 5 nerves on each side; nerves pubescent as well as the branchlets and calyxes; flowers almost sessile; branches roundish, tomentose; outer calycine teeth tubercle-formed; stamens 18.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Goyaz, on dry mountains. Corolla purple.

*Dicaricate Diplusodon.* Shrub 1 foot.

33 *D. MARGINATUS* (Pohl, pl. bras. 1. p. 83. t. 66.) quite glabrous; leaves sessile, ovate, or roundish-ovate, cordate at the base, glabrous, pruinose, with purplish edges; nerves 5-6 on each side, rising from the lower part of the middle nerve; flowers pedicellate; bracteas ovate; outer calycine teeth short and spreading; stamens 30.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Goyaz. Corolla purple. Leaves 2 inches long, and 12-13 lines broad.

*Marginate-leaved Diplusodon.* Shrub 2 feet.

34 *D. IMBRICATUS* (Pohl, pl. bras. 1. p. 85. t. 68.) glabrous; leaves sessile, ovate, acutish, cordate at the base, glabrous, pruinose, dotted when examined by a lens, imbricated: having 4 nerves on each side, rising from the lower part of the middle nerve; pedicels 1-flowered, shorter than the leaves; bracteas oval-elliptic; teeth of calyx reflexed; stamens 18.  $\frac{1}{2}$  l. S. Native of Brazil, in the province of Goyaz. Corolla purple. The nerves of the leaves almost agree with those of the following division of the genus.

*Imbricate-leaved Diplusodon.* Shrub 2 feet.

\*\*\* *Leaves palmately many-nerved.*

35 *D. GLAUDESCENS* (D. C. l. c.) quite glabrous; branches terete; leaves sessile, cordate, orbicular, hardly apiculated, coriaceous, palmately 7-nerved; pedicels shorter than the leaves; bracteas ovate, shorter than the tube; outer calycine teeth linear; stamens 12.  $\frac{1}{2}$  l. S. Native of Brazil, on mountains at Serro Frio, Itambe, &c. in the provinces of the mines. Allied to *D. rotundifolius*, but is easily distinguished by the smaller bracteas. Leaves 10-11 lines long and 8-9 broad.

*Glaucescent Diplusodon.* Shrub 1 to 2 feet.

36 *D. ROTUNDIFOLIUS* (D. C. l. c.) quite glabrous; branches terete; leaves sessile, cordate, orbicular, palmately 7-nerved,

crowded, coriaceous, pruinose; pedicels shorter than the leaves; bracteas broadly ovate, a little longer than the tube of the calyx; outer calycine teeth linear; stamens 12. *h. S.* Native of Brazil, in the province of Minas Geraes. *Frielandia rotundifolia*, Mart. mss. Leaves longer than the internodes. Petals apparently white from the dried specimen. Bracteas large.

*Round-leaved Diplusodon.* Shrub 1 to 2 feet.

37 *D. SPECIOSUS* (D. C. l. c.) quite glabrous; branches terete; leaves sessile, roundish-ovate, acute, many-nerved, coriaceous; pedicels 1-flowered, short; bracteas ovate, a little longer than the tube of the calyx; outer calycine teeth reflexed; stamens 24. *h. S.* Native of Brazil. *Nesæa speciosa*, Kunth, nov. gen. amer. 6. p. 191. in a note. *Dubyæa melastomoides*, D. C. in herb. mus. par. July, 1827.

*Sherry Diplusodon.* Shrub 1 to 2 feet.

*Cult.* All the species of *Diplusodon* are very elegant when in flower, but none of them have yet been introduced to our gardens. However, should they ever be, we would advise their being grown in a mixture of loam, peat, and sand, draining the pots in which they are planted well with sherds; they will be easily propagated by cuttings, like other plants of the same order. Judging from the elevated situations in which they naturally grow in the provinces of the mines in Brazil, we should imagine that many of them will stand in the open air in warm sheltered situations, especially against a south wall, at least they will be sufficiently hardy to stand as greenhouse plants, although we would recommend, on their first introduction, that they be treated as stove plants, until their hardiness be ascertained.

XIV. PHYSOCALYMNA (from *φύσα*, *physa*, a bladder, and *καλυμμα*, *calymma*, a covering; in reference to the inflated bracteas, which inclose the flower before expansion). Pohl, in flora, 1827. p. 152. with a figure, and pl. bras. 1. p. 99. tt. 92, 93. D. C. prod. 3. p. 89.

LIN. SYST. *Icosándria, Monogýnia*. Calyx bibracteolate at the base, campanulate, inflated, 8-toothed, without any teeth from the sinuses. Petals 8, oval, with undulately crenated margins, inserted in the top of the tube of the calyx. Stamens 24, rising from the base of the calyx beneath the germ. Ovary globose. Style filiform, exserted; stigma capitate. Capsule globose, probably 1-celled. A tree, with red wood. Leaves oval, quite entire, scabrous, somewhat plicate at the apex, feather-nerved, pilose on the veins beneath. Panicle large, spreading, thyrsoid, with opposite branches. Bracteas glabrous, roundish, mucronate, concave, inclosing the flower-bud before expansion. Calyx purplish. Corolla purplish red.

1 *P. FLORIBUNDA* (Pohl, pl. bras. 1. p. 100. tt. 92, 93.). *h. S.* Native of Brazil, in the province of Goyaz. Leaves opposite, decussate, on short petioles. Flower-bud inclosed by 2 inflated bracteas before expansion. The flowers resemble those of a species of *Lagerstræmia*. The wood is rose-coloured, and much esteemed by cabinet makers. It is the celebrated rose-wood of commerce. In Germany this wood is called *Rosenholz*. In the province of Goyaz in Brazil *Cego machado*; in the province of Rio Janeiro *Pao de rosa*; and in England *rose-wood*.

*Bundle-flowered Physocalymna* or Brazilian Rose-wood. Tree 26 to 30 feet.

*Cult.* This tree is most splendid when in flower. It has not yet, like the species of the last genus, been introduced to our gardens. The treatment recommended for the species of *Diplusodon* will answer this tree also.

XV. DECADON (from *δεκας*, *dekas*, ten, and *οδους οδοντος*, *odous odontos*, a tooth; in reference to the 10 teeth of the calyx).

Gmel. syst. 677. Ell. sketch. 1. p. 543. D. C. prod. 3. p. 90.—*Lythrum* species of Lin.—*Nesæa* species of Kunth.

LIN. SYST. *Decándria, Monogýnia*. Calyx hemispherically campanulate, bractless at the base, 10-toothed; inner 5 teeth erect, outer 5 or those from the sinuses spreading and horn-formed. Petals 5, alternating with the inner teeth of the calyx. Stamens 10, 5 of which are very long. Ovary sessile, almost globose, 3-celled. Capsule covered by the calyx. Seeds minute, wingless.—A downy North American herb. Leaves opposite, or 3 in a whorl. Peduncles 3 or many-flowered, furnished with 2 bracteas at the origin of each pedicel. Petals purple.

1 *D. VERTICILLATUM* (Ell. l. c. with an excellent description). *h. B. H.* Native from Canada to Florida, in swamps. *Lythrum verticillatum*, Lin. spec. 641. *Anónymos aquática*, Walt. car. 137. *Decodon aquaticus*, Gmel. syst. 677. *Nesæa verticillata*, H. B. et Kunth, nov. gen. amer. 6. p. 191. Leaves petiolate, lanceolate. Peduncles many-flowered. Flowers purple, disposed in aggregate, corymbose whorls.

*Whorled-flowered Decadon.* Fl. July, Sept. Clt. 1757. Pl. 2 to 4 feet.

*Cult.* See *Lythrum* for culture and propagation, p. 713. It is a pretty border-plant when in flower.

XVI. NESÆA (*Nesæa*, in mythology, a sea-nymph). Comm. in Juss. gen. p. 332. D. C. mem. soc. gen. 3. pt. 2. p. 74. prod. 3. p. 90.—*Nesæa* species of Kunth.—*Lythrum* species of Lin.

LIN. SYST. *Octo-Decándria, Monogýnia*. Calyx hemispherically-campanulate, bractless at the base, 8-12-lobed: the inner 4 or 6 lobes erect, and the outer 4-6 or those from the sinuses spreading and horn-formed. Petals 4-6, alternating with the erect lobes. Stamens 8-12, nearly equal. Ovary sessile, almost globose, 4-celled. Capsule covered by the calyx. Seeds minute, wingless. Herb glabrous. Peduncles 3-flowered, furnished with 2 bracteas at the origin of each pedicel. Petals blue.

1 *N. TRIFLORA* (H. B. et Kunth, nov. gen. amer. 5. p. 191. in a note). *h. B. S.* Native of the Mauritius, in humid grassy places, not of America, as had been formerly supposed. *Lythrum triflorum*, Lin. fil. suppl. p. 249. exclusive of the country. *Lythrum triantha*, Vent. herb. *Trótula trianthis*, Comm. herb. Willem. herb. maur. 3. with an excellent description. Leaves opposite, oblong-lanceolate, obtuse or acute, on short petioles. Flowers 3, on short pedicels, on the apex of the peduncle. Corolla blue.

*Three-flowered Nesæa.* Fl. Aug. Clt. 1802. Pl. 2 to 3 ft.

*Cult.* See *Diplusodon* for culture and propagation.

XVII. CRENEA (meaning not explained by Aublet). Aubl. guian. 1. p. 523. Lam. ill. t. 407. Meyer, prim. esseq. p. 186. D. C. prod. 3. p. 90.

LIN. SYST. *Octándria, Monogýnia*. Calyx urceolate, 4-cleft; lobes broad, triangular, but none are produced at the sinuses. Petals 4, inserted between the lobes of the calyx. Ovary roundish. Style filiform. Stigma oblong. Capsule 1-5-celled, covered by the calyx, many-seeded. Seeds very minute.—Herbs or subshrubs. Leaves opposite, glabrous. Peduncles axillary, 1 or many-flowered. Flowers white. In the capsules examined by Aublet they were 5-celled, but in those examined by Meyer and De Candolle, only 1-celled at maturity. Perhaps the capsules are 4-8-celled at first, but as they become more mature the dissepiments vanish, and the capsule becomes therefore 1-celled?

1 *C. MARITIMA* (Aubl. guian. l. c. t. 209.) stem nearly herbaceous, nodose; branches tetragonal; angles winged; leaves ovate-oblong; peduncles many-flowered. *h. B. S.* Native of

Cayenne, in saltish water by the sea-side. Pedicels 1-4, disposed in a kind of umbel at the top of the peduncle. Flowers white.

*Sea-side Crenea.* Pl. 2 to 3 feet.

2 *C. REPENS* (Meyer, l. c.) stem suffruticose, creeping; leaves spatulate; peduncles 1-flowered. *h. B. S.* Native of Guiana, in the island of Arowabisch, in sandy places inundated by the sea. Flowers white.

*Creeping Crenea.* Shrub creeping.

*Cult.* Should either of the species of *Crœnea* be ever introduced to the gardens, we would recommend their being grown in sand, kept moist by salted water, or the pots in which they are grown may be placed in pans filled with salted water.

XVIII. LAWSONIA (in honour of Isaac Lawson, M.D., author of a Voyage to Carolina, 4to. London. 1709.). Lin. gen. no. 482. Lam. ill. t. 296. f. 1. D. C. prod. 3. p. 90.

LIN. SYST. *Octândria, Monogýnia.* Calyx 4-parted, spreading, permanent, having no teeth or lobes produced at the sinuses. Petals 4, alternating with the lobes of the calyx, obovate, unguiculate, spreading. Stamens 8, approximating by pairs, which alternate with the petals. Ovarium sessile. Capsule hardly dehiscent, or a membranous berry, 4-celled, globose. Seeds angular, numerous in the cells. A smooth shrub. Leaves quite entire. Flowers white, disposed in panicles or corymbs. *Lawsonia acronychia* of Lin. fil. or more properly *Acronychia laevis* of Forster, is a genus that does not belong to this order. It has been referred to *Aurantiaæ* by Labillardiere in sert. austr. cal. p. 66.

1 *L. ALBA* (Lam. dict. 3. p. 106.) Leaves opposite, lanceolate, quite entire; flowers in panicles. *h. S.* Native of the East Indies, Levant, and north of Africa, where it is frequently cultivated in gardens. *Cyprus* of the ancients. *Henna* or *Al-henna* of the Arabs. Alcáma, Rumph. amb. 4. t. 17. Mail-Ansch, Rheed. mal. 1. p. 73. t. 40. *L. inermis* and *L. spinosa*, Lin. spec. 4. p. 498. *L. inermis*, Desf. atl. 1. p. 325. Young trees unarmed. Old trees having the branchlets hardened into spines. Flowers white. The powdered leaves, made into a paste, are much used by Egyptian women to dye their nails yellow, which they esteem an ornament. The colour lasts for 3 or 4 weeks before there is occasion to renew it. The plant is supposed to possess vulnerary and astringent properties.

*White-flowered Lawsonia.* Clt. 1752. Shrub 6 to 10 feet.

† *Species not sufficiently known.*

2 *L. FALCATA* (Lour. coch. 229.) leaves scattered, falcate, rather crenated; flowers corymbose. *h. G.* Native of Cochinchina, among bushes. Flowers white in racemose terminating corymbs. Berry 4-celled, many-seeded, but frequently 2-3 or 1-celled only. Leaves with a strong ungrateful smell.

*Falcate-leaved Lawsonia.* Shrub 6 feet.

3 *L. COCCINEA* (Smith, in Rees' cycl. 20. no. 3.) branches spinescent; leaves elliptic-obovate, acute; lobes of calyx twice the length of the tube. *h. S.* Native of Banda.

*Scarlet Lawsonia.* Shrub.

*Cult.* The species of *Lawsonia* thrive well in a mixture of loam and peat; and cuttings strike root readily in sand, with a hand-glass over them, in heat.

XIX. ABATIA (in honour of Pierre Abat, formerly professor of botany at Seville). Ruiz et Pav. syst. fl. per. et chil. 1. p. 136. gen. t. 14. fl. per. et chil. 5. t. 463. D. Don, in edimb. new phil. journ. jan. 1831.

LIN. SYST. *Icosándria, Monogýnia.* Calyx with a short, somewhat turbinate tube, having the throat beset with numerous hairs; limb 4-parted; lobes lanceolate. Petals none. Stamens about 20, inserted near the base of the calycine tube; filaments

flat, glabrous. Ovary globose, 1-celled, very villous. Style terete. Stigma small, truncate, pruinose. Capsule 1-celled, 2-valved, many-seeded, opening at the apex; valves placentiferous in the middle. Placentas at length free, connate at the base. Seeds small, angular, convex on one side, furnished with a small wing-like crest at the apex.—Shrubs clothed with fascicles of cinereous tomentum. Leaves opposite, petiolate, simple, crenated. Flowers racemose. Pedicels 1-flowered, solitary, or in fascicles, each propped by a bractea. This genus was formerly placed in the order *Bixinae* before its relationship was well known.

1 *A. RUDESA* (Ruiz et Pav. l. c.) leaves wrinkled above; anthers oblong. *h. S.* Native of Peru, on cold hills at Rondos, Pillao, and Nanyan. At Pillao it is commonly called *Taucca-taucca*.

*Wrinkled-leaved Abatia.* Shrub.

2 *A. PARVIFLORA* (Ruiz et Pav. l. c. fl. per. et chil. 5. t. 463.) leaves flat above; anthers roundish. *h. S.* Native of Peru, about Muna, where it is also called *Taucca-taucca*.

*Small-leaved Abatia.* Shrub.

*Cult.* See *Lawsonia* for culture and propagation, p. 722.

XX. ANTHERYLIUM (meaning unknown to us). Rohr, act. soc. hist. nat. hafn. 2. pt. 1. p. 211. D. C. prod. 3. p. 91.

LIN. SYST. *Dodecándria, Monogýnia.* Calyx 4-parted, equal; the sinuses not produced into other lobes. Petals 4, alternating with the lobes of the calyx, and hardly longer than them. Stamens 12-16, inserted in the bottom of the calyx. Ovarium sessile, ovate. Style filiform. Capsule many-seeded, ovate, 3-4-sided, 3-4-valved, and when young 3-4-celled; but in the adult state dehiscent, and bearing at the apex a 3-4-angled thick placenta.—A glabrous tree. Leaves opposite or alternate, ovate, quite entire. Spines 2, under each leaf, similar to spiny pulvini. Pedicels axillary, numerous, 1-flowered, crowded in fascicles. This genus is probably more nearly allied to *Legnôtis*, a genus belonging to *Rhizophoræ*.

1 *A. ROHRII* (Vahl. l. c.). *h. S.* Native of the islands of St. Thomas and Porto Rico.

*Rohr's Antherylium.* Tree.

*Cult.* See *Lawsonia* for culture and propagation, p. 722.

XXI. DODECAS (δωδεκα, *dodeka*, twelve; in reference to the number of stamens). Lin. fil. suppl. p. 36. Ern. Meyer, act. soc. nat. cur. bonn. 12. p. 800. D. C. prod. 3. p. 91.

LIN. SYST. *Dodecándria, Monogýnia.* Calyx 4-cleft; tube urceolate; lobes deltoid; the sinuses not produced into other lobes. Petals 4, almost orbicular. Stamens 12; filaments adnate to the tube of the calyx a long way. Anthers oblong, adnate. Style flexuous, obtuse. Capsule globose, half 4-valved, 1-celled. Central placenta stipitate, many-seeded.—A shrub, with tetragonal branches. Leaves opposite, obovate-oblong, quite entire. Pedicels axillary, usually 1-flowered, bibracteolate.

1 *D. SURINAMENSIS* (Lin. fil. suppl. p. 245. Ern. Meyer, l. c.). *h. S.* Native of Surinam. Habit of *Lycium barbarum*. *Surinam Dodecas.* Shrub 6 to 8 feet.

*Cult.* See *Lawsonia* for culture and propagation, p. 722.

XXII. GINORIA (so named by Jacquin in honour of the Marquis Carlo Ginori, who had a botanic garden near Florence kept up by his son Lorenzo). Jacq. amer. p. 148. t. 91. D. C. prod. 3. p. 91.—Ginora, Lin. gen. no. 605. Lam. ill. t. 407.—Genòria, Pers. ench. no. 1184.

LIN. SYST. *Dodecándria, Monogýnia.* Calyx campanulate permanent, 6-cleft; lobes lanceolate, acuminate, spreading; the sinuses not produced into other lobes. Petals 6, roundish, on long claws. Stamens 12; anthers reniform. Style subulate

Capsule roundish, 4-valved, 4-furrowed, 1-celled? opening from the apex. Seeds small, inserted in a large, roundish placenta. —A shrub. Leaves opposite, lanceolate. Pedicels axillary, 1-flowered. Flowers large, blue.

1 *G. AMERICANA* (Jacq. l. c.). *h. S.* Native of Cuba, on the banks of rivers, where it is called by the inhabitants *Rosa del Rio* or *River-rose*. Flowers nearly an inch in diameter, with a red calyx and blue corolla. Capsule dark red.

*American Ginoria.* Shrub 3 to 4 feet.

*Cult.* An elegant plant when in flower. Its culture and propagation is the same as that for *Larsonia*, p. 722.

XXIII. *ADENARIA* (from *ἀδήρ*, *aden*, a gland; in reference to the petals, calyxes, and ovarium being beset with glandular dots). *H. B. et Kunth*, nov. gen. amer. 6. p. 185. *D. C.* prod. 3. p. 91.—*Antherylum* species, Spreng. syst. 2. p. 474.

*LIN. SYST.* *Octo-Decandria, Monogynia.* Calyx turbinate campanulate, 4-5-cleft; the sinuses not produced into other lobes. Petals 4-5, unguiculate, inserted between the lobes of the calyx. Stamens 8-10, inserted in the base of the calyx, exserted. Ovarium stipitate, 2-celled. Style inclosed; stigma 2-lobed. Fruit globose, half covered by the calyx, probably indehiscent. Seeds angular, very numerous. American trees. Leaves opposite, quite entire, beset with glandular dots beneath, as well as on the calyxes, petals, and ovarium. Flowers white, disposed in axillary umbels.

1 *A. GRISLEOIDES* (*H. B. et Kunth*, l. c.) branches nearly terete, finely hairy; leaves oblong, acuminate, membranous, glabrous; umbels on short peduncles. *h. S.* Native of South America, on the banks of the river Magdalena, near Badilla. *Antherylum grisleoides*, Spreng. l. c. Leaves like those of *Grislea secunda*. Petals spotted with red or brown glands like the rest.

*Grislea-like Adenaria.* Tree 20 feet.

2 *A. PURPURATA* (*H. B. et Kunth*, l. c.) branchlets terete, when young puberulous; leaves oblong, acuminate, purplish, glabrous, but puberulous on the nerves and veins beneath; umbels almost sessile. *h. S.* Native of New Granada, on the banks of Smith's and Quilquasa rivers; and at Guayaquil. *Antherylum purpuratum*, Spreng. l. c.

*Purplish-leaved Adenaria.* Tree 20 to 30 feet.

3 *A. FLORIBUNDA* (*H. B. et Kunth*, l. c. p. 188. t. 549.) branchlets tetragonal, clothed with canescent pubescence, as well as the under side of the leaves, but the upper surface is quite glabrous; leaves oblong-lanceolate, acuminate; umbels on short peduncles. *h. S.* Native along with the preceding species. *Antherylum floribundum*, Spreng. l. c.

*Bundle-flowered Adenaria.* Tree 20 feet.

*Cult.* See *Larsonia* for culture and propagation, p. 722.

XXIV. *GRISLEA* (in honour of G. Grisley, a Portuguese chemist; author of *Viridarium Lusitanicum*, Lisbon, 1661, 8vo. republished by Seguer in 1749. It is also in Ray's *Sylloge stirpium exterarum*). *Læf.* itin. p. 245. *Lin. gen.* no. 474. *H. B. et Kunth*, nov. gen. amer. 6. p. 184. *D. C.* prod. 3. p. 92.—*Woodfordia*, *Salisb.* par. lond. t. 42.

*LIN. SYST.* *Octo-Decandria, Monogynia.* Calyx coloured, tubular (f. 107. a.), 8-12-toothed; the 4 or 6 inner teeth erect; and the 4 or 6 outer ones, or those produced from the sinuses, horn-formed and smaller. Petals 4-6, oblong, unguiculate, inserted in the top of the calycine tube, between the inner teeth of the calyx. Stamens 8-12 (f. 107. c.), exserted, inserted in the base of the calyx. Capsule globose, inclosed in the calyx. —Shrubs. Leaves opposite, quite entire, dotted with black glands beneath. Peduncles axillary, many-flowered. Flowers red.

1 *G. SECUNDA* (*Læf.* itin. p. 245. *H. B. et Kunth*, nov. gen.

amer. 6. p. 185.) branchlets glabrous; leaves on short petioles, puberulous on both surfaces, but paler beneath; flowers usually with 4 petals and 8 stamens. *h. S.* Native of South America, between Cumana and the Orinoco, and near Caracas. Perhaps the plant of *Læf.* who says the leaves are glabrous, the calyxes 4-toothed, and the flowers secund, is the same as that of Humboldt, who says that the leaves are puberulous, the flowers axillary, and calyx 8-toothed. Perhaps both plants have 5 petals and 10 stamens in the flowers. Calyx greenish. Petals hardly conspicuous, flesh-coloured. Stamens long, purple.

*Secund-flowered Grislea.* *Clt.* 1820. Shrub 4 to 6 feet.

2 *G. TOMENTOSA* (*Roxb. cor.*

1. p. 29. t. 31.) branchlets pubescent; leaves sessile, clothed with hoary tomentum beneath, but smoothish above; flowers usually with 6 petals and 12 stamens. *h. S.* Native of the north of Coromandel, on hills (*Roxb.*), China (*Lin.*), and the islands of Timor and Java. *Ker. bot. reg.* 30. *Lythrum fruticosum*, *Lin. spec.* 641. *Woodfordia floribunda*, *Salisb.* par. lond. t. 42. Calyx and stamens red. Petals hardly conspicuous. (f. 107.)

*Tomentose Grislea.* *Fl. May*, *Ju. Clt.* 1804. *S. 10* ft.

3 *G. PUNCTATA* (*Hamilt. ex Smith* in *Rees' cycl.* vol. 17. no. 2.) leaves petiolate, lanceolate, smooth; branches and flowers erect; calyx 4 times longer than broad; petals 6; stamens 12. *h. S.* Native of the East Indies. Flowers red. *Alabastra* turbinate.

*Dotted Grislea.* Shrub.

*Cult.* Pretty shrubs and profuse flowerers. Their culture and propagation is the same as that for *Larsonia*, p. 722.

## Tribe II.

*LAGERSTRÆMIÆ* (plants agreeing with *Lagerstræmia* in important characters). *D. C. mem. soc. hist. nat. gen.* 3. pt. 2. p. 70. Lobes of calyx exactly valvate in aestivation. Petals numerous, alternating with the calycine lobes, and inserted at the top of the calycine tube between its lobes. Stamens inserted lower down in the calycine tube than the petals, and twice or thrice their number. Seeds expanded into membranous wings. —Trees or shrubs.

XXV. *LAGERSTRÆMIA* (so named by Linnaeus from Magnus Lagerström of Gottenburg, who procured many curiosities from China, and gave them to the public). *Willd. spec.* 2. p. 1178. *D. C.* prod. 3. p. 93.—*Lagerstræmia* and *Murchausia*, *Lin. gen.*

*LIN. SYST.* *Icosandria, Monogynia.* Calyx bibracteolate at the base, 6-cleft; lobes distinct, but none produced from the sinuses. Petals 6, unguiculate. Stamens 18-30. Capsule 3-6-valved, girded by the calyx, 3-6-celled. —East Indian trees, and shrubs. Branches tetragonal. Leaves opposite, quite entire. Peduncles axillary, usually constituting panicles or racemes at the tops of the branches. Flowers purple, red or white, showy.

SECT. I. *LAGERSTRÆMIA* (see genus for derivation). *Lin. gen.* no. 667. Calyx neither furrowed nor plaited. The 6 outer stamens longer and thicker than the rest.

1 *L. INDICA* (*Lin. spec.* 784.) leaves roundish-ovate, acute, glabrous; panicle many-flowered, terminal; petals curled on

long claws. *h. S.* Native of China, CochinChina, and Japan, not in India, unless cultivated in gardens. Curt. bot. mag. t. 405.—Rumph. amb. 7. t. 28. Sibi, Kœmpf. amœn. p. 855. Flowers flesh-coloured; large, and handsome. Branchlets acutely tetragonal, nearly 4-winged.

*Indian Lagerstrœmia.* Fl. Aug. Oct. Clt. 1759. Shrub 6 to 10 feet.

2 *L. PARVIFLORA* (Roxb. cor. 1. p. 47. t. 66.) leaves oblong or oval, obtuse, rather scabrous; peduncles axillary, 3-6-flowered; petals flat, on short claws. *h. S.* Native of the mountains called the Circars, in the East Indies. The peduncles being numerous at the tops of the branches, may be called a panicle. The flowers are small and white. The wood is used for various economical purposes in its native country. Leaves downy beneath.

*Small-flowered Lagerstrœmia.* Clt. 1818. Sh. 6 to 12 feet.

SECT. II. *MUNCHIAUSIA* (so named from Baron Gerlach Adolphus de Munchausen). Lin. mant. 153. Juss. gen. 331.—Bañava, Cam. ex Ray, hist. 3. luz. p. 80. Calyx neither furrowed nor plaited. Stamens equal among themselves.

3 *L. SPECIOSA* (Pers. ench. 2. p. 72.) leaves oval, glabrous, somewhat attenuated at both ends; panicle terminal; petals flat, orbicular, on long claws. *h. S.* Native of China. Munchausia speciosa, Lin. mant. p. 243. Murr. prod. with a figure. Munch. hausv. 5. p. 356. ex Willd. Lagerst. Munchausia, Willd. spec. 2. p. 1179. *L. major*, Retz. Upper leaves alternate. Petals 9 lines long. Flowers very showy, disposed in terminal racemes.

*Sheny Lagerstrœmia.* Tree.

4 *L. GRANDIFLORA* (Roxb. hort. beng. p. 38.) leaves ovate, cordate at the base, acuminate at the apex, glabrous on both surfaces; panicles subcorymbose, terminal; petals oval-oblong, on short claws. *h. S.* Native of the East Indies, at Chittagong. Calyx large, cleft into 5 parts beyond the middle. Petals an inch long. Style compressed, thick, exserted. D. C. mem. hist. nat. gen. 3. pt. 2. p. 84.

*Great-flowered Lagerstrœmia.* Clt. 1818. Shrub.

SECT. III. *ADAMBEA* (*Adamba* is the Malabar name of *L. reginæ* and *Katau-adambæ* of *L. hirsuta*). Lam. dict. 1. p. 39. D. C. prod. 3. p. 93. Calyx furrowed and plaited longitudinally. Stamens nearly equal in length.

5 *L. REGINÆ* (Roxb. cor. 1. p. 46. t. 65.) leaves oblong, glabrous; panicle terminal; calyxes tomentose; petals orbicular, undulated, on short claws. *h. S.* Native of the East Indies, in woods on the Circars, and in Java; also of Malabar, in sandy or stony places. *Adámbea glabra*, Lam. l. c.—Rheed. mal. 4. tt. 20, 21. Flowers large, nearly 2-3 inches in diameter, of a beautiful rose-colour in the morning, growing deeper through the day, until they become purple in the evening. Angles of branches winged.

*Queen's Lagerstrœmia.* Clt. 1792. Tree 20 feet.

6 *L. HIRSA* (Willd. spec. 3. p. 1178.) leaves oblong, pubescent; panicle corymbose, terminal; petals flat, oval. *h. S.* Native of Malabar, on the mountains. Rheed. mal. 4. t. 22. *Adámbea hirsuta*, Lam. dict. 1. p. 39. Flowers red.

*Hairy Lagerstrœmia.* Shrub.

7 *L. FLORIBUNDA* (Jack, mal. misc. 1. no. 2. p. 38.) leaves nearly opposite, ovate-oblong, glabrous; panicle terminal, much branched, many-flowered, clothed with rusty villi; stamens unequal: calyx turbinate, furrowed. *h. S.* Native of Penang. Flowers smaller and more numerous than those of *L. reginæ*, but of the same colour. Perhaps belonging to a different section.

*Bundle-flowered Lagerstrœmia.* Tree 20 feet.

*Cult.* *Lagerstrœmia* is a splendid genus of shrubs. *L. Indica*

is a hardy stove plant and easily cultivated, and flowers freely. The rest of the species are more tender, and more difficult to preserve through the winter, at which time they require a great heat and but little water, for if they are too freely watered at this season it is a great chance if they survive. In summer they grow freely, at which time they require plenty of room to grow, and to be plentifully supplied with water. Cuttings of them all root readily if planted in sand, with a hand-glass placed over them in heat.

XXVI. *LAFOENSIA* (in honour of the duke of Lafoens, formerly president of the Academy of Sciences of Lisbon). Vand. fl. lus. et bras. (1788) p. 33. t. 2. f. 13. ed. Rœm. p. 112. D. C. prod. 3. p. 93.—*Calyplæctus*, Ruiz et Pav. prod. fl. per. (1794). p. 73.

LIN. SYST. *Icosándria, Monogýnia*. Calyx bibracteolate at the base, campanulate, plicately 10-12-toothed at the apex; teeth as if they were joined together by a peculiar membrane. Petals 10-12. Stamens twice the number of the petals. Ovary 2-celled. Berry coriaceous, spherical. Placenta central, globose.—American trees. Leaves opposite, quite entire. Peduncles solitary, 1-flowered. Flowers large, white or pale. The bracteas under the flower caducous.

1 *L. SPECIOSA* (D. C. prod. 3. p. 94.) leaves oblong, acuminate; fruit spherical, smooth. *h. S.* Native of New Granada, on the Andes near Almaguer. *Calyplæctus speciosus*, H. B. et Kunth, nov. gen. amer. 6. p. 183. t. 548. A. and B. Flowers white. Petals oblong, with somewhat lobed and undulated edges.

*Sherry Lafoensia.* Tree 20 to 30 feet.

2 *L. ACUMINATA* (D. C. l. c.) leaves oblong, bluntly acuminate; fruit spherical, stellately rayed from the middle to the apex. *h. S.* Native of Peru, in warm groves about Pozuzo, where it is called by the inhabitants *Cabeza de Monge*. *Calyplæctus acuminatus*, Ruiz et Pav. syst. fl. per. p. 129. Racemes large. Fruit sessile, ex Ruiz et Pav.

*Acuminate-leaved Lafoensia.* Shrub 4 to 6 feet.

3 *L. PUNICIFOLIA* (D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 86. t. 1.) leaves oblong, bluntly acuminate, with the middle nerve porose at the apex underneath; fruit ovate, globose, smooth, somewhat apiculated. *h. S.* Native of St. Martha. *Calyplæctus puniceifolius*, Bert. ined. *Lafoensia Mexicana*, Moc. et Sesse, fl. mex. icon. ined. does not appear to be different.

*Pomegranate-leaved Lafoensia.* Tree.

4 *L. VANDELLIANA* (D. C. prod. 3. p. 94.) leaves obovate, retuse at the apex, with one gland in the recess, and running down the short petiole at the base, coriaceous, glabrous, shining above; calyx half 10-cleft; fruit ovate-globose, somewhat apiculated. *h. S.* Native of Brazil. *Lefoensia*, Vand. fl. lus. et bras. p. 33. t. 3. f. 13. and Rœm. script. p. 112. t. 7. f. 13. Ovary on a short stipe. Style subulate. Petals oblong, serrated, emarginate at the apex, furnished with a nectariferous scale at the base of each.

*Vandelli's Lafoensia.* Tree.

*Cult.* See *Lagerstrœmia* for culture and propagation.

† *Genera not sufficiently known, and probably not belonging to the present order.*

XXVII. *PHYSOPodium* (from *φύσα*, *physa*, a bladder, and *πους ποδος*, *pous podos*, a foot; in reference to the tumid pedicels). Desv. in ann. sc. nat. 1826. vol. 9. p. 403.

LIN. SYST. *Decándria, Monogýnia*. Calyx turbinate, 5-toothed, beset with strigose hairs inside. Petals 5, oval-oblong. Stamens 10, twice the length of the petals, alternate ones a little shorter. Anthers oblong, 2-celled. Ovary oblong. Style

capillary, subulate at the apex. Fruit unknown.—Shrub twining. Leaves alternate, quite entire and glabrous, lanceolate. Flowers in spicate panicles, secund, bracteolate; pedicels tumid at the apex. According to Desvaux the present genus is allied to the *Lythariæ*, but the æstivation of the calyx, the fruit, and seeds is unknown.

1 *P. VOLUBILE* (Desv. l. c.)  $\frac{1}{2}$ . S. Native of the Island of Bourbon. Stem terete. Leaves long, lanceolate, stiff, rather mucronate.

*Twining Physopodium.* Shrub tw.

*Cult.* See *Lagerstræmia* for culture and propagation, p. 724.

XXVIII. SYMMETRIA (from *συμμετρία*, *symmetria*, symmetry; in reference to the proportion of the parts of the flower). Blume, bijdr. p. 1130. D. C. prod. 3. p. 94.

LIN. SYST. *Dodecandria, Monogynia*. Calyx campanulate, 6-cleft. Petals 6, small, inserted in the calyx. Stamens 12, alternate ones shortest, at length inflexed and marcescent. Ovary girded by the disk, 4-celled; cells 2-ovulate. Style thick. Stigma obtuse, 4-sided. Drupe baccate, umbonate, covered by the calyx, 1-3-celled; cells containing one nut each; nuts reniform, 1-seeded, covered with fibrous aril. Embryo inverted and curved in the albumen.—A tree, with opposite, obovate, obtuse, obsoletely-denticulated, coriaceous, glabrous leaves, which are full of fine parallel veins. Corymbs axillary, short. Flowers small. The seeds and fruit of this genus disagree entirely with the other genera of this order.

1 *S. OBOVATA* (Blume, l. c.)  $\frac{1}{2}$ . S. Native of Java, in mountain woods, where it is called by the inhabitants *Kikukuran*.

*Obovate-leaved Symmetria.* Tree.

*Cult.* See *Lagerstræmia* for culture and propagation, p. 724.

ORDER XCVII. TAMARISCINÆ (plants agreeing with *Tamarix* in important characters). Desv. diss. inst. gall. lect. 1815. ex ann. sci. nat. (1825) 4. p. 344. Aug. St. Hil. mem. mus. (1816) 2. p. 205. Link, enum. (1821) 1. p. 291. —*Tamariscus*, Tourn. inst. 661.—*Tamarix*, Lin. gen. 375. Lam. ill. t. 213. Willd. act. ac. berol. (1812). 13. (ed. 1816) p. 77.

Calyx 4-5-parted, permanent; lobes imbricate in æstivation. Petals inserted into the base of the calyx, marcescent, imbricate in æstivation, equal in number to the lobes of the calyx, and alternating with them. Stamens either equal in number to the petals, or twice that number; filaments either free or monadelphous. Ovary free, superior, pyramidal, trigonal. Style short; stigmas 3. Capsule trigonal, 3-valved, 1-celled, many-seeded. Placentas 3, either at the base of the cavity, or along the middle of the valves. Seeds erect or ascending, oblong, compressed, comose at the apex, exalbuminous. Embryo with a small straight inferior radicle, and plano-convex oblong cotyledons.—Shrubs, rarely perennial suffruticose herbs, with twiggy branches. Leaves alternate, small, scale-formed, entire, usually glaucous. Flowers in close spikes or racemose spikes; pedicels bracteate. Corollas white or red.

According to De Candolle, this order is allied to *Portulacææ* from the similitude of the flowers with those of *Telèphium*, but differs in the parietal exalbuminous comose seeds; but according to Auguste St. Hilaire it is more nearly allied to *Lythariææ* and *Onagrariææ*, from the former it differs in the æstivation of the petals, as well as in their insertion at the base of the calyx, and in the parietal seeds; from the latter in the free ova-

rium, and in the imbricate æstivation of the calyx. Dr. Ehrenberg, however, asserts that the order has hypogynous stamens. The same botanist in separating the *Tamarix Songarica* of Willd., and referring it to the vicinity of *Reaumuria*, establishes the affinity of *Tamariscinææ* to the order *Reaumuriææ*.

The bark of all is slightly bitter, and probably tonic. *Tamarix Gállica* and *T. Africana* are remarkable for the quantity of sulphate of soda which their ashes contain. Dr. Ehrenberg found that the manna of Mount Sinai is produced by a variety of *Tamarix Gállica*. This substance being analyzed by M. Mitscherlich was found to contain no crystallizable matter, but to consist wholly of pure mucilaginous sugar.

#### *Synopsis of the genera.*

1 *TAMARIX*. Calyx 4-5-parted. Petals 4-5. Stamens 4-5. Stigmas 3, long, glandular and oblique at the apex. Seed inserted at the base of the valves, or almost in the centre of the capsule; hairs on seeds simple.

2 *MYRICARIA*. Calyx 5-parted. Petals 5. Stamens 10. Stigmas 3 in a head. Seeds parietal in the middle of the valves; hairs on seeds feathery.

3 *HOLOPACHINA*. Calyx 4-5-parted. Petals 4-5. Stamens 8-10. Stigmas 2-4. Seeds parietal in the middle of the valves, their whole surface vilose.

1. *TAMARIX* (so called from growing on the banks of the Tamaris, now Tambo, on the borders of the Pyrenees). Desf. ann. sc. nat. 4. p. 348. D. C. prod. 3. p. 95. *Tamarix*, with 4-5 stamens of other authors.

LIN. SYST. *Tetra-Decandria, Trigynia*. Calyx 4-5-parted. Petals 4-5. Stamens 1-5, alternating with the petals, almost free. Ovary tapering to the apex. Stigmas 3, long, divaricate, glandular and oblique at the apex. Seeds erect, inserted nearly at the base of the valves, or almost in the centre of the capsule. Seeds tufted; tuft composed of numerous simple hairs, rising from the apex. Spikes of flowers usually disposed in panicles. Flowers small, red, seldom white.

SECT. I. *OLIGADENIA* (from *ὀλιγος*, *oligos*, few, and *ἀδην*, *aden*, a gland; few surrounding the ovary). Ehrenberg in Schlecht. Linnaea. 2. p. 253. Gland surrounding the germ, 8-toothed. Filaments 4, one between each alternate tooth of the gland.

1 *T. TETRA'NDRA* (Pall. ind. taur. ex Bieb. fl. taur. 1. p. 247.) glabrous, rather glaucous; leaves lanceolate, stem-clasping, adult ones diaphanous at the apex; racemes of flowers lateral, an inch and a half long; flowers a line long; bractæas longer than the pedicels; ovary longer than the corolla.  $\frac{1}{2}$ . H. Native of the south of Tauria, in valleys about Astracan and Kisliar, ex Bieb.; and probably of the island of Cyprus. *T. Gállica*, Habb. ined. taur. 6. p. 105. There is a variety having 3-4 valved capsules in the same spike.

*Var. β, octándra* (Pall. nov. act. sc. petr. 10. p. 376.) Stamens 8. Capsules 3-4-valved.

*Tetrandrous Tamarisk.* Sh. 6 to 8 feet.

2 *T. LA'XA* (Willd. act. soc. berol. 1812. vol. 13. p. 82. no. 10.) glabrous, rather glaucous; leaves ovate, sessile, acuminate, erect; racemes lateral, about an inch long; flowers remotish, shorter than a line in length; bractæas shorter than the pedicels.  $\frac{1}{2}$ . H. Native of Siberia, in the valleys of Astracan and Kisliar, about salt lakes. Capsule reddish yellow, hardly a line in length. Calycine segments orbicularly-ovate, acutish, with membranous edges.

*Loose Tamarisk.* Shrub 5 to 6 feet.

3 *T. ELONGATA* (Led. fl. ross. alt. ill. t. 254. fl. alt. 1. p. 421.) glabrous, glaucous; flowers crowded, pedicellate, disposed in simple, elongated, lateral racemes; bractees reflexed, 2 or 3 times longer than the pedicels; calycine segments broad, ovate, acutish, keeled, with membranous margins; petals spreading, exceeding the genitals; styles very short; leaves ovate-lanceolate, acute, when young incurved at the apex; when adult recurved.  $\frac{1}{2}$ . H. Native of Siberia, in the desert of Soongaria, in saltish places. Petals reddish.

*Elongated Tamarisk.* Shrub.

4 *T. PARVIFLORA* (D. C. prod. 3. p. 97.) glabrous, rather glaucous; leaves small, lanceolate, subulate, a little keeled, acute; spikes lateral, crowded, short; bractees longer than the pedicels; ovary not exceeding the corolla when in flower.  $\frac{1}{2}$ . H. Native country unknown, but cultivated about Constantinople. Spikes or racemes 9-10 lines long. Flowers white, one-half smaller than those of the first species.

*Small-flowered Tamarisk.* Shrub.

SECT. II. DECADE'NIA (from *δεκα*, *deca*, ten, and *αδην*, *aden*, a gland; the gland surrounding the ovary is 10-toothed). Ehrenberg in Schlecht. *Linnaea*. 2. p. 253. Gland surrounding the ovary 10-toothed. Petals 5. Stamens 5, one in each of the alternate teeth of the gland.

5 *T. AFRICANA* (Poir. voy. 2. p. 189. Desf. fl. atl. 1. p. 269.) glabrous, rather glaucous; leaves lanceolate, stem-clasping, imbricate; racemes sessile, scaly, dense, rising from the branches of the same year, usually  bractees ovate, chaffy; flowers trigynous; capsule 3-valved.  $\frac{1}{2}$ . F. Native in the sand along the Mediterranean sea, in Mauritania; shores of Naples, Egypt; and of the Levant at the torrents about Trapezon. *T. Gállica*  $\gamma$ , Willd. spec. 1. p. 1498. The bark is browner, and the flowers a little larger than in *T. Gállica*.

*African Tamarisk.* Shrub 6 to 10 feet.

6 *T. TETRAGYNA* (Ehrenberg in Schlecht. *Linnaea*. 2. p. 258.) like the last; but differs in the bractees being linear-lanceolate, in the flowers being tetragynous, and in the capsule being 4-valved.  $\frac{1}{2}$ . H. Native of the south of Europe. There is a variety of this having the racemes simple at the apex, and proliferous at the base, leafy.

*Tetragynous Tamarisk.* Shrub 6 to 8 feet.

7 *T. GRACILIS* (Willd. l. c. no. 8.) leaves lanceolate, sessile; racemes short, usually solitary, sessile, rising from the branches of the preceding year; pedicels elongated, about equal in length to the bractees.  $\frac{1}{2}$ . H. Native of Siberia, in salt marshes at the river Irtysh.

*Slender Tamarisk.* Shrub 4 to 6 feet.

8 *T. EFFUSA* (Ehrenberg in Schlecht. *Linnaea*. 2. p. 258.) leaves lanceolate; racemes loose, elongated, somewhat panicle; pedicels much shorter than the bractees.  $\frac{1}{2}$ . H. Native of the north of Africa.

*Effuse-panicle Tamarisk.* Shrub.

9 *T. ORIENTALIS* (Forsk. descrip. 206.) glabrous, glaucous; leaves minute, distant, stem-clasping or sheathing, mucronate; spikes or racemes lateral, slender; capsule 4-valved.  $\frac{1}{2}$ . S. Native of Arabia, Persia, and the East Indies. *Thuya aphylla*, Lin. spec. 1422. exclusive of the synonymes. *T. articulata*, Vahl. symb. 2. p. 48. t. 32. Flowers minute. Bractees mucronate. Branches as if they were articulated at the origin of the leaves, with the internodes turbinate. The largest tree of this species appears to be one at Babylon, on the supposed site of the hanging gardens.

*Oriental Tamarisk.* Tree 10 to 20 feet.

10 *T. HISPIDA* (Willd. l. c. no. 2.) leaves and branches clothed with cinereous hispid pubescence; branches ascending; styles

short.  $\frac{1}{2}$ . H. Native in the sandy deserts about the Caspian sea. *T. pentandra* var. Pall. fl. ross. 1. t. 79. B. C. D. *T. Gállica*  $\beta$ , Willd. spec. *T. tomentosa*, Smith in Rees' cycl. 35. no. 2. *T. canescens*, Desv. ann. sc. nat. 4. p. 348. Spikes or racemes lateral, somewhat panicle. Leaves lanceolate, subulate, imbricate. Flowers pale red.

*Hispid Tamarisk.* Shrub 6 to 8 feet.

11 *T. CHINE'NSIS* (Lour. coch. p. 182.) branches drooping; leaves very minute, imbricate, acute; spikes panicle, slender, and long; petals linear, erect.  $\frac{1}{2}$ . G. Native of China, in the province of Canton. According to Loureiro this plant is nearly allied to *T. orientalis*. *T. Gállica* var. Ehrh. l. c. Flowers red.

*China Tamarisk.* Tree 12 to 20 feet.

12 *T. DIOICA* (Roth, nov. spec. 185.) glabrous, greenish; leaves scale-formed, acute, stem-clasping at the base; spikes panicle, very slender, elongated; bractees longer than the flowers; stigmas in the female flowers exserted.  $\frac{1}{2}$ . S. Native of the East Indies. Stamens none, or 5 inclosed. A female specimen has only been examined.

*Diocious Tamarisk.* Clt. 1823. Shrub 6 feet.

13 *T. INDICA* (Willd. l. c. no. 5.) glabrous, greenish; branches stiffish, twiggy; leaves short, ovate, acute, of an obscure green, with white edges; spikes of flowers elongated, straight, panicle; bractees shorter than the flowers, subulate, longer than the pedicels; stamens exceeding the corolla.  $\frac{1}{2}$ . S. Native of the East Indies. *T. epacrioides*, Smith in Rees' cycl. 35. no. 4. *T. Gállica* var. *Indica*, Ehrenberg, l. c.

*Indian Tamarisk.* Shrub 6 feet.

14 *T. CANARI'ENSIS* (Willd. l. c. no. 4. Buch, can.) glabrous, hardly glaucous; branches divaricate; leaves small, stem-clasping, obscure green, margined with white, ending in long cirrhose points, some adpressed, and some spreading; spikes somewhat panicle, very long, slender; stamens length of the corolla.  $\frac{1}{2}$ . G. Native of the Grand Canary Island, along the sea side, and at the entrance of the valleys near Las Palmas. In Tenerife on the east of Santa Cruz, near the sea, where we have seen it growing in great plenty.

*Canary Island Tamarisk.* Shrub 4 to 6 feet.

15 *T. RAMOSISSIMA* (Led. fl. ross. alt. ill. t. 256. fl. alt. 1. p. 424.) glabrous, glaucous; flowers crowded, disposed in cylindrical racemes, forming a decompound panicle; bractees exceeding the pedicels; calycine segments ovate-orbicular, acutish; petals erectly connivent; styles much shorter than the ovary; leaves ovate-lanceolate, acute, stem-clasping, glabrous.  $\frac{1}{2}$ . H. Native of Siberia, at Lake Noor-Laisan. Flowers reddish. *T. Gállica*, Sievers in Pall. nord. beytr. vii.

*Much-branched Tamarisk.* Shrub 5 to 6 feet.

16 *T. GÁLICA* (Lin. spec. 386.) glabrous, glaucous; leaves minute, stem-clasping, adpressed, acute; spikes lateral, somewhat panicle, slender, 5 times longer than broad.  $\frac{1}{2}$ . H. Native of France, frequent; and along the Mediterranean. In England, on the coasts of Cornwall, Hampshire, and Sussex. Smith, engl. bot. 1318. Mill. fig. 262. f. 1. Blackw. herb. 331. *Tamariscus Gállicus*, All. *Tamariscus pentandrus*, Lam. fl. fr. but not of Pall. Flowers flame-coloured or pale-red.

*Var. a, subtilis* (Ehrenberg in Schlecht. *Linnaea*. 2. p. 267.) branches subtile, effuse; leaves glabrous, pale green, a little spreading.

*Var. b, Narbonensis* (Ehrenberg, l. c.) branches stiff, spreading; leaves glabrous, obscure green, densely imbricated, margined with white; spikes of flowers short, rather lateral.

*Var. c, Nilótica* (Ehrenberg, l. c. p. 269.) branches effuse, rather loose; leaves short, glaucous, spreading; spikes elongated; gland surrounding the ovary, hypogynous, with 10 equally distant teeth.

*Var. d, arborea* (Sieb. ex Ehrenberg, l. c.) branches effuse,

thickened, stiffish, nearly terete; leaves glabrous, densely adpressed to the stem; teeth of hypogynous gland usually approximate by pairs.

*Var. ε, mannifera* (Ehrenberg, l. c. p. 270.) branches stiffish; leaves short, glaucous, covered with white powder, spreading; hypogynous gland with teeth at equal distances. The manna of Mount Sinai is the produce of this variety.

*a*; branches effuse; anthers and gland white. There is another variety of this having the anthers and gland red.

*b*; branches divaricate; anthers and gland rose-coloured.

*Var. ι, heterophylla* (Ehrenberg, l. c. p. 270.) branches very slender; leaves light green, glabrous, short, acute, the upper ones densely imbricated, the middle ones elongated and bluntish, lower rameal ones broad-ovate, flat; spikes much elongated, all very slender.

*French Tamarisk.* Fl. May, Oct. Britain. Sh. 6 to 12 ft.

17 *T. PALLASII* (Desv. ann. sc. nat. 4. p. 349.) glabrous, hardly glaucous; leaves small, acute, imbricated; spikes panicled, rather thickish; stamens twice the length of the corolla; stigmas very short. *h*. H. Native at Cape Caucasus, and in deserts about the Caspian Sea. *T. pentandra*, Pall. fl. ross. t. 77. *T. Gallica*, Bieb. fl. taur. 1. p. 246. *T. paniculata*, Steven in litt. A plant gathered by Olivier and Bruguiere between Bagdad and Aleppo is very nearly allied to this species.

*Pallas's Tamarisk.* Shrub 6 to 12 feet.

18 *T. CUPRESSIFORMIS* (Led. fl. ross. alt. ill. t. 253. fl. alt. 1. p. 423.) glabrous, glaucous; flowers remotish, disposed in lateral simple racemes; bracteas shorter than the pedicels; calycine segments orbicular, with membranous edges; petals spreading; styles much shorter than the ovary; leaves ovate, stem-clasping, closely imbricated when young. *h*. H. Native of Siberia, in the desert of Soongaria, near salt lakes.

*Cypress-formed Tamarisk.* Shrub 5 to 8 feet.

19 *T. SENEGALENSIS* (D. C. prod. 3. p. 96.) glabrous, glaucous; leaves lanceolate-subulate, keeled, somewhat stem-clasping, acute, spreading a little; spikes slender, numerous, panicled; stamens hardly longer than the corolla; ovary acutely trigonal, almost triangular. *h*. S. Native of Senegal, where it flowers in the month of January.

*Senegal Tamarisk.* Tree.

SECT. III. POLYADENIA (from *πολυ*, *poly*, many, and *αδην*, *aden*, a gland; in reference to the gland surrounding the ovary being many toothed). Ehrenberg in Schlecht. Linnæa. 2. p. 271. Gland surrounding the ovary 20-toothed. Stamens 10, one between each alternate tooth of the gland.

20 *T. ERICOIDES* (Rottl. ex Willd. nov. act. nat. scrut. 4. p. 214. t. 4.) leaves oblong, sheathing; spikes terminal; flowers decandrous; bracteas equal in length to the pedicels. *h*. S. Native of the East Indies. Roots creeping deep. *T. ericoides*, Roth, nov. spec. p. 184. and *T. mucronata*, Smith in Rees' cycl. do not appear to differ from the present species. Flowers large.

*Heath-like Tamarisk.* Shrub 4 to 6 feet.

21 *T. AMPLEXICAULIS* (Ehrenberg in Schlecht. Linnæa. 2. p. 275.) stems shrubby; branches divaricate, intricate; young leaves stem-clasping, glaucous, short, acute, older ones half stem-clasping; flowers small, in spikes; capsule 2 lines long. *h*. S. Native of Egypt, in the oases of Jupiter Ammon.

*Stem-clasping-leaved Tamarisk.* Shrub 4 to 6 feet.

22 *T. PYCNOCARPA* (D. C. prod. 3. p. 97.) leaves stem-clasping, ovate, acute, small, when young adpressed, at length spreading and mucronate; spikes panicled; flowers decandrous; bracteas equal in length to the pedicels; fruit ovate, trigonous, turgid. *h*. F. Native of the Levant, along the road side between Bagdad and Kermacha.

*Slender-fruited Tamarisk.* Shrub 2 to 3 feet.

23 *T. PASSERINOIDES* (Del. fl. ægypt. p. 58. Desv. in ann. sc. nat. 4. p. 349.) stem erect; branches cinereous, diffuse; leaves half stem-clasping all the summer, short, somewhat triangular, canescent; capsule 3 lines long. *h*. F. Native of Arabia and Egypt, in arid places.

*Var. α, divaricata* (Ehrenberg in Schlecht. Linnæa. 2. p. 275.) branchlets divaricate; leaves densely imbricated, obtuse, adpressed; flowers large; capsules about 4 lines long. *h*. F. In the oases of Jupiter Ammon.

*Var. β, Hammōnis* (Ehrenberg, l. c.) branches straight, torose; leaves hoary, densely imbricated, bluntish, adpressed; flowers small; capsule 3 lines long. *h*. F. In the oases of Jupiter Ammon.

*Var. γ, macrocarpa* (Ehrenberg, l. c.) branches loose, erectish; leaves short, dilated, acuminate, glaucous, rather remote, at length spreading; flowers large; capsule about half an inch long.

*Passerina-like Tamarisk.* Shrub.

*Cult.* *Tamarix* is a genus of very pretty and delicate shrubs. The hardy species are fit ornaments for decorating shrubberies; they will grow well in any soil or situation, and cuttings planted out in the open ground in autumn or early in spring strike root readily. The stove and greenhouse kinds succeed well in a mixture of loam and peat; and cuttings of them root freely in sand under a hand-glass, those of the former in heat.

II. MYRICARIA (*μυρικη*, *myrice*, in Greek, a synonyme of *Tamarix*, derived from *μυρο*, *myro*, to run; from growing on the banks of running streams). Desv. ann. sc. nat. 4. p. 349. D. C. prod. 3. p. 97. Ehrenberg, in Schlecht, Linnæa. 2. p. 278.—*Tamarix* species of authors.

LIN. syst. *Monadelphica*, *Decandria*. Calyx 5 parted. Petals 5. Stamens 10, alternate ones shorter than the rest; filaments monadelphous from the base to about the middle. Stigmas 3, sessile, in a head. Seeds inserted in a line along the middle of the valves, ascending, tufted at one end; hairs of tuft feathery. Flowers in simple, solitary, terminal spikes.

§ 1. *Leaves long, linear, or oblong, sessile, becoming gradually broader towards the base.*

\* *Shrubby; fruit pedicellate.*

1 *M. GERMANICA* (Desv. l. c. p. 349.) shrubby; leaves linear-lanceolate, flat; racemes subspicate, elongated, terminal, solitary, but those at the tops of the branchlets are branched; mature flowers distended, ascending; bracteas longer than the pedicels; capsules ascending. *h*. H. Native nearly throughout the whole of Europe, on the banks of rivers; and of Caucasus. Mill. fig. t. 262. f. 2. *Tamarix Germanica*, Lin. spec. p. 386. Schkuhr, handb. t. 35. fl. dan. 434. Blackw. t. 331. *Tamariscus decandrus*, Lam. fl. fr. *T. decandra*, Moench. *Tamariscus decandrus*, Lob. icon. 2. t. 218. Flowers pink. *Tamarisk*, especially this species, is sometimes used abroad in obstructions of the lower viscera, and especially in diseases of the spleen. By combustion it yields a considerable quantity of fixed salt, which is diuretic and aperient, and approaches to Glauber's salts. The bark of the root is the most efficacious part. A decoction of this is given in doses of 2 or 3 drachms, or even an ounce; of the wood and leaves double that quantity may be taken.

*German Myricaria.* Fl. June, Sept. Clt. 1582. Sh. 6 to 8 ft.

2 *M. DAURICA* (D. C. prod. 3. p. 98. Ehrenberg, l. c.) shrubby, glabrous; leaves linear-lanceolate, flat; racemes subspicate, obtuse, lateral, but those on the secondary branches are terminal and simple; bracteas equal in length to the flowers; mature flowers coarctate, ascending. *h*. H. Native of Siberia,

beyond the Baikal, and of Dahuria. *Tamarix Dahurica*, Willd. l. c. no. 16. Flowers pink.

*Dahurian Myricaria*. Clt. 1818. Shrub 4 to 8 feet.

3 *M. squamosa* (Desv. l. c. p. 350.) shrubby; glabrous; leaves oblong, keeled; racemes lateral, short, scaly at the base.

h. H. Native of Siberia. Flowers pink?

*Scaly-racemed Myricaria*. Shrub 4 to 6 feet.

• • *Herbaceous; fruit obsoletely pedicellate.*

4 *M. HERBACEA* (Desv. l. c. p. 350.) glabrous; leaves linear-lanceolate; spikes terminal, simple, solitary; bracteas longer than the flowers; capsules spreading. 2. F. Native about the Caspian Sea, on the Persian side. *Tamarix Germanica subherbacea*, Pall. fl. ross. 2. p. 73, t. 80. f. 3. *T. Germanica* β, Willd. spec. *T. herbacea*, Willd. l. c. no. 14. *T. Germanica Caspica*, Pers. Flowers red.

*Herbaceous Myricaria*. Pl. 3 to 4 feet.

§ 2. *Leaves flat, lanceolate-linear, sessile, constricted near the base.*

5 *M. LONGIFOLIA* (D. C. prod. 3. p. 97. Ehrenberg, l. c. p. 279.) leaves spreading; racemes terminal, compound at the base; pedicels elongated, about equal in length to the expanded flower; bracteas with membranous edges; capsules nodding.

h. H. Native of Siberia, at the Baikal, in saltish places. *Tamarix Germanica*, Pall. fl. ross. 2. p. 73. *T. decandra*, Pall. l. c. t. 80. f. A. *Tamarix longifolia*, Willd. l. c. no. 15. *M. linearifolia*, Desv. l. c. p. 349. Flowers red.

*Var. α, laxiflora* (Ehrenberg, in *Sav. Annæa*. 2. p. 279.) flowers distended; capsules drooping.

*Var. β, coarctata* (Ehrenberg, l. c.) flowers coarctate; capsules drooping.

*Long-leaved Myricaria*. Shrub 4 to 6 feet.

*Cult.* For culture and propagation, see hardy species of *Tamarix*, p. 727.

III. HOLOLACHNA (from ὅλος, *holos*, the whole, and λαχνη, *lachne*, wool; in reference to the whole surface of the seeds being covered with hairs). Ehrenberg, in Schlecht. 2. p. 273. *Tamarix* species of Pall.

LIN. SYST. *Monadelphica, Decandria*. Calyx 4-5-parted. Petals 4-5. Stamens 8-10, hypogynous, monadelphous, inserted in the hypogynous gland. Styles short, subulate, 2-4. Capsule 2-4-angled, 2-4-valved, 2-4-celled. Seeds few, large, with the whole surface pilose, attached to the dissepiments in the middle of the valves.—A small shrub, with trigonal, fleshy, obtuse, spreading leaves; spikes lateral; flowers nearly sessile, about equal in length to the bracteas.

1 H. *SONGARICA* (Ehrenberg, l. c.). h. H. Native of Siberia, in the Soongarian desert, in salt places. *Tamarix Songarica*, Pall. act. petr. 10. p. 374. t. 10. f. 4.

*Soongarian Hololachna*. Shrub 2 to 3 feet.

*Cult.* See hardy species of *Tamarix* for culture and propagation. The plant requires to be refreshed with salted water at the roots now and then.

ORDER XCVIII. MELASTOMACEÆ (plants agreeing with *Melastoma* in important characters). D. Don, in wern. soc. mem. 4. (1823.) p. 281. Schrank et Mart. diss. mss. Ser. diss. mss.—*Melastomæ*, Juss. gen. p. 328. dict. sc. nat. p. 29. p. 505.

Calyx divided into 4, 5 (f. 808. b.), or 6 lobes (f. 109. b.), cohering more or less with the angles of the ovary, but distinct from the surface between the angles, and thus forming a number of cavities, within which the anthers are curved down-

wards. Petals equal in number to the segments of the calyx (f. 108. d. f. 111. c. f. 113. b.), arising from their base, or from the edge of the disk that lines the calyx, twisted in æstivation (f. 112. b.) Stamens usually twice as many (f. 109. d. f. 110. c.), sometimes equal to them in number; in the former case those which are opposite to the segments of the calyx are alone fertile; filaments curved downwards in æstivation; anthers long (f. 109. c. f. 111. c. f.), 2-celled, usually bursting by 2 pores at the apex (f. 111. c.), which is rostrate, and elongated in various ways (f. 109. c.) beyond the insertion of the filaments; sometimes bursting longitudinally (f. 113. c.); before flowering contained within the cases between the ovary and sides of the calyx. Ovary more or less coherent with the calyx (f. 113. c. d.), with several cells, and indefinite ovules; style 1 (f. 109. d. f. 113. f.); stigma simple, either capitate or minute; a cup often present upon the apex of the ovary, surrounding the style. Pericarpium either dry and distinct from the calyx, or succulent and combined with the calyx, with several cells; if dehiscent bursting through the valves, which therefore bear the septa in the middle; placentas attached to a central column. Seeds innumerable, minute, with a brittle testa, and no albumen, usually with appendages of some kind; embryo straight or curved, with equal or unequal cotyledons.—Trees, shrubs, or herbaceous plants. Leaves opposite, undivided, usually entire, without dots, with several ribs. Flowers terminal, usually thyrsoid.—De Candolle's remarks, in his memoir upon *Melastomaceæ*, although composed of exotic plants, and established at a period when but few species were known, is so well characterised, that no one has ever thought of putting any part of it in any other group, or even introducing genera into it that do not rightly belong to it. These distinct characters are the opposite leaves, with several great veins or ribs running from the base to the apex, something as in monocotyledonous plants, and in long beaked anthers, to which, combined, there is nothing to be compared in other families. The greatest affinity is on the one hand with *Jythrariæ*, on the other to *Myrtaceæ*; from the former it differs in the æstivation of the calyx not being valvate, from the latter in having the petals twisted before expansion, and no dots on the leaves, and from both, and from all others to which they can be compared, in their long anthers bent down parallel to the filaments in the flower, and lying in niches between the calyx and ovary; with the exception of *Memecylæ*, in which, however, the union between the calyx and ovary is complete. The structure of the seeds of *Memecylæ* is also different.—A slight degree of astringency is the prevailing character of the order, which is, although one of the most extensive known, entirely destitute of any unwholesome species. The succulent fruit of many is eatable, some of which dye the mouth black. "*Blakea trinervi* produces a yellow fruit, which is pleasant and eatable, in the woods of Guiana." (Hamilt. prod. p. 42.)

#### *Synopsis of the genera.*

SUBORDER I. MELASTOMEA. Anthers opening by 1-2 pores

#### TRIBE I.

LAVOISIERIÆ. Ovary free, neither scaly nor bristly at ti

*apex. Capsule dry. Seeds ovate or angular, with a lateral linear hilum.*

1 *MERIA'NIA*. Calyx campanulate (f. 108. *a.*), 5-6-lobed; lobes subulate at the apex (f. 108. *b.*). Petals 5-6 (f. 108. *d.*). Anthers opening by 2 pores, furnished with a short spur at the base. Capsule 5-6-celled; placentas lunate.

2 *AXINÆ'A*. Calyx cup-shaped, 5-6-toothed. Petals 5-6. Anthers opening by two pores, ending in a simple spur at the base. Capsule 5-6-celled.

3 *CHASTENÆ'A*. Calyx campanulate, truncate, entire. Petals 5. Stamens 10. Anthers linear, acute, opening by 1 pore: having the connectives drawn out into an ample roundish appendage at the base. Capsule 5-celled.

4 *LAVOISIE'RA*. Calyx turbinate, 5-10-lobed. Petals 5-10. Stamens 10-20. Anthers opening by 1 pore, furnished with a short, blunt beak; the alternate ones drawn out into a 2-lobed appendage at the base. Capsule 5-10-celled.

5 *DA'VYA*. Calyx campanulate, with the teeth concrete into an entire, membranous limb. Petals 5-6. Anthers beaked, opening by 1 pore: having the connectives drawn out at the base in a simple or bristled spur. Capsule 5-celled.

6 *GRAFFENRIE'DA*. Calyx campanulate, bluntly 5-toothed. Petals 5. Stamens 10. Anthers linear, acute, opening by 1 pore, furnished each with a simple appendage at the base. Capsule 5-valved.

7 *CENTRÔNIA*. Calyx oblong, beset with bristles; with a coarctate, entire limb. Petals 5. Anthers with a long beak, and furnished with a long subulate process at the base. Capsule 5-celled.

8 *TRUNCA'RIA*. Calyx cylindrical; limb truncate, almost entire. Stamens 10. Anthers elongated, beaked, but without any process at the base, opening by 1 pore.

9 *RHYNCHANTHE'RA*. Tube of calyx ovate, globose; lobes 5, linear or setaceous. Petals 5. Stamens 10, 5 of which are sterile. Anthers ending in a long beak, with the connectives long and auricled at the base. Capsule 3, but usually 5-celled.

10 *MACA'IREA*. Tube of calyx ovate; lobes 4. Petals 4. Stamens 8, the 4 longest beset with glandular hairs inside. Anthers linear, opening by 1 pore: in 4 of which the connective is elongated and stipe-formed. Capsule 4-celled.

11 *BUCQUE'TIA*. Tube of calyx globose; lobes 4, broad. Petals 4. Stamens 8, equal. Anthers opening by 1 pore, without any auricle at the base. Ovary furnished with 4 tubercles at the apex. Capsule 4-celled.

12 *CAMBESSEDE'SIA*. Tube of calyx globose; lobes 5, narrow. Petals 5. Stamens 10. Anthers linear, falcate, a little beaked, drawn out at the base into an obtuse, undivided auricle, each of various lengths. Capsule 3-celled.

13 *CHETÓSTOMA*. Tube of calyx obovate-turbinate, girded by a ring of 4-5 stiff bristles under the lobes, which are 4-5. Petals 4-5. Anthers with short beaks, with the connectives hardly drawn out at the base. Capsule prismatic, 4-5-gonal.

14 *SALPI'NGA*. Calyx oblong-turbinate, 8-10-ribbed, 4-5-toothed. Petals 4-5. Stamens unknown. Capsule trigonal, 3-valved.

15 *BERTOLÒNIA*. Calyx campanulate, 5-lobed; lobes some-

times nearly obsolete. Petals 5. Anthers ovate-obtuse, opening by 1 pore: attenuated at the base, but hardly or not auricled. Capsule trigonal, 3-valved.

16 *MEISNE'RIA*. Calyx globose, 4-lobed. Petals 4. Stamens 8. Anthers ovate, beaked, tubular: in 4 of which the connective is long and auricled at the articulation, in the other 4 it is hardly evident. Capsule 2-celled.

## TRIBE II.

*RHEXIE'Æ*. Anthers opening by 1 pore at the apex. Ovary free, neither scaly nor bristly at the apex. Capsule dry. Seeds cochleate, with an orbicular basilar hilum. Species all American, except one.

17 *APPENDICULÁ'RIA*. Tube of calyx somewhat urceolate; limb somewhat campanulate, bluntly 4-toothed. Petals 4. Stamens 8, equal. Connectives drawn out into 2 long bristles at the articulation beneath and above the cells of the anthers. Capsule 3-celled, 3-valved.

18 *COMÓLIA*. Tube of calyx campanulately cylindrical; lobes 4-linear. Petals 4. Anthers 8, oblong-linear, falcate; having their connectives short and drawn out into 2 auricles at the articulation. Capsule ovate, 2-celled.

19 *SPE'NNERA*. Calyx globose, with 4-5 short lobes. Petals 4-5. Stamens 8. Anthers ovate, obtuse, with their connectives long, but not appendiculated. Capsule 2, rarely 3-celled.

20 *MICROLÍ'CIA*. Calyx globose, or obovate; lobes 5, subulate. Petals 5. Anthers alternately dissimilar, ovate, short-beaked, with their connectives drawn out into a simple spur at the articulation. Capsule 3-celled, 3-valved.

21 *ERNE'STIA*. Calyx globose; lobes 4, narrow. Petals ciliated. Anthers triquetrous, drawn out at the base into 2 long bristles. Capsule 4-celled.

22 *SIPHANTHE'RA*. Calyx campanulate, 4-toothed, girded by many bracteas. Petals 4. Stamens 4. Anthers furnished with an obcordate, ascending process at the base, and a tubular beak at the apex. Capsule depressed, 2-celled, obcordate.

23 *RHE'XIA*. Tube of calyx ventricose (f. 109. *a.*) at the base, but narrowed into a neck at the apex (f. 109. *b.*), limb 4-cleft. Petals 4. Anthers 8 (f. 108. *c.*), with their connectives hardly evident and not auricled. Capsule at the bottom of the calyx, 4-celled; placentas lunate, pedicellate.

24 *HETERONÔMA*. Calyx tubular, 4-toothed. Petals 4. Anthers 8, alternate ones longer; the connectives of the shorter ones drawn out into 2 bristles, of the longer ones into a linear appendage, each of which is bifid at the apex. Capsule 4-celled.

25 *PACHYLÔMA*. Calyx obconically cylindrical, drawn out beyond the ovary, hardly 4-toothed. Petals 4. Stamens 8, equal. Anthers linear, elongated: with the connectives long in 4 of them, and drawn out into a simple bristle-like appendage at the base, but in the other 4 drawn out into 2 bristle-like appendages each.

26 *OXY'SPORA*. Calyx oblong, 4-lobed. Petals 4. Stamens 8, equal. Anthers elongated, drawn out into 2 blunt spurs at the base, with their connectives hardly perspicuous. Capsule 4-celled, 4-valved.

27 *TRICE'NTRUM*. Calyx ovate; lobes 4, narrow, often with

73 CRECHTTON. *Tubular, ...*  
 ... at the apex. Anthers 8, linear: having their connectives furnished with 3 spurs at the base. Capsule 4-celled.

28 MARGETIA. Calyx oblong or cylindrical, 4-lobed. Petals 4. Stamens 8, equal. Anthers oblong, with 2 tubercles at the base. Capsule 4-valved, 4-celled.

29 TREMBLEYA. Calyx ovate, constricted at the apex, 5-lobed. Petals 5. Stamens 10, with 5 of the anthers ovate, shortly and bluntly beaked, having their connectives drawn out into an obcordate or spatulate simple ligula: the 5 alternate ones having the ligula almost abortive. Capsule 5-celled.

30 ADELOBOTRYS. Calyx somewhat campanulate, bluntly 5-toothed. Petals 5. Stamens 10. Anthers bifurcate at the base. Capsule 5-valved.

### TRIBE III.

ORBECKIÆ. *Anthers opening by one pore at the apex. Ovary sometimes free, sometimes adnate to the calyx, crowned by bristles or scales at the apex. Seeds cochleate; with an orbicular, basilar hilum.—Species American, African, Asiatic, and a few Australian.*

31 LASIA'NDRA. Calyx ovate; lobes 5, narrow. Petals 5. Stamens 10, pilose. Anthers elongated, with a short beak: having their connectives tumid and biauriculate at the base. Ovary bristly at the apex, rather ... the calyx. Capsule 5-celled.

32 CHELOGA'STRA. Calyx turbinate (f. 109. a.), pilose or scaly, 5-lobed. Petals 5 (f. 109. d.). Filaments 10, glabrous. Anthers oblong: having their connectives drawn out into a simple or bifid spur, and sometimes only into 2 blunt tubercles. Ovary bristly at the apex. Capsule 5-celled.

33 ARTHROSTE'MMA. Calyx turbinate or campanulate, usually beset with bristles or scales on the outside, 4-lobed. Petals 4. Stamens 8, glabrous. Anthers oblong: having their connectives rather long, and bluntly biauriculate at the base. Ovary bristly at the apex. Capsule 4-celled.

34 ORBECKIA. Calyx ovate, usually clothed with stellate bristles or down on the outside, 4-5-lobed, furnished with appendages between the lobes on the outside, of various forms and sizes. Petals 4-5. Stamens 8-10, glabrous. Anthers nearly equal, ending in short beaks, but their connectives are furnished with 2 short auricles at the base. Ovary bristly at the apex. Capsule 4-5-celled.

35 TIBOU'CHINA. Calyx turbinate, clothed with imbricate scales on the outside: and girded by a double involucre at the base, both composed of 2 connate bracteas; lobes 5. Petals 5. Stamens 10, glabrous. Anthers with their connectives bluntly biauriculated at the base. Ovary free, bristly at the apex.

36 TRISTE'MMA. Calyx tubular, girded by many bracteas at the base, 4-5-cleft, and furnished with bearded appendages near the limb. Petals 4-5. Stamens 8-10. Anthers arched, biauriculate at the base. Ovary hardly adnate to the calyx at the base, bristly at the apex. Berry 4-5-celled.

37 SARCOPI'RAMUS. Calyx obversely pyramidal, adnate to the ovary at the base, with a truncate 4-toothed limb; teeth ciliated. Petals 4. Stamens 8. Anthers simple, straight,

naked, opening by 2 pores at the apex. Capsule square, 4-winged at the apex, 4-celled, 4-valved. Seeds triangular.

38 MELASTOMA. Calyx ovate, densely covered with scales or bristles; limb 5, (f. 111. a.) rarely 6-cleft, the segments alternating with deciduous appendages. Petals 5-6. Stamens 10-12. Anthers a little arched: the connectives stipe-formed (f. 111. e.) in the longer anthers, in the shorter ones biauriculate (f. 111. f.) or emarginate. Ovary bristly at the apex. Capsule baccate, 5-6-celled.

39 OTANTHE'RA. Calyx with an ovate tube, half adhering to the ovary, beset with palmately ciliated scales; limb 5-cleft, deciduous. Petals 5. Stamens 10, equal. Anthers oblong-linear, a little arched, tapering upwards, and opening by a pore, but biauriculate in front at the base. Ovary bristly at the apex. Berry 5-celled, pulpy.

40 LACHNORHODIUM. Tube of calyx ovate-oblong; limb 5-cleft; segments subulate. Petals 5. Stamens 10, equal; filaments girded by a ring of hairs at the base; anthers oblong, beaked, naked. Capsule 5-celled; crowned by the segments of the calyx.

41 PLEROMA. Calyx ovate, when young often inclosed in 2 bracteas; lobes 5, deciduous. Petals 5. Stamens 10, glabrous. Anthers nearly equal, elongated, arched at the base: having their connectives stipe-formed, and furnished with 2 short auricles at the base. Ovary adnate to the calyx, bristly at the apex. Capsule baccate, 5-celled.

42 DIPLOSTE'GIUM. Calyx 5-cleft, inclosed in the double, cucullate, hispid calyptra. Petals 5. Anthers nearly equal. biauriculate at the base. Capsule baccate, 5-celled.

43 ACIDRIS. Calyx globose, fleshy; limb coarctate, 4-toothed. Petals 4, awned. Stamens 8, furnished with long connectives, and as if it were jointed in the middle. Anthers erect, naked at the base. Capsule baccate, 4-celled.

44 CENTRADE'NIA. Calyx somewhat campanulate, tetragonal; limb 4-toothed. Petals 4. Stamens 8, unequal; the connectives of the larger anthers are drawn out into an elongated cuneate spur, but those of the smaller anthers are gland-formed. Capsule 4-valved, 4-celled.

### Tribe IV.

MICONIÆ. *Anthers opening by 1 or 2 pores at the apex. Ovary adnate to the calyx. Fruit baccate. Seeds not cochleate. Species for the most part American.*

45 ROUSSEAU'XIA. Calyx hemispherical, glabrous, 4-lobed. Petals 4. Stamens 8. Anthers oblong-linear, sometimes all fertile, with their connectives somewhat gibbous at the base: sometimes the alternate ones are sterile, with short connectives, the rest fertile with long connectives, which are furnished with 2 bristles at the base. Ovary furnished with 4 scale-like bristles at the apex.

46 LEA'NDRA. Calyx urceolate, drawn out beyond the ovary; lobes double, 4-6 exterior ones subulate, 6 interior oval. Petals 4-6. Stamens 8-12. Anthers linear, hardly biauriculate at the base. Berry dry? 3-4-celled.

47 TSCHUDYA. Calyx globose; lobes 5, bristle-formed. Stamens 10. Anthers oblong, without auricles. Ovary free bristly at the apex. Capsule globose, 4-5-celled.

48 CLIDEMIA. Calyx ovate, 5-lobed; lobes narrow. Petals 5, rarely 6. Stamens 10. Anthers somewhat constricted at the base, and somewhat biauriculate. Ovarium bristly at the apex. Berry 5-celled.

49 MYRIASPOKA. Calyx ovate-globose, very hispid, irregularly ruptured into 5 lobes. Petals 5? Stamens 10. Anthers thick, bluntish, gibbous at the base. Free part of ovarium bristly. Berry 5-celled.

50 TOCÔCA. Calyx oblong, glabrous; with an urceolate, 5-toothed limb. Petals 5. Stamens 10. Anthers equal, with short connectives, or with 2 hardly visible auricles behind. Ovarium crowned by a circle of bristles. Berry 5-celled.

51 MAIETA. Calyx oblong-ovate, more or less hispid, and often bracteate; lobes 5, subulate. Petals 5. Stamens 10. Anthers equal: having short connectives, which are biauriculate behind. Ovarium glabrous. Berry 5-celled.

52 CALOPHYSA. Calyx oblong, bottle-shaped when in fruit; lobes 4, ciliated. Petals 4. Stamens 8. Anthers oblong, without auricles. Berry 4-celled.

53 SONERILA. Calyx with an oblong or somewhat trigonal tube, usually muricated, adhering to the ovarium; limb trifid, deciduous. Petals 3. Stamens 3; anthers linear-oblong, emarginate at the base, opening by 2 pores at the apex. Ovarium glabrous at the apex. Capsule turbinate, 3-celled.

54 MEDINILLA. Calyx with an obovate tube, and a cylindrical, truncate limb. Petals 4. Stamens 8, equal. Anthers elongated, bluntly biauriculate at the base. Berry bottle-formed, 4-celled.

55 PACHYCENTRIA. Tube of calyx cup-shaped, constricted beneath the middle; limb obsoletely 4-toothed. Petals 4. Stamens 8, equal. Anthers oblong-linear, beaked at the apex, and furnished with a thick, fleshy connective each at the base. Free part of ovarium angular. Berry globose, 4-celled.

56 POGONANTHERA. Tube of calyx cup-shaped, rather quadrangular, adhering to the ovarium at the base; limb 4-cleft. Petals 4. Stamens 8; anthers oblong, acute, bearded at the base. Ovary hairy at the apex. Berry globose, 4-celled, pulpy.

57 ALLOMORPHIA. Tube of calyx oblong, adhering to the ovarium at the base; limb 4-toothed. Petals 4. Stamens 8. Anthers linear, acute, emarginate at the base. Fruit dry, ovate-oblong, 4-celled.

58 HUBERIA. Calyx oblong, constricted at the apex, 4-5-toothed. Petals 4-5. Stamens 8-10. Anthers oblong-linear, drawn out on the back at the base into 2 spur-formed bristles. Free part of ovarium conical. Berry 4-5-celled.

59 OCTHOCARIS. Tube of calyx obovate, adhering to the ovarium; limb obsoletely 5-toothed, permanent. Petals 5. Stamens 10, equal; anthers oblong, straight, ending each in a bristle at the base. Ovarium truncate and glabrous at the apex. Capsule globose, umbilicate, dry, 3-celled, opening irregularly.

60 CALYGOONIUM. Tube of calyx nearly globose, 4-5-sided; limb 4-5-lobed, longer than the tube. Petals 4-5. Stamens 8-10, equal. Anthers oblong, without any auricles at the base. Berry roundish, 4-5-angled, 4-5-celled.

61 OSSÆA. Tube of calyx ovate, more or less 5-nerved, glabrous ovarium; lobes 4, short. Petals 4. Stamens 8. Anthers hardly auricled at the base. Ovarium smoothish at the apex. Berry 4-celled.

62 SAGRÆA. Calyx not drawn out beyond the ovarium; lobes 4, short. Stamens 8. Anthers hardly auricled at the base. Ovarium smoothish at the apex. Berry 4-celled.

63 TETRAZY'GIA. Tube of calyx globose or urceolate; limb drawn out beyond the ovarium, 4-toothed. Petals 4. Stamens 4-8, equal. Anthers linear, obtuse at the base. Ovarium glabrous. Berry 4-celled.

64 DISSOCHÆTA. Calyx with an oblong, obscurely tetragonal tube, adhering to the ovarium: but with the limb drawn out beyond the ovarium, permanent, and 4-toothed at the apex. Petals 4. Stamens 4, sometimes 8, but the alternate ones are usually sterile. Anthers oblong, linear, furnished on the back near the base with a lamellate, 2-awned, rarely undivided connective each. Berry globose, nearly dry, somewhat 4-celled, indehiscent.

65 APLECTRUM. Calyx with an ovate, globose tube: having the limb drawn out beyond the ovarium, which is truncate or obsoletely 4-toothed. Petals 4. Stamens 8, alternate ones sterile. Anthers oval, thick, blunt at both ends. Ovarium crowned by 4 erect, dry subglobose, 4-celled?

66 HETEROTRICHUM. Calyx with an ovate-globose tube, and a 5-6-cleft limb. Petals 5-8. Stamens 10-16, equal, glabrous. Anthers oblong, hardly gibbous at the base. Ovary umbilicate at the apex. Berry 5-8-celled.

67 CONOSTEGIA. Limb of calyx conical (f. 111. a. b.), calyptriform (f. 111. a.), undivided, at length circumscribed or irregularly ruptured at the base, and falling off in one piece (f. 111. a.). Petals 5-6. Stamens 10-16. Anthers usually biauriculate at the base. Berry 3-8-celled.

68 DIPLOGENEA. Calyx with a calyptriform, conical, deciduous limb. Petals 4, inserted in the fleshy disk. Stamens 8. Anthers ovate, bicalcarate at the base. Ovarium adhering to the calyx, crowned by the large fleshy disk.

69 DIPLOCHITA. Calyx adhering only at the base to the ovarium, cylindrical, inclosed in 2 bractæas when young: having the throat usually ciliated after flowering; limb 5-6-toothed, drawn out beyond the ovarium. Petals 5-6. Anthers biauriculate at the base. Capsule dry, 5-celled.

70 PHYLLOPUS. Tube of calyx turbinate campanulate; limb 5-toothed; teeth ciliated. Petals 5. Stamens 10, equal. Anthers beaked. Fruit probably baccate, 5-celled.

71 HENRIETTEA. Calyx campanulate, 5-lobed. Petals 5, velvety. Stamens 10. Anthers thick, bifid at the base, and terminating in a long beak at the apex. Berry juicy, 5-celled.

72 MARUMIA. Tube of calyx adhering to the ovarium at the base, oblong-ovate, bristly; limb quadrifid, drawn out beyond the ovarium, with the segments permanent. Petals 4. Stamens 8; anthers linear, arched, beaked at the apex, and opening by 1 pore, furnished with a fascicle of bristles at the base. Ovarium villous at the apex. Berry ovate, 4-celled.

73 CRECHT'ON. Tube of calyx globose, adhering to the ovarium; limb short, obsoletely 4-toothed, permanent. Petals 4. Stamens 8, equal. Anthers long, thick, arched, beaked, apiculated at the base by a short connective each. Ovarium glabrous. Berry dry, globose, 4-celled.

74 PHYLLAGATHIS. Tube of calyx oblong, glabrous, adhering to the ovarium at the base; limb 4-cleft, drawn out beyond the ovarium. Petals 4. Stamens 8, equal. Anthers arched, beaked at the apex, but unappendiculate at the base.

75 LORE'YA. Calyx campanulate, truncate at the apex, only adhering to the ovarium at the very base. Petals 5. Stamens 10. Anthers thick, ovate, obtuse, somewhat gibbous at the base. Berry 5-celled.

76 MIC'ONIA. Limb of calyx short, 5-toothed. Petals 5. Stamens 10. Anthers oblong-linear, shortly and bluntly auriculated at the base. Berry 5-celled.

77 OXYMERIS. Calyx obovate-turbinate; teeth 5, callous, very short. Petals 5. Stamens 10, equal. Anthers oval-oblong, obtuse, tapering to the base: having their connectives filiform, short, and rather gibbous at the base. Berry 3-5-celled.

78 CREMANIUM. Tube of calyx campanulate or obovate; limb 4-5-toothed. Petals 4-5. Stamens 10, equal. Anthers short, rather cuneated at the base, opening by 2 pores at the apex. Berry 3-5-celled.

79 BLAKEA. Calyx campanulate, ad at the base by 4-6 broad scales, which are disposed cruciately or in a triple order; limb membranous, 6-lobed, or 6-toothed. Petals 6. Anthers large, twisted into a ring, obtuse at the apex, and opening by 2 pores, and furnished with a short spur-like process at the base. Berry crowned by the calyx, 6-celled.

SUB-ORDER II. CHARIA'NTHEÆ. Anthers 2-celled, bursting longitudinally by 2 chinks (f. 113. c.). Fruit fleshy. Seeds cuneated, angular.

80 KIBE'SSIA. Limb of calyx falling off in the form of a calyptra. Petals 4. Stamens 8. Ovarium muricated by branched bristles. Fruit indehiscent, 4-celled.

81 EWE'CKIA. Tube of calyx hemispherical, adhering to the ovarium; limb truncate, obsoletely 4-toothed. Petals 4. Stamens 8, equal. Anthers oblong, obtuse at both ends, furnished each at the base with a short fleshy connective. Berry globose, 4-celled.

82 CHARIA'NTIUS. Tube of calyx ovate, rather urceolate; (f. 113. a.) limb 4-lobed. Petals 4. (f. 113. b.) Stamens 8. Ovarium adnate to the calyx (f. 113 c.). Berry globose, umbilicate, 4-celled.

83 CHÆNOPLU'RA. Calyx adnate to the ovarium; limb bluntly 5-toothed. Petals 5. Stamens 10. Anthers bluntly auriculate at the base. Berry 3-4-celled.

84 ASTRONIA. Calyx adnate to the ovarium; limb 5-6-toothed. Petals 5-6. Stamens 10-12; filaments compressed. Berry dry, umbilicate, 2-4-celled.

SUB-ORDER I. MELASTOMEÆ (plants agreeing with *Melastoma*, in the anthers opening by pores at the apex). Ser. in *D. C. prod. 3. p. 100.* Anthers bursting by 1 or 2 pores at the apex.

### Tribe I.

LAVOISIEREÆ (plants agreeing with the genus *Lavoisiera* in the characters mentioned below). *D. C. prod. 3. p. 100.* Anthers bursting by 1 or 2 pores at the apex. Ovarium free from the calyx, neither scaly nor bristly at the apex. Capsule dry. Seeds ovate or angular, never cochleate, with a lateral linear hilum.—American plants.

I. MERIA'NIA (in honour of Maria, Sybilla Merian, or Græffin, authoress of *De Metamorphosis Insectorum Surinamensium*). Swartz, fl. ind. occ. 2. p. 824. t. 15. *D. Don*, Wern. mem. soc. 4. p. 322.—*Wrightia*, Sol. mss. but not of Brown.—*Rhèxia* species, Swartz, prod. Ser. mss.

LIN. SYST. *Decandria, Monogynia.* Calyx with a campanulate tube, and a 5-6-lobed limb (f. 108. b.); lobes broad, dilated, and membranous at the base and subulate at the apex. Petals 5-6. (f. 108. d.) Stamens 10-12. Anthers obtuse at the apex, and bursting by 2 pores, furnished with 2 short processes at the base. Ovarium globose, rather depressed, glabrous at the apex. Style filiformly-clavate. Capsule free, 5-6-celled; placentas lunate. Seeds small, cuneately angular.—Trees or shrubs, native of Jamaica or South America. Leaves petiolate, denticulated, glabrous, or hardly downy on the nerves. Flowers large, pedicellate, solitary, axillary, white, or purple.

1 *M. LEUCANTHIA* (Swartz, fl. ind. occ. p. 826.) branches tetragonally compressed, glabrous; leaves petiolate, ovate-oblong, acuminate, 3-nerved, denticulated, glabrous; peduncles axillary, solitary; bractæas 2, under each flower, ovate-lanceolate, 3-nerved, quite entire; tube of calyx campanulate, 5-lobed; lobes broad at the base and subulate at the apex. *h. S.* Native of the higher mountains of Jamaica. *Rhèxia leucantha*, Swartz, prod. 61. *Rhèxia speciosa*, Bert. in herb. Balb. Petals white, reddish at the base. Anthers large, appendiculated by a short horn.

*White-flowered Jamaica Rose.* Clt. 1825. Tree 15-30 feet.

2 *M. ROSEA* (Tuss. fl. ant. p. 78. t. 1.) branches terete, glabrous; leaves petiolate, oval, 3-nerved, rather serrulated, glabrous; pedicels axillary, 1-flowered, longer than the petioles; bractæas 2, linear, rather dilated at the apex. *h. S.* Native of Jamaica. Flowers rose-coloured, drying black. This species differs from *M. purpurea* in there being only 2 bractæas under each flower, not 4; from *M. leucantha* in the colour of the flowers, and from both in the form of the bractæas.

*Rose-coloured-flowered Jamaica Rose.* Shrub 6 feet.

3 *M. PURPUREA* (Swartz, fl. ind. occ. p. 826.) branches terete, glabrous; leaves petiolate, ovate-lanceolate, denticulated, glabrous; peduncles axillary, opposite, longer than the petioles; bractæas 4, under each flower, lanceolate, denticulated; tube of calyx campanulate, 5-lobed; lobes broad at the base and subulate at the apex. *h. S.* Native of Jamaica, on the tops of the mountains. *Rhèxia purpurea*, Swartz, prod. p. 61. Flowers purple or blood-coloured. Leaves brownish-green.

*Purple Jamaica Rose.* Clt. 1825. Shrub 6-10 feet.

4 *M. OBTUSIFOLIA* (*D. C. prod. 3. p. 101.*) quite glabrous; branches nearly terete; leaves on short petioles, elliptic, obtuse, somewhat emarginate, coriaceous, 3-nerved, besides 2 small, marginal nervules, denticulated; pedicels axillary, 1-flowered; bractæas obovate, 3-nerved, denticulated, 4 under each flower. *h. S.* Native of St. Domingo. *Melastoma involucrata*, Desv. in Lam.

FIG. 108.

dict. 4. p. 35. but not of D. Don. Petals obovate, yellow, and red. Style exserted. Fruit 5-lobed. Connectives of stamens drawn out into a spur at the base. Anthers bursting by 2 pores at the apex.

*Obtuse-leaved Meriania.* Shrub 6-10 feet.

5 *M. PRUNIFOLIA* (D. Don, in wern. soc. mem. 4. p. 223.) branches terete; petioles, peduncles, and nerves of leaves beneath clothed with flocky, powdery, rufous down; leaves petiolate, ovate, acute, crenulately-serrated, 3-nerved; flowers sessile, solitary in the axils of the upper leaves and at the tops of the branches; calyx 10-stripped.  $\frac{1}{2}$ . S. Native of Peru. *Rhèxia axillaris*, Pavon. in herb. Moric. Tube of calyx ovate, nearly 10-ribbed, when young tomentose, but at length glabrous, 5-lobed; lobes dilated at the base. Capsule 5-celled, 5-valved, truncate at the apex. Seeds small, angular. Flowers purple.

*Plum-leaved Meriania.* Shrub 6 feet.

6 *M. PARVIFLORA* (D. Don, l. c.) leaves elliptic, acute, denticulated; peduncles trifid, 3-flowered.  $\frac{1}{2}$ . S. Native of Brazil. Shrub erect, branched. Leaves more than an inch long. Flowers small, rose-coloured.

*Small-flowered Meriania.* Shrub.

*Cult.* This is an elegant genus. The species grow best in a mixture of peat and sand, and half-ripened cuttings root freely if planted in the same kind of soil, with a hand-glass over them, in heat.

II. *AXINÆA* (*ἀξίνη*, *axine*, a hatchet; form of petals). Ruiz et Pav. fl. per. syst. p. 122. D. Don, in wern. mem. soc. 4. p. 320. D. C. prod. 3. p. 101.

LIN. SYST. *Deca-Doecandria*, *Monogynia*. Calyx cup-shaped, naked at the base; limb permanent, 5-6-toothed. Petals 5-6. Stamens 10-12. Anthers obtuse at the apex and opening by 2 pores, and ending in a simple spur at the base. Capsule free, 5-6-celled.—Frondose trees or shrubs, natives of Peru. Leaves ovate-lanceolate, or broadly cordate, coriaceous, dentate, or crenated, 5-nerved, reticulately veined, petiolate, wrinkled or flat above, clothed with short brown tomentum beneath. Flowers terminal, corymbose, or sub-racemose, large, purple, or white.

1 *A. PURPUREA* (Ruiz et Pav. syst. 1. p. 122.) leaves cordate, 7-nerved, crenated, reticulately veined, wrinkled above and scabrous, but lacunose and clothed with brown tomentum beneath; peduncles 1-flowered, corymbose.  $\frac{1}{2}$ . S. Native of Peru, in groves. Ruiz et Pav. fl. per. 5. t. 510. Flowers purple.

*Purple-flowered Axinæa.* Shrub 6 to 10 feet.

2 *A. MURICATA* (D. Don, in wern. soc. mem. 4. p. 321.) leaves large, elliptic, crenated, 3-nerved, shortly acuminate, rather cordate at the base, naked above, but granular beneath as well as the branchlets; calyxes muricated.  $\frac{1}{2}$ . S. Native of Peru. Leaves a foot long and 5 inches broad. Panicle terminal, many-flowered.

*Muricated-calyxed Axinæa.* Shrub 5 to 8 feet.

3 *A. LANCEOLATA* (Ruiz et Pav. l. c. p. 122.) leaves elliptic, acuminate, toothed, 5-nerved, flat above, clothed with fuscous tomentum beneath; racemes paniced and terminal.  $\frac{1}{2}$ . S. Native of Peru, in woods at Muna and Pinao. Ruiz et Pav. fl. per. 5. t. 509.

*Lanceolate-leaved Axinæa.* Shrub 6 to 10 feet.

4 *A. GLANDULOSA* (Ruiz et Pav. fl. per. 5. t. 512.) leaves ovate, 5-nerved, denticulated, clothed with yellowish tomentum beneath, but flat and glabrous above and biglandular at the base; panicle terminal, many-flowered.  $\frac{1}{2}$ . S. Native of Peru. Tree frondose. Flowers white.

*Glandular Axinæa.* Shrub 6 to 10 feet.

5 *A. DEPENDENS* (Ruiz et Pav. fl. per. 5. t. 511.) leaves

lanceolate, acuminate, denticulately serrated, 5-nerved, glabrous above; raceme terminal, paniced, pendulous.  $\frac{1}{2}$ . S. Native of Peru.

*Hanging-racemed Axinæa.* Shrub 6 to 10 feet.

*Cult.* This genus is composed of elegant flowering shrubs like the last; and its species are cultivated and propagated in the same manner.

III. *CHASTENÆA* (in honour of Victorina de Chastenay, who drew and painted the plants collected by Madame Merian in an elegant style. See *Meriania* and *Calendrier de flore*, &c.). D. C. prod. 3. p. 102.

LIN. SYST. *Decandria*, *Monogynia*. Calyx naked at the base, campanulate, truncate, entire. Petals 5, obovate. Stamens 10; filaments flat; anthers linear, acute, bursting by 1 pore, having the connectives dilated into a large, rounded, and perhaps hollow appendage. Style filiform; stigma a pruinose dot. Ovary free, glabrous. Capsule 5-celled, opening at the apex. Seeds unknown.—A smooth shrub, with the habit of *Meriania*. Leaves petiolate, oval, 3-nerved, entire, coriaceous. Flowers pedicellate, ample, bractless, disposed somewhat in umbels at the tops of the branches and branchlets.

1 *C. MERIANIÆ* (D. C. l. c.).  $\frac{1}{2}$ . S. Native of South America, but in what place is unknown. Flowers purple, according to the dried specimen.

*Merian's Chastenæa.* Shrub 4 to 6 feet.

*Cult.* See *Meriania* for culture and propagation. An elegant shrub, worthy of cultivation.

IV. *LAVOISIERA* (this genus is dedicated by De Candolle to the celebrated but unfortunate Lavoisier, whose name deserves this mark of respect). D. C. prod. 3. p. 102.

LIN. SYST. *Deca-Icosandria*, *Monogynia*. Tube of calyx turbinate-oblong; lobes 5-10. Petals 5-10, oval, or obovate. Stamens 10-20. Anthers ovate, terminating in a short blunt beak at the apex, and bursting by a single pore, dissimilar from the connectives being alternately long and drawn out into a long, somewhat 2-lobed appendage at the articulation, and the others being short and hardly produced. Ovary not beset with bristles at the apex. Capsule 5-10-celled. Seeds angular.—Brazilian shrubs, nearly all glabrous. Leaves sessile, flat, or keeled, quite entire, or ciliated by a few stiff hairs, 1-nerved or many-nerved at the base: the narrower ones nerveless. Flowers terminal, solitary, sessile. This is a very shewy genus of plants.

§ 1. *Diosmoidæ* (from *Diosma*, an idea, similar; plants with the habit of *Diosma*). D. C. prod. 3. p. 102. *Leaves ciliated with stiff bristles.*

1 *L. CATAPHRACTA* (D. C. l. c.) shrubby, dichotomous, or trichotomous; branches somewhat tetragonal, loricated; leaves sessile, half stem-clasping, keeled, having the middle nerve and nerve-formed margins serrated from stiff bristles, the rest quite glabrous and stiff; flowers terminal, sessile, solitary; tube of calyx ovate, shorter than the lobes, which are 6 lanceolate, and ciliately serrated; anthers dissimilar.  $\frac{1}{2}$ . S. Native of Brazil, on Serro Frio, in marshes, at the height of 4000 feet. *Rhèxia cataphracta*, Schrank, et Mart. mss. Allied to *L. imbricata*, but the leaves spread more, and the branches are less squarrose; more nearly allied to *L. insignis*, but the leaves are shorter and more crowded, and the ciliae of the calyx are not glandular. Perhaps referrible to *Axinæa*.

*Cuirass Lavoisiera.* Shrub 1 to 2 feet.

2 *L. IMBRICATA* (D. C. l. c. p. 103.) shrubby, quite glabrous; branches somewhat tetragonal; leaves imbricated, in 4 rows,

sessile, ovate, 1-nerved, having the nerve-formed margins ciliated with stiff bristles; flowers terminal, solitary, sessile; tube of calyx turbinate, bristly, 6-lobed; lobes drawn out into an obovate, scarious appendage each; anthers dissimilar. *h. S.* Native of Brazil, among rocks. *Rhèxia blepharocéntra ciliàta* or *floribúnda*, Mart. herb. *Rhèxia imbricàta*, Thunb. diss. pl. bras. 1. p. 10. t. 2. f. 2. Bilb. icon. 1847. ex flora, 1821. p. 331. Leaves shining, when dried yellowish. Petals obovate. Stamens 12, shorter than the petals. Anthers ovate-oblong, terminating in a short beak, with the connectives drawn out into a blunt appendage at the base.

*Imbricated-leaved Lavoisiera.* Shrub 1 to 2 feet.

3 *L. cómpita* (D. C. l. c.) shrubby, nearly quite glabrous; branches terete; leaves sessile, imbricated in 4 rows, stiff, keeled, acute, hairy, the middle nerve roughish, and the nerve-formed margins serrately ciliated; flowers terminal, solitary, sessile; tube of calyx villous, turbinate, with the lobes ovate-oblong, acute, and entire; anthers dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes, on the tops of a chain of mountains called Morro de Villa Rica, and elsewhere. *Rhèxia cómpita*, Mart. et Schrank, mss. Very like *L. imbricàta*.

*Neat Lavoisiera.* Shrub 1 to 2 feet.

4 *L. insignis* (D. C. l. c.) shrubby, quite glabrous; branches slender, rather tetragonal; leaves sessile, lanceolate, keeled, usually 1-nerved, imbricated in 4 rows, having the nerve-formed margins ciliated with stiff bristles; flowers terminal, solitary, sessile; tube of calyx turbinate, 6-lobed; lobes oblong, acute, ciliate-serrated; anthers dissimilar. *h. S.* Native of Brazil. Very like *L. imbricàta*, but different, the leaves being longer, less adpressed, and more acute, in *L. insignis* the leaves being ciliated at the apex, and in the different calyx. Stamens as in *L. imbricàta*. Capsule 5-celled, permanent, deliscing from the base as in *L. mucorífera*. D. C. coll. 1. t. 2.

*Shewy Lavoisiera.* Shrub 1 to 2 feet.

5 *L. viminàlis* (D. C. l. c.) shrubby, glabrous; branches twiggy, tetragonal; leaves sessile, adpressed, lanceolate, many-nerved, striated, ciliated with bristles; floral leaves setose beneath; flowers terminal, few, aggregate, almost sessile; calyx hispid, turbinate, 5-toothed; teeth long, acuminate; anthers dissimilar. *h. S.* Native of Brazil, in alpine fields on Serra de Sincora, at the height of 4500 feet. *Rhèxia viminàlis*, Mart. et Schrank, mss. Leaves stiff, imbricate. Petals large, purple. Anthers 10, oblong, yellow, beaked, 5 of which are furnished with an obtuse appendage at the base. Allied to *L. imbricàta*.

*Twiggy Lavoisiera.* Shrub 1 to 2 feet.

§ 2. *Mucorìsæ* (from *mucor*, mouldiness; appearance of bristles). D. C. prod. 3. p. 103. *Leaves flat, ciliated, with villi or soft hairs.*

6 *L. mucorífera* (D. C. l. c.) shrubby; branches tetragonal, puberulous; leaves sessile, lanceolate, ovate at the base, acuminate, quite entire, setosely ciliated, 7-nerved, the middle nerve bristly beneath, the lateral ones hardly perspicuous; flowers terminal, solitary, sessile among the leaves; tube of calyx subglobose, 5-7-lobed; lobes linear, acuminate, ciliated, deciduous; anthers dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes, in alpine fields at 2000 or 3000 feet above the level of the sea. *Rhèxia mucorífera*, Mart. et Schrank, mss. Setæ for the most part pellucid, and terminated by a globule each, and therefore mucoriferous. Petals obovate-oblong. Anthers 10-14, oval-oblong, terminating in an oblique porose beak, having the connective drawn out in some into a long appendage at the articulation, in others into a short appendage. Capsule 5-7-celled, opening from the base. Seeds angular.

*Mucoriferous Lavoisiera.* Shrub 1 to 2 feet?

§ 3. *Carinàtæ* (from *carina*, a keel; leaves keeled). D. C. prod. 3. p. 103. *Leaves glabrous, not ciliated, keeled, not flat.*

7 *L. tetragòna* (D. C. l. c.) shrubby, glabrous, usually dichotomously branched; branches terete; leaves sessile, keeled, densely imbricated, in 4 rows, bluntish, destitute of hairs and ciliae, quite entire, stiff, 1-nerved. *h. S.* Native of Brazil, on the top of Mount Itambe. *Rhèxia tetragòna*, Mart. et Schrank, mss. Flowers and fruit unknown. Like the rest the flowers are seen to be sessile, terminal, and solitary. In habit it agrees with *L. imbricàta*.

*Tetragonal Lavoisiera.* Shrub 1 to 2 feet.

§ 4. *Gentianoideæ* (*gentiana*, *gentian*, and *idea*, like; plants resembling the *Gentian* in habit). D. C. prod. 3. p. 103. *Leaves flat, glabrous.*

8 *L. álba* (D. C. l. c.) shrubby, quite glabrous; branches and stem tetragonal; leaves sessile, half stem-clasping, broadly ovate, 9-nerved, quite entire; flowers axillary, solitary, on short pedicels, when young involved in 2 bractæ; tube of calyx somewhat cylindrical, longer than the lobes, which are 5-6, oblong, and acute; anthers rather dissimilar. *h. S.* Native of Brazil, on the mountains between Villa Rica and Tejuco, in stony, exposed places. *Rhèxia álba*, Mart. et Schrank, mss. Flowers large, white. Petals 5-6, oval-oblong. Anthers 10-12, ovate, terminating in a short and blunt beak, having the connective in 5-6 of them drawn out into a long, somewhat 2-lobed appendage each at the articulation, and in the other 5-6 hardly produced at all.

*White-flowered Lavoisiera.* Shrub 1 to 2 feet.

9 *L. gentianoídes* (D. C. l. c. p. 104.) shrubby; stem and branches tetragonal, glabrous; leaves sessile, half stem-clasping, lanceolate, acuminate, quite entire, many-nerved: the upper and young ones are setose and ciliated; flowers terminal, crowded, on short pedicels; calyx bristly, with the tube cylindrical: and the lobes 5, apiculated by pili, about equal in length to the tube; anthers dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes, in high rocky places. *Rhèxia gentianoídes*, Mart. et Schrank, mss. Habit almost of *Gentiana saponària*. Flowers white. Petals somewhat joined at the base. Anthers 10, ovate, terminating in a short blunt beak, in 5 of them the connective is long and tumid at the articulation, in the other 5 short and hardly auricled.

*Gentian-like Lavoisiera.* Shrub 1 to 2 feet.

10 *L. crassifòlia* (D. C. prod. 3. p. 104.) shrubby, dichotomously branched, quite glabrous; branches terete; leaves sessile, half stem-clasping, ovate, approximate, stiff, quite entire, 1-nerved; lateral veins obsolete; flowers terminal, solitary, sessile; tube of calyx broad, turbinate, much longer than the lobes, which are broad, mucronate, and very short; anthers dissimilar. *h. S.* Native of Brazil, on Serro Frio. *Rhèxia crassifòlia*, Mart. et Schrank, mss. Petals 6, obovate, purple, thickish. Anthers terminating in a very short beak, in some the connective is very long and arched, in others short.

*Thick-leaved Lavoisiera.* Shrub 2 to 4 feet.

11 *L. punctàta* (D. C. l. c.) shrubby, dichotomous, quite glabrous; branches tetragonal; leaves sessile, half-stem-clasping, lanceolate, quite entire, many-nerved, beset with brown dots beneath, 3 of the nerves are much elevated; flowers terminal, solitary, sessile; tube of calyx 16-ribbed, cylindrical, twice the length of the lobes, which are 5, and lanceolate; anthers 10-16, dissimilar. *h. S.* Native of Brazil, in high cold fields. *Rhèxia punctàta*, Mart. et Schrank, mss. Petals ample, obovate-oblong, purple. Stamens much shorter than the petals, the

alternate ones having longer connectives than the others. Anthers bluntly beaked. Cells of capsule equal in number to the petals.

*Dotted-leaved Lavoisiera.* Shrub 1 to 2 feet.

12 *L. ITAMBA'NA* (D. C. l. c.) shrubby, dichotomous, quite glabrous; branches rather angular; leaves sessile, imbricated in 4 rows, ovate, hardly stem-clasping, attenuated at both ends, rather serrated, 1-nerved, lateral veins almost obsolete; flowers terminal, solitary, sessile; calyx dotted with white, having a broad turbinate tube, and 6-7 oval lobes, which are about equal in length to the tube; anthers dissimilar. *h. S.* Native of Brazil, on the high mountains of Itambe and Serro Frio, in the province of Minas Geraes. *Rhèxia Itambana*, Mart. et Schrank, mss. Petals obovate-oblong, much longer than either the calyx or stamens. Anthers like those of *L. punctata*.

*Itambe Lavoisiera.* Shrub 1 to 2 feet.

13 *L. FIRMULA* (D. C. l. c.) shrubby, branched, almost quite glabrous; branches bluntly tetragonal; leaves sessile, half stem-clasping, oval, acutish, quite entire, 1-nerved, lateral veins obsolete; flowers terminal, solitary, sessile; tube of calyx cylindrical, rather ribbed; limb campanulate, 6-cleft; anthers dissimilar. *h. S.* Native of Brazil, on the high mountains of Itambe and Serro Frio. *Rhèxia firmula*, Mart. et Schrank, mss. Leaves few, beset with scattered glandular bristles in the disk and on the edges, the rest quite glabrous.

*Firm Lavoisiera.* Shrub 2 to 4 feet.

14 *L. PULCHERRIMA* (D. C. l. c. p. 104.) shrubby, dichotomous, quite glabrous; branches nearly terete, rather glaucous; leaves sessile, half stem-clasping, ovate-lanceolate, acute, quite entire, many veined, with 3 of the veins more elevated than the rest; flowers terminal, solitary; tube of calyx ovate, twice the length of the lobes, which are 6-10 ovate, acute; anthers dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes, in elevated fields. *Rhèxia pulcherrima*, Mart. et Schrank, mss. Leaves deflexed. Flowers purple. Anthers ovate, with short blunt beaks, the alternate ones with long connectives, which are tumid at the base.

*Very-fair Lavoisiera.* Shrub 2 to 4 feet.

15 *L. LINIFOLIA* (D. C. l. c.) shrubby, much branched, glabrous; leaves on short petioles, linear, quite entire, nerveless; flowers solitary, almost sessile, axillary or terminal; tube of calyx turbinate, beset with glandular dots, shorter than the lobes, which are subulate; petals obovate, when young apiculate; anthers dissimilar. *h. S.* Native of Brazil in moist meadows, in the province of Minas Geraes, at Serro Frio. *Rhèxia linifolia*, Mart. et Schrank, mss. Anthers 10, oblong, terminated by a blunt beak, in 5 of them the connective is rather long, and hardly tumid at the articulation, in the other 5 it is drawn out into a blunt appendage.

*Flax-leaved Lavoisiera.* Shrub 1 to 2 feet.

*Cult.* See *Meriania*, p. 733. for culture and propagation. All the species are delicate elegant plants, well deserving cultivation.

V. DAVYA (named by De Candolle in honour of the celebrated chemist, Sir Humphry Davy). D. C. prod. 3. p. 105.

*LIN. SYST. Deca-Dodecandria, Monogynia.* Calyx with a campanulate or ovate-oblong tube; teeth 10-12, connected into a membranous entire limb. Petals 5-6. Anthers beaked, opening by one pore, having the connectives drawn out into an elongated simple spur, which is sometimes furnished with 2-3 bristles at the apex. Ovary free, globose or oblong, depressed and glabrous at the apex. Style filiform. Capsule 5-celled. Seeds unknown.—Shrubs or trees, natives of South America, with the habit of *Banisteria*. Leaves petiolate, oval, 5-nerved, almost glabrous. Flowers corymbose or panicked, yellow. The calyx

agrees with *Meriania*, but the habit and colour of the flowers are different.

1 *D. PANICULATA* (D. C. l. c.) branches terete, tomentose at the apex, as well as the petioles and middle nerve of the leaves, from thick fascicles of pili; leaves petiolate, ovate, acuminate, quite entire, 5-nerved, glabrous, except on the middle nerve; corymbs terminal, trifid at the base; pedicels subumbellate; tube of calyx ribbed, campanulate; anthers 10, 5 of which are furnished with a somewhat spatulate obtuse spur each, and the other 5 with a shorter, somewhat cylindrical spur each. *h. S.* Native of Brazil, in woods near Rio Janeiro. *Rhèxia paniculata*, Mart. herb. but not Buch. Petals 5-6, yellow, obovate. Alternate anthers longer, with the appendages copper-coloured.

*Panicled-flowered Davya.* Shrub 2 to 4 feet.

2 *D. GLABRA* (D. C. prod. 3. p. 105.) quite glabrous in every part; branches bluntly tetragonal, hardly terete; leaves petiolate, elliptic, attenuated at the base, acuminate at the apex, 3-nerved, quite entire; raceme terminal, somewhat paniced, few-flowered; calyx campanulate, bluntly 5-lobed; anthers with a long copper-coloured spur each. *h. S.* Native of Brazil. Flowers yellow.

*Glabrous Davya.* Shrub 2 to 3 feet.

3 *D. GUIANEENSIS* (D. C. l. c.) branchlets teretely tetragonal, clothed with deciduous brown bristly down, as well as the petioles, panicles, and leaves when in a young state; leaves petiolate, ovate, acuminate, somewhat crenulate, 5-nerved; nerves beset with rufous bristles, the rest glabrous; panicle terminal, with its branchlets many-flowered and umbelliferous at the apex; tube of calyx oval, somewhat urceolate; spurs of anthers bearing many bristles at the apex. *h. S.* Native of French Guiana. D. C. coll. 1. t. 3. *Topobea paniculata*, Rich. herb. Flowers pale yellow. Stem 10 inches in diameter, and 20 feet in height.

*Guiana Davya.* Tree 20 feet.

4 *D. PERUVIANA* (D. C. prod. 3. p. 105.) branchlets somewhat compressedly terete, hardly terete; petioles, panicles, and young leaves clothed with powdery flocky down; leaves on long petioles, ovate, quite entire, abruptly acuminate, 5-nerved; panicle terminal, having its branches opposite and many-flowered, and its branchlets 3-flowered; calyx bluntly 5-toothed. *h. S.* Native of Peru, near Cochera. Petals yellowish red. Petioles nearly 2 inches long.

*Peruvian Davya.* Shrub 5 to 6 feet.

*Cult.* See *Meriania* for culture and propagation, p. 733. Plants worth cultivating for their beauty.

VI. GRAFFENRIEDA (this name has been given by De Candolle to recall the labours of Fr. L. de Graffenried, editor of J. Bauhin's *Historiæ Plantarum*). D. C. prod. 3. p. 105.

*LIN. SYST. Decandria, Monogynia.* Tube of calyx oblong; its limb campanulate and bluntly 5-toothed. Petals 5, obovate. Stamens 10; anthers linear, acute, opening by one pore, furnished with a simple appendage at the base. Style filiform. Ovary free, not bristly at the apex, but furnished with something like 5 tubercles. Capsule ovate, 5-valved, opening at the apex. Seeds angular, straight.—Shrubs, with the habit almost of *Diplachita*, but differs in the bracteas being absent, in the fruit dehiscing at the apex, and in the different formed appendages of the anthers.

§ 1. *Anthers furnished with a setaceous appendage each. Teeth of calyx very short and blunt. Fruit not umbilicate at the apex.*

1 *G. ROTUNDIFOLIA* (D. C. l. c.) branchlets terete, glabrous; leaves on short petioles, orbicular, somewhat cordate, quite entire, glabrous and shining above, but powdery beneath, 3-nerved, the lateral nerves approximating the margin; thyrses panicked,

terminal; petals 5, obovate. *h. S.* Native of New Andalusia, near Caripe. *Rhèxia rotundifolia*, Bonpl. rhex. t. 25. Flowers rose-coloured.

*Round-leaved Graffenrieda.* Shrub 3 to 6 feet.

§ 2. *Anthers with an obtuse appendage each. Lobes of calyx triangular. Fruit umbilicate at the apex. Perhaps a proper genus.*

2 *G. EXCELSA* (D. C. l. c.) branchlets tetragonal; peduncles, petioles, and under side of leaves clothed with velvety rufescent down; leaves on long petioles, oval, 7-nerved, crenulated, blistered above, glabrous; thyse paniced, terminal; bractes 2 under each flower. *h. S.* Native of South America, in shady places near Loxa. *Rhèxia excelsa*, Bonpl. rhex. t. 34. *Osbèckia excelsa*, Spreng. syst. 2. p. 312. Stems numerous from the same root, herbaceous, 6-10 feet high. The flower-bud or alabastrum almost like that of *Conostegia*, but differs in being cleft longitudinally. Flowers red?

*Tall Graffenrieda.* Pl. 6 to 10 feet.

*Cult.* See *Meriània* for culture and propagation, p. 733. Elegant plants, which deserve to be cultivated in every collection of stove plants.

VII. *CENTRONIA* (from *κεντρον*, *kentron*, a spur; anthers furnished with a long spur each). D. Don, wern. mem. soc. 4. p. 311. D. C. prod. 3. p. 106.

*Lin. syst. Decándria, Monogýnia.* Calyx oblong, clothed with retrograde bristles; limb coarctate, entire. Petals 5. Anthers terminating in a long beak, furnished with a long subulate acute process at the base. *Abf* style elongated, tubular, inclosing the ovarium. Stigma blunt. Capsule 5-celled.—A tree, having its branchlets densely clothed with rusty tomentum. Leaves ample, elliptic, acuminate, quite entire, petiolate, coriaceous, feather-nerved and reticulately veined, glabrous and shining above, but when young clothed with brownish deciduous tomentum beneath. Panicle terminal, large, brachiate. Flowers large, purple.

1 *C. LAURIFOLIA* (D. Don, in wern. soc. mem. 4. p. 315.) *h. S.* Native of Peru, in groves. *Osbèckia Peruviana*, Ruiz et Pav. in herb. Lamb.

*Laurel-leaved Centronia.* Tree.

*Cult.* See *Meriània*, p. 733. for culture and propagation. An elegant shrub when in flower.

VIII. *TRUNCARIA* (from *trunco*, to lop off; limb of calyx truncate). D. C. prod. 3. p. 106.

*Lin. syst. Decándria, Monogýnia.* Tube of calyx cylindrical, hardly turbinate; limb truncate, nearly entire. Petals 5, ovate. Stamens 10; anthers elongated, beaked, opening by 1 pore, without any auricles. Ovary altogether free in the bottom of the calyx, 10-sided, and somewhat cup-shaped at the apex. Style filiform. Stigma hemispherical. Fruit unknown.—A climbing Brazilian shrub. It differs from *Medinilla* in the quinary number of its parts, and in the free ovary; from *Miconia* in the cylindrical calyx; and from *Meriània* in the absence of bractes to the flowers.

1 *T. CARYOPHYLLÆA* (D. C. l. c.) branchlets bluntly tetragonal; petioles and peduncles nearly glabrous; leaves oval, somewhat cuneate at the base, and mucronately acuminate at the apex, 5-nerved, quite entire, ciliated, rather pilose on both surfaces; thyse terminal, elongated, having its branchlets 3-flowered, with some bristles under the flowers holding the place of bractes. *h. S.* Native of Brazil, in the province of Para. *Melastoma* or *Meriània truncata*, Schrank et Mart. mss. Flower-bud or alabastrum almost like that of the clove. Calyx quite glabrous.

*Clove-budded Truncaria.* Shrub cl.

*Cult.* For culture and propagation see *Meriània*, p. 733. A plant worthy of cultivation.

IX. *RHYNCHANTHERA* (from *ῥυγχος*, *rhynchos*, a beak, and *ανθηρα*, *anthera*, an anther; anthers terminated by a long beak each). D. C. prod. 3. p. 106.—*Rhèxia* species, Bonpl. Schrank et Mart. mss. Ser. mss.—*Proboscidia*, Rich. herb.

*Lin. syst. Decándria, Monogýnia.* Tube of calyx ovate-globose; lobes 5, linear or setaceous. Petals 5, obovate. Stamens 10, 5 of which bear ovate, long beaked anthers, having their connectives long and auricled at the base; the other 5 are castrated and smaller. Ovary ovate-globose, glabrous. Capsule 3, but usually 5-celled. Seeds angular or oblong.—Sub-shrubs or herbs, natives of South America. Branches terete or bluntly tetragonal, hairy or pilose. Leaves cordate or oblong, 5-9-nerved. Peduncles axillary, cymose, usually disposed in a terminal thyse. Flowers purple, not involved by bractes when young.

\* *Leaves cordate.*

1 *R. GRANDIFLORA* (D. C. prod. 3. p. 107.) branches terete, and are, as well as the petioles, clothed with glandular pili; leaves on long petioles, cordate, somewhat denticulated, hairy, 9-nerved; flowers tern at the tops of the branchlets; tube of calyx subglobose, shorter than the teeth, which are setaceous. *h. S.* Native of Cayenne, and near the Orinoco, in wet meadows. *Melastoma grandiflora*, Aubl. guian. 1. p. 414. t. 160. *Rhèxia grandiflora*, Bonpl. rhex. p. 26. t. 11. *Osbèckia Aubletiana*, Spreng. syst. 2. p. 311. Tube of calyx purple. Genitals hardly longer than the petals. Five of the stamens are fertile, but the 5 sterile ones reduced to threads. Calyx hispid. Perhaps the plant of Bonpland is the same as that of Aublet.

*Great-flowered Rhynchanthera.* Shrub 3 to 5 feet.

2 *R. NOVENNÆRVIA* (D. C. l. c.) shrub oppositely branched; branches nearly terete, beset with glandular bristles; leaves petiolate, cordate, ovate, somewhat acuminate, crenate, 9-nerved, hardly pilose above, but villous beneath; flowers solitary, in the axils of the bractes, almost sessile, disposed in something like racemes; tube of calyx hairy, globose, equal in length to the lobes, which are linear-setaceous. *h. S.* Native of Brazil, in marshes in woods. Flowers purple. The 5 longest anthers have a flat long connective each, and the 5 shortest ones have a terete short connective each. Capsule nearly globose, 3-celled, 3-valved. Seeds ovate, reticulately dotted.

*Nine-nerved-leaved Rhynchanthera.* Shrub 2 to 4 feet.

3 *R. DICHOTOMA* (D. C. l. c.) shrubby; branches somewhat tetragonal; petioles and calyxes rather hispid; leaves petiolate, cordate, ovate, acute, serrated, 7-9-nerved, puberulous on both surfaces; peduncles axillary and terminal, paniced, dichotomous, leafy; tube of calyx ovate; lobes subulate-lanceolate; 5 of the anthers are acuminate by a beak, longer than the connective, which is auricled at the base. *h. S.* Native of Brazil, in marshes about Rio Janeiro; and of St. Christopher. *Melast. dichotoma*, Desv. in Lam. Dict. 4, p. 41. *Rhèxia Christophorea*, Schrank et Mart. mss. Petioles 9-10 lines long. The pili on the upper side of the leaves are scattered and largish, under side villous along the nerves and veins. The hairs of the calyx often glandular. Seeds oblong.

*Dichotomous Rhynchanthera.* Shrub 3 to 5 feet.

4 *R. CORDATA* (D. C. l. c.) suffruticose, simple; stem nearly terete, hispid from long spreading hairs; petioles short, slender, hispid; leaves cordate, ciliate-serrated, acute, 7-nerved, setose on both surfaces; thyse paniced, elongated, terminal; rachis, calyxes, and peduncles beset with glandular hairs. *h. S.* Na-

tive of the province of Minas Geraes, in moist meadows. *Mc-lástoma cordatum*, Schrank et Mart. mss. Flowers purple. Capsule 3-celled.

*Cordate-leaved Rhynchanthera*. Shrub 1 to 2 feet.

5 *R. HÆNKEANA* (D. C. l. c.) shrubby; branches terete, hairy, densely clothed with glandular down at the apex; leaves on short petioles, cordate, somewhat peltate, acuminate, serrated, 7-nerved, rather pilose above, and hairy beneath, having the serratures ciliate serrated; flowers cymosely corymbose, terminal; tube of calyx ovate, pilose, shorter than the lobes, which are 5, and setaceous, 5 of the anthers furnished with long beaks. *h. S.* Native of Peru. *Melástoma grandiflora*, Schrank, mss. *Melástoma Hænkeana*, Mart. mss. Leaves 3 inches long. Petioles 2 lines long. Flowers large, purple, like those of *R. grandiflora*. Five of the anthers are hardly longer than their elongated beak, but a little longer than their connective, which is tumid at the articulation; the others abortive, and changed into ligule. Ovarium fig.

*Hænke's Rhynchanthera*. Shrub 1 to 2 feet.

6 *R. SCHRANKIANA* (D. C. l. c.) shrubby; branches terete, hispid from unequal glandular stiff hairs; leaves petiolate, cordate, acuminate, serrated, 5-nerved, hairy on both surfaces; pedicels axillary, 1-flowered; tube of calyx ovate, hairy, shorter than the lobes, which are 5 and linear; anthers 10, 5 of which are short and castrated, the other 5 bearing long beaks. *h. S.* Native of Brazil, in the province of Minas Geraes, in marshes on the mountains. *Rhèxia Schrankiana*, Mart. herb. Very like *R. grandiflora* and *R. Hænkeana*; from the first it differs in the pentantherous flowers, and from the last in the petioles being twice the length, and from both in the flowers being axillary and solitary.

*Schrank's Rhynchanthera*. Shrub.

7 *R. MONODYNAMA* (D. C. l. c.) branches terete, hispid from long spreading bristles, as well as the petioles, peduncles, and calyxes; leaves petiolate, cordate, ovate, acuminate, toothed, pilose on both surfaces, 7-nerved; pedicels axillary, 1-3-flowered; lobes of calyx setaceous, longer than the tube; five of the stamens are antheriferous, one of them twice the size of the others. *h. S.* Native of Brazil, in the province of Para, in woods, and along the river Amazon. *Melástoma fothergilloides*, Schrank et Mart. mss. Capsule 5-celled. A very distinct species. The specific name is derived from *μονος*, one, and *δυναμις*, power; in reference to the long stamen.

*Monodynamous Rhynchanthera*. Shrub.

8 *R. PENTANTHERA* (D. C. l. c.) shrubby; branches rather tetragonal, beset with glandular pili; leaves petiolate, ovate, acuminate, rather cordate at the base, ciliate serrated, 7-nerved, rather pilose above, but hairy on the nerves beneath; panicle loose, terminal; calyx rather pilose, at length glabrous, with an ovate tube: and 5 subulate lobes, which are broadest at the base, and longer than the tube; the 5 barren stamens filiform, the 5 fertile ones having the anthers bearing long beaks. *h. S.* Native of Brazil, in the province of Minas Geraes, in marshes and woods. *Rhèxia pentanthera*, Ser. mss. Flowers purple. Anthers oval, hardly longer than the beaks. Capsule 5-celled. Allied to *Hænkeana*.

*Five-anthered Rhynchanthera*. Shrub 1 to 2 feet.

9 *R. MEXICANA* (D. C. l. c.) shrubby; branches tetragonal, hairy; leaves petiolate, ovate, acuminate, somewhat cordate at the base, ciliate serrated, 7-9-nerved; pedicels axillary, opposite, longer than the petioles, hairy, 1-flowered, each bearing 2 lanceolate-linear leaves; anthers 5, equal. *h. S.* Native of Mexico. *Thenardia rosea*, Moc. et Sesse, fl. mex. icon. ined. Flowers elegant, rose-coloured. Petals mucronate. Capsule 4-valved.

*Mexican Rhynchanthera*. Shrub 4 to 6 feet.

VOL. II.

\* \* Leaves shorter than those of the preceding division, not cordate at the base, petiolate or sessile.

10 *R. LIMOSA* (D. C. l. c.) shrubby, erect, branched; branches nearly terete, clothed with glandular hairs; leaves lanceolate, on short petioles, acuminate, bluntly subcordate at the base, serrated, 5-7-nerved, puberulous on both surfaces, paler beneath; thyse terminal; calyx puberulous, with a globose tube: and 5 setaceous lobes, which are a little shorter than the tube; anthers 5, with long beaks; capsule 3-celled. *h. S.* Native of Brazil, in the province of Bahia, in muddy places near Caitete. *Meriania violacea*, Schrank, mss. *Rhèxia limosa*, Mart. herb. Leaves like those of *Cistus Monspelianus*. Flowers purple, like those of *R. grandiflora*. Capsule globose. Seeds numerous, angular.

*Muddy Rhynchanthera*. Shrub.

11 *R. ROSTRATA* (D. C. l. c.) shrubby; branches nearly terete, clothed with glandular bristles; leaves petiolate, oblong, bluntish at the base, acuminate at the apex, ciliate serrated, 5-nerved, pilose above, and rather hairy on the nerves beneath; cymes axillary and terminal; calyx hairy, with an oblong tube: and 5 setaceous lobes, which are a little shorter than the tube; stamens 10, 5 of which are barren, and 5 bearing long, beaked anthers. *h. S.* Native of Brazil, on the sides of the mountains called Serra St. Antonio. *Rhèxia rostrata*, Schrank et Mart. mss. Flowers violaceous. Filaments glabrous.

*Beaked Rhynchanthera*. Shrub 1 to 2 feet.

12 *R. FOTHERGILLÆ* (D. C. l. c.) shrubby; branches somewhat tetragonal; pedicels densely clothed with bristles; leaves petiolate, oblong, cuneate at the base, acuminate at the apex, 5-nerved, quite entire, beset with adpressed bristles above, but with villi beneath; racemes short, terminal; flowers pedicellate, when young involved in 2 bractees; calyx strigose, with a campanulate tube, and 5 triangular acute lobes; anthers dissimilar. *h. S.* Native of Brazil, in the provinces of St. Paul and Minas Geraes, in low woods. *Rhèxia Fothergillæ*, Schrank et Mart. mss. Allied to *R. grandiflora*. Petals large, nearly orbicular, purple. Anthers arched, wrinkled transversely, 5 with a drawn out connective, and the other 5 with a short hardly tumid connective each. Filaments rather pilose.

*Fothergill's Rhynchanthera*. Shrub 1 to 2 feet.

13 *R. STACHYDIMORPHA* (D. C. l. c.) suffruticose; branches tetragonal, rather hairy; leaves on short petioles, ovate-lanceolate, acute, quite entire, 5-nerved, clothed with adpressed pili on both surfaces; peduncles axillary, few-flowered, disposed into an elongated leafy thyse; flowers decandrous; calyx with an ovate tube, and setaceous ciliated lobes. *h. S.* Native of Brazil, in high grassy fields about Minas Novas. *R. stachyoides*, Schrank et Mart. mss. but not of Humb. et Bonpl. Petals red. The 5 stamens, with the long filaments, bear elongated anthers, which have their connectives not drawn out, but with their beaks dilated at the apex. Seeds irregular, usually oblong-conical, truncate at the base, and reticulated from lacunæ.

*Spike-formed Rhynchanthera*. Shrub 1 to 2 feet.

14 *R. SERRULATA* (D. C. l. c.) plant herbaceous, erect, clammy; branches bluntly tetragonal, rather hairy; leaves almost sessile, attenuated at both ends, linear-lanceolate, serrated, 5-nerved; flowers axillary and terminal, solitary, on short pedicels; tube of calyx rather hairy, with rather longer linear lobes; 5 of the stamens sterile; capsule 3-celled. *○. H.* Native of Guiana, in meadows. *Rhèxia serrulata*, Rich. in Bonpl. rhex. t. 28. but not of Nutt. Flowers deep purple.

*Serrulated-leaved Rhynchanthera*. Pl.  $\frac{3}{4}$  foot.

15 *R. SALICIFOLIA* (Mart. herb. Schrank, mss. ex D. C. prod. 3. p. 109.) plant herbaceous; stem nearly simple, puberulous, 5 B

tetragonal at the apex; leaves on short petioles, serrulated, 3-nerved; middle ones linear; upper ones lanceolate or obovate; flowers axillary, on short pedicels, solitary; tube of calyx ovate, pilose, shorter than the lobes, which are 5, acute and linear. ☉. S. Native of Brazil, in the province of Bahia in low moist fields. Root fibrous. Leaves sparingly pilose. Anthers linear, falcate, beaked: having their connectives tumid at the articulation, and shortly auricled, not half the length of the anthers; filaments flat.

*Willow-leaved Rhynchanthera.* Pl. 1 foot.

*Cult.* The species of *Rhynchanthera* being natives of marshes and bogs require to be kept moist, especially through the summer; for this purpose the pots in which the species are grown should be kept in pans filled with water; in other respects their culture and propagation is the same as that of *Meriania*, see p. 732.

**X. MACAIREA** (dedicated by De Candolle to M. Isr. Macaire, who has written on vegetable chemistry, and who has published in the *Memoirs of the Natural History Society of Geneva*, some curious remarks upon the influence of narcotic poisons upon living vegetables, &c.) D. C. prod. 3. p. 109.

LIN. SYST. *Octándria, Monogýnia*. Tube of calyx ovate; lobes 4, permanent. Petals 4, obovate. Stamens 8, unequal; the 4 longer ones bearing one series of glands on the inner side at the apex; the 4 shorter ones smoothish. Anthers linear, elongated, opening by one pore, in the longer ones the connectives are elongated and stipe-formed, but in all unequally dilated at the base. Ovary free, ovate, beset with glandular bristles. Style filiform. Capsule 4-celled, clothed by the calyx. Seeds ovate, somewhat truncate at the hylum.—South American shrubs, with terete branches. Petioles and young leaves clothed with rufous villi. Leaves petiolate, ovate, mucronate, coriaceous, quite entire, glabrous above, but rather velvety beneath even in the adult state, at first sight feather-nerved, but there is sometimes a marginal nerve on each side; in this case the leaves are somewhat 3-nerved. Thyse of flowers panicle and very villous. Flowers white, according to the dried specimens. This genus is analogous to *Lasiandra*, but differs from it in the flowers being octandrous, and in the seeds being ovate.

1 *M. THYRSIFLORA* (D. C. l. c.) branchlets terete, clothed with short adpressed rufous down; leaves petiolate, oval, rosulate, glabrous above, but clothed with short rufous pubescence beneath, 3-nerved; lateral nerves slender, and approximating the margin of the leaf; thyse panicle; calyx clothed with adpressed short rufous down. ☉. S. Native of Brazil.

*Thyrsiflora Macairea.* Shrub 5 to 6 feet.

2 *M. RUFESCENS* (D. C. l. c.) branches bluntly tetragonal; petioles, panicles, calyxes, and young leaves clothed with long rufous villi; leaves petiolate, oval, coriaceous, glabrous above, but clothed with deciduous villi beneath, 3-nerved; lateral nerves slender, and near the margins of the leaf; thyse panicle; calyx villous, with narrow acute lobes. ☉. S. Native of Brazil, in the province of Rio Negro, on mount Araracoara. *Rhexia anomala*, Schrank et Mart. mss.

*Rufescent Macairea.* Shrub 3 to 6 feet.

3 *M. RADULA* (D. C. l. c.) shrubby; branches tetragonal; calyxes and under side of leaves clothed with rusty hairs; leaves elliptic, quite entire, coriaceous, 5-nerved, strigose above; flowers in corymbose fascicles. ☉. S. Native of Brazil. *Rhexia radula*, Bonpl. rhex. p. 107. t. 41. Lobes of calyx linear, acute, longer than the tube. Petals oval, dark purple. Style filiform, curved, hardly thicker at the apex. Calyx clothed with rufous villi, 4-cleft. Filaments clothed with glandular pili.

*Rasp-leaved Macairea.* Shrub 2 to 4 feet.

4 *M. ADENOSTEMON* (D. C. l. c.) shrubby; branches nearly

terete; petioles, peduncles, and calyxes clothed with stiff villi; leaves petiolate, obovate, 3-nerved, echinate by strong strigæ above, hairy beneath; panicle terminal; lobes of calyx 5, linear, subulate; filaments bearing stipitate glands. ☉. S. Native of Brazil, in fields near Salgada. D. C. coll. 1. t. 4. Lateral nerves near the edge of the leaf. Leaves obtuse, when young apiculated. Flowers small, purple. Anthers 8, having their connectives short and biauriculate at the base.

*Var. β, ursina* (Schrank et Mart. herb. ex D. C. l. c.) leaves oblong. ☉. S. Native of the province of Minas Geraes, in calcareous places.

*Glandular-stamened Macairea.* Shrub 4 to 6 feet.

*Cult.* For the culture and propagation of the species of this genus see *Meriania*, p. 733.

**XI. BUCQUETIA** (dedicated by De Candolle to M. Bucquet, author of introduction à l'étude des corps naturels tirés du regne vegetal, 2 vol. 8vo. Paris. 1773). D. C. prod. 3. p. 110.

LIN. SYST. *Octándria, Monogýnia*. Tube of calyx globose; lobes 4, nearly triangular, hardly acute, permanent. Petals 4, obovate. Stamens 8, equal; filaments glabrous; anthers oblong, opening by one pore at the apex, without anricles at the base; the connectives hardly perspicuous. Style filiform. Ovary free, somewhat thickened at the tops of the valves, truncate, and furnished with 4 tubercles. Capsule 4-celled. Seeds cuneated, angular.—A shrub, native of New Granada. Branches clammy. Leaves on short petioles, elliptic, 3-nerved, smooth, almost quite entire. Pedicels tern at the tops of the branches. Habit of *Osbéckia* or *Arthrostemma*, but differs in the seeds being angular, not cochleate. Flowers violaceous.

1 *B. GLUTINOSA* (D. C. l. c.) ☉. S. Native at the bottom of the Andes about Quindiu. *Rhexia glutinosa*, Bonpl. rhex. t. 17. *Osbéckia glutinosa*, Spreng. syst. 2. p. 213.

*Clammy Bucquetia.* Shrub 4 to 6 feet.

*Cult.* For culture and propagation see *Meriania*, p. 733.

**XII. CAMBESSEDESIA** (in honour of James Cambessedes, coadjutor of Auguste St. Hilaire, in his *Flora Brasiliæ meridionalis*, and author of several botanical memoirs. D. C. prod. 3. p. 116.

LIN. SYST. *Decándria, Monogýnia*. Tube of calyx globose or obovate, hardly constricted under the limb; lobes 5, narrow, acute, permanent. Petals 5, obovate. Stamens 10; anthers equal in size and shape, linear, falcate, somewhat beaked, gibbously auricled at the base; having the connectives hardly perspicuous, and drawn out into an undivided obtuse anricle at the base, of various lengths. Style filiform. Capsule ovate, globose, 3 celled. Seeds angular or ovate, with the hylum linear.—Brazilian subshrubs, for the most part glabrous. Leaves sessile. Flowers sometimes purple, sometimes copper-coloured, as in *Tropæolum*.

1 *C. LATÉ-VENOSA* (D. C. l. c.) suffruticose; leaves sessile, nearly orbicular, cordate, ciliate fringed, serrated, blistered on the upper surface, reticulated by broad flat veins beneath, clothed with short velvety down on both surfaces; branches of cyme many flowered, opposite, divaricate; flowers decandrous; tube of calyx ovate, coarctate at the apex, longer than the lobes, which are subulate. ☉. S. Native of Brazil, in the province of Minas Geraes, on mountains at the height of 3500 feet. *Rhexia Bucardia*, Schrank, mss. *R. laté-venosa*, Mart. herb. Flowers red, pedicellate. Calyx when young sparingly pilose. Stamens equal among themselves. Anthers falcate, gradually beaked. Seeds oblong, minutely tuberculated; the hylum linear.

*Broad-veined-leaved Cambessedesia.* Shrub 1 foot.

2 *C. PURPURA-TA* (D. C. prod. l. c.) shrubby, quite glabrous; leaves sessile, orbicularly reniform, quite entire, somewhat 5-

nerved, smoothish; cymes terminal, dichotomous; flowers decandrous; tube of calyx ovate, 3 times longer than the lobes, which are lanceolate.  $\frac{1}{2}$ . S. Native of Brazil, in the province of Bahia, at the elevation of 5000 feet. *Rhèxia purpurata*, Schrank et Mart. mss. Cymes subumbellate, and as if they were involucreted by the 2 upper leaves; the rest of the bractees small, and lanceolate. Petals scarlet. Anthers bluntly sagittate at the base.

*Purplish Cambessedesia*. Shrub 1 to 2 feet.

3 *C. CORYMBOSA* (D. C. l. c.) shrubby; leaves petiolate, oblong, acute, quite entire, 5-nerved, glabrous above, clothed with velvety tomentum beneath, and dotted from lacunæ; flowers terminal, in cymose corymbs, decandrous; petals acuminate.  $\frac{1}{2}$ . S. Native of Brazil, at Itambe, in the province of Minas Geraes, in bogs. *Rhèxia corymbosa*, Mart. et Schrank, mss. Branchlets tetragonal. Leaves 10-12 lines long, and 3-4 broad: the lateral nerves hardly distinct. Bractees glabrous. Calyx glabrous; lobes 5, lanceolate-subulate. Petals red, acute. Anthers yellow, exserted, elongated, with the connectives not drawn out; filaments jointed in the middle.

*Corymbose-flowered Cambessedesia*. Shrub 1 foot.

4 *C. BALSAMIFERA* (D. C. l. c.) shrubby, quite glabrous; branches dichotomous, terete; leaves oblong, acutish at both ends, dotted, quite entire, 3-nerved; lateral nerves very small; flowers terminal, solitary, decandrous.  $\frac{1}{2}$ . S. Native of Brazil, in the province of Bahia, on the tops of mountains, at the elevation of 4000 or 5000 feet. *Rhèxia balsamifera*, Mart. et Schrank, mss. Leaves almost like those of *Phyllirea angustifolia*. Calyx bearing balsam; tube obovate; lobes acute. Petals purple. Anthers yellow, apiculated by a beak: having the connectives short, and drawn out into an obtuse flat auricle each.

*Balsam-bearing Cambessedesia*. Shrub 1 to 2 feet.

5 *C. SINCORENSIS* (D. C. prod. 3. p. 111.) shrubby, much branched, quite glabrous; branches somewhat tetragonal at the apex; leaves on very short petioles, oblong, acutish, quite entire, one-nerved, hardly 3-nerved at the base, beset with minute dots on both surfaces; flowers nearly terminal, axillary, almost sessile; tube of calyx cylindrically obovate, with 5 short teeth.  $\frac{1}{2}$ . S. Native of Brazil, on the alps of Serra de Sincora, at the elevation of 4000 feet. *Rhèxia resinosa*, Schrank, mss. *Rhèxia Sincorensis*, Mart. herb. Leaves 4 lines long, and  $1\frac{1}{2}$  broad. Petals purple, obovate, not ciliated. Anthers yellow, apiculated by long beaks, twice the length of the connectives, which are expanded into an obtuse appendage each at the base. Genitals not longer than the petals.

*Sincora Cambessedesia*. Shrub 1 to 2 feet.

6 *C. CRENULATA* (D. C. l. c.) shrubby, glabrous, clammy at the tops; branches tetragonally terete; leaves sessile, ovate, hardly 3 veined at the base, flat, length of the internodes, with glandular, hardly crenated, margins; flowers few, at the tops of the branches, disposed in cymose corymbs; calyx with an ovate tube, and 5-6 linear acute lobes.  $\frac{1}{2}$ . S. Native of Brazil, in alpine meadows, particularly on Serro Frio. *Rhèxia crenulata*, Mart. et Schrank, mss. Flowers purple. Anthers ovate, beaked: with the connectives drawn out at the base into a crenate-patulate ligula each. Capsule ovate, glabrous. Seeds unknown.

*Crenulate-leaved Cambessedesia*. Shrub 1 to 2 feet.

7 *C. ESPORA* (D. C. l. c.) plant suffruticose, erect, glabrous, branched from the base; branches somewhat tetragonal; leaves sessile, ovate-cordate, acute, sparingly serrated, 3-nerved; flowers on the short axillary branchlets, solitary, and therefore disposed in a leafy elongated thyrs; calyx turbinate, with 5 acute lobes; petals lanceolate, acute; anthers nearly alike.  $\frac{1}{2}$ . S. Native of Brazil, in grassy bogs, in the provinces of St. Paul, and Minas Geraes. *Rhèxia Espora*, St. Hil. in Bonpl. rhex. t. 58. *Rhèxia chamædrifolia*, Schrank et Mart. herb.

Very like *R. adamantium* in habit and colour of flowers, but differs in being glabrous in every part, in the petals being much smaller and of a different form, in the anthers being obtuse, and in their connectives not being drawn out.

*Var.  $\beta$ , ilicifolia* (D. C. prod. 3. p. 111.) stem simple, straight, terete, velvety; leaves ovate, in fascicles; thyrses spicate, cylindrical.  $\frac{1}{2}$ . S. Native of Brazil, in the province of Minas Geraes. *Rhèxia ilicifolia*, Schrank et Mart. mss. Leaves 2 or 3 lines long: those of branches very short and nerveless, in fascicles. Flowers yellow; petals oval-oblong; anthers fuscicent, elongated.

*Espora Cambessedesia*. Shrub 1 to 2 feet.

8 *C. ADAMANTUM* (D. C. l. c.) suffruticose, branched, procumbent, beset with scattered glandular pili; branches tetragonal, pilose, woolly at the knots; leaves on short petioles, ovate-lanceolate, somewhat 3-nerved, rather ciliate serrated, and beset with glandular hairs; thyrses terminal, crowded; calyx turbinate, with very short cordate lobes; petals ovate, acute; anthers nearly similar.  $\frac{1}{2}$ . S. Native of Brazil, near Tejuco, in sandy places on the Diamond Mountains. *Rhèxia adamantium*, St. Hil. in Bonpl. rhex. t. 60. Colour of petals almost like that of a *Tropæolum*. Anthers 10, oblong, obtuse, 5 of which are rather gibbous at the base. Capsule ovate-oblong, 3-valved, pilose at the apex. Seeds half ovate.

*Adamant Cambessedesia*. Shrub procumbent.

9 *C. HILARIANA* (D. C. l. c.) suffruticose, glabrous, ascending; branches tetragonal; leaves on short petioles, oblong-linear, bluntish, quite entire, or furnished with 1 or 2 teeth, 3-nerved, bearing small glands in their axils; peduncles 1-3-flowered, axillary, terminal; calyx bearing glandular hairs, obovate, with 5 broad short mucronate lobes; stamens rather dissimilar.  $\frac{1}{2}$ . S. Native of Brazil, in the province of Minas Geraes, in moist sandy places on the tops of the mountains. *Rhèxia galioides*, Schrank et Mart. mss. *Rhèxia Hilariana*, Kunth in Bonpl. rhex. t. 56. *Rhèxia suberosa*, Spreng. syst. 2. p. 308. Allied to *R. adamantium* in habit and colour of flowers, but differs from that species in the longer and narrower leaves, and in the much more loose panicle.

*St. Hilare's Cambessedesia*. Shrub 1 to 2 feet.

10 *C. BIDENTATA* (D. C. l. c.) suffruticose; branches tetragonal, divaricate; leaves lanceolate, in fascicles, glabrous, bidentate; corymbs paniced; pedicels pilose; petals ovate, acuminate; calyx muricated, 10-ribbed; ovary 3-celled.  $\frac{1}{2}$ . S. Native of Brazil, at Barra-da Vareda, in open fields. *Rhèxia bidentata*, Nees et Mart. nov. act. bonn. 12. p. 53. Said to be allied to *C. Hilariana*, and probably only a variety of that species according to Kunth.

*Bidentate Cambessedesia*. Shrub 1 foot.

*Cult.* See *Meriania* for culture and propagation, p. 733. All the species are small elegant shrubs, deserving cultivation.

XIII. CHÆTOSTOMA (from  $\chi\alpha\upsilon\tau\eta$ , *chaite*, a head of hair, and  $\sigma\tau\omicron\mu\alpha$ , *stoma*, a mouth; in allusion to the calyx, which is girded by a ring of stiff hairs round the mouth under the lobes on the outside). D. C. prod. 3. p. 112.

LIN. syst. *Octo-Decandria, Monogynia*. Calyx with a somewhat obovate turbinate tube, girded by a ring of stiff bristles on the outside under the lobes; limb 4-5-lobed; lobes erect, pungent. Petals 4-5. Anthers with very short 1-pored beaks: having their connectives not drawn out at the articulation, and hardly gibbous. Capsule prismatic, longish, 4-5-angled. Seeds unknown.—Brazilian heath-like quite glabrous sub-shrubs. Stems slender. Leaves crowded, dry, 1-nerved, acute, quite entire, small. Flowers terminal, solitary. The habit of this genus is very distinct, but its normal characters are not well known.

\* *Flowers 5-cleft, decandrous. Capsule prismatic.*

1 *C. PUNGENS* (D. C. l. c.) shrubby, quite glabrous; leaves sessile, triangular, stiff, pungent, imbricate, quite entire, 3-nerved; lateral nerves hardly perspicuous; flowers terminal, solitary, decandrous; lobes of calyx spinulose. *h. S.* Native of Brazil, in the province of Minas Geraes, on Serro Frio. *Rhèxia pungens*, Mart. et Schrank, mss. Branches slender, terete. Leaves 2-3 lines long, having the middle nerve thick. Lobes of calyx lanceolate, pungent; spinules rising from the top of the tube. Petals purple. Stamens yellow, 5 shorter than the others; filaments jointed in the middle; connectives not drawn out. Perhaps the same as *Rhèxia armata*, Spreng. syst. 2. p. 308.

*Pungent-calyxed Chætostoma.* Shrub 1 to 2 feet.

\* \* *Flowers 4-cleft, octandrous. Fruit unknown.*

2 *C. TETRASTICHUM* (D. C. l. c.) shrubby, glabrous, erect; leaves sessile, triquetrous, stiff, acute, keeled, imbricated in 4 rows; flowers terminal, solitary, octandrous; calyx glabrous, but with a ring of stiff hairs under the teeth. *h. S.* Native of Brazil, on the mountains. Plant 6-8 inches long. Stems terete, slender. Leaves 2 lines long. Calyx campanulate, with an oblong tube, and 4 lanceolate teeth. Anthers with short beaks, dilated at the base.

*Var. a, crassipes* (D. C. l. c.) caudex or root thick and tuberous, with numerous simple stems rising from it. *Rhèxia tetrasticha*, Mart. et Schrank, mss.

*Var. β, fibrillosum* (D. C. l. c.) *h. S.*; stem branched. Perhaps a proper species. *R. scopulorum*, *h. S.* herb.

*Four-rowed-leaved Chætostoma.* Shrub  $\frac{1}{2}$  to 1 foot.

† *A doubtful species.*

3 *C. ERICOIDES* (D. C. l. c.) shrubby; leaves sessile, opposite, somewhat decurrent, linear, complicated, ciliated; flowers terminal, solitary, octandrous; calyx bearded with bristles at the apex. *h. S.* Native of Brazil. *Rhèxia ericoides*, Spreng. syst. 2. p. 310. Perhaps the same as *Rhèxia ericoides*, Spreng. neue. entd. 1. p. 302. of which the author says that the leaves are almost sessile, in fascicles, quite glabrous; the peduncles corymbose; and the flowers sessile.

*Heath-like Chætostoma.* Shrub 1 foot.

*Cult.* This genus is composed of pretty shrubs. For their culture and propagation see *Meriania*, p. 733.

XIV. SALPINGA (from *σαλπιγξ*, *salpinx*, a tube; in reference to the elongated tube of the calyx). Mart. herb. Schrank, mss. D. C. prod. 3. p. 112.—*Aulacidium*, Rich. herb.

*LIN. SYST.* *Octo-Decándria, Monogýnia.* Calyx turbinate oblong, much elongated, 8-10-ribbed; ribs separated by deep furrows; teeth 4-5, broad, short, permanent. Petals 4-5, lanceolate, acute, connivent. Stamens 8-10. Style short. Stigma orbicular. Capsule cylindrically trigonal, free within the calyx, 3-valved; valves bearing with nerves in the middle, retuse at the apex; central column free. Seeds small, numerous, semi-ovate, disposed in rows along the axis; hylum linear.—Smooth Brazilian subshrubs or herbs. Branches from compressed to terete. Leaves on long petioles, ovate, acuminate, ciliated, rather crenate, 3-5-nerved, membranous, smoothish. Spikes axillary or terminal, disposed in panicles. Flowers sessile along the rachis, all on one side.

\* *Calyx 5-toothed, 10-furrowed.*

1 *S. SECUNDA* (Schrank et Mart. mss. ex D. C. l. c.) stem suffrutescent, from compressed to terete, branched, glabrous; leaves ovate, bluntish at the base, acuminate, 5-nerved, ciliate ser-

rated; cymes terminal and axillary, with its branchlets elongated, and bearing a row of secund flowers each; calyx elongated, tube-formed, 10-furrowed. *h. S.* Native of Brazil, in shady humid woods at Porto dos Miranhas. Calyx 6-7 lines long when in fruit.

*Secund-flowered Salpinga.* Shrub 1 foot.

2 *S. FASCICULATA* (Rich. herb. under *Aulacidium*, ex D. C. l. c.) stems herbaceous, branched, somewhat tetragonal, glabrous; leaves oval, attenuated at the base, acutish, ciliate serrated, 3-nerved, membranous, bearing a few scattered bristles on the upper surface, pale beneath and hardly muricated; cymes few-flowered, fascicled; calyx turbinate, 10-furrowed. *h. S.* Native of French Guiana, in the humid shady woods of Gabriella. Calyx 5 lines long when in fruit. Flowers in fascicles of 4 or 5.

*Fascicled-flowered Salpinga.* Pl. 1 foot.

\* \* *Calyx 4-toothed, 8-furrowed.*

3 *S. CRISTATA* (Rich. herb. under *Aulacidium*, ex D. C. l. c.) stem herbaceous, branched, tetragonal, glabrous; leaves ovate-oblong, coarsely and ciliate toothed, 3-nerved, glabrous on both surfaces; cymes axillary and terminal; flowers numerous, secund along the branches of the cyme; calyx turbinate, attenuated at the base, 8-furrowed. *h. S.* Native of French Guiana, where it is called *Itoupou*. Calyx 4 lines long.

*Crested Salpinga.* Pl. 1 foot.

4 *S. PARVIFLORA* (D. C. l. c.) stem herbaceous, tetragonal, branched, glabrous; leaves oval-oblong, attenuated at the base, serrulately-subciliated, 3-nerved, membranous, smoothish; cymes terminal, 5-8-flowered; flowers on short pedicels, disposed in secund fascicles; calyx 4-toothed, 8-furrowed, oval, hardly turbinate. *h. S.* Native of French Guiana. Calyx 1-3 lines long. Capsule trigonal: having the valves thickened and somewhat lid-formed at the apex, and bearing a dissepiment in the middle of each; column free.

*Small-flowered Salpinga.* Shrub 1 to 2 feet.

*Cult.* The seeds of the annual species of this genus should be sown in pots, filled with a mixture of loam and sand, which should be placed in a hot-bed, and kept rather moist; and when the plants have attained 2 or 3 inches in height, they should be potted off into separate pots, and again placed into the hot-bed, where they may remain until they have ripened their seed, or be removed to the stove when in flower. The shrubby kind thrive well in the same kind of soil, and young cuttings of them root readily if planted in a pot of sand, with a hand-glass placed over them, in heat.

XV. BERTOLONIA (in honour of Ant. Bertoloni, an Italian botanist, author of *Rariorum Italiae Plantarum* decades, in 3 vols. 8vo. &c.). Raddi, mem. bras. add. (1820.) p. 5. but not of other authors. D. C. prod. 3. p. 113. Triblémma, R. Br. ex Schrank, et Mart. mss.

*LIN. SYST.* *Decándria, Monogýnia.* Calyx with a campanulate tube: and 5 obtuse lobes, which are usually very short and broad, and sometimes concrete into an entire limb. Petals 5, obovate. Stamens rather unequal; anthers ovate-obtuse, opening by 1 pore, attenuated at the base, and hardly or not auriculated. Ovarium not bristly. Capsule trigonal, 3-valved; valves as if they were retusely uncinated at the apex, and cut transversely under the apex, and therefore exhibiting the appearance of a lid. Seeds cuneate, triquetrous, scabrous.—Brazilian, rooting herbs. Leaves stalked, ovate-cordate, 5-11-nerved, crenulate. Cymes corymbose, terminal. Flowers white or purple.

1 *B. NYPHÆIFOLIA* (Raddi, l. c.) stem simple, short, creeping, glabrous; leaves petiolate, cordate, rather orbicular, undulately crenulate, 9-11-nerved, smoothish, white beneath;

corymbs pedunculate; limb of calyx hardly erose. *Æ. S.* Native of the neighbourhood of Rio Janeiro, especially on the mountains called Serra d'Estrella, in humid places, in woods. *Rhèxia nymphæifolia*, Kunth, in Bonpl. rhex. t. 53. Flowers white. Leaves 4 inches in diameter.

*Water-lily-leaved Bertolonia.* Pl. creeping.

2 *B. OVA'TA* (D. C. prod. 3. p. 113.) stems very short, hairy, simple, creeping; leaves petiolate, cordate, ovate, 5-nerved, somewhat undulately crenated, smoothish; flowers disposed in rather secund spikes; limb of calyx broadly and bluntly 5-lobed. *Æ. S.* Native of Brazil. *Triblenna nymphæifolium*, Mart. herb. This is very distinct from the first species, the leaves being hardly an inch long. Flowers small and purple.

*Ovale-leaved Bertolonia.* Pl. creeping.

3 *B. LEUZEANA* (D. C. l. c.) stems suffrutescent, short, simple, tetragonal, ascending, rather creeping; leaves petiolate, oval-oblong, acute, sharply denticulated, 5-nerved, smoothish; corymbs terminal; limb of 5 obtuse lobes, equal in length to the tube; petals obliquely acuminate. *Æ. S.* Native about the town of Rio Janeiro. Flowers lilac. *Rhèxia Leuzeana*, Bonpl. rhex. p. 144. t. 54. and t. 55.

*De Leuze's Bertolonia.* Pl. 6 feet.

4 *B. MACULATA* (D. C. l. c.) stem rooting at the base; branches, petioles, peduncles, and calyxes hispid from long bristles; leaves on long petioles, cordate, ovate, quite entire, pilose on both surfaces and on the margins, 5-nerved; peduncles axillary, bearing at the apex a short raceme of 6-7 flowers. *Æ. S.* Native of Brazil, in the province of Bahia on the mountains, in shady humid places of woods. *Triblenna maculata*, Mart. herb. Racemes twisted at the apex. Lobes of calyx 5, ovate, and very blunt. Petals violaceous. Anthers truncate, opening by 1 pore, attenuated at the base but not auricled, 5 of which are smaller than the others. Calyx permanent, at length white from small bristles on the outside at the base. Capsule 3-valved. Seeds small, trigonal, cuneate, scabrous.

*Spotted Bertolonia.* Pl. creeping.

*Cult.* *Bertolonia* is a genus of elegant little creeping plants; its species grow best in a mixture of peat and sand. The pots in which they are grown should be kept in pans of water, especially in the summer, when the plants are in full vigour. They are easily increased by dividing the plants, or by seeds.

XVI. MEISNERIA (dedicated by De Candolle to C. F. Meisner, author of a monograph on the difficult genus *Polypogonum*, &c). D. C. prod. 3. p. 114.

*LIN. SYST. Octandria, Monogynia.* Tube of calyx globose; lobes 4, lanceolate, acuminate. Anthers 8, ovate, ending in a tubular beak each; 4 of which have a very long connective each, which is auricled at the articulation, in the other 4 the connective is hardly evident. Capsule 2-celled. Seeds small, ovate, triquetrous.—Herbs hardly shrubby, probably annual. Stems erect, terete, rather hairy. Leaves ovate, acute, sessile, 3-nerved, somewhat ciliate serrated. Flowers pedicellate, solitary, alternate in the axils of the branches and of the leaves, and truly cymose at the apex, small, purple. This genus differs from *Spennera* in the seeds not being cochleate.

1 *M. ARENARIA* (D. C. prod. 3. p. 114.) almost herbaceous; stem and branches almost terete, hispid; leaves hairy. *Æ. S.* Native of Brazil, in the province of Minas Geraes, at Serro Frio in sandy sub-irrigated places. *Rhèxia arenaria*, Schrank et Mart. mss. Hairs on the stems, panicles, and calyxes glandular at the apex, usually pale purple in a young state. Petals apiculated. Capsule subglobose.

*Sand Meisneria.* Pl. 1 foot.

2 *M. PALUDOSA* (D. C. l. c.) almost herbaceous; stem and branches tetragonal, rather pilose; leaves smoothish on both surfaces. *Æ. S.* Native of Brazil, in the province of Minas

Geraes, in marshes on the mountains. *Rhèxia bilocularis*, Schrank et Mart. mss. Very like the preceding species, but the hairs are much fewer, shorter, and never red; the stem is evidently tetragonal, and the hairs are sometimes scattered and sometimes disposed in rows along the branches. Petals purple.

*Marsh Meisneria.* Pl.  $\frac{1}{2}$  to 1 foot.

*Cult.* See the annual species of *Salpinga*, p. 740. for culture and propagation. The plants should be kept moist by placing the pots in which they are grown in pans filled with water.

## Tribe II.

RIHIXIÆ (plants agreeing with the genus *Rhèxia* in the seeds being cochleate). D. C. prod. 3. p. 114. Anthers opening by 1 pore at the apex. Ovarium free, neither scaly nor bristly at the apex. Capsule dry. Seeds cochleate, with a basilar orbicular hylum.—Species all natives of America, except one.

XVII. APPENDICULARIA (from *appendix*, an appendage; appendages to anthers). D. C. prod. 3. p. 114. *Rhèxia* sect. *Appendicularia*, Ser. mss.

*LIN. SYST. Octandria, Monogynia.* Tube of calyx ovate and rather urceolate; limb campanulate, broadly and bluntly 4-toothed. Petals 4, obovate. Stamens 8, equal: having the connectives filiform, and drawn out both beneath and above the cells of the anthers into 2 bristles at the articulation. Capsule oblong, 3-celled, 3-valved; central column at length free, and bearing the seeds. Seeds cochleate. An annual, erect, glandular herb, native of Guiana. Root fibrous. Leaves petiolate, ovate, 3-5-nerved, serrulate. Cymes terminal, few-flowered. Flowers white. This genus comes very near *Salpinga*, but differs in the anthers.

1 *A. THYMIFOLIA* (D. C. l. c.) *Æ. S.* Native of Cayenne. *Rhèxia thymifolia*, Bonpl. rhex. p. 133. t. 50. Nerves of calyx 8, elevated.

*Thyme-leaved Appendicularia.* Pl. 1 to 1½ foot.

*Cult.* See annual species of *Salpinga* for culture and propagation, p. 740.

XVIII. COMOLIA (dedicated to M. Jos. Comoli, author of a Flora of the environs of Come). D. C. prod. 3. p. 114.

*LIN. SYST. Octandria, Monogynia.* Tube of calyx campanulately cylindrical; lobes 4, linear. Petals 4, obovate. Anthers oblong-linear, falcate, opening by 1 pore: having the connectives short and biauricled at the articulation. Ovarium glabrous. Capsule ovate, 2-celled. Seeds cochleate, compressed, furrowed on the back, and scabrous from tubercles.—A Brazilian shrub, with tetragonal branches. Leaves obovate, somewhat cuneate, ciliate serrated, 3-nerved, beset with adpressed pili. Flowers white, axillary, solitary, nearly sessile.

1 *C. BERBERIFOLIA* (D. C. l. c.) *Æ. S.* Native of Brazil. *Rhèxia berberifolia*, H. B. et Bonpl. rhex. p. 110. t. 42. Petals rather acuminate, longer than the genitals. Style filiform. Ovarium glabrous. Glands few along the lobes of the calyx and at their origin. Calyx 8-nerved. Connectives of anthers drawn out at both sides at base.

*Barberry-leaved Comolia.* Shrub 2 to 3 feet.

*Cult.* For culture and propagation see *Meriania*, p. 733.

XIX. SPENNERA (dedicated by Martius to M. Spenner, author of a Flora of the environs of Friburg). Mart. herb. D. C. prod. 3. p. 115.

*LIN. SYST. Octo-Decandria, Monogynia.* Tube of calyx globose; lobes 4-5, short. Flower-bud conical. Petals lanceolate, acute. Stamens 8-10; anthers ovate, obtuse, opening by 1 pore: having their connectives long, but not appendiculated. Capsule free, 2, rarely 3-celled. Seeds cochleate, rough.—American erect herbs. Roots fibrous. Leaves petiolate, 5-

nerved, membranous, ciliate serrated. Panicle terminal, loose, with the branches divaricate. Bractees small, linear, inserted under the branches. Flowers small, white, or rose-coloured.

\* *Flowers octandrous. Leaves not cordate at the base.*

1 *S. PALUDOSA* (Mart. herb. ex D. C. l. c.) stems rooting at the base, angular, clothed with rufous hairs, the hairs disposed in a bifarious manner; leaves on short petioles, ovate, acute, ciliate serrated, 3-5-nerved, sparingly pilose; cymes somewhat panicled, short. ☉. S. Native of Brazil, about Rio Janeiro, in humid sandy places. Rhéxia hexándria, Schrank. mss. Calyx 4-cleft. Stamens 8. Fruit small, globose, puberulous.

*Marsh Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

2 *S. ANNUA* (Mart. herb. ex D. C. l. c.) stem tetragonal; angles rather winged; petioles and leaves sparingly pilose; leaves on short petioles, broadly ovate, acute, 5-nerved, ciliate serrated; panicle oblong; fruit glabrous. ☉. S. Native of Brazil, in the province of Bahia, in watery places. Melástoma annua, Schrank. mss. Very like the preceding species, but smaller in every part, and the petioles are shorter. Leaves 15 lines long and 9-10 broad.

*Annual Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

3 *S. BRACHYOTRYA* (D. C. l. c.) stem creeping at the base, ascending, erect, angular, rather pilose; angles a little winged; leaves on short petioles, oval, acute, 5-nerved, rather pilose, hardly serrated; panicle short; fruit glabrous. ☉. S. Native of Brazil, in marshes. Very like *S. annua*, but the leaves are on shorter petioles, and the panicle is shorter and more crowded.

*Short-branched Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

4 *S. LATIFOLIA* (D. C. l. c.) stem hardly rooting at the base, erect, angular, pilose; petioles pilose, elongated; leaves ovate, bluntish at both ends, 5-nerved, ciliate serrated, rather pilose beneath; panicle corymbose; fruit glabrous. ☉. S. Native of Brazil, in marshes. Petioles 8 lines long. Leaves 3 inches long and  $1\frac{1}{2}$  broad.

*Broad-leaved Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

5 *S. FRAGILIS* (D. C. prod. 3. p. 115.) suffruticose, quite glabrous; stem tetragonal; angles winged; leaves soft, oval-oblong, acuminate, 3-nerved, ciliate serrated; petiole a little winged; thyse panicled, loose. ♀. S. Native of Guiana, in shady woods, by the sides of ponds and pools of water. Melástoma fragilis, Richb. herb. Capsule 2-celled. Flowers white. Leaves almost pellucid.

*Brittle Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

6 *S. PELLUCIDA* (D. C. l. c.) suffruticose; stem tetragonal, branched, smoothish; angles winged; leaves petiolate, ovate, acuminate, obtuse at the base, 5-nerved, ciliate serrated, rather scabrous, pellucid, purplish beneath; thyse panicled, terminal. ♀. S. Native of Guiana, in humid shady parts of woods. Melástoma pellucens, Rich. herb. Lower part of stem rather decumbent. Capsules 2-celled, globosely compressed.

*Pellucid-leaved Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

7 *S. LONGIFOLIA* (Mart. herb. ex D. C. l. c.) stems terete; branches, petioles, and nerves of leaves sparingly pilose; leaves on long petioles, oblong, acuminate, 5-nerved, ciliate serrated. ☉. S. Native of Para, in Brazil. Very like *S. rubicaulis* and *S. acuminifolia*.

*Long-leaved Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

8 *S. RUBRICAULIS* (Mart. herb. ex D. C. l. c.) stems terete, and are as well as the petioles and leaves beset with spreading hairs; leaves petiolate, oval-ovate, long-acuminate, 5-nerved, ciliate serrated; panicle elongated. ☉. S. Native of Brazil, in the province of Bahia, in woods at the river Hahype. Melástoma rubricaule, Schrank, mss. Petioles hispid. Stems purplish. Petals white. Anthers red.

*Red-stemmed Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

9 *S. ACUMINIFOLIA* (Mart. herb. ex D. C. l. c.) smoothish; stem terete, and is as well as the leaves sparingly pilose; leaves oval-oblong, acuminate, 5-nerved, ciliate serrated; panicles loose, in the forks of the branches. ☉. S. Native of Brazil. Very like *S. rubricaulis* and *S. annua*, but differs from both in the smoothness and narrowness of the leaves.

*Acuminate-leaved Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

10 *S. CIRCEOIDES* (Mart. et Schrank. mss. ex D. C. l. c.) branches quadrangular; hairs scattered, capitulate at the apex; leaves petiolate, ovate, acuminate, ciliate serrated, 3-nerved, membranous, glabrous on both surfaces, shining above; thyse oblong, with its branches opposite; tube of calyx rather urceolate, with short, subulate lobes. ♀. ? S. Native of Brazil, about Ega, at the river Amazon. Flowers small, white. Petals oblong. Four of the anthers are oblong-obovate, and the other 4 shorter, all very blunt: with the connectives hardly drawn out. Leaves like those of *Circea*. Fruit unknown.

*Circea-like Spennera.* Sh.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

11 *S. LAXA* (D. C. l. c.) shrubby, weak, hispid in every part from glandular hairs; branches tetragonal; leaves petiolate, ovate, acuminate, obtuse at the base, 5-nerved, ciliate; thyse panicled, loose, terminal, many-flowered; calyx with an ovate tube, and short acute lobes. ♀. S. Native of French Guiana in shady marshy places of woods. Melástoma laxa, Rich. herb. Capsule 2-celled. Flower-bud acute. Petals apiculated by a short hair each.

*Loose Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

\* \* *Flowers octandrous. Leaves cordate at the base.*

12 *S. CIRCEIFOLIA* (D. C. l. c.) stem branched; branches quadrangular, pilose; leaves cordate, ovate-oblong, acuminate, 5-nerved, ciliate serrated, glabrous above and shining, rather pilose beneath; branches of panicle short; capsule 2-celled. ☉. S. Native of Brazil, in woods. Rhéxia circeifolia, Humb. et Bonpl. rhex. p. 101. t. 39. Flowers white.

*Circea-leaved Spennera.* Pl. 1 foot.

13 *S. AQUATICA* (Mart. herb. ex D. C. l. c.) stem branched; branches quadrangular, pilose; leaves cordate, ovate-oblong, somewhat acuminate, serrated, 5-nerved, glabrous above, but covered with adpressed pili on the nerves beneath; branches of panicle elongated, filiform, loose; capsule 3-celled. ♀. S. Native of Brazil, West Indies, and Guiana, in marshes and bogs. Rhéxia aquatica, Swartz, fl. ind. occ. 2. p. 650. Bonpl. rhex. p. 104. t. 40. E. Meyer, in act. bonn. 12. p. 650. Melástoma aquatica, Aubl. guian. 1. p. 430. t. 169. Petals oblong, acute, white, shorter than the genitals. Anthers reddish. Capsule nearly globose.

*Aquatic Spennera.* Shrub  $\frac{1}{2}$  to 1 foot.

14 *S. POLYSTACHYA* (D. C. l. c.) stem much branched; branches beset with glandular pili; leaves cordate, ovate, acute, sharply serrated, ciliate, 5-7-nerved, rather pilose; flowers remote along the branches of the panicle; capsule 2-celled. ☉. S. Native of Brazil, in humid parts of woods. Rhéxia polystachya, Bonpl. rhex. p. 98. t. 38. Tube of calyx elliptically campanulate. Petals oblong. Capsule spherical, compressed. Flowers white.

*Many-spiked Spennera.* Pl. 1 foot.

15 *S. INDECORA* (D. C. l. c.) stem branched; branches quadrangular, hairy; leaves cordate, acuminate, serrated, ciliate, pilose on both surfaces; branches of panicle dichotomous, hairy; flowers pedicellate; calyx clothed with glandular pili, with 4 short teeth. ♀. ? S. Native of Brazil. Rhéxia indecora, Bonpl. rhex. p. 131. t. 49. Flowers small, white. Leaves like those of *Circea lutetiana*. Petals ovate, obliquely mucronate. Capsule unknown.

*Indecorous Spennera.* Pl. 1 to 2 feet.

16 *S. SILENIFLORA* (D. C. l. c.) stem branched; branches quadrangular; glabrous; leaves obsolete cordate, oblong, acu-

minated, serrulated, ciliated, 5-nerved; flowers sessile, along the branches of the dichotomous panicle; calyx with an inflated, glabrous tube, and 4 hardly manifest lobes. *U. ? S.* Native of Brazil. *Rhèxia sileniflora*, Bonpl. *rhex.* p. 130. t. 48. Flowers small, white. Petals ovate, obliquely mucronate. Capsule unknown. This and the preceding species have been placed in this genus from their habit, the capsules being unknown.

*Catchfly-flowered Spennera.* Pl. 1 to 2 feet.

\*\*\* *Flowers decandrous.*

17 *S. PENDULIFOLIA* (D. C. l. c.) leaves cordate, oval-lanceolate, 5-nerved, denticulated, pendulous, quite glabrous; panicle terminal, much branched; flowers decandrous, minute; capsule 3-celled. *U. S.* Native of Guiana. *Rhèxia pendulifolia*, Bonpl. *nav.* p. 68. t. 26. Calyx with an ovate-roundish tube and 5 linear lobes. Petals oval. Connectives of anthers not auricled. Capsule globose. Habit of *S. aquatica*.

*Pendulous-leaved Spennera.* Pl.  $\frac{1}{2}$  to 1 foot.

18 *S. GLANDULOSA* (D. C. l. c.) leaves oval, crenulated, quite glabrous on both surfaces, 3-5-nerved; flowers usually solitary, terminal, and axillary, small; capsule 3-celled. *U. S.* Native of Guiana. *Rhèxia glandulosa*, Bonpl. *nav.* p. 70. t. 27. Calyx with a subglobose tube: and linear-oblong lobes, which are much longer than the tube. Petals ovate, white, with 2 spots at the base of each. Filaments red. Connectives of anthers biglandular.

*Glandular-stamened Spennera.* Shrub  $\frac{1}{2}$  to 1 foot.

19 *S. ? CHÆTODON* (D. C. l. c.) shrubby; branches terete, smoothish; petioles ciliated with long hairs in front; leaves oblong, acuminate, membranous, somewhat serrulated, glabrous, triple-nerved; panicles axillary, divaricate, capillary; calyx pilose, urceolate, narrowed at the neck: having its lobes setaceous; capsule 3-4-celled. *U. S.* Native of Brazil, in dense woods, in the province of Rio Negro. *Melastoma chætodon*, Schrank et Mart. mss. Flowers small. Leaves 4-6 inches long.

*Hair-toothed-calyxed Spennera.* Shrub  $\frac{1}{2}$  to 1 foot.

*Cult.* Pretty little plants, native of marshes and bogs. The species grow best in a mixture of peat and sand, and the pots in which they are grown should be kept in pans of water. The greater part are annuals, and even those called shrubby will not survive more than a season in our stoves; therefore they are all to be increased by seeds. The seeds should be sown in pots filled with the same kind of mould recommended for the plants, placing them in a hot-bed, where they should be kept rather moist; and when the plants are coming into flower they should be removed from the hot-bed to shelves in the stove.

XX. MICROLICIA (from *μικρος*, *micro*, small, and *ῥακία*, *clikia*, stature; all the plants contained in this genus are humble in stature). D. Don, in *wern. soc. mem.* 4. p. 301. D. C. prod. 3. p. 117.

*LIN. SYST.* *Decandria, Monogynia.* Calyx with a globose or obovate tube, and 5 subulate permanent lobes. Petals 5, obovate. Anthers alternately dissimilar, ovate, ending in short beaks, opening by 1 pore; having their connectives drawn out into a simple blunt spur at the articulation, those in the longer anthers long, and those in the shorter anthers short. Capsule dry, 3-celled, 3-valved, but in a few 2-celled and 2-valved. Seeds cochleate.—Herbs or subshrubs, natives of Brazil and Guiana, in marshes and bogs, and all humid places. Stems branched. Leaves sessile, quite entire, linear or oval, hardly 3-nerved. Flowers purple, terminal or axillary, pedicellate, usually solitary.

\* *Annual plants.*

1 *M. BREVIFOLIA* (D. C. l. c.) glabrous; stem straight, tetragonal; leaves oblong, quite entire, 3-nerved, lower ones obtuse,

upper ones acute; flowers terminal, on short pedicels, solitary; lobes of calyx subulate, longer than the tube; capsule 3-valved. *C. B. S.* Native of Guiana, in marshes. *Melastoma triválvis*, Aubl. *guian.* 1. p. 406. t. 155. f. b. *Rhèxia triválvis*, Vahl. *eclog.* 1. p. 38. *Rhèxia brevifolia*, Rich. *herb.* Upper branches rather panicled. Petals ovate, length of the lobes of the calyx, white. Capsule ovate. Seeds cochleate.

*Short-leaved Microlicia.* Pl. 1 to 2 feet.

2 *M. BIVÁLVIS* (D. C. l. c.) glabrous; stem straight, tetragonal, hardly branched at the apex; leaves oval, obtuse, 3-nerved, quite entire; flowers terminal, solitary, on short pedicels; lobes of calyx subulate, longer than the tube; capsule 2-valved. *C. B. S.* Native of Guiana, in marshes. *Melastoma biválvis*, Aubl. *guian.* 1. p. 406. t. 155. f. a. *Rhèxia biválvis*, Vahl. *eclog.* 1. p. 38. Corolla white.

*Two-valved Microlicia.* Pl.  $\frac{1}{2}$  foot.

3 *M. INUNDATA* (D. C. l. c.) erect; stems tetragonal, glabrous at the base, but beset with glandular hairs above, as well as the pedicels and calyxes; leaves ovate, obtuse, 3-nerved, entire, glabrous, upper ones clothed with glandular down; flowers solitary, pedicellate; tube of calyx ovate, rather shorter than the lobes, which are linear-lanceolate. *C. B. S.* Native of Brazil, in watery places. *Rhèxia inundata*, Schrank et Mart. mss. Capsule 2-valved. Seeds cochleate. Perhaps sufficiently distinct from *M. biválvis*.

*Inundated Microlicia.* Pl.  $\frac{1}{2}$  foot.

\* \* *Herbaceous, perennial, or suffruticose plants.*

4 *M. LIMNÓBIOS* (D. C. l. c.) herbaceous, rooting at the base, hairy from glandular pili; leaves roundish, sessile, rather cordate at the base, quite entire, smoothish; flowers pedicellate; calyx with an obovate tube, and 5 linear lobes; capsule 2 or 3-celled. *U. B. S.* Native of Brazil, in water. *Rhèxia limnóbios*, Schrank et Mart. mss. Flowers red.

*Lake-living Microlicia.* Pl.  $\frac{1}{2}$  foot.

5 *M. ALSINEFOLIA* (D. C. l. c.) herbaceous, ascending, a little branched; stems tetragonal, hispid; leaves on short petioles, rather orbicular, somewhat cordate at the base, acutish at the apex, 5-nerved, almost quite entire, ciliated, rather pilose on both surfaces, appearing pitted from dots on the upper surface when examined by a lens; flowers solitary, terminating the branchlets; calyx rather hairy, with an ovate tube, and 5 linear lobes, which are longer than the tube; anthers retuse, dissimilar. *U. B. S.* Native of Brazil, in elevated places in the province of Minas Geraes. *Rhèxia alsinefolia*, Mart. et Schrank, mss. Petals obovate, purplish. Anthers 10, the 5 longest having long connectives, and the 5 shortest having short connectives, all 2-lobed at the articulation.

*Chickweed-leaved Microlicia.* Pl.  $\frac{1}{2}$  foot.

6 *M. PUNCTATISSIMA* (D. C. prod. 3. p. 118.) plant somewhat herbaceous, much branched, hispid from glandular pili in every part; branches tetragonal; leaves petiolate, ovate, acute, ciliate subserrated, 3-nerved, appearing pitted from dots on the upper surface when examined by a lens; flowers solitary, axillary, and terminal, on short pedicels; calyx with a globose tube, equal in length to the linear lobes; anthers dissimilar. *U. B. S.* Native of Brazil, in moist meadows in the province of Minas Geraes. *Rhèxia punctatissima*, Mart. et Schrank, mss. Allied to *M. alsinefolia*. Capsule ovate, 3-celled, 3-valved. Seeds obovate, truncate at one end.

*Var. β, angustifolia* (D. C. l. c.) leaves oblong, almost quite entire.

*Much-dotted-leaved Microlicia.* Pl.  $\frac{1}{2}$  foot.

7 *M. RECURVA* (D. C. l. c.) plant herbaceous, branched, beset with glandular pili in every part; stem and branches tetragonal; leaves petiolate, ovate, somewhat crenated, deflexed, acutish, 3-

nerved; flowers solitary, hardly pedicellate in the axils, and on the tops of the branches. *℥. B. S.* Native of Cayenne. *Rhèxia recurva*, Rich. act. soc. hist. nat. par. 1792. p. 108. Poir. suppl. 6. p. 6. *Rhèxia uniflora*, Vahl. symb. 2. p. 48, but not of Raddi. *Melastoma diffusa*, Desr. in Lam. dict. 4. p. 38. *Rhèxia uniflora*, *recurva*, and *diffusa*, Spreng. syst. no. 21. 35. and 84. Stems erect or somewhat decumbent. Calyx globose; lobes 5, subulate. Petals small. Capsule 3-celled, glabrous. Seeds cochleate, muricated.

*Recurved Microlicia.* Pl. 1 foot.

8 *M. VARIA'BILIS* (Mart. mss. ex D. C. l. c.) suffruticose, erect; branches tetragonal, beset with glandular pili; leaves almost sessile, broadly ovate, acute, ciliate serrated, pilose on both surfaces, 3-nerved; flowers pedicellate, axillary and terminal, solitary; calyx rather hairy, with a globose tube, and linear subulate lobes, which are about equal in length to the tube; anthers dissimilar. *℥. B. S.* Native of Brazil, in alpine meadows in the provinces of St. Paul and Minas Geraes. Anthers as in *M. alsinefolia*. Flowers rose-coloured.

*Var. β, radicans* (Schränk et Mart. mss. ex D. C. l. c.) plant herbaceous, erect, rooting at the base, and less pilose than the species. *℥. B. S.* Native of marshes, especially at Serro Frio.

*Var. γ, herbacea* (Schränk et Mart. mss. ex D. C. l. c.) plant herbaceous, ascending, rooting at the base, smoothish in every part; flowers axillary, almost sessile. *℥. B. S.* Native of the province of St. Paul, in bogs. *Rhèxia cordata*, Spreng. neue entd. 1. p. 301. *Rhèxia variabilis*, Mart. et Schrank, mss. Very like variety *β*, and truly decandrous. Perhaps a proper species. Flowers bluish red.

*Variable Microlicia.* Pl. 1 foot.

9 *M. LANCEFLORA* (D. C. prod. 3. p. 118.) suffruticose, much branched, erect, hispid from glandular pili in every part; leaves on short petioles, ovate, ciliate serrated, 3-nerved; pedicels axillary, 3-flowered, disposed in an elongated thyse; tube of calyx cylindrical, a little longer than the lobes, which are 5 and linear; petals oblong; anthers elongated, with their connectives hardly drawn out. *℥. B. S.* Native of Brazil, in inundated parts of meadows, particularly in the province of St. Paul. *Rhèxia lanceiflora*, Mart. et Schrank, mss. Plant almost like that of *M. variabilis*, but the flowers are much more numerous, and the calyxes tubular; the petals 3 times the length of their breadth. Flower-bud lanceolate. Longer anthers rather unequal among themselves, with their connectives long, but hardly drawn out at the articulation.

*Lance-flowered Microlicia.* Shrub  $\frac{1}{2}$  to 1 foot.

10 *M. VIOLACEA* (D. C. prod. 3. p. 118.) suffruticose, hispid from glandular hairs; leaves sessile, broadly ovate, quite entire, 5-nerved, full of pitted dots on the upper surface when examined by a lens; flowers axillary, solitary, almost sessile; tube of calyx globose, about equal in length to the oblong-linear lobes; petals oblong; anthers elongated, dissimilar. *℥. S.* Native of Brazil, on the high mountains in the province of Minas Geraes. *Rhèxia violacea*, and perhaps also *Rhèxia viscidula*, Schrank et Mart. mss. The leaves resemble those of *M. alsinefolia* and *M. punctatissima*; anthers and petals those of *M. lanceiflora*. The five longer anthers have long connectives, which are drawn out into a small blunt 2-lobed appendage each; the five shorter ones have short connectives, which are hardly tumid at the base.

*Violaceous Microlicia.* Shrub  $\frac{1}{2}$  to 1 foot.

11 *M. SERPYLLIFOLIA* (D. Don, in mem. wern. soc. 4. p. 301.) shrubby; leaves elliptic, acute, spreading, downy on both surfaces, as well as the branchlets; flowers solitary, pedicellate; calyxes pubescent. *℥. S.* Native of Brazil. Stem erect, much branched. Branches tetragonal. Leaves obsoletely 3-nerved, about the size of those of wild-thyme. Flowers purple.

*Wild-thyme-leaved Microlicia.* Sh.  $\frac{1}{2}$  foot.

12 *M. GRAVEOLENS* (D. C. prod. 3. p. 119.) suffruticose, diffusely branched; branches somewhat tetragonal, beset with glandular hairs; leaves sessile, ovate, acute, 3-nerved, obsoletely serrated, full of setose dots on both surfaces; flowers axillary, sessile, solitary, crowded at the tops of the branches; tube of calyx 10-furrowed, beset with glandular bristles, longer than the lobes, which are 5, lanceolate and acute; anthers dissimilar. *℥. B. S.* Native of Brazil, in the province of Minas Geraes, on the mountains and in irrigated parts of meadows. *Rhèxia graveolens*, Mart. et Schrank, mss. Leaves 2 lines long. Petals violaceous. Anthers 10, ovate, with short blunt beaks: having the connectives of 5 drawn out into a dilated somewhat 2-lobed appendage each, those of the other 5 short. Capsule ovate-conical, 3-celled, 3-valved. Seeds somewhat cochleate. Plant with a heavy scent.

*Strong-scented Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

13 *M. MARIFOLIA* (D. Don, mem. wern. soc. 4. p. 301.) shrubby; leaves decussate, ovate, bluntish, 3-nerved, on short petioles, downy on both surfaces, as well as the branches; flowers axillary, solitary, pedicellate. *℥. S.* Native of Brazil: An erect, much branched, leafy shrub, with tetragonal branches and obsoletely ercudated leaves. Calyx downy.

*Cat-thyme-leaved Microlicia.* Sh.  $\frac{1}{2}$  foot.

14 *M. JUNGERMANNIOIDES* (D. C. l. c.) shrubby; branches hispid; leaves sessile, ovate, ciliate serrated, 5-nerved, smoothish above, but bristly beneath; flowers usually solitary, axillary, and terminal; calyx setigerous, with the tube globose, and the lobes linear-subulate, about equal in length to the tube; anthers dissimilar. *℥. S.* Native of Brazil, in the province of Minas Geraes, on the Diamond Mountains. *Rhèxia jungermannioides*, Mart. et Schrank, mss. The bristles on the upper part of the plant are glandular. Leaves like those of *Bétula nana*. Petals violaceous. Anthers 10, ovate-oblong, ending each in a short cucullate beak: 5 of which have their connectives longer than the anthers; those of the other 5 short. Capsule ovate-globose, 3-valved.

*Jungermannia-like Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

15 *M. SUBSETOSA* (D. C. l. c.) stem shrubby; branches terete, bristly; leaves sessile, oblong-ovate, acutish, quite entire, finely 3-nerved, full of glandular dots on both surfaces, and with a few bristles on the margins and nerves; flowers terminal, solitary, sessile, decandrous; calyx full of glandular dots, having 5 oblong rather bristly lobes. *℥. S.* Native of Brazil, on the mountains. *Rhèxia setosa*, Schrank et Mart. mss. but not of Spreng. Leaves 2-3 lines long. Petals purple. Anthers yellow, beaked: having their connectives drawn out at the articulation into a blunt appendage each, 3-times the length of the anthers. From habit this species is allied to *M. variolosa*.

*Subsetose Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

16 *M. SERINGEA'NA* (D. C. l. c.) shrubby, hispid from yellowish hairs; branches tetragonal; leaves sessile, ovate, serrated, approximate, somewhat 3-nerved, full of glandular and pellucid dots, hairy; flowers solitary, sessile, terminal; calyx hairy, with a turbinate 10-ribbed tube, and 5 triangular lobes; anthers dissimilar. *℥. S.* Native of Brazil. *Rhèxia Seringeana*, Mart. herb. Petals purple, ciliated when young. Anthers 10, oval, bluntly beaked, 5 with long connectives, which are appendiculated at the base. Capsule 3-celled, permanent. Allied to *M. variolosa*, but distinct.

*Seringe's Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

17 *M. VESTITA* (D. C. l. c.) shrubby, branched; branchlets filiform, rather hairy from small pili; leaves sessile, somewhat imbricated in four rows, ovate, acute, quite entire, somewhat 3-nerved, smoothish above, beset with long adpressed bristles or

villi beneath, and on the margins; flowers solitary, on short pedicels in the axils of the upper leaves; calyx bristly, with an unrecolate tube and a 5-toothed limb; anthers dissimilar. *h. S.* Native of Brazil, in the province of Bahia, on the mountains. *Rhèxia vestita* Schrank et Mart. mss. Petals purplish. Leaves 2 lines long. Anthers ovate, terminating in short beaks; with the connectives appendiculate, the appendages in 4 filiform, and in the other 4 they are dilated and blunt.

*Clothed Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

18 *M. VARIOLÒSA* (D. C. prod. 3. p. 119.) shrubby, branched, erect; branches tetragonal; leaves sessile, ovate, oval or oblong, quite entire, somewhat 3-nerved, full of glandular dots on both surfaces; flowers solitary, axillary or subterminal, on short pedicels; calyx turbinate, with 5 triangularly oblong lobes, which are hardly shorter than the tube; anthers dissimilar. *h. S.* Native of Brazil and Peru. Leaves 2-4 lines long, and  $1\frac{1}{2}$  to 3 broad. Capsule ovate, 3-celled, 3-valved. Seeds oblong, kidney-shaped, dotted when examined with a lens.

*Var. a, hirsuta* (D. C. l. c.) branches and leaves villous on both surfaces, or velvety. The *Rhèxia fasciculata*, *virgulata*, *thymifolia*, *baccharoides*, *euphorbioides*, *avicularis*, *hirsuta*, *venaista*, and *enèrvia* of Schrank and Mart. mss. are probably only variations of the same.

*Var. β, glabra* (D. C. l. c.) branches rather hispid; leaves glabrous. The *Rhèxia elachistophylla*, *Cochobámbar*, *alternans*, and *variolosa* of Schrank et Mart. mss. are probably variations of this plant.

*Variolose Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

19 *M. GLABRA* (D. C. prod. 2. p. 120.) shrubby, much branched, glabrous on both surfaces; branches fastigiate, tetragonal; leaves sessile, oval-oblong, acute, quite entire, hardly 3-nerved at the base, full of depressed dots on both surfaces; flowers on short pedicels, axillary and terminal, solitary; calyx with an obovate tube: and 5 lobes, which are triangular at the base, and subulate at the apex, hardly shorter than the tube; anthers dissimilar. *h. S.* Native of Brazil. This is an intermediate species between *M. variolosa* and *M. scopària*. Perhaps the same as *M. linophylla*.

*Glabrous Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

20 *M. LINOPHYLLA* (D. Don, l. c.) shrubby, much branched, glabrous; leaves lanceolate, awned, flat, quite entire, 3-nerved, glabrous; flowers solitary, nearly sessile, terminal or axillary. *h. S.* Native of Brazil. Shrub erect, twiggy, with tetragonal branches. Leaves spreading. Calyx glabrous.

*Flax-leaved Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

21 *M. SCOPÀRIA* (D. C. l. c.) suffruticose, much branched, quite glabrous; branches fastigiate, tetragonal, erect; leaves sessile, linear-subulate, quite entire, rather fleshy, nerveless, channelled above; flowers solitary, terminal, on short pedicels; calyx with a cylindrically turbinate tube: and 5 linear-subulate lobes, which are about equal in length to the tube; anthers dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes in sandy fields on the tops of the highest mountains. *Rhèxia scopària*, Aug. St. Hil. in Bonpl. rhex. p. 152. t. 59. Leaves 2-3 lines long. Petals purple. Anthers 10, oblong, the 5 smaller ones ending in a short cylindrical appendage each, and having their connectives drawn out into an arched thread. Ovary 3-celled, many-seeded.

*Broom Microlicia.* Sh. 1 to 2 feet.

22 *M. ISOPHYLLA* (D. C. l. c.) fruticulose, much branched, glabrous; branches fastigiate, filiform, tetragonal; leaves sessile, oblong-subulate, quite entire, 1-nerved, full of pitted dots; flowers solitary, terminal; tube of calyx turbinate; lobes subulate, longer than the tube. *h. S.* Native of Brazil in the province of Minas Geraes, in the high sandy pastures on the mountains. *Rhèxia isophylla*, and *R. unèata*, Schrank and Mart. mss. Very like *M. scopària*. Capsule 3-4-celled. An-

thers dissimilar, ovate, beaked: in the longer ones the connective is drawn out into a long, cuneiform, rather emarginate appendage, but in the others it is short and blunt at the articulation.

*Equal-leaved Microlicia.* Sh. 1 foot.

23 *M. ARISTA'TA* (D. C. prod. 3. addend. p. 484.) fruticulose, much branched, glabrous; branches tetragonal; leaves linear, quite entire, slightly 3-nerved, full of dots on both surfaces, ending in an awn, like the calycine lobes; flowers axillary, solitary, and terminal tern, almost sessile; calyx oblong, 10-ribbed. *h. S.* Native of Brazil, in the province of Minas Geraes on the mountains, particularly on Serro Frio. The habit of the plant is almost that of *Lythrum* or *Satureja*. Anthers ovate-oblong, terminated by a tubular beak each; the connectives of the 5 longer ones long, and calcarate at the base. Capsule 3-celled. Seeds cochleate, permanent around the axis.

*Awned-calyxed Microlicia.* Pl.  $\frac{1}{2}$  to 1 foot.

24 *M. ERICOIDES* (D. Don, l. c. p. 302.) shrubby; leaves linear, mucronate, flat, loose; flowers twin; calyx glabrous. *h. S.* Native of Brazil. Stems numerous, ascending, tetragonal, almost simple, tufted, rising from a thick root. *Rhèxia ericoides*, Spreng. is distinct from this plant, and is probably referrible to the genus *Chatostoma*.

*Heath-like Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

25 *M. CUTRESSINA* (D. Don, l. c.) shrubby; leaves lanceolate, pungent, numerous, imbricate, marginate; flowers solitary; calyx hispid. *h. S.* Native of Brazil. Stem erect, much branched; branches terete, slender, proliferous, full of leaves at the apex, but naked below.

*Cypress-like Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

26 *M. TRICHOCALYCINA* (D. C. l. c.) shrubby, much branched, smoothish; branches tetragonal; leaves sessile, oblong-linear, acute, almost quite entire, usually 3-nerved, glabrous, full of glandular dots beneath; floral and calyx leaves bearing long distant stiff hairs; calyx subglobose, with 5 subulate lobes; anthers dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes, on Mount Grao-mayor, at the height of 4000 feet. *Rhèxia trichocalycina*, Mart. et Schrank, mss. Leaves longer and more spreading than those of *M. scopària*, to which the present plant is nearly allied. Petals purple. Anthers 10, ovate, with short beaks: 5 of which have their connectives appendiculate. Capsule 3-celled. Seeds oblong, rather incurved, dotted when examined with a lens.

*Hairy-calyxed Microlicia.* Sh. 1 foot.

27 *M. ARENARIÆFOLIA* (D. C. l. c.) suffruticose, much branched, quite glabrous; branches slender, terete; leaves sessile, linear, acuminate, quite entire, almost veinless; flowers on short pedicels, axillary, solitary; lobes of calyx 5, linear-subulate, longer than the tube; capsule 3-valved. *h. S.* Native of Peru, at Cochobambo. *Rhèxia arenariæfolia*, Mart. et Schrank, mss. Flower-bud oblong, acute. Stamens unknown. Flowers unknown.

*Sand-wort-leaved Microlicia.* Sh.  $\frac{1}{2}$  to  $\frac{1}{2}$  foot.

28 *M. SETOSA* (D. C. l. c.) fruticulose; branches glabrous, fuscous, knotted; leaves almost sessile, full of dots, quite glabrous, linear-oblong, obsoletely 3-nerved, bristly; peduncles very short, axillary, and terminal; calyx campanulate, with 5 linear spreading teeth, each terminating in a bristle. *h. S.* Native of Brazil. *Rhèxia setosa*, Spreng. neue. entd. l. p. 301.

*Bristly Microlicia.* Sh.  $\frac{1}{2}$  to 1 foot.

*Cult.* All the species are dwarf plants, growing in inundated places of meadows. Some of them, therefore, require to be grown as subaquatic plants, that is, in pans filled with a mixture of peat and sand in the bottom, and filled up with water, but the water should not rise higher than an inch or an inch and a half above the soil; others require to be grown in pots, placed in pans of water. The species are increased by seeds or dividing.

XXI. ERNESTIA (in honour of Ernest Meyer, author of *primitiæ Floræ Essequiboensis* Gottingen. 4to. 1818.) D. C. prod. 3. p. 121.

LIN. SYST. *Octândria, Monogýnia*. Calyx with a globose tube, and 4 narrow acuminate lobes. Petals 4, obovate, ciliated. Anthers triquetrous, drawn out at the base into 2 long bristles each. Capsule 4-celled. Seeds unknown.—Herb, with the habit of *Spennera*, but differs in the form of the anthers, which are anomalous in this genus, and in the capsule being 4-celled.

1 E. TENELLA (D. C. l. c.) ☉. S. Native of New Granada, on Mount Quindiu in shady places. Leaves cordate, oval, acuminate, setosely denticulated, 5-nerved. Flowers panicle, octandrous. Calyx clothed with glandular pili; tube ovate; lobes ovate, ending in long points. Petals obovate, white. Genitals longer than the corolla. Style subclavate.

*Slender Ernestia*. Pl.  $\frac{1}{2}$  to 1 foot.

*Cult.* For culture and propagation see *Spennera*, p. 743.

XXII. SIPHANTHERA (from *σῆψον*, *siphon*, a tube, and *ἀνθή*, *anthera*, an anther; in reference to the anthers, which terminate in a long tubular beak). Pohl. pl. bras. 1. p. 102. D. C. prod. 3. p. 121.

LIN. SYST. *Tetrandria, Monogýnia*. Calyx campanulate, 4-toothed, girded by many bracteas; bracteas permanent. Petals 4, orbicular. Stamens 4, exserted; anthers oblong, furnished with an obcordate ascending process at the base, and a tubular beak at the apex. Ovarium adnate to the calyx at the base. Style filiform. Capsule depressed, 2-celled, 2-valved, obcordate at the apex. Seeds numerous, ~~small~~, orbiculate or ovate, rather convex on one side, reticulated.—Small elegant annual herbs, clothed with glandular hairs. Leaves opposite, sessile, toothed, feather-nerved. Flowers crowded into axillary and terminal heads; with rose-coloured or white petals, and blue anthers.

1 S. CORDATA (Pohl. pl. bras. 1. p. 183. t. 84.) leaves broad, cordate, upper ones narrower, serrated, villous; fascicles many-flowered, on short peduncles; bracteas ovate, toothed, inner ones narrow; beak of anthers long and attenuated. ☉. S. Native of Brazil, in the province of Goyaz, in boggy meadows on the tops of the mountains. Rhæxia veronicæfolia, Mart. herb. Stem reddish. Branches somewhat tetragonal. Petals rose-coloured.

*Cordate-leaved Siphanthera*. Pl.  $\frac{1}{2}$  to 1 foot.

2 S. TENERA (Pohl. pl. bras. 1. p. 104. t. 85. a.) leaves roundish-ovate, unequally toothed; fascicles of flowers on long peduncles; bracteas ovate, acute, terminated by a long hair each; beaks of anthers very short. ☉. S. Native of Brazil, on the tops of mountains in the province of Goyaz. Branches tetragonal. Petals white, spotted with red at the base.

*Tender Siphanthera*. Pl.  $\frac{1}{2}$  foot.

3 S. SUBTILIS (Pohl. l. c. p. 105. t. 85. f. b.) leaves oblong-ovate, acutish, unequally denticulated; fascicles of flowers on long peduncles; bracteas oblong, denticulated, terminated by a long hair each; beaks of anthers rather elongated. ☉. S. Native of Brazil, in the province of Goyaz, on sandy parts of mountains, particularly between Corimba and Rio St. Marcos. Branches tetragonal. Corolla white.

*Subtile Siphanthera*. Pl.  $\frac{1}{2}$  foot.

*Cult.* All the species are elegant little annual plants. Their culture and propagation are the same as that for *Spennera*, p. 743.

XXIII. RHÆXIA (from *ῥήξω*, *rhæxis*, a rupture; supposed to cure by its astringent qualities). R. Br. ex D. Don, mem. soc. wern. 4. p. 297. Nutt. gen. amer. 1. p. 244.—Rhæxia species, Lin. Bonpl. and Seringe.

LIN. SYST. *Octândria, Monogýnia*. Tube of calyx ovate and

ventricose at the base (f. 109. a.), but constricted at the neck at the apex (f. 109. b.); limb 4-cleft (f. 109. b.), permanent. Petals 4, obovate. Stamens 8 (f. 109. c.). Anthers not drawn out at the base. Capsule free in the bottom of the calyx, 4-celled, with lunate pedicellate placentas. Seeds cochleate.—Smooth North American herbs. Stems erect, quadrangular. Leaves sessile, quite entire, linear-lanceolate, or ovate, 3-nerved. Flowers by threes, disposed in cymose corymbs, purple or yellow.

1 R. MARIA'NA (Lin. spec.

FIG. 109.

491.) stem terete, hairy; leaves on short petioles, lanceolate, acute at both ends 3-nerved; calyx smoothish. 2. II. Native of North America, in sandy woods from New Jersey to Carolina; also in Maryland, and probably in Louisiana, if R. Ludoviciana, Rafin. fl. lud. p. 92. be the same. Lodd. bot. cab. t. 366.—Pluk. alm. t. 428. f. 1. Lam. ill. t. 283. f. 1.

*Var. α, purpurea*; leaves narrow-lanceolate or oblong; flowers deep purple. Michx. fl. bor. amer. 1. p. 221.

*Var. β, rubella*; leaves oval-oblong; flowers pale red. Michx. l. c. Sweet, fl. gard. t. 41.

*Maryland Rhæxia*. Fl. June, Aug. Clt. 1759. Pl.  $\frac{3}{4}$  to 1 foot.

2 R. VIRGINICA (Lin. spec. p. 491.) stem tetragonal, smoothish; angles winged; leaves sessile, oval-lanceolate, ciliate serrated, 3-nerved, rather hispid, as well as the calyxes. 2. II. Native of North America, from New York to Carolina, in bogs and woods in humid places. Lam. ill. t. 283. f. 2. Sims, bot. mag. t. 968. Flowers small, purple.

*Var. β, septemnervia* (Walt. fl. car. p. 130.) leaves 5-7-nerved. 2. II. R. Virginica gigantea, Poir. dict. 6. p. 1.

*Virginian Rhæxia*. Fl. June, Aug. Clt. 1759. Pl.  $\frac{3}{4}$  foot.

3 R. CILIOSA (Michx. fl. bor. amer. 1. p. 221.) stem somewhat quadrangular, smooth; leaves on short petioles, oval, glabrous beneath, but with a few hairs above and ciliated on the margins; flowers growing by threes, sessile, involucreted. 2. II. Native of Lower Carolina, in marshes. Pursh, fl. amer. sept. 1. t. 10. Sweet, fl. gard. 298.—Pluk. amalth. t. 425. f. 4. ex Nutt. gen. amer. 1. p. 243. R. petiolata, Walt. car. 130.? Leaves small. Flowers large, reddish purple. Anthers short. Calyx when in fruit rather globose at the base.

*Ciliated Rhæxia*. Fl. June, Aug. Clt. 1812. Pl.  $\frac{1}{2}$  to  $1\frac{1}{2}$  foot.

4 R. SERRULATA (Nutt. gen. amer. 1. p. 243.) stem quadrangular, smooth; leaves on short petioles, roundish-ovate, smooth on both surfaces, rather ciliated at the base, and with the margins serrated; flowers pedunculate, ciliated; calyx beset with glandular hairs; the lobes acute. 2. II. Native of Georgia and Florida, in open marshes. Very like R. ciliosa. Flowers purple, subcorymbose.

*Serrulate-leaved Rhæxia*. Pl.  $\frac{3}{4}$  foot.

5 R. GLABELLA (Michx. fl. bor. amer. 1. p. 222.) stems terete, smooth; leaves sessile, erect, lanceolate, smooth, finely denticulated or entire (ex Nutt.); flowers subcorymbose; calyx beset with glandular hairs. 2. II. Native of Carolina and Georgia, in sandy humid woods. Bonpl. rhæx. t. 44. Flowers large, pale purple. Root tuberous.

*Var. β*; leaves obovate. R. Alifanus, Walt. car. p. 131. ex Pursh, fl. bor. amer. 1. p. 258.

*Smooth Rhæxia*. Pl. 4 feet.

6 R. STRICTA (Pursh, fl. amer. sept. 1. p. 258.) stem straight, tetragonal, glabrous, but bearded at the joints; angles winged;

leaves sessile, erect, narrow-lanceolate, tapering into an acumen at the apex, 3-nerved, glabrous on both surfaces; corymbs dichotomous; calyxes smoothish. *Æ. H.* Native of Georgia and Lower Carolina, in humid places. Flowers purple. Very like the variety of *R. glabellâ* according to Nutt. gen. amer.

*Straight Rhæxia.* Pl.  $\frac{3}{4}$  to 1 foot.

7 *R. LU' TEA* (Michx. fl. bor. amer. 1. p. 222.) stem quadrangular, hispid; leaves furnished with a few long hairs, lower ones cuneate-oblong, obtuse; upper ones lanceolate; calyx margined, with the lobes acute; anthers short. *Æ. F.* Native of Georgia and Florida. Flowers yellow. Petals oval, obtuse.

*Yellow-flowered Rhæxia.* Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

8 *R. ANGUSTIFOLIA* (Nutt. gen. amer. 1. p. 244.) stem nearly terete, hairy; leaves linear-lanceolate, sometimes oblong, hairy, bearing smaller leaves in the axils; flowers cymose; cymes bifid; calyx cylindrical, short, smooth; stamens declinate. *Æ. H.* Native of Georgia and Carolina. *R. lanceolata*, Walt. fl. car. 129. Poir. dict. ency. 6. p. 2. *R. Mariâna*  $\gamma$  *exâlbida*, Lam. ill. t. 288. f. 3. Michx. fl. bor. amer. 1. p. 221. Flowers middle-sized, white.

*Narrow-leaved Rhæxia.* Fl. June, Aug. Clt. 1812. Pl.  $\frac{1}{2}$  ft.

N. B. *Rhæxia linearifolia* of Poir is *Isnârdia alternifolia*.

*Cult.* All the species of this genus are very elegant when in flower, and if planted in a bed of peat soil (which is the only soil in which they grow) they will thrive and increase abundantly; and if grown in pots, which is sometimes the case, they must be planted in peat soil. They are all increased by dividing at the root.

XXIV. HETERONOMA (from *ἕτερος*, *heteros*, and *νόμα*, *atos*; original form; inequality of leaves). D. C. prod. 3. p. 122.

LIN. SYST. *Octândria*, *Monogýnia*. Calyx tubular, with 4 triangular, acute, permanent teeth. Petals 4, oval, somewhat mucronate. Stamens 8. Anthers alternately longer; in the longer anthers the connective is drawn out into a linear appendage, which is bifid at the apex; in the smaller or shorter ones it is drawn out into 2 bristles. Capsule 4-celled, equal in length to the calyx. Seeds cochleate, compressed, wrinkled transversely, scabrous, the stripes on the back parallel.—A glabrous herb. Branches tetragonal. Leaves petiolate, ovate, acute, 5-nerved, ciliate serrated, opposite, very unequal in size, the one large and the other small. Cymes corymbose, few-flowered, loose, terminal. Flowers elegant, rose-coloured.

1 *H. DIVERSIFOLIUM* (D. C. prod. 3. p. 122.) *Æ. S.* Native of Peru ex herb., Dombey, and of Mexico. *Rhæxia diversifolia*, Bonpl. rhex. t. 45. *Rhæxia inæqualifolia*, Moc. et Sesse, fl. mex. ined. t. 334.

*Diverse-leaved Heteronoma.* Pl. 2 feet.

*Cult.* Peat is the best soil for this plant; and cuttings will root in the same kind of earth under a hand-glass, in heat.

XXV. PACHYLOMA (from *παχυσ*, *pachys*, and *λωμα*, *loma*, a fringe; in reference to the thick marginal nerve of the leaf). D. C. prod. 3. p. 122.

LIN. SYST. *Octândria*, *Monogýnia*. Tube of calyx obconically cylindrical, drawn out beyond the ovary; limb somewhat truncate, hardly 4-toothed. Petals 4, oval. Stamens 8, equal. Anthers linear, elongated, acuminate, opening by one pore; having the connectives in 4 of them long and drawn out into a simple bristle-like appendage; in the other 4 it is drawn out into 2 bristle-like appendages. Ovary free, 4-ribbed, glabrous. Style filiform, exserted. Stigma dot-formed. Fruit unknown.—Smooth Brazilian shrubs. Branches terete, nodose at the insertion of the leaves. Leaves on short petioles, oval, 5-nerved, besides being margined by a thick nerve, coriaceous, quite

entire. Thyse panicle, loose, terminal, bractless. Flowers purple. The character of this genus is very doubtful, from the fruit being unknown, but the habit is very singular.

1 *P. CORIACEUM* (D. C. l. c.) *Æ. S.* Native of Brazil, in the province of Rio Negro, and at the river Amazon. *Rhæxia pachyloma*, Mart. herb.

*Var. α, glaberrima* (D. C. l. c.) calyxes glabrous; leaves oblong. *Rhæxia bicuspis*, Schrank, mss.

*Var. β, subsetosa* (D. C. l. c.) calyx covered with glandular bristles; leaves ovate. *Rhæxia Amazonium*, Schrank, mss.

In both varieties the leaves vary in the same specimen, and are cleft in a singular manner at the apex, the points cross over each other in the manner of the bill of a cross-beak, *Lóxia* of Lin.

*Coriaceous-leaved Pachyloma.* Tree 30 to 40 feet.

*Cult.* See *Meriania*, p. 733. for culture and propagation.

XXVI. OXYSPORA (from *ὄξύς*, *oxys*, sharp, and *σπορά*, *spora*, a seed; in allusion to the seeds being awned at both ends). D. C. prod. 3. p. 123.—*Arthrostemma* species, D. Don, in wern. soc. mem. l. c.

LIN. SYST. *Octândria*, *Monogýnia*. Tube of calyx oblong; lobes 4, ovate, mucronulate. Petals 4, lanceolate, obliquely acute. Stamens 8, equal; filaments flattish. Anthers elongated, drawn out at the base into 2 blunt spurs, having their connectives hardly evident. Capsule 4-celled, 4-valved. Seeds small, hardly curved, awned at both ends: with the hylum concave and terminal.—Shrubs, native of Nipaul. Leaves petiolate, elliptic, long, acuminate, denticulated, 5-7-nerved, glabrous on the upper surface. Thyse panicle, terminal. Flowers red, drooping.

1 *O. VAGANS* (Wall. pl. rar. asiat. 1. p. 78.) rather climbing; branches nodding; leaves somewhat cordate-ovate, acuminate, crenulated, ciliated, clothed with tomentose villi on the under surface, as well as on the branchlets and petioles; panicle elongated, nodding; connectives of anthers all spurred upwards; calyx ribbed. *Æ. G.* Native of Chittagong. *Melastoma vagans*, Roxb. mss. Flowers red.

*Var. β, cernua* (Wall. l. c.) leaves ovate-lanceolate, 5-nerved, glabrous; panicle terminal, slender, elongated, nodding; peduncles 4-winged. *Æ. S.* Native of Chittagong. *Melastoma cernua*, Roxb. mss.

*Common Oxyspora.* Shrub 2 to 4 feet.

2 *O. PANICULATA* (D. C. prod. 3. p. 123. Wall. pl. rar. asiat. 1. p. 78. t. 88.) leaves somewhat cordate-ovate, acuminate, crenulated, clothed with villous tomentum beneath as well as on the petioles and peduncles; panicle ovate, erect; connectives of the longer anthers obsoletely spurred; capsule nerveless. *Æ. G.* Native of Nipaul. Flowers red. D. C. coll. p. 33. t. 4. *Arthrostemma paniculata*, D. Don, prod. fl. nep. p. 222.

*Panicle-flowered Oxyspora.* Shrub 2 to 4 feet.

*Cult.* For culture and propagation see *Lasiandra*, p. 752. Both are very elegant shrubs when in blossom.

XXVII. TRICE'NTRUM (from *τρεῖς*, *treis*, three, and *κέντρον*, *centron*, a spur; in reference to the connectives of the anthers being furnished with three spurs at the base). D. C. prod. 3. p. 123.

LIN. SYST. *Octândria*, *Monogýnia*. Tube of calyx ovate; lobes 4, narrow, acute, usually ending in three bristles each at the apex. Petals 4, oblong or oval. Stamens 8; filaments glabrous; anthers similar linear, opening by one pore, beaked; having their connectives furnished with 3 spurs each, 2 of the spurs are above and 1 behind. Ovary free, not bristly at the apex. Style filiform. Capsule ovate, 4-celled. Seeds cochleate.—Small South American shrubs. Flowers rose-coloured, solitary, nearly like those of *Rhæxia*.

1 *T. OVALIFOLIUM* (D. C. l. c.) beset with glandular pili in

every part; branches somewhat tetragonal; leaves ovate, mucronate, villous, 5-nerved; flowers bibracteolate, on short pedicels in the axils of the upper leaves. *h. S.* Native of Brazil. Calyx cylindrical, villous; lobes 4, linear. Petals oblong. Stamens exactly as in the following species.

*Oval-leaved Tricentrum.* Sh. 1 foot.

2 *T. ? LEPTOPHYLLUM* (D. C. prod. 3. p. 123.) glabrous; stems procumbent, tetragonal; leaves linear, 1-nerved, serrulated at the apex; flowers terminal, solitary. *h. S.* Native on the banks of the Orinoco, near Maypures. *Rhèxia leptophylla*, Bonpl. rhex. t. 24. Habit very different from the first species, but the flowers and fruit, as far as known, are similar. Seeds unknown. Ovarium free. Style filiform.

*Slender-leaved Tricentrum.* Sh. procumbent.

*Cult.* For culture and propagation see *Lasiandra*, p. 752.

XXVIII. MARCETIA (dedicated by De Candolle to his friend Fr. Marcet, who has advanced vegetable physiology by a singular memoir on the effects of poison on living vegetables). D. C. prod. 3. p. 124.

*LIN. SYST. Octandria, Monogynia.* Tube of calyx oblong or cylindrical; lobes 4, lanceolate. Petals 4, oval, acute. Stamens 8, equal; anthers oblong, furnished with 2 tubercles at the base, opening by one pore. Ovarium free, glabrous. Style filiform. Stigma dot-formed. Capsule 4-valved, 4-celled, about equal in length to the tube of the calyx. Seeds cochleate.—Brazilian shrubs. Branches terete. Leaves rather fleshy, oblong, usually with revolute edges, cordate at the base, on very short petioles or almost sessile, quite entire, usually nervy. *h. S.* Flowers axillary, solitary, almost sessile, bibracteolate, white or reddish.

1 *M. DECUSSATA* (D. C. l. c.) suffruticose, branched; leaves sessile, ovate, rather cordate, bluntish, quite entire, 3-nerved at the base, downy, as well as the branchlets and calyxes; flowers axillary, pedicellate; lobes of calyx lanceolate-subulate, hardly shorter than the tube; petals oval, acute. *h. S.* Native of Brazil, in the province of Bahia, on woody mountains, at the height of 2000 feet. *Rhèxia decussata*, Mart. et Schrank, mss. Leaves hardly 2-3 lines long. Genitals exserted. Stamens alternately unequal, but similar to the rest. Anthers furnished with 2 tubercles at the base. Seeds wrinkled, truncate at the base.

*Decussate-leaved Marcetia.* Sh. 1 foot.

2 *M. CORDIGERA* (D. C. l. c.) shrubby, much branched; branches hispid from bristles; leaves sessile, cordate, when young revolute at the margins, but at length becoming flat, and truly heart-shaped, rather scabrous from minute glandular down; flowers axillary, pedicellate, solitary, disposed in a leafy raceme; petals obliquely mucronate. *h. S.* Native of Brazil, in the province of Rio Janeiro, on the Alps. *Rhèxia cordigera*, Mart. et Schrank, mss. Flowers white. Allied to *M. taxifolia*.

*Heart-bearing Marcetia.* Sh. 1 foot.

3 *M. EXCORIATA* (D. C. l. c.) suffruticose, much branched; leaves almost sessile, oblong, rather cordate at the base, obtuse at the apex and mucronulate, densely clothed with down, somewhat 3-nerved; flowers axillary, pedicellate, disposed in short leafy racemes; anthers furnished with 2 tubercles at the base. *h. S.* Native of Brazil, on the mountains between Villa Rica and Tejuco. *Rhèxia excoriata*, Mart. et Schrank, mss. Bark at length separating from the stem. Leaves with a bluntish mucrone, covered with resiniferous down. Teeth of calyx linear. Petals oblong-obovate, rose-coloured. Genitals exserted. Seeds hardly wrinkled, truncate at the base.

*Excoriated Marcetia.* Sh. 2 to 3 feet.

4 *M. TAXIFOLIA* (D. C. l. c.) shrubby, much branched, clothed with glandular down in every part; leaves nearly sessile, oval-oblong, nearly linear, cordate at the base, with the margins revolute; flowers axillary, solitary; calyx covered with glandular hairs, with 4 oblong-linear lobes; petals obliquely mucronate.

*h. S.* Native of Brazil, in the province of Minas Geraes, in sandy places. *Rhèxia taxifolia*, St. Hil. in Bonpl. rhex. t. 57. Flowers white, on pedicels, which are furnished with one bractea each?

*Var. β, cinèrea* (D. C. l. c.) the whole plant almost white from short cinereous down. *h. S.* Native of Brazil, in the province of Minas Geraes, at the height of 4000 feet, in fields. *Rhèxia cinèrea*, Mart. herb. Flowers purplish.

*Few-leaved Marcetia.* Sh. 1 to 2 feet.

5 *M. GLANDULOSA* (D. C. l. c.) shrubby, much branched; branches thickly beset with glandular hairs; leaves sessile, oval-oblong, but nearly lanceolate from the margins being revolute; cordate at the base, nerveless, crowded, ornamented with glandular hairs; flowers axillary; pedicels short, bibracteolate in the middle; lobes of calyx subulate. *h. S.* Native of Brazil, in the province of Minas Geraes. *Rhèxia quadrivalvis*, Mart. herb. Flowers purplish, a little larger than those of *M. taxifolia*.

*Glandular Marcetia.* Sh. 1 to 2 feet.

6 *M. PUBESCENS* (D. C. l. c.) shrubby, branched; branches clothed with glandular down; leaves sessile, oval-oblong from the revolution of the margins, oblong, cordate at the base, downy, not glandular, nerveless; flowers axillary, almost sessile; bracteoles small, setaceous; lobes of calyx short. *h. S.* Native of Brazil. *Rhèxia Langsdorffiana*, Kunth ex Mart. Flowers purplish.

*Pubescent Marcetia.* Sh. 1 to 2 feet.

7 *M. TENUIFOLIA* (D. C. l. c.) shrubby, much branched; branches rather tetragonal, clothed with short hispid down; leaves sessile, linear, nerveless, clothed with short velvety down, revolute at the margins; pedicels axillary, short, 1-flowered, furnished with 2 bracteas each. *h. S.* Native of Brazil. *Rhèxia tenuifolia*, Mart. herb. Allied to *M. taxifolia*, from the white flowers, but differs from it in the down not being glandular, and in the leaves being narrower and more spreading.

*Fine-leaved Marcetia.* Sh. 1 to 2 feet.

8 *M. JUNIPÉRINA* (D. C. l. c.) suffruticose; branches slender, downy; leaves lanceolate, but linear from the revolution of the edges, acute, nerveless, clothed with rough pubescence; flowers axillary, solitary, sessile, bibracteate; lobes of calyx linear-subulate; petals oval-oblong, awnedly mucronate. *h. S.* Native of Brazil. *Rhèxia junipérina*, Spreng. syst. 2. p. 310.

*Juniper-like Marcetia.* Sh. 1 foot.

9 *M. TAMARISCINA* (D. C. l. c.) shrubby; leaves sessile, rather fleshy, oblong, cordate, with revolute margins, and hence as if they were sagittately cordate; flowers axillary, almost sessile; petals lanceolate. *h. S.* Native of Brazil, in the province of Minas Geraes. *Rhèxia tamariscina*, Schrank et Mart. mss. Leaves, branches, and calyxes rather downy; lobes of calyx narrow, acute, accrose. Petals white. Stamens similar. Anthers rather tumid at the base. Seeds truncate at the base. Leaves almost like those of *Empétrum*. Very near *M. taxifolia*.

*Tamarisk-like Marcetia.* Sh. 1 to 2 feet.

10 *M. ACEROSA* (D. C. l. c.) suffruticose, very humble; leaves clothed with velvety down, oblong-linear, with revolute edges; flowers solitary, terminal, erect, sessile; genitals shorter than the petals, which are orbicular, and hardly apiculated. *h. S.* Native of Brazil, in the province of Minas Geraes, in the Certao or desert, in stony sandy fields. *Rhèxia acerosa*, Schrank et Mart. mss. A small heath-like shrub. Leaves 1-2 lines long. Branches filiform. Anthers ovate, hardly auricled at the base. Petals purple. Allied to *M. taxifolia* from the leaves, but differs in the flowers being 4-petalled and octandrous. Habit of *Tetrathèca*.

*Needle-leaved Marcetia.* Sh. 1 foot.

11 *M. SERRULARIA* (D. C. l. c.) shrubby, branched; branchlets and leaves rough from thick glandular down; leaves sessile,

oval, with revolute margins, nerveless, small, crowded, coriaceous; flowers solitary at the tops of the branches; calyx oblong, beset with short, glandular hairs. *h. S.* Native of Brazil, in the province of Minas Geraes, at the height of 5000 feet. D. C. coll. mem. 1. t. 5. *Rhèxia sertularia*, Schrank et Mart. mss. Stamens exserted. Petals oval, white in a dried state. Very elegant and very distinct from the other species.

*Sertularia-like Marcetia.* Shrub 1 foot.

*Cult.* The species of *Marcetia* are elegant little shrubs, but probably of difficult cultivation. Should any of them be ever introduced to the gardens, we would recommend their being grown in a mixture of loam, peat, and sand, draining the pots well with sherds, and placing them on the shelves in a stove. Young cuttings will perhaps root in sand under a bell-glass, in heat.

XXIX. TREMBLEYA (dedicated to Abraham Trembley, who by his observations on fresh water polypes, has contributed to determine the limits of the vegetable kingdom). D. C. prod. 3. p. 125.

*LIN. SYST.* *Decándria, Monogýnia.* Tube of calyx ovate, constricted at the apex; lobes 5, rather dilated from the base, awned, or oblong. Petals 5, oval. Stamens 10, 5 of which bear ovate-oblong anthers, with short blunt beaks; having their connectives drawn out into an obcordate or spatulate simple ligula each; the 5 alternate ones having the ligula hardly evident. Stigma dot-formed. Capsule ovate, 5-celled, glabrous. Seeds cochleate?—Shrubs, native of Brazil. Leaves sessile or petiolate, oblong or linear, quite entire, 1-3-nerved. Pedicels axillary or terminal, 1-3-flowered.—This genus agrees with *Rhèxia* in the urceolate calyx, but differs in the corolla being pentapetalous. The habits of the species are heterogeneous, but the characters are not so. The genus is therefore divided into 3 sections.

SECT. I. JACOBIA (dedicated to James Andr. Trembley, who wrote a thesis on vegetation, which has been falsely attributed to Calandrini, a Swiss botanist). D. C. prod. 3. p. 125. Calyx turbinate, hardly constricted at the apex; lobes subulate. Petals oval, mucronate. Connectives of anthers drawn out into a short appendage each. Flower solitary, yellow. This section almost agrees with the genus *Marcetia*, but differs in the petals being yellow. Perhaps a proper genus. Seeds unknown.

1 *T. ROSMARINOIDES* (D. C. prod. 3. p. 125.) shrubby, much branched, glabrous; branches tetragonal; leaves on short petioles, linear, quite entire, 1-nerved, besides 2 marginal veins, which are joined with the reticulating veins, clothed with yellowish down beneath; flowers axillary, solitary, pedicellate, and at the tops of the branches; tube of calyx ovate, somewhat costate, equal in length to the lobes, which are subulate, and 5-6 in number; anthers dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes, on the tops of mountains, at the elevation of 5000 feet. *Rhèxia rosmarinoides*, Schrank et Mart. mss. Petals obovate, yellow. Anthers ovate, with short blunt beaks; the alternate ones furnished with a longer auricled connective each.

*Rosemary-like Trembleya.* Shrub 1 foot.

SECT. II. ABRAHAMIA (in honour of Abraham Trembley, see genus). D. C. prod. 3. p. 126. Calyx urceolate; lobes subulate or linear. Petals not gradually mucronated but apiculated. Connectives of anthers drawn out into a broad appendage each. Flowers purplish, pedicellate.

2 *T. PHLOGIFORMIS* (D. C. l. c.) plant suffruticose, oppositely branched; branches somewhat tetragonal, beset with glandular hairs; leaves sessile, elliptic-oblong, attenuated at both ends, ciliate serrated, 3-nerved, hispid on both surfaces; pedicels 1-flowered, axillary, and at the tops of the branches; calyx rather hispid, with an urceolate tube, and a limb which is campanulate at the base and 5-lobed at the apex, the lobes ending

in setaceous points, hardly shorter than the tube; anthers dissimilar. *h. S.* Native of Brazil, in the province of St. Paul, in fields. *Rhèxia phlogiformis*, Mart. et Schrank, mss. Petals oval-oblong, purple. Anthers 10, ovate, with short blunt beaks; the 5 longer ones having their connectives drawn out into a broad obcordate appendage each, and those of the 5 shorter ones drawn out into a small narrow appendage each. Capsule ovate, 5-celled.

*Phlox-leaved Trembleya.* Shrub 1 to 2 feet.

3 *T. AGRESTIS* (D. C. l. c.) shrubby; branches bluntly tetragonal; leaves elliptic-oblong, cuneated at the base, rather acutish, quite entire, 3-nerved, pruinose on both surfaces as well as the branchlets; upper ones pilose as well as the calyxes; flowers solitary, terminal; lobes of calyx 5, oblong, a little longer than the tube; petals obovate, cuneated. *h. S.* Native of Brazil, in the province of Minas Geraes, in elevated stony fields. *Rhèxia agrestis*, Mart. and Schrank, mss. Leaves 7-9 lines long and 3 lines broad. Flowers small. Anthers oval-oblong, ending in very short beaks, but having their connectives drawn out into a long, club-shaped process each at the articulation; inner anthers furnished with shorter connectives. The rest unknown.

*Field Trembleya.* Shrub 1 to 2 feet.

4 *T. HETEROSTEMON* (D. C. l. c.) shrubby; branches bluntly tetragonal, when young clothed with velvety villi; leaves petiolate, lanceolate, cuneated at the base, obtuse at the apex, quite entire, 3-nerved, clothed with velvety tomentum beneath, smoothish above, 5-6-flowered, axillary, 3-times shorter than the leaves; anthers 10, dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes, near subalpine fountains. *Rhèxia heterostemon*, Mart. et Schrank, mss. Leaves 2 inches long, and 5 lines broad. Petals oblong, white. Anthers ovate, short, ending in short beaks, 5 of which are spurless, and the other 5 having their connectives drawn out at the base into an obcordate appendage each, which is about equal in length to the anther.

*Variable-stamened Trembleya.* Shrub.

5 *T. TRIFLORA* (D. C. l. c.) shrubby; branches tetragonal, glabrous; leaves petiolate, oblong-lanceolate, quite entire, 3-nerved, glabrous above, but white beneath from very minute down; peduncles axillary, 3-flowered, angular; calyx turbinate, glabrous, with 5 triangular short lobes; anthers dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes, in woods near Villa Rica. *Rhèxia triflora*, Mart. et Schrank, mss. Petals obovate, oblong, 3-4 lines long, not ciliated. Anthers 10, ovate, ending in short beaks, 5 of which have their connectives drawn out into a yellow retuse appendage each.

*Three-flowered Trembleya.* Shrub 2 feet.

SECT. III. ERIOLEUCA (from *ερion*, *erion*, wool, and *λευκος*, *leucos*, white; plant clothed with white tomentum in every part). D. C. prod. 3. p. 126. Calyx hardly constricted at the apex, woolly on the outside; lobes oblong. Petals obtuse. Connectives of the longer anthers drawn out each into a broad appendage. Flowers axillary, sessile. Seeds unknown. Perhaps a proper genus.

6 *T. LYCHNITIS* (D. C. l. c.) shrubby, clothed in every part with white woolly tomentum, except the petals, genitals, and the upper surface of the adult leaves; branches terete; leaves almost sessile, ovate, or somewhat oblong, 3-nerved, quite entire; flowers axillary, sessile, somewhat verticillate; tube of calyx turbinate, equal in length to the lobes, which are 5, oblong, and glabrous inside; anthers dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes, in exposed stony places on the sides of mountains. *Rhèxia lychnitis*, Schrank et Mart. mss. Me-

*lástoma laniflorum*, D. Don, in mem. wern. soc. 4. p. 292. Flowers about 3 together in each axil, yellow? Petals obovate-oblong. Stamens 10, one-half shorter than the petals. Anthers ovate, obtuse, ending in short beaks. The specific name is derived from *λῦχνε*, a lamp; in reference to the cottony appearance of the wool on the plant resembling wicks.

*Lamp Trembleya*. Shrub 1 to 2 feet.

*Cult.* For culture and propagation see *Marcétia*, p. 749.

XXX. ADELOBOTRYS (from *ἀήλος*, *adelos*, obscure, and *βότρυς*, *botrys*, a raceme; in reference to the flowers not being sufficiently known). D. C. prod. 3. p. 127.

LIN. SYST. *Decándria, Monogýnia*. Calyx free, somewhat campanulate, with 5 short blunt teeth. Petals 5, oval. Stamens 10. Anthers bifurcate at the base, and 2-valved? at the apex. Ovarium and style unknown. Capsule bursting by 5 parts, with the central column at length free from the valves.—Seeds unknown.—A climbing shrub with terete branches. Leaves clothed with rufous villi on both surfaces when young, but in the adult state glabrous, except the nerves, petiolate, ovate-cordate, acuminate, ciliately serrated, 5-nerved. Flowers white, crowded in cymose heads at the tops of the branches.

1 *A. scándens* (D. C. l. c.). *h. S.* Native of French Guiana, on the banks of the river Sinemari. *Melástoma scándens*, Aubl. guian. 1. p. 435. t. 172. *Rhéxia scándens*, Rich. herb. Ser. mss.

*Climbing Adelobotrys*. Shrub cl.

*Cult.* For culture and propagation see *Lasiandra*, p. 752. Being a climbing shrub it is fit for covering trellises in stoves.

#### Tribe III.

OSBECKIA (plants agreeing with *Osbéckia* in important characters). D. C. prod. 3. p. 127. Anthers opening by 1 pore at the apex. Ovarium sometimes free, and sometimes adnate to the calyx, crowned by scales or bristles at the apex. Seeds cochleate, with a basilar orbicular hylum. The species are natives of America, Africa, Asia, and a few of Australia.

XXXI. LASIANDRA (from *λασιος*, *lasios*, hairy, and *ἀνдр*, *andros*, a male; in reference to the hairy stamens). D. C. prod. 3. p. 127. *Rhéxia* species, Schrank and Mart. mss. —*Pleroma* species, D. Don, l. c.

LIN. SYST. *Decándria, Monogýnia*. Tube of calyx ovate; lobes 5, narrow, acuminate. Petals 5, obovate. Stamens 10; filaments pilose; anthers elongated, terminating in short beaks, having their connectives tumid and bauriculate at the base. Ovarium setose at the apex, probably somewhat adnate to the calyx in the young state. Style usually pilose. Capsule dry, 5-celled. Seeds few, cochleate, rather angular, with a somewhat orbicular, basilar hylum.—Shrubs, natives of South America. Branches clothed with adpressed bristles. Leaves on short petioles or sessile, 3-5-nerved, quite entire, ciliated, bristly on the upper surface; the bristles adpressed, and usually regularly directed from the middle to the nerves; villous or setose on the nerves beneath, and velvety or villous between the nerves. Flowers large, purple, disposed in terminal racemes or panicles; before expansion hidden by 2 bracteas each, which fall off as the flower expands. The species have the habit of *Pleroma*, but differ in the genitals being hispid, and in the capsule being dry and free, not baccate and adnate to the calyx.

\* *Calyx rough from stiffish bristles.*

1 *L. FRIGÍDULA* (D. C. prod. 3. p. 127.) branches somewhat compressed, smoothish; leaves sessile, somewhat cordate at the base, oval-oblong, acute, quite entire, 3-nerved, glabrous; peduncles axillary, trichotomously cymose, disposed in a paniced thyrs; bracteas involving the flower-bud when young; calyx

bristly, with 5 ciliated lobes; petals ciliated; filaments rather pilose. *h. S.* Native of Brazil, in the alpine fields of Serro Frio. *Rhéxia frigidula*, Schrank et Mart. mss. Style much elongated.

*Frigid Lasiandra*. Shrub 2 to 3 feet.

2 *L. TRIFÓLIA* (D. C. l. c.) branches trigonal, roughish; leaves 3 in a whorl, almost sessile, oblong, quite entire, acute, 3-nerved, glabrous in the disk above, but beset with adpressed bristles beneath and on the margins; panicle terminal; calyx bristly, with 5 ciliated deciduous lobes; petals ciliated; filaments hispid; style glabrous. *h. S.* Native of Brazil, in the province of St. Paul, in fields and on the edges of woods. Leaves 3 inches long, but hardly an inch broad. Pedicels and calyxes bristly. *Rhéxia trifolia*, Schrank et Mart. mss.

*Three-leaved Lasiandra*. Shrub 2 to 3 feet.

3 *L. MARTUSIANA* (D. C. l. c.) shrubby; branches nearly terete, beset with adpressed bristles; leaves sessile, ovate, 3-nerved, quite entire, glabrous above, dotted beneath but hardly bristly; thyrs terminal; bracteas 2, oval, half involving the flower-bud; calyx bristly, with an obovate tube; and 5 oval-oblong ciliated lobes, which are longer than the tube; filaments hispid; anthers rather dissimilar. *h. S.* Native of Brazil, in the province of Minas Geraes in fields, at the elevation of 2000 feet. *Rhéxia Lasiandra*, Schrank et Mart. mss.

*Martius's Lasiandra*. Shrub 2 to 3 feet.

4 *L. MORICANDIANA* (D. C. prod. 3. p. 128.) shrubby; branches nearly terete, clothed with short adpressed villi; leaves petiolate, oblong, acute, 3-5-nerved, clothed with adpressed bristles above and pale villi beneath; flowers in threes, terminal; bracteas ovate, clothed with adpressed villi, large; tube of calyx campanulate, bristly, longer than the lobes; filaments beset with glandular pili. *h. S.* Native of Brazil. *Rhéxia Moricandiana*, Ser. mss. Anthers long, having their connectives furnished with 2 tubercles at the base. Lobes of calyx at length deciduous. The outer nerves of the leaves almost marginal.

*Moricand's Lasiandra*. Shrub 2 to 3 feet.

5 *L. MAXIMILIANA* (D. C. l. c.) branches tetragonal, and are as well as the petioles and peduncles scabrous from bristles; leaves petiolate, ovate, obtuse at the base, acute at the apex, 5-nerved, bristly above, nerveless beneath, but with the nervules beset with silky bristles; thyrs paniced, corymbose, terminal; bracteas, and outside of calyx scabrous from adpressed bristles; style glabrous; filaments rather pilose at the base. *h. S.* Native of Brazil, where it was collected by Prince Maximilian de Neuweid. Very like *L. Gaudichaudiana*, but differs in the bristles being more stiff and harsh.

*Maximilian's Lasiandra*. Shrub 4 to 6 feet.

6 *L. GAUDICHAUDIANA* (D. C. l. c.) branches tetragonal, rough from small adpressed bristles; leaves petiolate, ovate, acuminate, 5-nerved, beset with small, softish bristles on both surfaces; panicle terminal; bracteas acuminate, shorter than the tube of the calyx; calycine tube ovate, clothed with adpressed bristles, twice the length of the lobes, which are acuminate; filaments rather pilose; style glabrous. *h. S.* Native of Brazil. Lateral nerves of leaves forming a margin. Anthers long, falcate, having their connectives hardly drawn out into a thick appendage at the base.

*Gaudichaud's Lasiandra*. Shrub 2 to 3 feet.

7 *L. OCHYPÉTALA* (D. C. l. c.) branches tetragonal, and are as well as the petioles, peduncles, and upper surface of leaves beset with adpressed bristles; leaves petiolate, oblong, acuminate, 5-nerved, quite entire, clothed with adpressed villi beneath; racemes terminal, short; pedicels opposite, 1-3-flowered; calyx bristly, with an ovate-globose tube and lanceolate lobes; filaments and style hispid at the base. *h. S.* Native of Peru, on the mountains. *Rhéxia ochypétala*, Ruiz et Pav. fl. per. 3. p. 86. t. 321. f. a. *Rhéxia oxypétala*, Spreng. syst. 2. p. 306.

*Pleroma ochypétala*, D. Don, l. c. Bracteas ovate, deciduous, bristly. Petals large, obovate, retuse, nearly obcordate, with a mucrone in the recess. Ovarium free.

*Sharp-petalled Lasiandra*. Shrub 10-12 feet.

8 *L. KUNTHIANA* (D. C. l. c.) branches tetragonal, and are as well as the petioles clothed with adpressed villi; leaves petiolate, oblong, acute, 5-nerved, quite entire, scabrous above from little bristles, but white from adpressed silky villi beneath; pedicels hispid, axillary, 1-flowered, and terminal; tube of calyx campanulate, beset with stiff bristles, but with the lobes deciduous; filaments and style hispid.  $\frac{1}{2}$  S. Native of Brazil. Petals very blunt. Ovarium bristly at the apex, rather longer than the tube of the calyx. Bracteas large, deciduous.

*Kunth's Lasiandra*. Shrub 4 to 8 feet.

9 *L. EMULA* (D. C. l. c.) shrubby; branches, petioles, and peduncles clothed with hairy tomentum; leaves petiolate, ovate, mucronately acute, 5-nerved, quite entire, scabrous from bristles above, but densely clothed with adpressed villi beneath; pedicels rising from the upper axils of the leaves, and solitary at the tops of the branches, disposed in something like racemes; calyx bristly, with a globose tube; and 5 lanceolate deciduous lobes, which are glabrous inside.  $\frac{1}{2}$  S. Native of Brazil, in the province of Minas Geraes. *Meriania emula*, Schrank and Mart. mss. Ovarium bristly at the apex. Filaments and style hairy. Very like *L. hygrophila*.

*Emulous Lasiandra*. Shrub 4 to 6 feet.

10 *L. HYGROPHILA* (D. C. l. c.) shrubby; branches terete, hispid from bristles; leaves sessile, ovate, acute, 5-7-nerved, ciliate, serrated, rough from stiff bristles above, but hairy beneath; pedicels axillary, 1-flowered, disposed in racemose cymes; calyx bristly; with 5 subulate lobes, which are a little longer than the tube.  $\frac{1}{2}$  S. Native of Brazil, in the province of St. Paul, in bogs in woods. *Rhéxia hygrophila*, Mart. mss. Leaves hardly an inch long and 8-9 lines broad. Like *L. Tomensis*, but differs in the anthers being shorter, and in the filaments bearing a few subglandular hairs.

*Water-loving Lasiandra*. Shrub 4 to 6 feet.

11 *L. TIBOUCHINOIDES* (D. C. l. c.) shrubby; branches bluntly tetragonal, beset with bristly pili; leaves petiolate, elliptic-oblong, mucronate, quite entire, 3-nerved, bearing a few scattered bristles above, but clothed with villous tomentum beneath; flowers terminal, bracteate, usually twin; calyx bristly, with 5, ovate, acute, ciliated lobes.  $\frac{1}{2}$  S. Native of Brazil, in the province of St. Paul, in marshes. *Rhéxia tibouchinoides*, Schrank and Mart. mss. Leaves an inch long and 5-6 lines broad. Calyx ovate, red; lobes 5. Petals large. Anthers linear, falcate, acuminate by the beaks, a little longer than the connectives, which are tumid at the base. Stamens exserted, rather unequal, glabrous, and bearing a few glands at the very base. Habit of *Tibouchina* of Aublet or *Chetogástra lepidota*.

*Tibouchina-like Lasiandra*. Shrub 6 to 8 feet.

12 *L. HOSPITA* (D. C. prod. 3. p. 129.) shrubby, much branched, scabrous in every part from adpressed bristles; branchlets somewhat tetragonal; leaves on short petioles, elliptic, 3-nerved, quite entire, acute; pedicels axillary, 1-flowered; calyx globose, scarcely 5-toothed; capsule 5-celled.  $\frac{1}{2}$  S. Native of Brazil, in the province of Minas Geraes, on the mountains, in cold places. *Rhéxia hospita*, Schrank and Mart. mss. Leaves an inch long. The bristles on the leaves regularly disposed between the veins. Bracteas deciduous. Stamens unknown. The branches becoming tumid from a species of cynips.

*Stranger Lasiandra*. Shrub 2 to 3 feet.

13 *L. MACROCHITON* (D. C. l. c.) shrubby; branches tetragonal, beset with adpressed little bristles; leaves petiolate, oval, 3-nerved, beset with adpressed bristles above, but with dot-like

setæ beneath; thyrses terminal; bracteas 2, rather villous, involving the flower in its young state; calyx bristly, with an ovate tube, and 5 ovate, ciliated, longer lobes; filaments hispid; anthers long, nearly similar.  $\frac{1}{2}$  S. Native of Brazil. *Rhéxia macrochiton*, Mart. mss. Petals ciliated when young. Anthers falcate, beaked.

*Long-coated Lasiandra*. Shrub 2 to 3 feet.

\* \* \* *Calyx clothed with adpressed, rather silky villi.*

14 *L. THEREMINIANA* (D. C. l. c.) shrubby; branches terete, clothed with adpressed short villi; leaves petiolate, ovate, acute, quite entire, 7-nerved, clothed with canescent villi beneath, villous above; flowers solitary, terminal; bracteas 2, ovate; villi on calyx silky and adpressed; calycine lobes longer than the tube, which is very villous; filaments villous; appendages of the connectives of the anthers bearing scattered glands.  $\frac{1}{2}$  S. Native of Brazil. Very like *Chetogástra muricata*, but differs in the longer petiolate 7-nerved leaves; the flowers are also larger, and bibracteate and the anthers shorter.

*Thereminian Lasiandra*. Shrub 8 to 10 feet.

15 *L. SEMIDECANDRA* (Schrank et Mart. mss. ex D. C. l. c.) shrubby; branches tetragonal, villous; leaves petiolate, ovate, acute, quite entire, 5-nerved, rough from stiff bristles above, but villous beneath; flowers solitary, terminal, and axillary, pedicellate; bracteas bristly, deciduous, involving the flower-bud before they fall off; calyx clothed with silky villi; with 5 acuminate lobes, which are glabrous inside and longer than the tube.  $\frac{1}{2}$  S. Native of Brazil, in the province of Minas Geraes, on the mountains. *Rhéxia semidecandra*, Schrank et Mart. mss. Bracteas 2. The rest as in *L. hygrophila*. Flowers as in *L. Fontanesiana*. The 5 alternate stamens larger; anthers falcate; having their connectives knotted at the base, and twice the length of the anthers. Style pilose.

*Semidecandrous Lasiandra*. Shrub 4 to 6 feet.

16 *L. CANDOLLEANA* (D. C. l. c.) shrubby; branches nearly terete, rough from small adpressed bristles; leaves petiolate, oval-oblong, attenuated at both ends, triple-nerved, membranous, quite entire, clothed with adpressed bristles on both surfaces; pedicels axillary, solitary, torn; bracteas oval, oblong, acute, deciduous; calyx white from adpressed villi, having its lobes longer than its tube, which is ovate; style and filaments hispid.  $\frac{1}{2}$  S. Native of Brazil, at Rio Grande de Belmonte. D. C. Coll. l. f. 6. *Rhéxia Candolleana*, Mart. herb. Allied to *L. Fontanesiana*, but differs in the lateral nerves of the leaves being simple, not bifid. Petals violaceous, ciliated when young. Stamens 10, alternate ones rather the smallest.

*De Candolle's Lasiandra*. Shrub 2 to 3 feet.

17 *L. RADDIANA* (D. C. l. c.) shrubby; branches somewhat tetragonal, furnished with a few adpressed bristles; leaves petiolate, oblong, acuminate at both ends, quite entire, smoothish, but bearing a few adpressed bristles, 3-nerved; flowers terminal, usually solitary; calyx densely clothed with adpressed silky villi.  $\frac{1}{2}$  S. Native of Brazil. *Rhéxia uniflora*, Raddi. mem. l. c. p. 9. but not of Vahl. *Rhéxia Raddiana*, Moricand. herb. Ser. mss. Flowers large. Style and filaments hispid. Lobes of calyx deciduous.

*Raddi's Lasiandra*. Shrub 4 to 6 feet.

18 *L. FONTANESIANA* (D. C. prod. 3. p. 130.) branches tetragonal; angles winged; petioles, peduncles, and upper surface of leaves beset with adpressed bristles; leaves petiolate, oblong, acute, 5-nerved, beset with adpressed bristles beneath on the nerves and on the margins, the rest clothed with white stellate velvety down; racemes terminal; pedicels opposite, 1-3-flowered; calyx very villous, white; filaments very hairy.  $\frac{1}{2}$  S. Native of Brazil, about Rio Janeiro and St. Paul. *Rhéxia Fontanesii*, Bonpl. rhex. t. 36. *Rhéxia alata*, Raddi. mem. p. 8. *Melastoma granulosa*, Desr. in Lam. dict. t. p.

44. Sims, bot. mag. t. 214. *Pleroma granulòsum*, D. Don, wern. soc. mem. 4. p. 293. *Melastoma Fontanesianum*, Spreng. syst. *Rhèxia dasystamínea*, Schrank, mss. Flowers large, of a rose-purple colour.

*Var. β, angustior* (D. C. l. c.) leaves not half the breadth; flowers smaller.

*Desfontain's Lasiandra*. Shrub 5 to 8 feet.

19 *L. FISSINÉRVIA* (D. C. l. c.) branches tetragonal, not winged; petioles, peduncles, and leaves beset with adpressed bristles; leaves petiolate, oblong, acute, 5-nerved or only 3-nerved, with the 2 lateral ones bifid, beset with adpressed bristles on the margins and on the nerves on the under surface, the rest velvety from dense stellate down; flowers racemose; peduncles opposite, 1-3-flowered; calyx clothed with adpressed white pubescence; filaments hairy; style glabrous. *h. S.* Native of Brazil, in the province of Minas Geraes. *Rhèxia fissinérvia*, Schrank et Mart. mss. Like *L. Fontanesiana*, but differs in the stem being tetragonal, not winged, in the calyx being less villous, and in the flowers being smaller.

*Cleft-nerved Lasiandra*. Shrub 5 to 10 feet.

20 *L. STENOCA'RPA* (D. C. l. c.) branches tetragonal, having the angles rather winged, and are as well as the petioles and peduncles clothed with adpressed stiff villi; leaves on short petioles, oblong, acute, mucronate, 5-nerved, quite entire, beset with adpressed bristles above, and silky villi beneath; flowers panicled; branches of panicle tetragonal, opposite, 3-flowered; calyx clothed with adpressed villi; filaments hairy; style rather pilose. *h. S.* Native of Brazil, in rocky places near Maraca, in the province of Bahia. *Rhèxia stenocarpa*, Schrank et Mart. mss. Allied to *L. Fontanesiana*, but differs in the flowers being smaller, and especially in the down, which is very distinct.

*Narrow-fruited Lasiandra*. Shrub 5 to 8 feet.

21 *L. LANGSDORFIA'NA* (D. C. l. c.) branches tetragonal, having the angles winged, beset with bristles as well as the peduncles; petioles short, villous; leaves oval, acute from a mucrone, 5-nerved, clothed with adpressed bristles above, and with adpressed villi on the nerves beneath, and soft stellate tomentum between the nerves; panicle thyrsoid, terminal, many-flowered; calyx clothed with adpressed white villi, with an ovate tube, and lanceolate, deciduous lobes; filaments and style beset with bristles. *h. S.* Native of Brazil, in exposed fields in the provinces of Rio Janeiro and St. Paul. *Rhèxia Langsdorfiana*, Bonpl. rhex. t. 51. *Osbéckia Langsdorfiana*, Spreng. syst. 2. p. 312. Allied to *L. Fontanesiana*, but differs in the leaves being ovate at the base, and rather rufescent beneath. Thyrses panicle-formed. Stamens beset with glandular pili.

*Langsdorf's Lasiandra*. Shrub 5 to 6 feet.

22 *L. PROTEAFÓRMIS* (D. C. l. c.) branchlets acutely tetragonal, and are as well as the peduncles beset with bristles; petioles hardly any, villous; leaves ovate, mucronate, 5-nerved, densely clothed with adpressed silky villi on both surfaces, the down on the under surface stellate; thyrses panicled, terminal, many-flowered; bracteas and calyxes very villous; lobes of calyx lanceolate, acute; petals a little ciliated, twice the length of the calycine lobes; style and filaments beset with a few hairs. *h. S.* Native of Brazil, in woods, and in bushy exposed places in the province of Minas Geraes. *Rhèxia proteafórmis*, Schrank et Mart. mss. Allied to *L. Langsdorfiana*, but differs in the flowers not being above half the size, and in the nerves of the leaves being clothed with yellowish villi.

*Protea-formed Lasiandra*. Shrub 5 to 6 feet.

23 *L. URVILLEA'NA* (D. C. l. c.) branches tetragonal, clothed with soft villi; leaves on short petioles, oval-oblong, mucronate, 5-nerved, quite entire, clothed with adpressed silky villi on both surfaces; thyrses panicled, crowded, terminal; bracteas and calyxes very villous; lobes lanceolate, acute; filaments and

style beset with glandular pili, from the base to the middle. *h. S.* Native of the island of St. Catharine, in the entrance to the Rio Janeiro, where it was collected by Captain d'Urville. Petals purple, ciliated, almost bearded at the apex. Knots of branches thickly beset with spreading bristles.

*D'Urville's Lasiandra*. Shrub 5 to 6 feet.

24 *L. ADENOSTÉMON* (D. C. l. c.) branches tetragonally winged, and are as well as the peduncles clothed with adpressed bristles; petioles hardly any; leaves ovate, quite entire, mucronate, 5-nerved, villous above and on the nerves beneath, but clothed with stellate tomentum between the nerves on the under surface; thyrses panicled, terminal; calyx and bracteas clothed with adpressed villi; lobes of calyx lanceolate; filaments and style pubescent and beset with glandular pili at the base; the 5 alternate filaments bearing a few thick pedicellate glands. *h. S.* Native of Brazil, about Rio Janeiro in exposed fields. *Melastoma adenostemon*, Schrank et Mart. mss. Habit of *L. proteafórmis*, but the stamens are almost that of *Macaírea*.

*Gland-stamened Lasiandra*. Shrub 5 to 6 feet.

25 *L. ARGÉNTEA* (D. C. prod. 3. p. 131.) branches tetragonal, clothed with adpressed bristles; leaves sessile, ovate, 5-7-nerved, quite entire, densely clothed with silky villi on both surfaces; thyrses panicled, terminal, with the rachis very villous and compressed; calyx tubular; filaments and style bearing a few pili. *h. S.* Native of Brazil, about Rio Janeiro. *Melastoma argentea*, Desv. in Lam. dict. 4. p. 45. *Rhèxia holosericea*, Bonpl. rhex. t. 12. Ker. bot. reg. t. 323. Lodd. bot. cab. t. 236. Delaun. herb. amat. t. 321. Spreng. syst. 2. p. 307. exclusive of the synonyme. *Pleroma holosericeum*, D. Don, mem. soc. wern. 4. p. 293. *Melastoma clavata*, Pers. ench. 1. p. 476. Flowers purple. A very beautiful species, and very distinct from the *Melastoma holosericea* of Lin. and Swartz.

*Silvery Lasiandra*. Fl. July. Clt. 1816. Sh. 6 to 10 feet.

*Cult.* All the species are elegant shrubs, bearing thyrsoid panicles of large purple flowers. They grow best in a mixture of loam, peat, and sand; and young cuttings root readily if planted in the same kind of soil, placed in heat, under a hand-glass.

XXXII. CHÆTOGA'STRA (from *χαῖτη*, *chaite*, a bristle, and *γαστήρ*, *gaster*, a belly; in allusion to the tube of the calyx being beset with bristles or scales). D. C. prod. 3. p. 131.

*Lin. syst.* *Decándria, Monogýnia*. Tube of calyx turbinate, pilose, or scaly; lobes 5, permanent. Petals 5, obovate. Stamens 10, with glabrous filaments and oblong anthers; anthers opening by 1 pore at the apex; having their connectives drawn out, sometimes into a simple or bifid spur, and sometimes into 2 small, obtuse tubercles. Ovary free, bristly at the apex, and often denticulated. Capsule 5-celled. Seeds cochleate.—Shrubs, rarely herbs, natives of South America, for the most part clothed with strigose pili. Leaves 3-5-nerved, quite entire, or hardly serrulated. Flowers terminal, purple, or white. This genus differs from *Lasiandra* in the stamens being glabrous, and in the inflorescence; from *Arthrostemma* in the quinary number of the parts of the flower, not quaternary; from *Osbéckia* in there being no appendages between the calycine lobes.

*SECT. I. MONOCÉNTRA* (from *μονος*, *monos*, one, and *κέντρον*, *kentron*, a spur; in reference to the anthers having their connectives drawn out into a simple spur at the base). D. C. prod. 3. p. 131. Tube of calyx obovate or turbinate; lobes 5, lanceolate, rather dilated at the base. Anthers having their connectives drawn out into a simple spur at the base. Ovary toothed at the apex.—Showy Peruvian shrubs, with the habit of *Lasiandra*. Branches terete. Flowers large, purple. Perhaps a proper-genus.

1 *C. SPECIÓSA* (D. C. l. c.) branches clothed with short, simple

down; leaves on short petioles, oblong, 3-nerved, quite entire, ciliated, glabrous on both surfaces, except the nerves, which are downy; flowers terminal, solitary; calyx turbinate, pubescent; connectives of anthers drawn out in a simple, thick, conical spur each. *h. S.* Native of Peru, on Mount Quindiu and near Popayan, where it is called *Flor de Mayo*. *Rhèxia speciosa*, Bonpl. rhex. t. 4. Habit of *Cistus ladaniferus*. Flowers large, of a rose-purplish colour.

*Showy Chætogastra*. Shrub 3 to 6 feet.

2 *C. RETICULATA* (D. C. l. c.) branches clothed with rufous villi; leaves petiolate, ovate-lanceolate, obtuse at the base, acuminate at the apex, denticulated, 5-nerved, beset with bristles on the upper surface, which are bullate at the base, reticulated beneath, and hairy on the nerves; flowers few, terminal; calyx villous; connectives of anthers drawn out into a simple, slender spur each; ovary toothed at the apex. *h. S.* Native of Peru, on Mount Saragura, in cold places near Loxa. *Rhèxia reticulata*, Bonpl. rhex. t. 9. Flowers large, violaceous. Style very long.

*Reticulated-leaved Chætogastra*. Tree 10 to 20 feet.

SECT. II. DIOTANTHÆRA (from *δύς*, *dis*, two, *ὄντος*, *ontos*, an ear, and *ἀνθήρα*, *anthera*, an anther; in reference to the connectives of the anthers being drawn out into a bifid spur or 2 auricles). D. C. prod. 3. p. 131. Tube of calyx obovate, bractless; lobes 5. Connectives of anthers drawn out into a bifid spur or two auricles at the base. Flowers white or rose-coloured.

3 *C. LANCEOLATA* (D. C. l. c.) stem herbaceous, rather tetragonal, clothed with adpressed villi; leaves petiolate, broad-lanceolate, acuminate, serrulately ciliated, 5-nerved, villous on both surfaces; peduncles trichotomous, axillary, and terminal; tube of calyx ovate, rather longer than the subulate lobes, which are reflexed and ciliated; connectives of anthers drawn out into a didymous spur at the base. *⊙. S.* Native of Peru and Trinidad. Hook. bot. mag. 2836. *Rhèxia flexuosa*, Ruiz et Pav. fl. per. 3. p. 85. t. 320. f. 6. *Rhèxia lanceolata*, Bonpl. rhex. t. 21. but not of Walt. or Poir.

*Osbéckia lanceolata*, Spreng. syst. 2. p. 312. Lateral nerves of leaves rather concrete at the base on both sides. Flowers white.

*Lanceolate-leaved Chætogastra*. Pl. 1 to 2 feet.

4 *C. LONGIFOLIA* (D. C. prod. 3. p. 132.) stem herbaceous, angular, beset with adpressed pili; leaves petiolate, lanceolate, elongated, acuminate, pilose, 5-nerved; lateral nerves concrete at the base; panicle axillary, dichotomous, shorter than the leaves; tube of calyx ovate, longer than the lobes, which are subulate. *⊙. S.* Native of South America. *Rhèxia longifolia*, Vahl. eelog. 1. p. 39. icon. amer. t. 15.

*Long-leaved Chætogastra*. Pl. 1 to 2 feet?

5 *C. HAVANENSIS* (D. C. prod. 3. p. 132.) stem almost herbaceous; branches tetragonal, hairy; leaves petiolate, oval, acuminate, almost quite entire, 5-7-nerved, beset with scattered villi on both surfaces; panicles axillary, cymose, shorter than the leaves, alternate ones disposed in a panicle; thyse; tube of calyx ovate, villous, rather longer than the lobes, which are subulate; anthers furnished with 2 tubercles at the base.

VOL. II.

FIG. 110.

*h. S.* Native about the Havannah, in Cuba, where we have seen it growing in plenty, at very little distance from the town. D. C. coll. 1. t. 7. It is very nearly allied to the preceding species, but differs in the leaves being broader, cymes shorter, and in the connectives of the anthers being hardly evident.

*Havanna Chætogastra*. Shrub 1 to 2 feet.

6 *C. SCHIEDEANA* (Schlecht. et Cham. in Linnæa. 5. p. 566.) suffruticose; branches terete, beset with adpressed hairs; leaves on short petioles, ovate-lanceolate, acuminate, 3-nerved, obsoletely serrulated, strigose on both surfaces and ciliated on the margins; cymes terminal and axillary, 3-5-flowered; flowers on short pedicels; calyx strigose, campanulate, with linear-spatulate segments, which are about equal in length to the petals, which are obovate; connectives of anthers biauriculate at the base. *h. S.* Native of Mexico, near Misantla. Flowers rose-coloured.

*Variety, macrantha* (Schlecht. et Cham. in Linnæa. 5. p. 566.) flowers purple, double the size of those of the species; petals twice the length of the calycine lobes; seeds small, white, cochleate.

*Schiedeana Chætogastra*. Shrub 1 to 2 feet.

7 *C. HISPIDA* (D. C. l. c.) stem herbaceous, tetragonal, hispid; leaves petiolate, oval, attenuated at the base, and acuminate at the apex, 5-nerved, hardly serrulated, (lateral nerves confluent at the base,) villous above, hispid on the nerves beneath, but pubescent between the nerves; panicles lateral and terminal, disposed in a thyse; calyx ovate, villous, with subulate lobes; connectives of anthers very short, furnished with 2 very short tubercles at the base of each. *⊙. S.* Native of Brazil. Like *C. lanceolata*, *C. macrantha*, and probably all three constitute but one species. Flowers white.

*Hispid Chætogastra*. Pl. 1 to 2 feet.

8 *C. HYPERICOIDES* (D. C. l. c.) plant erect, simple, densely clothed with canescent villi; leaves oval, on short petioles, acute, 7-nerved; panicles axillary and terminal, leafy, loose; tube of calyx ovate, longer than the lobes; petals obovate, hardly exceeding the calycine lobes. *⊙. S.* Native of Guiana, in marshes. *Melastoma villosa*, Aubl. guian. 1. p. 168. *Rhèxia villosissima*, Rich. in Bonpl. rhex. t. 31. Flowers small, white. Connectives of anthers drawn out into 2 elongated auricles. Ovary bristly at the apex.

*St. John's-wort-like Chætogastra*. Pl. 1 to 2 feet.

9 *C. LYCHNITOIDES* (D. C. l. c.) plant herbaceous, erect; stem almost simple, densely beset with spreading hairs; leaves sessile, oval, acute, clothed with adpressed silky villi, 7-nerved, quite entire; thyse elongated; flowers bracteate, crowded on the peduncles; calyx villous, with an ovate tube, nearly twice the length of the lobes, which are lanceolate and acuminate. *⊙. S.* Native of Brazil, in the province of Minas Geraes, on sandstone rocks. *Rhèxia lychnitoides*, Schrank et Mart. mss. Very like *C. hypericoides*, but differs in the calyxes being twice the size, and in the flowers being more crowded. Stamens unknown. Capsule 5-celled. Seeds small, cochleate, smooth.

*Lychnitis-like Chætogastra*. Pl. 1 to 3 feet.

10 *C. STACHYOIDES* (D. C. l. c.) plant herbaceous, erect; branches tetragonal, hairy; leaves on short petioles, oblong, obtuse at the base, acute at the apex, quite entire, 5-nerved, clothed with adpressed villi; flowers crowded into verticillate heads in the axils of the leaves; calyx 4-5-cleft; appendages hair-formed, hardly distinct. *⊙. S.* Native of Brazil. *Rhèxia stachyoides*, Bonpl. rhex. t. 43. Flowers rose-coloured. Five of the stamens are almost without auricles at the base, and the other 5 are furnished with a long connective each which ends in 2 bristles. There is a variety of this species, according to Bonpland, with 4-5-cleft octandrous or de-androus flowers.

5 D

*Stachys-like Chætogastra.* Pl. 2 feet.

11 *C. CILIARIS* (D. C. l. c.) stem herbaceous, tetragonal, and is as well as the petioles and peduncles hispid; leaves on short petioles, oblong, acuminate, serrulated, 5-nerved, beset with stiff villi above and densely clothed with pale soft villi beneath; cymes terminal, subcorymbose; calyx very villous, with short, lanceolate lobes; connectives of anthers bluntly bifurcated at the base. *U. S.* Native of Santa Fe de Bogota. ex herb. Humb. *Meriania ciliaris*, Vent. choix. t. 34. *Osbéckia ciliaris*, Ser. mss. Flowers purple. Petals obovate, ciliated. Stamens glabrous.

*Ciliated-petalled Chætogastra.* Pl. 1 foot.

12 *C. TORTUOSA* (D. C. l. c.) branches loose, terete, rather hairy; leaves petiolate, lanceolate, 3-nerved, quite entire, rather villous; flowers nearly terminal, 1-3-together; tube of calyx ovate, villous, almost equal in length to the lobes which are nearly subulate; connectives of anthers simple, but bifid at the apex. *U. S.* Native of Mexico, in arid places, near Tasco. *Rhèxia tortuosa*, Bonpl. rhex. t. 7. *Osbéckia tortuosa*, Spreng. syst. 2. p. 312. Flowers small, white.

*Twisted Chætogastra.* Shrub 1 foot.

13 *C. DIVARICATA* (D. C. l. c.) plant herbaceous, rather sarmentose; stem acutely tetragonal, divaricately branched at the apex, and scabrous along the angles; leaves on short petioles, lanceolate, acute, 3-nerved, ciliated, scabrous at the angles beneath; flowers disposed in a loose dichotomous panicle; calyx pentagonal, scabrous on the angles; petals oval, yawned, ciliated. *U. S.* Native on the banks of the Orinoco, in shady places. *Rhèxia divaricata*, Bonpl. rhex. t. 92. *Osbéckia divaricata*, Spreng. syst. 2. p. 312. Flowers small, white.

*Divaricate Chætogastra.* Pl. sarmentose.

14 *C. GRACILIS* (D. C. prod. 2. p. 133.) herbaceous, erect, nearly simple, naked at the apex; stem tetragonally terete, villous; leaves almost sessile, lanceolate-linear, acute, quite entire, 3-5-nerved, villous; pedicels axillary, 1-flowered; and terminal, in threes; tube of calyx ovate, about equal in length to the lobes, which are lanceolate and acuminate. *U. S.* Native of Brazil, in elevated grassy fields about Rio Janeiro. *Rhèxia gracilis*, Kunth, in Bonpl. rhex. t. 52. *Rhèxia agrostemma*, Mart. et Schrank. mss. Root creeping. Petals violaceous. Anthers elongated, acutish, opening by 1 pore. Capsule 5-celled. Seeds cochleate.

*Slender Chætogastra.* Pl. 2 to 3 feet.

15 *C. FRATERNA* (D. C. l. c.) herbaceous, erect; stem from compressed to terete, scabrous from adpressed short bristles; leaves hardly petiolate, oblong-linear, acute, 5-nerved, nearly entire, beset with adpressed bristles; racemes paniced, terminal, elongated; tube of calyx ovate, beset with adpressed bristles: with the lobes lanceolate, acute, coloured and glabrous on the inside. *U. S.* Native of South America. Very like *C. gracilis*.

*Brotherly Chætogastra.* Pl. 1 to 2 feet.

16 *C. HIRUTA* (D. C. l. c.) plant herbaceous, erect, almost simple; stem terete, densely clothed with spreading hairs; leaves sessile, lanceolate, 5-nerved; cymes axillary, pedunculate and terminal, almost disposed in a panicle; petals ciliated at the apex; calyx bristly, with an ovate tube and 5 lanceolate acuminate lobes. *U. S.* Native of Brazil. Very like *C. gracilis*, but differs in the stem being hairy, not beset with adpressed bristles.

*Hairy Chætogastra.* Pl. 1 to 2 feet.

17 *C. HIERACIOIDES* (D. C. l. c.) almost herbaceous; stems simple, and are as well as the leaves and calyxes very hairy; leaves sessile, ovate, acute, 5-nerved, very few at the base of the stem; cymes racemously paniced, contracted; flowers with 18 stamens; calyx very villous, with lanceolate, pectinately ciliated

lobes; petals obovate; anthers elongated, acute. *U. S.* Native of Brazil, in the province of Minas Geraes, on the more elevated mountains, in fields. *Rhèxia hieracioides*, Mart. et Schrank, mss. Very like *Rhèxia piloselloides* of Bonpl. but the leaves are much broader, and 5-nerved, not 7-nerved, and all parts of the plant are much more hairy, the flowers more numerous, and on shorter pedicels, and according to Schrank the petals are obovate, of pale lilac colour, not yellow, nor terminated by a hair, and in the anthers being twice the length.

*Hawkweed-like Chætogastra.* Pl. 1 foot.

18 *C. STRIGILLOSA* (D. C. l. c.) almost herbaceous, erect, densely clothed with adpressed stiff pili; leaves on short petioles, oval, acute, 5-nerved; peduncles longer than the leaves, bearing sessile flowers in the axils of the bracteas; flowers decandrous. *U. S.* Native of Brazil, in the province of Minas Geraes, on the sides of mountains. *Rhèxia strigillosa*, Schrank et Mart. mss. Stem a foot high, hardly branched. Leaves nearly 3 inches long. Flowers purple, 9-10 lines in diameter; lobes of calyx lanceolate-linear. Petals obovate, ciliated. Anthers having their connectives hardly produced under the cells, tumid, straightish, and acuminate at the base. Allied to *C. hieracioides*.

*Strigillose Chætogastra.* Pl. 1 foot.

19 *C. SHERARDIOIDES* (D. C. l. c.) plant erect, herbaceous, branched, rough from strigose adpressed short pili; leaves on very short petioles, narrow-lanceolate, quite entire, 3-nerved; flowers terminal, 3-together, or axillary and solitary, decandrous. *U. S.* Native of Peru, ex Hanke, or of Brazil, in the province of Minas Geraes, ex Mart. *Rhèxia sherardioides*, Schrank, mss. Leaves 6-7 lines long and 2-3 broad. Flowers middle-sized. Tube of calyx ovate; lobes 5, linear-subulate, elongated. Anthers linear, acuminate, drawn out at the base into a long pedicel each, which ends in 2 bristles. Style long, and is as well as the filaments glabrous.

*Sherardia-like Chætogastra.* Pl.  $\frac{1}{3}$  foot.

20 *C. CLINOPODIFOLIA* (D. C. l. c.) plant herbaceous, of many stems, beset with long villi in every part; leaves petiolate, ovate, serrulated, 3-nerved; flowers axillary, on short pedicels, solitary: or terminal, in threes; calyx hispid, campanulate, 5-toothed; anthers equal. *U. S.* Native of Brazil, in the provinces of St. Paul and Rio Janeiro, in shady woods. *Melastoma repens*, Schrank et Mart. mss. but the fruit is capsular, not baccate. Herb humble. Root fibrous. Flowers small. Anthers ovate, opening by 1 pore, having short hardly auricled connectives. Capsule globose, 5-celled, free, dehiscent. Seeds cochleate. Bristles on the ovarium few. Appendages hardly any, bristly, and rather palmate at the base.

*Clinopodium-leaved Chætogastra.* Pl.  $\frac{1}{3}$  foot.

21 *C. MOLLIS* (D. C. prod. 3. p. 134.) shrubby; branches terete, clothed with soft adpressed villi; leaves petiolate, ovate, acuminate, 7-nerved, beset with soft villi; thyrses paniced, terminal, crowded, hairy; tube of calyx ovate, velvety, about equal in length to the lobes, which are linear; petals oval, acuminate mucronate; anthers almost without auricles at the base. *U. S.* Native of Peru, in groves about Loxa. *Rhèxia mollis*, Bonpl. rhex. t. 19. Flowers of a violaceous blue colour. Ovarium hairy.

*Soft Chætogastra.* Shrub 6 feet.

22 *C. CANESCENS* (D. C. l. c.) shrubby; branches terete, and are as well as the leaves densely clothed with short hairs; leaves petiolate, ovate-lanceolate, 3-nerved, quite entire; flowers subterminal, usually 3 together, drooping, on short pedicels; calyx rather hairy, with an ovate tube, which is about the length of the lobes; connectives of anthers hardly evident; anthers bluntly bifurcate at the base. *U. S.* Native of cold places, on Mount Purase at Popayan, where it is called *Sarzileja*.

*Rhèxia canescens*, Bonpl. rhex. t. 6. Flowers dark purple or violaceous. Calyx red.

*Canescent* Chætoгастра. Shrub 3 feet.

23 *C. SARMENTOSA* (D. C. l. c.) shrubby; branches climbing almost terete, villous; leaves on short petioles, oval, somewhat cordate, serrulated, 7-nerved, villous; flowers terminal, approximating by threes, on very short pedicels; calyx villous, with the tube about equal in length to the lobes; connectives of anthers long, furnished with 2 tubercles each at the base.  $\frac{1}{2}$ . S. Native of Peru, in hot places near Cuenca and St. Felipe. *Rhèxia sarmentosa*, Bonpl. rhex. t. 10. Flowers large, of a reddish violaceous colour.

*Sarmentose* Chætoгастра. Shrub cl.

24 *C. MURICATA* (D. C. l. c.) shrubby; branches, peduncles, and calyxes pilose; leaves petiolate, broadly ovate, somewhat cordate, hardly acute, 5-nerved, beset with bristles above, which are blistered at the base, but clothed with silky tomentum beneath; flowers terminal, solitary; anthers each furnished with a slender appendage, which is bidentate at the base.  $\frac{1}{2}$ . S. Native of cold places on Mount Purase, near Popayan. *Rhèxia muricata*, Bonpl. rhex. t. 1. Habit almost of *Cistus salvifolius*. Flowers large, purple, or violaceous.

*Muricated* Chætoгастра. Shrub 4 to 5 feet.

25 *C. STRIGOSA* (D. C. l. c.) suffruticose; branches tetragonal, beset with adpressed bristles; leaves on short petioles, ovate, acute, hardly 3-nerved, quite entire, with a few thick, scattered, adpressed bristles on the upper surface, and scabrous on the nerves beneath; cymes terminal, pedunculate, few-flowered; tube of calyx hispid, with 5 short, acute, lobes.  $\frac{1}{2}$ . S. Native of Guadaloupe, on the top of the Sulphur Mountain, among sphagnum; and on the mountains of Montserrat and Martinique. *Melastoma strigosa*, Lin. fil. suppl. p. 236. *Mel. ciliata*, Desr. in Lam. dict. 4. p. 49. *Oshèkia ornata*, Swartz, fl. ind. occ. p. 647. *Rhèxia inconstans*, Vahl, etc. 1. p. 37. *Rhèxia strigosa*, Rich. act. soc. hist. nat. par. 1791. p. 108. *Rhèxia ornata*, Rich. in Bonpl. rhex. t. 26. *R. chamæcistus*, Sieb. pl. exsicc. mart. no. 297. Flowers pale purple, bractless. Anthers yellow, obtuse, almost without auricles at the base. Capsule ovate, 5-celled, bristly at the apex. There are varieties of this plant having flowers either with 4 or 5 petals, smaller, and larger.

*Strigose* Chætoгастра. Sh. 6 to 8 feet.

26 *C. LEPIDOTA* (D. C. l. c.) shrubby; branchlets bluntly tetragonal, and are, as well as the petioles, leaves, peduncles, and calyxes scabrous from imbricated scaly bristles; leaves petiolate, oblong-lanceolate, 5-nerved, hardly serrulated; cymes pedunculate, terminal; flowers few, almost sessile, crowded; calyx with an obovate tube, and obtuse lobes; connectives of anthers hardly evident, and almost without any auricles at the base.  $\frac{1}{2}$ . S. Native of Peru, in cold places near Jaen de Bracamoros. *Rhèxia lepidota*, Bonpl. rhex. t. 15. Flowers purple or violaceous. Capsule globose, bristly, and denticulated at the apex.

*Lepidotted* Chætoгастра. Sh. 6 feet.

27 *C. CARDINALIS* (D. C. l. c.) branchlets somewhat tetragonal, very hairy, and very leafy; leaves almost sessile, orbicularly reniform, quite entire, 5-7-nerved, strigose above, but clothed with silky hairs beneath; flowers terminal, crowded, almost sessile; calyx hispid, with a campanulate tube, rather longer than the lobes, which are bluntish; connectives of anthers hardly produced, emarginate.  $\frac{1}{2}$ . S. Native of Brazil, in hot places near Gran-Para. *Rhèxia cardinalis*, Bonpl. rhex. t. 37. *Melastoma cardinalis*, Spreng. syst. 2. p. 298. Calyx coloured inside. Flowers of a rose purple-colour.

*Cardinal* Chætoгастра. Sh. 2 to 4 feet.

28 *C. STRICTA* (D. C. l. c.) branches terete, velvety from short down; leaves on short petioles, oval-lanceolate, 3-nerved, quite

entire, rather hairy; flowers nodding, bibracteate; calyx campanulate, rather villous; connectives of anthers drawn out into 2 bristles, which are capitate at the apex.  $\frac{1}{2}$ . S. Native of Peru, in cold places on Mount Purase, and near Iloxa. *Rhèxia stricta*, Bonpl. rhex. t. 8. but not of Pursh. Shrub much branched, straight. Flowers purple or violaceous. Calyxes and bracteas purplish. Petals ciliated. Ovary bristly. There is a variety of this species having 4-petalled flowers.

*Straight* Chætoгастра. Sh. 4 to 5 feet.

29 *C. ECHINATA* (D. C. prod. 3. p. 135.) branches terete, and are, as well as the peduncles, petioles, and calyxes beset with thick adpressed stiff pili; leaves ovate, 5-nerved, woolly beneath, echinated above, quite entire; flowers inclinate; tube of calyx ovate, about equal in length to the lobes, which are lanceolate; connectives of anthers thick at the base.  $\frac{1}{2}$ . S. Native of Peru, on the tops of hills. *Rhèxia echinata*, Ruiz et Pav. fl. per. 3. p. 85. t. 319. f. 6. Flowers large, spreading, of a violaceous purple-colour. Capsule 5-celled, bristly at the apex. Seeds cochleate.

*Echinated* Chætoгастра. Sh. 2 to 3 feet.

30 *C. CERNUA* (D. C. l. c.) branches tetragonal, rough at the angles; leaves on short petioles, oval, rather crenulated, 5-nerved, often hispid along the nerves; flowers pedicellate, usually 3 together, terminal, drooping; tube of calyx campanulate, one half shorter than the lobes, which are linear-lanceolate.  $\frac{1}{2}$ . S. Native of Peru, on the Andes, on Mount Purase and Popayan. *Rhèxia cernua*, Bonpl. rhex. t. 13. *Oshèkia cernua*, Spreng. syst. 2. p. 312. Petals oval, violaceous. Capsule 5-celled.

*Drooping* Chætoгастра. Sh. 5 to 6 feet.

SECT. III. BRACTEARIA (from *bractea*, a bractea or prop; in reference to the flowers, which are furnished with 6 bracteas each at the base). D. C. prod. 3. p. 135. Calyx with an obovate pilose tube, girded at the base by 6 free bracteas, which are arranged in 3 series; lobes 5, obtuse. Anthers hardly bi-auriculate at the base.

31 *C. CONFERTA* (D. C. l. c.) suffruticose, much branched; branchlets hairy; leaves on short petioles, crowded, small, oval, obtuse, 3-nerved, beset with adpressed bristles; flowers terminal, solitary, drooping; bracteas 6, involving the flower; calyx pilose, with 5 bluntish teeth.  $\frac{1}{2}$ . S. Native of Peru, in cold places near Iloxa. *Rhèxia conferta*, Bonpl. rhex. t. 20. Petals roundish, violaceous, almost conniving into a tube. Capsule globose, denticulated from 5 bristle-like teeth.

*Crowded* Chætoгастра. Sh. 3 feet.

*Cult.* For culture and propagation see *Lasiandra*, p. 752.

XXXIII. ARTHIROSTEMMA (from *αρθρον*, *arthron*, a joint, and *στέμμα*, for *σθημον*, *stemon*, a stamen; in reference to their stamens or connectives being jointed). Pav. ex D. Don, mem. soc. wern. 4. p. 298. D. C. prod. 3. p. 135.—*Melanium*, Rich. herb.

LIN. SYST. *Octandria, Monogynia*. Tube of calyx turbinate or campanulate, usually clothed with bristles, pili, or scales; lobes 4, lanceolate, permanent, without any appendages between them. Petals 4. Stamens 8; filaments quite glabrous. Anthers oblong, opening by one pore at the apex, furnished with longish connectives, which are bi-auriculated at the base. Ovary bristly at the apex. Capsule 4-celled. Seeds cochleate.—Herbs or subshrubs, very variable in habit, all natives of South America. The genus is composed, as it now stands, of a heterogeneous mass of species, which may hereafter be divided into many genera, instead of sections.

SECT. I. CHÆTOPE'TALUM (from *χαίτη*, *chaite*, a bristle, and *πέταλον*, *petalon*, a petal; in reference to the petals, which are

terminated by a bristle each). D. C. prod. 3. p. 135. Petals 4, oval, each terminated by a bristle. Anthers 8, equal, having their connectives not appendiculated. Ovarium 4-toothed at the apex. Capsule 4-celled. Seeds reniform, not truly cochleate.—Herbs, suffruticose at the base. Flowers white or yellow. Perhaps this section is sufficient to form a proper genus.

1 *A. ANGUSTURENSE* (D. C. l. c.) herbaceous; leaves lanceolate, 3-nerved, quite entire, pilose on both surfaces; flowers terminal, almost solitary; calyx clothed with stellate down. *℥*. S. Native on the banks of the Orinoco, near Angustura. *Rhèxia Angusturènsis*, Bonpl. rhex. p. 77. t. 29. Flowers white. Genitals hardly longer than the petals. Anthers linear, falcate.

*Angustura Arthrostemma*. Pl. 2 to 3 feet.

2 *A. PILOSELLOIDES* (D. C. prod. 3. p. 136.) suffruticose at the base; leaves crowded at the roots, lanceolate, quite entire, 7-nerved, pilose; stem almost a scape, loosely panicled, few-flowered; calyx pilose. *℥*. S. Native of New Granada, in cold places at the elevation of 3900 feet. *Rhèxia piloselloides*, Bonpl. rhex. p. 12. t. 5. Flowers yellow, spreading. Style short, rather clavate.

*Mouse-ear-like Arthrostemma*. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

SECT. II. *BRACHYOTUM* (from *βραχυς*, *brachyus*, short, and *οὐς ωτός*, *ous otos*, an ear; auricles of the connectives of the anthers short). D. C. prod. 3. p. 136. Calyx 4-cleft, without any appendages. Petals 4, subaristate, usually involute. Connectives of anthers furnished with 2 short auricles each. Ovarium bearing bristles at the apex, not 4-toothed. Capsule 4-celled. Suffruticose at the base. Flowers white.

3 *A. ROSMARINIFOLIUM* (D. C. l. c.) suffruticose; branches terete, echinate; leaves nearly sessile, oblong-linear, 3-nerved, with revolute quite entire edges; peduncles 1-5-flowered, pendulous; calyx hispid; petals convolute. *℥*. S. Native of Peru, on arid hills. *Rhèxia rosmarinifolia*, Ruiz et Pav. fl. per. 3. p. 84. t. 318. f. a. Leaves small, numerous. Flowers violaceous, spreading in the night and morning. Style exserted, rather clavate.

*Rosemary-leaved Arthrostemma*. Shrub 1 to 2 feet.

4 *A. LUTEASCENS* (D. C. l. c.) shrubby; branches rugged, pilose; hairs thick, stiff, short; leaves ovate, 3-nerved, curled a little, white beneath; peduncles 3-flowered; calyx pilose; petals convolute. *℥*. S. Native of Peru, on the mountains. *Rhèxia luteascens*, Ruiz et Pav. fl. per. 3. p. 84. t. 319. f. a. Leaves small, firm; when in a dry state they are olive-coloured above, and yellowish beneath. Calyx purplish, with lanceolate teeth. Petals yellowish.

*Yellowish Arthrostemma*. Sh. 2 feet.

5 *A. QUINQUENERVE* (D. C. l. c.) shrubby, much branched; branches tetragonal, beset with adpressed bristles; leaves petiolate, ovate, acute, quite entire, 5-nerved, bristly above, but villously tomentose beneath; peduncles axillary and terminal, many-flowered, inflexed at the apex; flowers drooping; calyx bristly, with an ovate tube, shorter than the lobes, which are setaceous. *℥*. S. Native of Peru, on mountains and hills. *Rhèxia quinquenervis*, Ruiz et Pav. fl. per. 3. p. 83. t. 321. f. 3. Petals almost conniving into a tube, ciliated. Connectives of anthers furnished each with 2 very short auricles. Capsule 4-valved, bristly at the apex. Style exserted.

*Five-nerved-leaved Arthrostemma*. Sh. 6 feet.

6 *A. CAMPANULARE* (D. C. l. c.) shrubby; branches clothed with rufous down; leaves ovate, 5-nerved, quite entire, very hispid above, but tomentose beneath; flowers drooping, campanulate; calyx pilose. *℥*. S. Native of Peru, in cold places near Loxa, at the elevation of 3000 feet. *Rhèxia campanularis*, Bonpl. rhex. p. 35. t. 14. Petals deep purple or violaceous,

awned. Style thickened at the apex. Capsule globose. This plant appears to be intermediate between the first and the present section.

*Campanulate-flowered Arthrostemma*. Sh. 4 feet.

SECT. III. *LADANOPSIS* (from *λάνανος*, *ladanon*, the ladanum hush, and *opsis*, resemblance; plants with the habit of *Cistus ladanifera* or ladanum-tree). D. C. prod. 3. p. 136. Calyx 4-cleft. Petals 4, obovate, expanded. Connectives of anthers rather long, furnished with two short auricles at the base of each. Capsule 4-celled, bristly at the apex. Seeds cochleate.—Herbs or subshrubs.

7 *A. LADANOIDES* (D. C. l. c.) plant herbaceous, erect; hairs or strigæ on the stems and leaves adpressed, but those on the calyx are spreading, and in fascicles; stem tetragonal; leaves on short petioles, lanceolate, acuminate, ovate at the base, 3-nerved, serrulated; pedicels elongated, loose, axillary, 1-flowered, and terminal 3-flowered; tube of calyx ovate, longer than the lobes, which are oblong and ciliated. *⊙*. S. Native of Brazil and Guiana, in marshes. *Rhèxia hispida*, Rich. in act. soc. hist. nat. par. 1791. p. 108. *Rhèxia ladanoides*, Rich. in Bonpl. rhex. t. 27. *Rhèxia òda*, Mart. herb. *Melastoma trichotomum*, Willd. ined. ex herb. mus. par. Anthers oval, truncate, short, rather dissimilar, especially 4, having short connectives, and 4 with longer ones. Ovarium bristly, 4-celled. Seed cochleate. Flowers purplish.

*Ladanum-like Arthrostemma*. Pl. 1 to  $1\frac{1}{2}$  foot.

8 *A. HERBAECUM* (D. C. prod. 3. p. 137.) herbaceous; stem tetragonal, covered with minute hairs; leaves on short petioles, ovate-lanceolate, acuminate, crenulately serrated, villous above, but clothed with hairy tomentum beneath; cymes on long peduncles, axillary, 3-flowered; calyx villous, with 4 ovate ciliated lobes; anthers rather dissimilar. *⊙*. ? S. Native of Brazil, in woods, in the province of Rio Janeiro and Minas Geraes, but rare. *Rhèxia herbacea*, Schrank et Mart. mss. Petioles hairy. Petals obovate-oblong, when young ciliated at the apex. Anthers 8 oblong, with smooth beaks, the 4 longest having straight connectives, and the 4 shortest arched ones.

*Herbaceous Arthrostemma*. Pl. 1 foot.

9 *A. HIRSUTISSIMUM* (D. C. l. c.) herbaceous, erect; stem tetragonal, very hairy from long, rather bristly, spreading, somewhat retrograde hairs; leaves on short petioles, lanceolate, acuminate, crenulately serrated, densely clothed with adpressed villi; cymes on long peduncles, axillary, 3-flowered; calyx villous, with 4 ciliated lobes; anthers dissimilar. *⊙*. S. Native of Brazil. Very like *A. herbaceum*, but differs in the hairiness. Ovarium bristly at the apex. Seeds cochleate.

*Very-hairy Arthrostemma*. Pl. 1 foot.

10 *A. MARTUSIANUM* (D. C. l. c.) stem erect, hairy, almost herbaceous, oppositely and paniculately branched; branches quadrangular; leaves on short petioles, ovate-lanceolate, acute, serrulated, 5-nerved, beset with adpressed strigæ above, but with soft villi beneath; peduncles dichotomous, 3-7-flowered. *℥*. ? S. Native of Para, in Brazil. *Rhèxia paniculata*, Mart. herb. and Schrank, mss. but not Hamilt. *Rhèxia Martusiana*, Ser. mss. *Rhèxia cerastiifolia*, Schrank, et Mart. mss. Tube of calyx ovate, rather pilose; lobes 4, acute. Petals ovate, purple, pilose on the back. Anthers articulated at the base; the articulation distant from the cells, and tumid on one side. Ovarium bristly at the apex.

*Martius's Arthrostemma*. Pl. 1 to 2 feet.

11 *A. POLYGONOIDES* (D. C. l. c.) suffruticose? branches loose, tetragonal, beset with a few slender adpressed bristles; leaves on short petioles, oblong, quite entire, 3-nerved, beset with adpressed bristles on both surfaces; flowers axillary, solitary, almost sessile; lobes of calyx 4, rarely 5, longer than the

tube, ovate-lanceolate, each terminating in a hair.  $\mu$ .? S. Native of Brazil, in marshy fields in the province of Minas Geraes. *Rhèxia polygonoides*, Mart. herb. Very like *A. pumilum*. Leaves terminating in a long hair. Hairs on the calyx simple, and adpressed. Petals small, white. Ovarium bristly at the apex.—Bonpl. rhex. t. 35. f. 4.

*Polygonum-like Arthrostemma*. Pl. 1 to 2 feet.

12 *A. VILLOSUM* (D. C. l. c.) suffruticose, decumbent, hairy in every part; branches tetragonal; leaves on short petioles, oval, denticulated, 3-nerved; flowers few, almost sessile at the tops of the branches; calyx with an ovate tube, and 4 lobes, which are subulate at the apex; connectives of anthers furnished with 2 horns each.  $\frac{1}{2}$ . S. Native of Cayenne, at Aroura in sandy meadows. *Rhèxia villòsa*, Aubl. guian. 1. p. 334. t. 129. f. 1. Petals concave, violaceous. Capsule 4-celled.

*Villous Arthrostemma*. Pl. decumbent.

13 *A. AUBLETII* (D. C. l. c.) suffruticose, decumbent, hairy in every part; branches tetragonal; leaves on short petioles, roundish, acutish, serrulated, 5-nerved; flowers solitary, terminal; tube of calyx globose; lobes subulate at the apex; connectives of anthers furnished with 2 horns at the base.  $\frac{1}{2}$ . S. Native of Guiana, in sandy meadows at Aroura. *Rhèxia latifolia*, Aubl. guian. t. 129. f. 2. Very like the preceding species, but differs in every part, being twice the size.

*Aublet's Arthrostemma*. Shrub decumbent.

14 *A. VERSICOLOR* (D. C. l. c.) suffruticose, pilose; leaves petiolate, ovate, serrulated, 5-nerved, discoloured beneath; flowers terminal, solitary; lobes of calyx 4, serrated at the apex.  $\frac{1}{2}$ . S. Native of Brazil, on the sea shore. *Rhèxia versicolor*, Lindl. bot. reg. t. 1066. Petals obovate, ciliated, at first white, but at length becoming reddish. Ovarium bristly at the apex. Anthers hardly biauriculate at the base. Habit of *Chaetogástra clinipodifolia*.

*Partly-coloured-flowered Arthrostemma*. Fl. Sept. Clt. 1825. Shrub 1 foot.

15 *A. NUMMULARIOIDES* (D. C. l. c.) shrubby, much branched, clothed with minute down; leaves petiolate, nearly orbicular, cordate, crenated, 5-nerved, rather tomentose beneath; flowers solitary, on the tops of the axillary branchlets; connectives of anthers drawn out each into 2 blunt appendages, or one bifid one.  $\frac{1}{2}$ . S. Native near Esmaldas, on the Orinoco. *Rhèxia nummularioides*, Bonpl. rhex. 2. p. 23. Flowers rose-coloured. Perhaps this species belongs to a different section.

*Money-wort-like Arthrostemma*. Shrub decumbent.

SECT. IV. TRIFURCA'RIA (from *tres*, three, and *furca*, a fork; in reference to the connectives of the anthers being drawn out each into a 3-toothed appendage, or into 3 bristles at the base). D. C. prod. 3. p. 138. Calyx 4-cleft. Petals 4. Connectives of anthers drawn out each into a tridentate appendage, or into 3 bristles at the base.

16 *A. CILIA'TUM* (Pav. ex D. Don, mem. soc. wern. 4. p. 299.) stem herbaceous, quadrangular; leaves cordate, smooth on both surfaces, serrulated and ciliated on the margins; appendages of anthers tridentate at the base.  $\mu$ . S. Native of Peru.

*Ciliated-leaved Arthrostemma*. Pl. 2 to 3 feet.

17 *A. LATIFOLIUM* (D. Don, l. c.) stem shrubby; leaves broad, ovate, acuminate, serrulated and ciliated; panicle large; appendages of anthers of 3 bristles.  $\frac{1}{2}$ . S. Native of French Guiana.

*Broad-leaved Arthrostemma*. Shrub.

SECT. V. MONOCHE'TUM (from *μονος*, *monos*, one, and *χατη*, *chaite*, a bristle; in reference to the appendages of anthers being drawn out into one single or emarginate spur at the base). D. C. prod. 3. p. 138. Calyx 4-cleft. Petals 4. Connectives of anthers drawn out each into one simple or emarginate ascending

spur, or in a bristle at the same base. Perhaps this section is sufficient to constitute a distinct genus.

18 *A. CALCARATUM* (D. C. l. c.) shrubby; branchlets somewhat tetragonal, smoothish, bearing whorles of bristles at the knots; leaves petiolate, oblong, acuminate, 3-nerved, ciliate, serrated, beset with a few bristles beneath; flowers pedicellate, solitary, or by threes at the tops of the branchlets; calyx beset with adpressed bristles: with 4 lanceolate, somewhat coloured, ciliated lobes; anthers with long beaks, ending in a long slender spur at the base.  $\frac{1}{2}$ . S. Native of Mexico. Flowers purple, like those of a species of *Lasiandra*, but differs in the petals being 4, and in the stamens being glabrous. Ovarium densely beset with bristles.

*Spurred-anthered Arthrostemma*. Sh. 1 to 2 feet.

19 *A. DEPPEANA* (Schlecht. et Cham. in Linnæa. 5. p. 566.) suffruticose, much branched; branches terete, beset with adpressed hairs; leaves narrow-lanceolate, bluntish, triple-nerved, quite entire, strigose on the nerves on the under surface, and between the nerves on the upper surface, and on the margins; flowers terminal, solitary; tube of calyx turbinate, strigose; calycine segments lanceolate, acute; petals roundish, obovate; connectives of anthers drawn out into a simple ascending spur.  $\frac{1}{2}$ . S. Native of Mexico, at San Andres and on Serro Colorado. Flowers purple.

*Deppe's Arthrostemma*. Fl. Aug. Sh. 1 to 2 feet.

20 *A. MYRTIFOLIUM* (D. C. l. c.) suffruticose; branches clothed with powdery down; leaves oblong, quite entire, glabrous, triple-nerved beneath, perhaps from down; flowers axillary and solitary, or terminal and tern; tube of calyx turbinate, glabrous; lobes lanceolate, acute.  $\frac{1}{2}$ . S. Native of Mexico, near Cuaretero; and near Santa Fe de Bogota. *Rhèxia myrtoidea*, Bonpl. rhex. t. 3. Petals violaceous, oval-lanceolate. Adult branches glabrous, with separable bark. Ovarium downy at the apex from minute stellate down.

*Myrtle-like Arthrostemma*. Sh. 2 feet.

21 *A. BONPLANDII* (D. C. l. c.) suffruticose; branches densely clothed with short down; leaves on short petioles, ovate, 5-nerved, quite entire, villous on both surfaces from soft down, canescent beneath; flowers pedicellate, 1-3-together, axillary, and terminal; tube of calyx ovate, longer than the lobes.  $\frac{1}{2}$ . S. Native of South America, on the banks of the river Amazon. *Rhèxia canescens*, Bonpl. rhex. p. 14. t. 18. *Rhèxia Bonplandii*, Kunth, ined. *Rhèxia incana*, Spreng. syst. 2. p. 309. Flowers violaceous.

*Bonpland's Arthrostemma*. Sh. 3 feet.

22 *A. DICRANTHERUM* (D. C. l. c.) suffruticose, much branched; branches tetragonal, and arc, as well as the peduncles, calyxes, and leaves, beset with longspreading hairs; leaves almost sessile, ovate, acute, 5-nerved, entire; flowers subcorymbose; calyx with an ovate-globose tube, and 4 oval acute lobes.  $\frac{1}{2}$ . S. Native of Peru, in woods. *Rhèxia dicrananthera*, Ruiz et Pav. fl. per. 3. p. 84. t. 320. f. a. *Arthr. multiflorum*, D. Don, in mem. wern. soc. 4. p. 299. Ovarium pilose at the apex. Seeds cochleate.

*Two-headed-anthered Arthrostemma*. Sh. 1 to 2 feet.

23 *A. LINEATUM* (D. Don, l. c.) stem shrubby, pilose; leaves lanceolate, quite entire, with hairy lines on both surfaces.  $\frac{1}{2}$ . S. Native of Peru. The rest unknown.

*Lined-leaved Arthrostemma*. Shrub.

24 *A. MULTIFLORUM* (D. C. l. c.) suffruticose, branched at the base; leaves on short petioles, lanceolate, 5-7-nerved, quite entire, villous; thyrses paniced, terminal, many-flowered; appendages of anthers bristle-formed, rising from the base.  $\frac{1}{2}$ . S. Native on the banks of the Orinoco, in humid shady places. *Rhèxia multiflora*, Bonpl. rhex. . 16. *Osbéckia Bonplandiana*, Spreng. syst. 2. p. 313. Flowers rose-coloured.

*Many-flowered Arthrostemma*. Sh. 3 feet.

*Cult.* The shrubby species of this genus should be cultivated and propagated in the manner of the species of *Melastoma*, p. 754. The annual species in the manner of those of *Centradenia*, p. 766.

XXXIV. OSBECKIA (in honour of Peter Osbeck, a Swedish clergyman and naturalist, author of *Dagbock Oefren Ostendyck resa*, 1 vol. 8vo. Stockholm, 1757). Lin. gen. no. 467. D. Don, in *mem. soc. wern.* 4. p. 292. D. C. prod. 3. p. 138.

LIN. SYST. *Octo-Decandria, Monogynia*. Tube of calyx ovate, usually clothed with stellate bristles or down; lobes 4-5, permanent or deciduous: bearing appendages between the lobes on the outside of various sizes and forms. Petals 4-5. Stamens 8-10; filaments glabrous; anthers nearly equal, terminating in short beaks, and having their connectives furnished with 2 short auricles at the base. Ovarium bristly at the apex. Capsule 4-5-celled. Seeds cochleate. —Herbs, but usually subshrubs, natives of America, Africa, and Asia. Leaves quite entire, 3-5-nerved. Flowers terminal. This genus is perhaps divisible in several genera instead of sections.

SECT. I. MICROLEPIS (from μικρος, mikros, small, and λεπις, lepis, a scale; so named on account of the small scale-like appendages between the lobes of the calyx). D. C. prod. 3. p. 139. Tube of calyx ovate-oblong, urceolate, and constricted at the apex; limb 5-cleft: teeth deciduous. Stamens 8-10. Appendages between the lobes of the calyx small and ciliate. Species all South American. — *Flowers yellow.*

1 *O. URCEOLARIS* (D. C. prod. 3. p. 139.) plant almost herbaceous; stems tetragonal; leaves petiolate, oval, quite entire, 5-nerved, clothed with villous tomentum on both surfaces; panicles terminal and axillary; calyx 5-toothed, with an ovate tube, which is constricted under the teeth; appendages between the teeth of the calyx short and lacerately ciliated; petals ciliated. *h. S.* Native of Brazil, near Rio Janeiro. *Rhèxia urceolaris*, Schrank et Mart. mss. Petioles 6 lines long. Leaves 4 inches long. Petals purple. Anthers linear-falcate, beaked, length of filaments: having their connectives short, and tumid at the articulation. Seeds cochleate, truncate at the base, striated longitudinally.

*Urceolate-calyxed Osbeckia*. Pl. 1 foot.

2 *O. JUCUNDA* (D. C. l. c.) shrubby, glabrous; branches terete; leaves petiolate, ovate-lanceolate, acuminate, quite entire, 3-nerved, or somewhat 5-nerved; panicle terminal; peduncles and calyxes clothed with furfuraceous down; tube of calyx urceolate; petals oblong. *h. S.* Native of Brazil, in shady woods near Almada, in the province of Bahia. *Rhèxia jucunda*, Schrank et Mart. mss. Leaves 6-7 inches long, and 2 broad. Petals white, 3 or 4 times longer than the calycine teeth. Stamens 10; filaments bluish. Anthers yellow, elongated, with short beaks: 5 of which have their connectives drawn out into a little lateral sack, and those of the other 5 are not drawn out.

*Pleasant Osbeckia*. Shrub 1 to 2 feet.

3 *O. PITYROPHYLLA* (D. C. l. c.) shrubby; leaves on very short petioles, oblong-ovate, acuminate, 3-nerved, glabrous above and shining, with impressed veins, clothed with white tomentum beneath, as well as on the calyxes; cymes few-flowered, terminal; lobes of calyx acute, 3 times shorter than the ovate tube; petals acuminate. *h. S.* Native of Brazil, on high dry mountains, in the province of Minas Geraes. *Rhèxia pityrophylla*, Mart. herb. *Rhèxia acuminata*, Schrank, mss. Shrub branched; branches tetragonal, with separable bark. Leaves 10 lines long. Anthers falcate, without any beak. Style very long. Ovarium beset with small bristles at the apex. Ap-

pendages of calyx small. Tomentum velvety. Fruit and seeds unknown.

*Scurfy-leaved Osbeckia*. Sh. 1 to 2 feet.

4 *O. OLEÆFOLIA* (D. C. l. c.) suffruticose; branches hardly tetragonal, clothed with powdery tomentum; leaves petiolate, oblong-lanceolate, quite entire, 3-nerved, clothed with white velvety tomentum beneath, glabrous above; thyrses terminal; bractes hiding the calyx when young; calyx velvety from small stellate down: lobes or teeth 5 or 6, short, oblong; anthers rather dissimilar. *h. S.* Native of Brazil, in the province of St. Paul, in elevated dry fields. *Rhèxia oleæfolia*, Schrank et Mart. mss. Petals purple, minutely ciliated. Anthers linear, falcate, long, beaked: having their connectives drawn out into a ligula each, which are sometimes bifurcate, and sometimes somewhat 2-lobed. Leaves 15-20 lines long, and 6-7 broad.

*Var. β, quaternifolia* (D. C. l. c.) young branches tetragonal, furfuraceous, and bearing glandular pili; leaves on short petioles, 3 or 4 in a whorl, oblong, blunt at the base, and acute at the apex, 5-nerved, minutely dotted above, but clothed with white furfuraceous velvety down beneath. *h. S.* Native of Brazil, in the province of Minas Geraes, at the sides of woods. *Rhèxia quaternifolia*, Schrank et Mart. mss. Petals purple, obovate-oblong. Anthers long, linear, falcate, beaked: 5 of which have forked connectives. Ovarium bristly at the apex. Down on calyx stellate.

*Olive-leaved Osbeckia*. Sh. 1 to 2 feet.

SECT. II. CHAETOLEPIS (from χαιτη, chaite, a bristle, and λεπις, lepis, a scale; there are stiff bristles between the lobes of the calyx, which hold the place of the appendages). D. C. prod. 3. p. 140. Lobes of calyx 4, with as many stiff simple bristles between the lobes on the outside, holding the place of appendages. —American plants.

5 *O. MICROPHYLLA* (D. C. l. c.) shrubby, much branched; branches terete, scabrous from strigæ; leaves on short petioles, ovate, quite entire, 5-nerved, scabrous on both surfaces from adpressed strigæ, pale beneath; flowers solitary, subcorymbose, pedicellate; tube of calyx ovate, bristly at the apex; ovarium furnished with 8 bristles at the apex. *h. S.* Native of Guadalupe, on the mountains; and near Santa Fe de Bogota. *Rhèxia microphylla*, Bonpl. rhex. t. 2. Flowers yellow. Anthers obtuse. Petals obovate. Lobes of calyx, as well as the appendages, permanent.

*Small-leaved Osbeckia*. Sh. 1 foot.

SECT. III. PTEROLEPIS (from πτερον, pteron, a wing, and λεπις, lepis, a scale; in reference to the appendages between the lobes of the calyx being pectinated). D. C. prod. 3. p. 140. Stamens 8-10. Calyx 4-5-cleft; lobes permanent, with the appendages between the lobes elongated and pectinated. —American plants.

\* *Flowers 5-cleft, decandrous.*

6 *O. PARNASSIFOLIA* (D. C. prod. 3. p. 140.) shrubby, clothed in every part with silky villi; branches terete; leaves sessile, orbicular, rather cordate at the base, quite entire, 5-nerved; flowers almost sessile, axillary, usually solitary, but sometimes terminal and aggregate; calyx very hairy, with villous bristle-formed appendages between the lobes, and 5 ciliated coloured lobes. *h. S.* Native of Brazil, in stony grassy places, in the province of Bahia. *Rhèxia parnassifolia*, Mart. et Schrank, mss. Lobes of calyx purplish, linear-oblong. Petals purple, obovate-cuneate. Style a little longer than the calyx. Stamens unknown. Young leaves mucronate. Capsule 1-5-celled. Seeds cochleate.

*Parnassia-leaved Osbeckia*. Shrub.

7 *O. STRIPHOCALYX* (D. C. l. c.) shrubby; branches nearly terete, and are, as well as the peduncles and under side of the

leaves, scabrous from adpressed bristles; leaves petiolate, elliptic-oblong, acuminate, quite entire, 3-nerved, glabrous above, and with oblique stripes between the nerves; panicles terminal; calyx very hairy; bristles palmately stellate; anthers 5. *h. S.* Native of Brazil, in the province of Rio Negro. *Rhèxia striph-nocalyx*, Mart. herb. Anthers linear, beaked, 3 times the length of the connectives, which are drawn out into one or two small lobules at the base. Calyx clothed with long white hairs. Stripes between the nerves of the leaves very evident. Flowers purple.

*Hairy-calyxed Osbeckia.* Shrub.

8 *O. SIMSII* (D. C. l. c.) branches tetragonal, hispid; leaves on short petioles, oblong-elliptic, 3-nerved, ciliated on the nerves and margins; flowers terminal, aggregate; appendages of calyx bristle-formed. *h. S.* Native of the Mauritius, but probably cultivated there. *Melastoma Osbeckioides*, Sims, bot. mag. 2235. Flowers large, purple. Perhaps the same as *Osbèckia Chinensis*, Lin.

*Sims's Osbeckia.* Fl. July. Clt. 1818. Sh. 2 feet.

9 *O. PRINCEPS* (D. C. l. c.) branches angular, and arc, as well as the leaves, clothed with fuscous tomentum beneath; leaves petiolate, oblong, rather cordate at the base, sharply serrulated, 7-nerved, unequal, strigose on the upper surface; corymbs terminal; hairs on calyx glandular; appendages of calyx ending in a stellate tuft of hairs. *h. S.* Native of Brazil. *Rhèxia Princeps*, Bonpl. rhex. t. 43. Flowers large, purple, composed of 5 petals according to the description, but only of 4 according to the figure.

*Princeps's Osbeckia.* Sh. 3 to 4 feet.

\*\* Flowers 4-cleft, octandrous.

10 *O. ALPESTRIS* (D. C. l. c.) shrubby, beset in every part with somewhat adpressed strigose pili; leaves on short petioles, ovate, acute, quite entire, nerveless; flowers almost sessile, disposed in a terminal head; calyx very villous. *h. S.* Native of Brazil, on the alps of Serro Frio and Itambe. *Rhèxia semiadnata*, Schrank, mss. *Rhèxia alpestris*, Mart. herb. Leaves 6 lines long and 4 broad; petioles thick, semiadnate. Lobes of calyx lanceolate, glabrous inside. Petals violaceous, minutely ciliated. Anthers falcate, wrinkled transversely, with short beaks; having their connectives not drawn out beyond the articulation.

*Alp Osbeckia.* Sh. 1 to 2 feet.

11 *O. REPANDA* (D. C. prod. 3. p. 141.) herbaceous; stem nearly terete, and is, as well as the peduncles and leaves, villous from adpressed strigæ; leaves petiolate, lanceolate, 3-5-nerved, quite entire, acute; peduncles elongated, dichotomous; calyx very strigose, with the lobes acuminate and ciliated at the base, and having the scales or appendages between the lobes pectinated; petals somewhat repandly truncate at the apex. *h. S.* Native of Brazil, in elevated fields, in the province of Minas Geraes. *Rhèxia repanda*, Mart. et Schrank, mss. Petals purple. Anthers linear-falcate, acuminate by the beaks, twice the length of their connectives, which are hardly tumid at the base. Habit of *Arthrostemma gracilis*.

*Repand-leaved Osbeckia.* Pl. 1 to 2 feet.

12 *O. GLOMERATA* (D. C. prod. 3. p. 141.) herbaceous; branches nearly tetragonal, scabrous from adpressed bristles; leaves on short petioles, ovate-lanceolate, acuminate, 3-nerved, clothed with adpressed stiff hairs; flowers axillary, usually solitary, but capitate at the tops of the branches; tube of calyx beset with branched stellate pili, ovate: with its scales ciliately pectinated, elongated and distant, and with its lobes ciliated, stiff, and lanceolate. *h. S.* Native of Martinique, Trinidad, Surinam, and Brazil. Hook. bot. mag. 2838. *Rhèxia glomerata*, Rottb. sur. 8. t. 46. *Rhèxia capitata*, Rich. in Bonpl.

*melas.* 2. t. 32. Petals rose-coloured, obovate, hardly longer than the lobes of the calyx, minutely ciliated. Connectives furnished with 2 tubercles at the base of each.

*Var. β, albiflora* (D. C. l. c.) flowers white, fewer and larger. *Rhèxia glomerata*, Lodd. bot. cab. t. 334. Native of Brazil. Perhaps a proper species.

*Glomerate-flowered Osbeckia.* Fl. July, Aug. Clt. 1818. Pl. 1 to 2 feet.

13 *O. SIPANEIODES* (D. C. l. c.) shrubby, very hairy all over; leaves sessile, oval-oblong, acute, 3-nerved, terminated by a bristle; flowers sessile in the axils of the upper leaves, and somewhat aggregate at the tops of the branches; calyx hispid from palmate bristles, having its lobes terminating in a hair, and the appendages long, and ending in a palmate tuft of bristles at the apex. *h. S.* Native of Brazil. *Rhèxia sipaneoides*, Mart. herb. Habit almost of *Chatogastra lychnitoides*, but the characters are very different.

*Sipanea-like Osbeckia.* Sh. 1 to 2 feet.

14 *O. BRACTEOLARIS* (D. C. l. c.) shrubby; leaves on short petioles, oblong, 5-nerved, quite entire, villously pubescent above, but clothed with velvety tomentum beneath, reticulated; peduncles axillary, dichotomous, bracteolate; flowers octandrous; calyx 5-lobed, branches, and peduncles densely clothed with glandular hairs; lobes of calyx linear, about equal in length to the tube, which is ovate. *h. S.* Native of Brazil, in elevated fields, in the province of Minas Geraes. *Rhèxia bracteolaris*, Schrank et Mart. mss. Calyx nearly as in *Osbèckia Chinensis*, but only 8-10 from the intervening scales. Anthers elongated, falcate, 5-6. Seeds cochleate, hairy, truncate at the base. Ovary 5-6-lobed.

*Bracteolate Osbeckia.* Sh. 2 to 3 feet.

15 *O. PUMILA* (D. C. l. c.) herbaceous, rather pilose; leaves oblong-lanceolate, entire, 3-nerved; flowers axillary and terminal, solitary, almost sessile; calyx clothed with stellate hairs, with the lobes acute, and shorter than the tube, and having the appendages ending in a stellate tuft of hairs at the apex.—Native country unknown. *Rhèxia pumila*, Bonpl. rhex. t. 35. without a description. Flowers according to the figure small, and pale purple. Connectives of anthers bluntly biauriculated at the base. Ovary bristly at the apex. Calyx beset with scattered pili, which are stellate at the apex.

*Dwarf Osbeckia.* Pl.  $\frac{1}{2}$  foot.

SECT. IV. OSBECKIA'RIA (an alteration from the generic name). D. C. prod. 3. p. 141. Calyx 4-5-cleft, ornamented with bristles on the tube, which are palmate from the base: with the appendages between the lobes plumose, but usually pectinated; the lobes fall off along with the appendages, leaving the mouth of the calyx truncate, or as if it was cut round.—All natives of Asia.

16 *O. CHINENSIS* (Lin. spec. p. 490.) nearly herbaceous; stems 4-winged; leaves almost sessile, lanceolate-oblong, 3-nerved, rather hispid, a little crenulated; flowers cymose, terminal, few; calyx hemispherical, with 4-5 acute, linear acute, bristly, deciduous lobes. *h. G.* Native of China. Ker. bot. mag. t. 542. Petals obovate, acuminate, purple, longer than the stamens. Anthers rather falcate. Style filiform, incurved at the apex. Capsule roundish, white, 5-celled. Perhaps *O. Simsii*, no. 8. is the same.

*China Osbeckia.* Fl. July. Clt. 1818. Sh. 1 to 2 ft.

17 *O. ZEYLANICA* (Lin. fil. suppl. p. 215.) suffruticose; branches tetragonal, beset with adpressed bristles; leaves ovate-lanceolate, rather reflexed, 3-nerved, nearly sessile, strigose; flowers nearly sessile, usually 3-together; calyx tubular, with 4 ovate-oblong lobes; ovary crowned by 16-20 bristles. *h. S.* Native of Ceylon, Amboyna, and Manilla, Lam. ill. t. 283. f. a. l. Ker. bot. reg. t. 565. *O. Chinensis*, Gærtner. fruct. 2. p. 202.—Pluk. alm. t. 173. f. 4. Calycine scales radiating into cilia,

nearly the length of the tube. Petals 4, obovate, somewhat truncately acuminate, rose-coloured, largish. Stamens 8. Style a little curved. Capsule elliptic, 4-5-celled.

*Ceylon Osbeckia*. Fl. July, Aug. Clt. 1799. Sh. 1 to 2 ft.

18 *O. ANGUSTIFOLIA* (D. Don, prod. fl. nep. p. 221.) stem herbaceous, straight, tetragonal, beset with adpressed strigæ; leaves ovate-lanceolate, tapering to the apex, 3-nerved, beset with adpressed bristles; flowers bracteate, aggregate into terminal few-flowered heads; calyx tubular, glabrous, with 4 oval-oblong lobes, having the appendages between the lobes ending in a palmated tuft of bristles; ovarium crowned by 8 bristles. *U. S.* Native of Nipaul. Wall. pl. asiat. rar. 3. p. 93. t. 251. *O. ciliaris* and *O. tenuis* Hamilt. herb. Flowers purple. Anthers 8, furnished with a long slender beak each. Very nearly allied to *O. Nipaulensis*.

*Narrow-leaved Osbeckia*. Pl. 2 to 3 feet.

19 *O. LINEARIS* (Blum. in bot. zeit. 1831. no. 27. p. 473.) plant herbaceous, beset with short strigose bristles; branches tetragonal; leaves sessile, linear-lanceolate, 3-nerved; heads terminal, few-flowered, bracteate; calyx furnished with 5 appendages at the throat, terminating in palmated bristles; calycine segments ovate-oblong, acute, ciliated; ovarium crowned by numerous bristles. *U. S.* Native of Java, near Batavia, in humid places; also of the Moluccas. *Tristagma angustifolia*, Blum. bijdr. p. 1079.

*Linear-leaved Osbeckia*. Pl. 1 to 2 feet.

20 *O. NIPAULENSIS* (Hook. exot. fl. t. 37.) suffruticose; branches somewhat tetragonal, rough from short adpressed bristles; leaves sessile, oblong-lanceolate, beset with adpressed hairs, 5-nerved; flowers bracteate; scales of calyx broad, 3-5-angled. Flowers large, 5-lobed, deciduous, length of the tube, which is obovate. *h. G.* Native of Nipaul. *O. speciosa*, D. Don, prod. fl. nep. p. 222. Petals 5, obovate, violaceous. Anthers 10, somewhat falcate, undulated. Fruit 5-celled, truncate, naked from the scales being deciduous.

*Var. β*, *albiflora* (Lindl. bot. reg. 1475.) flowers white. *h. S.* Native of Nipaul.

*Nipaul Osbeckia*. Fl. June. Clt. 1821. Sh. 2 to 3 feet.

21 *O. STELLATA* (D. Don, in bot. reg. t. 674. and prod. fl. nep. p. 221.) suffruticose; branches rough from adpressed hairs; leaves petiolate, ovate-lanceolate, acuminate, 5-nerved, beset with stiff hairs on both surfaces; flowers corymbose; tube of calyx elongated, urceolate, covered with stellate plumose scales. *h. S.* Native of Nipaul. Petals 4, obovate, violaceous. Anthers 8, yellow, falcate, long. Style deflexed. Capsule 4-celled, inclosed in the truncate, elongated calyx. Seeds scabrous. Hook. exot. fl. t. 37. *Melastoma stellata*, Hamilt. mss.

*Var. β*; scales of calyx palmately ciliated, and more distant.

*Stellate-calyxed Osbeckia*. Fl. Ju. Aug. Clt. 1820. Sh. 2 ft.

22 *O. TERNIFOLIA* (D. Don, in prod. fl. nep. 221.) shrubby; branches trigonal, furnished with rough bristles; leaves opposite, but usually 3 in a whorl, and sometimes even 4, almost sessile, lanceolate, acuminate, 5-nerved, beset with minute bristles along the margins and the nerves; racemes disposed in a terminal panicle; bractæas cordate; calyx urceolate, beset with ciliate pectinated scales, which at length fall off, and the calyx becomes in consequence naked; lobes of calyx lanceolate-linear, acute, hispid, deciduous. *h. S.* Native of Nipaul. Wall. pl. asiat. rar. t. 3. p. 21. t. 240. Calyx almost like that of *O. stellata*. Flowers large, purple. Anthers 8, yellow.

*Tern-leaved Osbeckia*. Shrub 2 to 4 feet.

23 *O. LESCHENAUTIA'NA* (D. C. prod. 3. p. 142.) shrubby; branches tetragonal, beset with stiff pili; leaves sessile, ovate, acutish, approximate, 5-nerved, villous on both surfaces; flowers sessile, bracteate, in heads, usually of threes; tube of calyx globose, with the scales palmately ciliated, and the lobes 4 and

lanceolate. *h. S.* Native of the East Indies, on the Nelli-gerry mountains, where it is called *Taberi-Guida*. Leaves hardly an inch long. Stamens 8.

*Leschenault's Osbeckia*. Shrub 3 to 4 feet.

24 *O. MANILLIA'NA* (D. C. l. c.) suffruticose; branches tetragonal, and are as well as the petioles hispid; leaves petiolate, ovate, acuminate, 5-nerved, somewhat ciliate serrated, and with a few scattered hairs on both surfaces, pale beneath; flowers terminal, and in the forks of the branches, 3-5 in a fascicle; tube of calyx beset with long stellate hairs: having the lobes and appendages deciduous. *h. S.* Native of Manilla, one of the Philippine Islands. Flowers large, purple, almost like those of a species *Lasiandra*.

*Manilla Osbeckia*. Shrub 6 to 8 feet.

25 *O. ASPERA* (Blum. in bot. zeit. 1831. no. 27. p. 474.) shrubby, rough from short strigose bristles; branches obscurely tetragonal; leaves on short petioles, oblong-ovate, or oblong-lanceolate, acute, obtuse at the base, 3-nerved; flowers decandrous, on short pedicels, terminal, subracemose; calyx clothed with adpressed down, furnished with subulate, minute appendages at the throat; calycine segments ovate-oblong, obtuse; ovarium rather downy. *h. S.* Native of Ceylon. *Melastoma aspera*, Lin. spec. p. 560. Rheed. mal. 4. p. 91. t. 43. Rumph. amb. 4. p. 135. t. 71. Flowers red or purple.

*Rough Osbeckia*. Shrub 3 to 4 feet.

26 *O. REPENS* (D. C. prod. 3. p. 142.) stem suffruticose, branched, creeping at the base, tetragonal at the apex, glabrous; leaves petiolate, roundish-obovate, somewhat cuneate at the base, 3-5-nerved, glabrous, almost quite entire; flowers terminal, solitary, on short pedicels; tube of calyx beset with chaffy bristles; lobes 4-7, lanceolate: with the appendages between the lobes spiny-ciliated. *h. S.* Native of China. *Melastoma repens*, Desrous. in Lam. dict. 4. p. 54. *Rhexia heteranthæra*, Bonpl. rhex. t. 23. Flowers rose-coloured. Capsule 5-celled. Habit of *Cornus Canadensis*.

*Creeping Osbeckia*. Shrub creeping.

27 *O. OCTANDRA* (D. C. prod. 3. p. 142.) stems suffruticose, glabrous, but beset with adpressed bristles at the tops, creeping at the base; leaves petiolate, ovate, 3-nerved besides the 2 marginal nervules, glabrous, except the margins and the nerves on the under surface, which are beset with adpressed bristles; flowers solitary, terminal, on short pedicels; tube of calyx ovate, scabrous from bristles. *h. S.* Native of Ceylon. *Melastoma octandra*, Lin. spec. 560. Willd. spec. 2. p. 595. Very like *O. repens*, but differs in the leaves being not cuneate at the base.

*Octandrous Osbeckia*. Shrub 1 foot.

28 *O. CHULE'SIS* (D. Don, prod. fl. nep. p. 221.) shrubby; branches lepidotted; leaves oval-oblong, mucronulate, 5-nerved, cordate at the base, pilose and rough on both surfaces, canescent beneath; flowers corymbose; scales on calyx membranous, ciliated with bristles, scattered: segments ovate-oblong and ciliated. *h. G.* Native of Nipaul, at Narainhetty. *Melastoma Chulesis*, Hamilt. mss. Leaves 3 inches long and an inch or an inch and a half broad. Flowers large, pale purple, 5-cleft, at first bracteate by broad membranous scales.

*Chulesis Osbeckia*. Fl. June. Shrub 2 to 3 feet.

29 *O. ROSTRATA* (D. Don, prod. fl. nep. p. 221.) leaves lanceolate, acute, somewhat 5-nerved, rounded at the base, nakedish on both surfaces, green; flowers corymbose; bractæas cordate; calyx oblong, furnished with numerous scattered bristly scales; the lobes oblong-lanceolate and ciliated. *h. G.* Native of Nipaul, at Narainhetty. *Melastoma? rostrata*, Hamilt. mss. Flowers purple, 4-cleft.

*Beaked Osbeckia*. Shrub 2 to 3 feet.

*Cult.* All the species of *Osbeckia* are worth cultivating for

the beauty of their flowers. Their culture and propagation is the same as that for the species of *Melastoma*, p. 764.

**XXXV. TIBOUCHINA** (meaning not explained by Aublet). Aubl. guian. 1. p. 445. D. C. prod. 3. p. 143.—Savastènia, Neck. elem. no. 795.

**LIN. SYST.** *Decándria, Monogýnia*. Tube of calyx turbinate, clothed with imbricate scales; girded at the base by a double involucre, both formed of 2 connate bracteas; lobes 5-lanceolate, without any appendages between the lobes, as in *Osbéckia*. Petals 5, oval. Stamens 10; filaments glabrous; connectives of anthers bluntly biauriculate at the base. Ovarium free, bristly at the apex. Capsule dehiscent. Seeds cochleate.—A shrub, native of Guiana. Branches slightly tetragonal, and are as well as the petioles scabrous from scales. Leaves on short petioles, ovate, blunt at the base and acute at the apex, quite entire, 5-nerved, clothed with stiffish hairs beneath, and adpressed villi above, which is confluent between the nerves. Flowers few, nearly terminal, girded by a double involucre.

1 *T. ASPERA* (Aubl. guian. 1. p. 177.).  $\frac{1}{2}$  S. Native of French Guiana. *Rhèxia aspera*, Willd. spec. 2. p. 304. *Melastoma Tibouchina*, Desr. in Lam. dict. 4. p. 49. D. Don, mem. soc. wern. 4. p. 288. *Melastoma aromática*, Vahl. ecl. 1. p. 41. Flowers purple.

*Rough Tibouchina*. Shrub 2 to 3 feet.

*Cult.* For culture and propagation, see *Melastoma*, p. 764.

**XXXVI. TRISTEMMA** (from *τρεῖς*, *treis*, three, and *στέμμα*, *stemma*, a crown; in reference to the calyx being girded by 3 circles of bristles). Juss. gen. p. 329. D. C. prod. 3. p. 144.

**LIN. SYST.** *Octo-Decándria, Monogýnia*. Calyx tubular, 4-5-cleft, furnished with margins or bearded appendages near the limb, and surrounded by many bracteas at the base. Petals 4-5, unguiculate. Stamens 8-10; anthers a little arched, somewhat auriculate at the base. Ovarium hardly adnate to the calyx at the base, and crowned by stiff hairs at the apex. Berry variously depressed, 4-5-celled, clothed by the calyx. Seeds unknown. Subshrubs or herbs, with tetragonal stems. Leaves 3-5-nerved. Flowers capitate. This genus appears to be intermediate between *Osbéckia* and *Melastoma*.

1 *T. VIRUSANUM* (Comm. mss. ex Juss. l. c.) stem suffrutescent; leaves oval, acuminate, 5-nerved, pilose on both surfaces as well as the branches; heads of flowers terminal, almost sessile, usually composed of 5-8 flowers.  $\frac{1}{2}$  S. Native of the Mauritius. Vent. choix. t. 35. *Tristemma Mauritianum*, Pers. ench. 1. p. 476. *Melastoma virusana*, D. Don, in wern. soc. mem. 4. p. 396. Calyx girded by 3 rings of bristles. Flowers purple.

*Poisonous Tristemma*. Shrub 1 foot.

2 *T. HIRTUM* (Vent. choix. p. 35. in a note) stem herbaceous, tetragonal; branches and petioles beset with spreading stiff hairs; leaves ovate, 5-nerved, acuminate; flowers capitate, terminal, sessile, bracteate.  $\frac{1}{4}$  S. Native of Guinea, in the kingdom of Warea. Beav. fl. d'ow. vol. 1. p. 93. t. 57, with a figure. Very like *T. virusanum*, but differs in the stems being herbaceous, and in the hairs being longer and more patent. Calyx having only 2 circles of bristles. Flowers red.

*Hairy Tristemma*. Pl. 1 foot.

*Cult.* For culture and propagation, see *Melastoma*, p. 764.

**XXXVII. SARCOPYRAMUS** (*σαρξ σαρκος*, *sarx sarcos*, flesh, and *πυραμς*, *pyramis*, a pyramid; in allusion to the herb, which is fleshy and pyramidal in its growth). Wall. tent. fl. nep. 1. p. 32. t. 23. D. C. prod. 3. p. 485.

VOL. II.

**LIN. SYST.** *Octándria, Monogýnia*. Calyx adhering to the ovarium at the base, permanent, obversely pyramidal, with a truncate 4-toothed border; teeth compressed, ciliated, having the interstices naked. Petals oval, acute. Stamens 8. Anthers simple, straight, naked, opening by 2 pores at the apex. Ovarium semi-adnate to the calyx, with a funnel-shaped, 4-lobed apex. Capsule square, 4-winged at the apex, 4-celled, 4-valved; valves dilated and foliaceous. Seeds cuneated and triangular.—A fleshy erect herb. Leaves petiolate, oval, acute, 3-nerved, with entire margins, those opposite each other unequal in size. Flowers rose-coloured, in cymes. This genus differs from others in a remarkable degree, in the fruit being capsular, and in the ovarium being semi-adnate at the same time.

1 *S. NIPAULENSIS* (Wall. l. c. t. 23.).  $\odot$  S. Native of Nipaul, in moist stony valleys, among the mountains.

*Nipaul Sarcopyramus*. Pl. 1 foot.

*Cult.* For culture and propagation, see *Centradenia*, p. 766.

**XXXVII. MELASTOMA** (from *μελας*, *melas*, black, and *στομα*, *stoma*, the mouth; the berries of some of the species are black: the are commonly eaten by children, whose mouths they stain black). Burm. fl. ind. D. C. prod. 3. p. 144.—*Melastoma* Species of Lin. gen. 544. D. Don, in wern. soc. mem. 4. p. 288.

**LIN. SYST.** *Deca-Decándria, Monogýnia*. Tube of calyx ovate, half adnate to the ovarium, densely covered with scales or bristles; limb 5 (f. 111. a.), rarely 6-cleft; the segments all furnished with appendages, both deciduous. Petals 5 (f. 111. c.)-6. Stamens 10, the anthers of the petals. Anthers oblong-linear, a little arched, opening by a pore at the apex, each furnished with a stipe-formed connective, which is in some species elongated, and in others short, but always biauriculate or emarginate in front. Free part of ovarium conical and bristly. Style filiform, somewhat thickened at the apex. Stigma a pruinose dot. Capsule baccate, 5-6-celled opening irregularly. Seeds cochleate.—Shrubs, usually covered with strigæ. Leaves petiolate, quite entire, or serrulated, nerved. Peduncles terminal, disposed in fascicles or panicle-corymbs, sometimes solitary; pedicels bi-bracteate. Flowers large, white, rose-coloured, or purple. The genus differs from *Osbéckia* in the fruit being hardly dry, not opening regularly at the cells, but fleshy at the base and opening in an irregular transverse manner.

\* *Fruit baccate*.

1 *M. DENTICULATUM* (Labill. calcd. 1. p. 65. t. 64.) shrubby; branches a little compressed, and are as well as the petioles scabrous from adpressed bristles; leaves petiolate, oval-oblong, acuminate, 5-nerved, scabrous from small bristles above, pale beneath, and beset with adpressed strigæ along the nerves; flowers few, in a kind of cyme; calyx urceolate, clothed with adpressed strigæ, with the lobes lanceolate and deciduous.  $\frac{1}{2}$  G. Native of New Caledonia. Ovarium bristly at the apex. Seeds cochleate. Flowers white?

*Denticulated-leaved Melastoma*. Shrub 3 to 4 feet.

2 *M. TAITENSE* (D. C. prod. 3. p. 144.) shrubby; branches tetragonal, and are as well as the petioles rough from strigæ; leaves petiolate, oval-oblong, acuminate, rather denticulated, 3-nerved, besides the 2 marginal nervules, scabrous from bristles on the upper surface, but strigose on the nerves beneath; corymbs few-flowered; calyx scabrous from thick bristles; lobes 5, oblong, deciduous.  $\frac{1}{2}$  G. Native of the Island of Tait, in the South Sea. Allied to *M. denticulatum*, but differs in the corolla being of 5, not of 6 petals, and in the leaves being 3-nerved, not 5-nerved. Flowers white. Berry 5-celled. Seeds cochleate.

5 E

*Tait Melastoma.* Shrub 3 to 6 feet.

3 *M. AFFINE* (D. Don, in mem. wern. soc. 4. p. 288.) shrubby; branches scaly; leaves lanceolate, acute, 3-nerved, pilose on both surfaces; flowers usually 3 together; calyx densely clothed with scales. *h. S.* Native of the East Indies and the Straits of Sunda. Very like the preceding and following species, and probably only a variety of one or the other; from the following it differs in the leaves being longer and narrower, 3-nerved, and more rough.

*Allied Melastoma.* Shrub 4 to 6 feet.

4 *M. MALABATHRICUM* (Lin. spec. p. 559.) shrubby; branches tetragonal, rough from strigæ; leaves elliptic-oblong, obtuse at the base, acute at the apex, quite entire, green on both surfaces, and scabrous from strigæ; corymbs 1-5-flowered; calyx clothed with adpressed strigose scales: with ovate, acute lobes; alternate stamens barren, according to Blume; connectives of the anthers short or very long. *h. S.* Native of the East Indies; frequent in the Indian Archipelago.—Rheed. *Mal.* 4. t. 42.—Rumph. amb. 4. t. 72. Flowers large, purple.

*Malabar Melastoma.* Fl. Ju. Aug. Clt. 1793. Sh. 6 to 8 ft.

5 *M. ERECTUM* (Jack, in Lin. soc. trans. 14. p. 41) shrubby; branches terete, or obscurely tetragonal; leaves ovate, 5-nerved, acute at both ends, villous; flowers corymbose, terminal, few; bracteas small; calyx scabrous from long, erect strigæ, with linear deciduous segments; fruit 5-celled. *h. S.* Native of Sumatra and Java. Petals large, purple. Probably distinct from *M. Malabathricum*, according to Blume, *bijdr.* p. 116.

*Erect Melastoma.* Shrub 6 to 8 feet.

6 *M. CANDIDUM* (D. Don, in mem. soc. wern. 4. p. 228.) shrubby; branches terete, 3-nerved, densely clothed with silky white down on both surfaces; calyxes covered with soft, white, linear-elongated, adpressed scales. *h. S.* Native of China and the Straits of Sunda. Flowers purple.

*White Melastoma.* Fl. May, Ju. Clt. 1822. Sh. 4 to 6 ft.

7 *M. MACROCARPUM* (D. Don, in mem. soc. wern. 4. p. 289.) shrubby; branches nearly terete, clothed with adpressed stiff hairs, as well as the petioles; leaves oval-oblong, acuminate, 5-nerved, quite entire, green on both surfaces, scabrous from scattered bristles above, as well as on the nerves beneath, and between them puberulous; flowers terminal, usually solitary; calyx roundish, densely clothed with long stiff hairs; stamens alternately dissimilar. *h. G.* Native of China. *Melastoma Malabathricum*, Sims, bot. mag. t. 529. D. Don, in bot. reg. t. 672. Flowers large, reddish purple.

*Large-fruited Melastoma.* Fl. June, Aug. Clt. 1793. Sh. 4 to 6 feet.

8 *M. SANGUINEUM* (D. Don, l. c.) shrubby; branches terete, very rough from red bristles; leaves on short petioles, ovate-lanceolate, acuminate, 5-nerved, green above and shining, but red at the nerves beneath and on the petioles; flowers few, terminal; calyx covered with very long incurved bristles; petals 6, large. *h. S.* Native of the Straits of Sunda. Sims, bot. mag. 2241. Flowers large, purple. Very like *M. macrocarpum*.

*Bloody-veined Melastoma.* Fl. Sept. Oct. Clt. 1818. Sh. 4 to 6 feet.

9 *M. POLYANTHEMUM* (Blume, in bot. zeit. 1813. no. 28.)

branches, petioles, and under side of leaves rough on the nerves, from little scales; leaves elliptic or ovate-oblong, acute at both ends or obtuse at the base, quite entire, 3-nerved, besides 2 little marginal nervules, scabrous from strigæ above, but clothed with silky pubescence beneath; flowers 7-11 or more, disposed in a corymbose panicle; calyx covered with adpressed, scale-like strigæ: having short, triangular, ovate, acute segments; each of the alternate stamens has its connective elongated. *h. S.* Native of Java and Sumatra in bushy places. *M. Malabathricum*, Jack, in Lin. trans. 14. p. 4. Blum. *bijdr.* p. 1070.—Rumph. amb. 4. t. 72. Flowers purple.

*Var. β*; scales of the calyx spreading.

*Var. γ*; leaves on short petioles; flowers smaller, white; segments of the calyx bluntish.

*Many-flowered Melastoma.* Shrub 4 to 6 feet.

10 *M. TIDORENSE* (Blum. l. c. p. 482.) branches, petioles, and nerves on the under surface of the leaves rough from scaly strigæ; leaves ovate-oblong, acuminate, rounded at the base or obtuse, denticulated, rough from strigæ above, but very hairy beneath, 5-nerved; flowers subcorymbose, terminal; calyx beset with adpressed bristles: with broad, subulate segments; each alternate stamen has its connective elongated. *h. S.* Native of the Moluccas, on the top of Mount Tidor. *M. Malabathricum*, Reinwd. ined. Flowers purple.

*Tidor Melastoma.* Shrub 4 to 6 feet.

11 *M. ROYENII* (Blum. l. c. p. 483.) branches, petioles, and nerves of leaves on the under surface, rough from little scales; leaves lanceolate or ovate-lanceolate, acuminate at both ends or bluntish at the base, slightly denticulated, 3-nerved, as well as having 2 marginal, hardly distinct nervules, rough from strigæ; flowers 5-7, disposed in a terminal kind of corymb; calyx beset with scale-like adpressed strigæ: having short, broad-subulate segments; each alternate stamen has its connective elongated. *h. S.* Native of Ceylon.—Burm. thes. 2. p. 154. t. 72. Flowers purple.

*Royen's Melastoma.* Shrub 4 to 6 feet.

12 *M. ASPERUM* (Blume, *bijdr.* p. 1076. but not of Lin.) branches, petioles, and nerves of leaves on the under surface, rough from little scales; leaves ovate-oblong, acuminate, obtuse at the base, quite entire, sub-5-nerved, rough from strigæ; flowers 3-7, in a terminal fascicle; calyx beset with adpressed, scale-like strigæ, with linear elongated segments; stamens equal, each with an elongated connective. *h. S.* Native of Java, in woods on the higher mountains. *M. Malabathricum*, flore albo, Reinwd. ined. Flowers white. Stamens all equal and fertile.

*Rough Melastoma.* Shrub 4 to 6 feet.

13 *M. SYLVATICUM* (Blum. *bijdr.* p. 1077.) branches, petioles, and nerves of leaves on the under surface, rough from little scales; leaves elliptic-oblong, acuminate, acute at the base, quite entire, 5-nerved, scabrous; flowers 3-5, in terminal fascicles; calyx beset with scale-like strigæ: with linear-elongated segments; stamens equal, each having a short connective. *h. S.* Native of Java, where it is called *Harendong-Gunung*. Flowers whitish. Stamens 10, yellowish.

*Var. β, uniflorum* (Blum. l. c. in bot. zeit. 428.) stems decumbent, rooting; leaves smaller; flowers terminal, solitary. *h. S.* Native of Java, in the province of Bantam.

*Wood Melastoma.* Shrub 4 to 6 feet.

14 *M. SETIGERUM* (Blum. *bijdr.* p. 1077.) branches, petioles, and nerves on the under surface of the leaves, thickly beset with chaffy bristles; leaves ovate-oblong, acuminate, rounded at the base, 5-nerved, bristly above, roughish and hairy beneath. *h. S.* Native of Java, on Mount Salak.

*Var. β, angusto-bracteatum* (Blum. in bot. zeit. 1831. no. 28.) leaves ovate-oblong, rounded at the base, nearly 5-nerved; flowers in terminal corymbs; bracteas linear, acuminate; calyx

beset with adpressed scale-like strigæ, with the segments broad-subulate. *h. S.* Native of Java, on the mountains called Megamendung in woods.

*Var. γ, lato-bracteatum* (Blum. l. c.) leaves oblong-lanceolate, obtuse at the base, 3-nerved; flowers in terminal bundles; bractæas oval, acuminate, fringed. *h. S.* Native along with the preceding var. at Laga.

*Bristle-bearing Melastoma.* Shrub 4 to 6 feet.

15 *M. LANUGINOSUM* (Blum. bijdr. p. 1077.) branches, petioles, and nerves of leaves on the under surface clothed with chaffy bristles; leaves ovate, or oblong-ovate, acute, rather cordate at the base or roundish, quite entire, 5-nerved, clothed with yellowish villi on both surfaces, but when in a young state woolly; flowers few, in terminal fascicles; calyx beset with adpressed scale-like bristles, with the segments broad-subulate; each alternate stamen has its connective elongated. *h. S.* Native of Java, in the province of Tjanjor, near Tjibidoy. Flowers purple? •

*Woolly Melastoma.* Shrub 4 to 6 feet.

16 *M. CELEBICUM* (Blum. in bot. zeit. 1831. no. 28.) branches, petioles, and nerves of the leaves on the under surface covered with adpressed scales; leaves ovate-oblong, acuminate, rounded at the base, or obtuse, finely denticulated, 3-nerved, as well as with 2 lateral nervules, bristly above and villous beneath; flowers in terminal corymbs; calyx beset with adpressed scale-like strigæ, with the segments subulate. *h. S.* Native of Celebes, on Mount Sempa.

*Celebes Melastoma.* Shrub 3 to 6 feet.

17 *M. PORPHYREUM* (Zipp. ex Blum. l. c.) branches, petioles, and nerves of leaves on the under surface, rough from scales; leaves oblong-lanceolate, acuminate, obtuse at the base, finely denticulated, 3-nerved, as well as having 2 lateral nervules, rather scabrous; flowers terminal, usually solitary, on short peduncles; calyx covered with long, incurved, spreading bristles. *h. S.* Native of the Moluccas. Flowers purple?

*Porphyry Melastoma.* Shrub 4 to 6 feet.

18 *M. WALLICHII* (D. C. prod. 3. p. 146.) branches terete, strigose; leaves elliptic-oblong, narrowed at the base, acuminate at the apex, 5-nerved, villous on both surfaces; flowers 3 together at the tops of the branches; calycine tube subglobose, covered with scale-like ciliated strigæ, with 6 deciduous segments. *h. G.* Native of Nipaul. Appendages between the lobes of the calyx small. Flowers purple. Each alternate stamen has its connective elongated.

*Wallich's Melastoma.* Shrub 4 to 6 feet.

19 *M. NORMALE* (D. Don, prod. fl. nep. 220.) branches thickly covered with bristly hairs; leaves elliptic, acute, rounded at the base, 5-nerved, beset with bristly hairs above and with tomentum beneath; flowers 3 together at the tops of the branches; calyx globose, covered with narrow, hoary, ciliated adpressed scales, the lobes deciduous. *h. G.* Native of Nipaul. Appendages between the lobes of the calyx small. Flowers pale red. Each alternate stamen has its connective elongated. Habit of *M. Malabáthricum*.

*Normal Melastoma.* Shrub 3 to 6 feet.

20 *M. DECEMFIDUM* (Roxb. hort. beng. p. 90. ex Jack. in Lin. trans. 114. p. 6.) shrubby, decandrous; branches terete, beset with scattered, scale-like strigæ; leaves ovate-lanceolate, attenuated, 5-nerved, hardly spinulose on the margins; flowers terminal, usually solitary, on short pedicels; calyx 5-cleft, echinate, from soft stretched bristles; anthers of the longer stamens apiculated at the base. *h. S.* Native of Pulo-Penang. Flowers purple. Allied to *M. Malabáthricum*, but the flowers are larger and more beautiful. The appendages between the lobes of the calyx large.

*Ten-cleft-calyx Melastoma.* Shrub 3 to 4 feet.

21 *M. CYANOIDES* (Smith, in Rees. cycl. vol. 23.) leaves ovate, acute, entire, 5-nerved, beset with yellowish bristles; racemes terminal, forked; calyx densely clothed with bristles; bractæas oval, fringed. *h. S.* Native of Amboyna. Rumph. amb. 4. t. 71.—Rheed. mal. 4. t. 43. ex Smith.

*Cyanus-like Melastoma.* Shrub 3 to 6 feet.

22 *M. DODECANDRUM* (Lour. coch. p. 274.) shrubby; leaves ovate, quite entire, glabrous, 5-nerved; peduncles few-flowered, terminal; flowers dodecandrous, rose-coloured; larger stamens have their connectives elongated, in the smaller ones the connectives are hardly evident, all fertile; berry roundish, 5-celled. *h. G.* Native of Cochinchina and China, about Canton. *M. rosea*, Poir. dict. suppl. 3. p. 644. Flowers red.

*Dodecandrous Melastoma.* Shrub 1 foot.

23 *M. OBVOLUTUM* (Jack. in Lin. trans. 14. p. 3.) shrubby; branches tetragonal, scaly; leaves ovate, 5-nerved, clothed with adpressed pili; flowers few, in terminal panicles; bractæas ovate, involving the calyx; calyx covered with stellate pili; anthers of long stamens furnished with 2 appendages at the base; ovary 5-celled. *h. S.* Native of Sumatra. Limb of calyx lined by long scales on the outside. Flowers purple.

*Obvolute-calyx Melastoma.* Shrub 2 feet.

24 *M. SEMNERVIUM* (Lour. p. 273.) shrubby; branches terete; leaves oval-lanceolate, quite entire, 7-nerved, pilose on both surfaces, glabrous, petiolate; flowers few, terminal, large, purple, decandrous; calyx 5-cleft; petals roundish; stamens furnished with a long tail each; berry ovate, 5-celled. *h. G.* Native of Cochinchina, everywhere on the coast. Flowers purple.

*Seven-nerved-terete Melastoma.* Shrub 6 feet.

25 *M. MADAGASCARIENSIS* (D. Don, mem. wern. soc. 4. p. 290.) leaves elliptic, 3-nerved, mucronate, acute at the base, beset with stiff hairs beneath as well as the branches; flowers panicled; calyx hispid; anthers furnished with long connectives, each ending in 2 bristles. *h. S.* Native of Madagascar.

*Madagascar Melastoma.* Shrub.

\* \* *Species natives of Sierra Leone, with dry capsules.*

26 *M. CYMOSUM* (D. C. prod. 3. p. 147.) stem branched, bluntly tetragonal, warted, pubescent; leaves cordate, acuminate, petiolate, serrulated, 7-nerved; flowers cymose; calyx campanulate; with its teeth triangular, and one-half shorter than the tube; petals obovate, somewhat laterally acuminate, purple or red; genitals deflexed; larger stamens falcate, purple, each furnished with a prominent connective, which is broadish at the base and somewhat truncately emarginate at the apex; style filiform; capsule 5-celled, 5-valved. *h. S.* Native of Sierra Leone. Vent. hort. malm. t. 14. Lois. herb. amat. t. 135. ex Balb. Sims, bot. mag. 984. Flowers purple.

*Cymose-flowered Melastoma.* Shrub 2 feet.

27 *M. PLUMOSUM* (D. Don, l. c.) herbaceous, erect; stem branched; branches quadrangular; leaves roundish-ovate, entire, acute, 3-nerved, pilose on both surfaces as well as the branches; flowers scattered, solitary, on the tops of the branches and branchlets; calyx beset with scales, which are stellately plumose at the apex. *h. S.* Native of Sierra Leone, on the mountains, particularly in the coffee plantations near the Governor's house. *Osbéckia rotundifolia*, Smith, in Rees' cycl. vol. 25.

*Plumose-scaled Melastoma.* Pl.  $\frac{3}{4}$  foot.

28 *M. INVOLUCRATUM* (D. Don, l. c. but not of Desr. nor Schrank, nor Mart.) the whole plant beset with stiff pili; stems and branches red; branches diffuse; leaves elliptic, or ovate-lanceolate, acute, obsoletely 5-nerved, quite entire; flowers few

together, sessile, terminal, glomerated, involucreted by lanceolate bracteas; calyx pilose, with the segments lanceolate and acuminate. *h. S.* Native of Sierra Leone, on the banks of rivulets, in shady places. Petals red. Anthers yellow. Flowers 3-5 in each cluster.

*Involucreted-flowered Melastoma.* Shrub 1 to 2 feet.

29 *M. AFZELIÆNUM* (D. Don, l. c.) the whole plant beset with short stiff hairs; branches erect and furrowed; leaves ovate, acuminate, 5-nerved as well as with 2 marginal nervules; flowers secund, terminal, racemose or paniced; calyx covered with bristles, which are usually disposed in stellate fascicles, with the segments linear and plumose at the apex. *h. S.* Native of Sierra Leone, by the sides of rivulets, in shady places. Osbeckia Afzeliana, Smith, in Rees' cycl. vol. 25.

*Afzelius's Melastoma.* Shrub 1 to 2 feet.

30 *M. ALBIFLORUM*; shrubby, branched; rather pilose; stems and branches quadrangular; leaves elliptic, acute, 5-nerved, beset with short pili on both surfaces, purplish beneath; flowers in terminal, crowded heads; calyx glabrous. *h. S.* Native of Sierra Leone. Petals white; anthers yellow. The calyx very smooth, that is, without any bristles or scales; it is therefore doubtful whether it is a true species of *Melastoma*.

*White-flowered Melastoma.* Shrub 2 to 3 feet.

31 *M. CAPITATUM*; shrubby, branched; branches quadrangular, pilose; leaves ovate, acute, quite entire, 5-nerved, pilose, yellowish beneath; calyx glabrous, nerved; flowers sessile, disposed in crowded heads. *h. S.* Native of Sierra Leone. Petals red. Anthers yellow. Calyx smooth, like the 2 last species.

*Capitate-flowered Melastoma.* Shrub 1 to 2 feet.

32 *M. THERIOPHYLLUM*; shrubby, branched; branches quadrangular; leaves small, ovate-lanceolate, quite entire, sessile, 3-nerved; flowers terminal, disposed in crowded heads. *h. S.* Native of Sierra Leone, in the low lands, common. Calyx smooth, like the 2 last species.

*Tea-leaved Melastoma.* Shrub 5 to 10 feet.

33 *M. ELONGATUM* (D. Don, l. c.) the whole plant beset with stiff hairs; root black, tuberous; tubers numerous from the same neck, fusiform; stems herbaceous, quadrangular, erect, simple, several from the same root; leaves small, elliptic, acute, entire, 3-nerved, as well as with 2 lateral nervules; flowers paniced; peduncles axillary and terminal, few-flowered; calyx oblong, clothed with scales on the outside, which are terminated by a tuft of hair at the apex; having the segments oblong and membranous, bristly at the apex. *h. S.* Native of Sierra Leone, plentiful in the low lands about Freetown, among grass, flowering in great abundance in March and April. Nothing can exceed the beauty of this plant when in flower, in its native place of growth; the flowers are large and vary from blue to purple and white. Osbeckia grandiflora, Afz. mss. Smith, in Rees' cycl. vol. 25.

*Elongated-peduncled Melastoma.* Fl. March, April. Clt. 1822. Pl. 1 to 1½ foot.

34 *M. DECUMBENS* (Beauv. fl. d'ow. 1. p. 69. t. 61.) stem decumbent at the base, tetragonal; leaves ovate-lanceolate, 3-nerved, besides the lateral nervules, petiolate serrated; flowers solitary, terminal. *h. S.* Native of the western coast of Africa, on the banks of the river Formosa, in humid parts of woods. Flowers large, rose-coloured. Anthers 10, bisetose under the anthers. Capsule 5-celled.

*Decumbent Melastoma.* Shrub dec.

*Cult.* All the species of *Melastoma* are very showy when in flower. A mixture of loam, peat, and sand suits them best; and young cuttings root readily, if planted in pots filled with peat, and placed in heat, with a hand-glass over them.

XXXIX. OTANTHERA (from *ovc wroc*, *ous otos*, an ear,

and *ανθηρα*, *anthera*, an anther; in reference to the anthers being furnished with 2 auricles at the base of each). Blume, in bot. zeit. 1831. no. 28. p. 438. *Melastoma* species, Blum. bijdr. 1078.

*LIN. SYST. Decandria, Monogynia.* Tube of calyx ovate, half adhering to the ovarium, beset with palmately ciliated scales; limb 5-cleft, deciduous. Petals 5, obovate. Stamens 10, equal. Anthers oblong-linear, a little arched, attenuated upwards and opening by 1 pore, but bauriculate in front at the base; their connectives indistinct. Free part of ovarium conical and bristly. Style filiform. Stigma a pruinose dot. Berry pulpy, 5-celled. Seeds cochleate.—A shrub with terete, glabrous branches, outer branches rather tetragonal; petioles and nerves of leaves on the under surface beset with scattered, adpressed bristles. Leaves elliptic-lanceolate, acuminate, almost quite entire, 5-nerved, membranous, roughish, pale green, but with the nerves bluish on the under surface. Panicle terminal, trifid, or trichotomous; branches usually 3-flowered. Flowers small, white, lateral ones bibracteate, middle one on a short pedicel, bractless.

1 *O. MOLUCCANA* (Blum. l. c. p. 489.). *h. S.* Native of Amboyna. *Melastoma Moluccana*, Blum. bijdr. p. 1078.—Rumph. amb. 4. t. 71. middle figure.

*Molucca Otanthera.* Shrub 1 to 2 feet.

*Cult.* See *Melastoma* for culture and propagation, p. 764.

XL. LACHNOPODIUM (from *λαχνη*, *lachne*, down, and *πους ποδος*, *pous podos*, a foot; in reference to the filaments or leaves of the anthers being girded by a crown of hairs at the base). Blum. in bot. zeit. 1831. no. 27. p. 477. in a note.—*Melastoma* species, Link. et Otto.

*LIN. SYST. Decandria, Monogynia.* Tube of calyx ovate-oblong, adhering to the ovarium; limb 5-cleft, with the segments linear-subulate. Petals 5, ovate-oblong, obtuse. Stamens 10, equal; filaments girded by a crown of hairs at the base. Anthers oblong, beaked. Style filiform; stigma small, obtuse. Capsule 5-celled, crowned by the calycine segments. Seeds cochleate? This genus comes very near *Pleroma* and *Lasiandra*.

1 *L. RUBRO-LIMBATUM* (Blum. l. c.) branches terete, clothed with rufescent stiff hairs; leaves opposite, petiolate, cordate-oblong, acuminate, denticulately crenated, 5-nerved, wrinkled, beset with rufous pili; flowers cymose, axillary, contracted; bracteas obsolete; calyx margined with red in the adult state. *h. S.* Native of the East Indies. *Melastoma rubro-limbatum*, Link. et Otto, abb. t. 41. Flowers white.

*Red-limbed-calyxed Lachnopus.* Shrub 4 to 6 feet.

*Cult.* For culture and propagation, see *Melastoma*, p. 764.

XLI. PLEROMA (from *πληρωμα*, *pleroma*, fulness; cells of capsule). D. Don, wern. soc. 4. p. 293. exclusive of *Lasiandra* of D. C. prod. 3. p. 151.

*LIN. SYST. Decandria, Monogynia.* \*Tube of calyx ovate, when young often involved in 2 deciduous bracteas; lobes 5, deciduous. Petals 5, obovate. Stamens with glabrous filaments; anthers nearly equal, elongated, arched at the base, each furnished with a stipe-formed connective, which is bauriculate at the base. Ovarium adnate to the calyx, bristly at the apex; stigma a pruinose dot. Capsule baccate, 5-celled. Seeds cochleate.—American shrubs, with the habit of *Lasiandra*, but differs in the filaments being glabrous, not villous, and in the ovarium being adnate to the calyx, not free. Capsule baccate, not dry.

1 *P. LEVIFOLIUM* (D. C. prod. 3. p. 151.) branches nearly terete, villous from stiffish somewhat adpressed hairs beneath; leaves ovate-oblong, obtuse at the base, acutish at the apex, scabrous from scattered bristles above, 3-nerved, with revolute edges; pedicels axillary, 1-flowered, length of petioles; brac-

teas 2- under each flower, ovate, villous on the outside and brown inside. *h. S.* Native of Peru. *Melastoma ledifolia*, Desr. in Lam. dict. 4. p. 48. Tube of calyx beset with adpressed bristles; lobes 5, obtuse. Petals purple, ciliated. Stamens with smooth filaments. Free part of ovarium conical, rather bristly.

*Ledum-leaved Pleroma.* Shrub.

2 *P. LAXUM* (D. C. l. c.) branches nearly terete, and are as well as the petioles beset with spreading bristles; leaves ovate, rather cordate, ending in a short acumen, ciliate serrated, beset with scattered nearly adpressed bristles on the upper surface, but villously tomentose beneath; peduncles nearly opposite, axillary, long, bifid at the apex: branches 3-flowered; calyx very villous. *h. S.* Native of Peru. *Melastoma laxa*, Desr. in Lam. dict. 4. p. 41. Tube of calyx ovate; lobes 5, lanceolate-linear, about equal in length to the tube. Petals purple, ciliated. Filaments glabrous. Anthers long, rather falcate, beaked, each furnished with a long connective. Fruit baccate.

*Loose Pleroma.* Shrub 3 to 6 feet.

3 *P. TRICHOPODUM* (D. C. l. c.) branches from compressed to tetragonal, rather hispid; petioles hispid from villi; leaves oval-oblong, acuminate at both ends, 3-nerved, somewhat denticulated, hardly pubescent above, pale beneath, and clothed with adpressed bristles, especially on the nerves; flowers solitary in the axils of the upper leaves, and on the tops of the branches, pedicellate; bractees 2, oval, involving the calyx, which is bristly. *h. S.* Native of Brazil. Habit of *Lasiandra*, but differs from that genus, in the stamens being glabrous, and ovarium being adnate to the calyx.

*Hairy-petioled Pleroma.* Sh. 4 to 6 feet.

4 *P. VIMINEUM* (D. Don, in mem. soc. wern. 4. p. 293.) leaves ovate-lanceolate, acute, petiolate, and are as well as the branches scabrous, but canescent beneath; calyx covered with glandular hairs: having the segments lanceolate and mucronate. *h. S.* Native of Brazil. *Rhèxia viminea*, D. Don, in bot. reg. t. 664. Spreng. syst. 2. p. 302. Flowers purple. Filaments smooth.

*Twiggy Pleroma.* Fl. Ju. Aug. Clt. 1821. Sh. 6 feet.

5 *P. HETEROMALLA* (D. Don, l. c.) leaves oval, cordate, petiolate, beset with flocky wool beneath; calycine segments oblong, obtuse; petals obcordate. *h. S.* Native of Brazil. *Melastoma heteromalla*, D. Don, in bot. reg. t. 644. Sims, bot. mag. 2337. Filaments short, glabrous, conniving. Anthers arched at the base. Petals 5-6, purplish violet. Calyx pubescent; teeth deciduous.

*Heteromallous Pleroma.* Fl. July, Sept. Clt. 1819. Sh. 4 to 6 feet.

6 *P. VILLOSUM* (D. C. prod. 3. p. 152.) branches terete, and are, as well as the leaves, villous beneath; leaves ovate, acute, quite entire, villous, 5-nerved; flowers terminal, few, pedunculate; petals obovate, retuse, mucronate; stamens 5 fertile and 5 sterile. *h. S.* Native of South America. *Melastoma villosum*, Sims, bot. mag. t. 2630. Lodd. bot. cab. t. 853. but not of Aubl. Filaments glabrous.

*Villous Pleroma.* Fl. May, Ju. Clt. 1820. Sh. 3 to 4 ft.

7 *P. ? DIFFUSUM* (D. C. prod. 3. p. 152.) stems tetragonal, decumbent, much branched, pilose; leaves ovate, acute, 3-nerved, serrated, pilose beneath; flowers axillary, solitary, pedicellate; calyx globose, nearly naked: having lanceolate, mucronate segments. *h. S.* Native of Porto Rico. *Melastoma diffusa*, Pav. ex D. Don, mem. wern. soc. 4. p. 291. Flowers purple.

*Diffuse Pleroma.* Sh. decumbent.

8 *P. ? MEXICANUM* (D. C. prod. 3. p. 152.) stem erect, branched, pilose; leaves lanceolate, acuminate, 3-nerved, pilose on both surfaces; flowers 1-2, axillary or terminal; calyx pilose, with linear acute segments. *h. S.* Native of Mexico.

*Melastoma aspera*, Pav. in herb. Lamb. *Melastoma Mexicana*, D. Don, in mem. wern. soc. 4. p. 290.

*Mexican Pleroma.* Sh. 2 to 3 feet.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

**XLII. DIPLOSTEGIUM** (from *διπλοος*, *diploos*, double, and *στεγος*, *stegos*, a covering; in reference to the calyx, which is inclosed in a double calyptra or covering). D. Don, in mem. wern. soc. 4. p. 296. D. C. prod. 3. p. 152.

*LIN. SYST.* *Decandria, Monogynia*. Limb of calyx 5-cleft, permanent, inclosed in a double cucullate hispid calyptra. Petals 5. Stamens 10; anthers nearly equal, biariculate at the base. Ovarium? Stigma a pruinose dot. Capsule baccate, 5-celled. Seeds unknown. — A Brazilian shrub. Stem terete, densely beset with white pili. Leaves ovate, acute, quite entire, petiolate, 5-nerved, clothed with silky pili beneath, but scabrous above. Peduncles terminal, trichotomous, 3-flowered. Flowers large, red.

1 *D. CANESCENS* (D. Don, l. c.) *h. S.* Native of Brazil.

*Canescent Diplostegium.* Sh.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

**XLIII. ACIOTIS** (from *ακίς*, *akis*, a point, and *ὄψις ὠτος*, *ous otes*, an ear; in reference to the petals, which are obliquely awned). D. Don, in mem. wern. soc. 4. p. 296. D. C. prod. 3. p. 152.

*LIN. SYST.* *5. Octandria, Monogynia*. Tube of calyx globose, fleshy; limb 5-lobed, permanent, 1-lobed; petals 4, obliquely awned at the base. Stamens 8, with long connectives, and as if *intere* joined in the middle. Anthers erect, naked at the base. Capsule baccate, 4-celled. Seeds cochleate. — A West Indian shrubby plant, with numerous, erect, tetragonal, branched stems. Leaves petiolate, elliptic-oblong, acuminate, 3-nerved, purple beneath, and of a deep shining green above. Flowers small, red, disposed in spicate racemes. Berry globose, purple, edible, with a grateful acid taste.

1 *A. DISCOLOR* (D. Don, l. c. p. 301.) *h. S.* Native of the Island of St. Vincent. *Rhèxia bicolor*, Anders. in herb. Lamb. *Two-coloured-leaved Aciotis.* Fl. July, Sept. Clt. 1816. Sh. 1 foot.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

**XLIV. CENTRADENIA** (from *κεντρον*, *centron*, a spur, and *ἀδην*, *aden*, a gland; in reference to the gland-formed spur of the smaller stamens). *Rhèxia*, nov. gen. Cham. et Schlecht. in Linnæa. 5. p. 567.

*LIN. SYST.* *Octandria, Monogynia*. Calyx rather tetragonal, campanulate, membranous, 8-nerved, rather pilose; limb 4-toothed; teeth broad, triangular, acute. Petals obovate. Stamens 8, alternately smaller; filaments glabrous; anthers opening by 1 pore, elliptic, those of the longer stamens drawn out each into an emarginate cuneated copper-coloured spur or connective, but the spurs of the smaller stamens are gland-formed. Style short, smooth, crowned by a subcapitate stigma. Ovarium free, crowned by one series of short bristles at the base of the style. Capsule within the calyx 4-valved, 4-celled, at length separating from the axis along with the dissepiments. Seeds numerous, minute, clavately elliptic, echinated, brown: with a terminal dot-formed hardly coloured hylum. — An annual, branched herb, with tetragonal pilose branches. Leaves opposite each other, unequal in size, one of which being almost abortive. Large leaves, oblong-lanceolate, acute, on short petioles, unequal-sided, quite entire, ciliated, triple-nerved, pale beneath, 2 inches long, and 5 lines broad. Racemes few-flowered, axillary. Flowers on longish pedicels, small, white.

1 *C. INÆQUILATERALIS*. *h. S.* Native of Mexico, in Cuesta Grande de Chiconquiaco. *Rhèxia inæquilateralis*, Cham. et Schlecht. l. c.

*Unequal-sided-leaved* Centradenia. Pl. 1 to 1½ foot.

*Cult.* The seeds of this plant require to be sown in a hot-bed; and when the plant have attained the height of 2 or 3 inches, they may be potted off into separate pots, and again returned to the hot-bed; and when they begin to come into flower, they may be removed to the stove.

#### Tribe IV.

MICONIÆ (this tribe contains plants agreeing with *Miconia* in important characters). D. C. prod. 3. p. 152. Anthers opening by 1 or 2 pores at the apex. Ovarium adnate to the calyx. Fruit baccate. Seeds not cochleate.

XLV. ROUSSEAUZIA (dedicated by De Candolle to — Desrousseaux, coadjutor with Lamarck in his Dictionnaire de Botanique.) D. C. prod. 3. p. 152.

LIN. SYST. *Octândria, Monogýnia*. Tube of calyx hemispherical, smooth; lobes 4, broad. Petals 4, obovate. Stamens 8; anthers oblong-linear, opening by 1 pore? sometimes all fertile, with their connectives rather gibbous at the base; sometimes the alternate ones are sterile, having their connectives short: and the others fertile, with long connectives, which are furnished with 2 bristles at the base. Ovarium adnate to the calyx, bearing 4 bristle-like scales at the base around the origin of the style. Style filiform. Capsule baccate, opening at the apex. Seeds angular, shining.—Shrubs, natives of Madagascar. Leaves petiolate, 3-nerved, quite entire, oval-oblong. Cymes trichotomous, terminal.

§ 1. *Stamens equal, all fertile, each furnished with 2 bristles at the base of the connective.*

1 R. CHRYSOPHYLLA (D. C. l. c.) branches bluntly tetragonal, at length glabrous, rather bristly at the apex; leaves petiolate, oval-oblong, acute, 3-nerved, glabrous on both surfaces, beset with adpressed setæ on the nerves beneath, and on the margins, which are entire; cymes terminal, twice trifid; tube of calyx campanulate, quite smooth: with 4 broad-lanceolate lobes, which are ciliated with bristles. h. S. Native of Madagascar. *Melástoma chrysophylla*, Desr. in Lam. dict. 4. p. 50. but not of Rich. Leaves yellowish when dried. Petals 5, obovate. Flower-bud conical, acute. Stamens 8, equal; filaments glabrous. Anthers oblong-linear, bluntish. Ovarium crowned by 4 spiny-ciliated scales. Style filiform, rising between the scales. Fruit unknown.

*Golden-leaved Rousseauxia.* Shrub.

§ 2. *Stamens alternately unequal; fertile ones furnished each with a long connective, which ends in 2 bristles.*

2 R. ARTICULATA (D. C. l. c.) branches bluntly tetragonal, at length terete, knotted at the insertion of the leaves, roughish from rather adpressed scattered bristles; leaves petiolate, oval-oblong, acuminate, quite entire, 3-nerved, glabrous above, bristly beneath, but especially on the nerves; cymes trichotomous; tube of calyx hemispherical, glabrous, with 4 broad obtuse lobes; ovarium bristly at the apex. h. S. Native of Madagascar, ex herb. Juss. not of Cayenne, as mentioned by Desrousseaux. *Melástoma articulata*, Desr. in Lam. dict. 4. p. 56. Capsule adnate to the calyx, opening at the apex. Seeds angular, shining. Style filiform. Filaments glabrous, filiform. Anthers linear, opening by one pore, rather shorter than their connectives.

*Articulated-stamened Rousseauxia.* Shrub.

*Cult.* See *Melástoma* for culture and propagation, p. 764.

XLVI. LEANDRA (in honour of — Leandro do Sacramento, director of the botanic garden at Rio Janeiro, author of *Nova Plantarum Geneva*, inserted in Act. Acad. Monach. vol. 7. Raddi in mem. soc. ital. 1820. p. 6. D. C. prod. 3. p. 153.)

LIN. SYST. *Octo-Decándria, Monogýnia*. Tube of calyx ovate, urceolate, almost bottle-shaped, drawn out beyond the ovarium; lobes disposed in two rows, with 4-6 outer subulate ones, and 6 inner oval membranous ones, in front of the outer ones. Petals 4-6, linear-lanceolate. Stamens 8-12. Anthers linear, hardly auricled at the base. Style filiform, exserted, hairy at the base. Stigma dot-formed. Berry dry, 3-4-celled. Seeds angular, somewhat ovate and shining, with a linear hylum.—Brazilian shrubs, more or less rough from villi or setæ. Leaves triple-nerved, ciliate-serrated. Flowers capitate, usually bracteate.

SECT. I. LEANDRA'RIA (an alteration from the generic name). D. C. prod. 3. p. 153. Calyx 5-6-cleft; lobes disposed in two series. Hairs of the calyx and bractæas bristly.

1 L. AMPLEXICAULIS (D. C. l. c.) branches tetragonal, rough from bristles, as well as both surfaces of the leaves and margins; leaves oval-oblong, acuminate, triple-nerved, quite entire, sessile, cordate and stem-clasping at the base; heads of flowers bracteate; bractæas obtuse or emarginate. h. S. Native of Brazil, at the river Xipote. L. hispida, Schrank et Mart. mss. Calyx almost bottle-shaped, rough from short bristles; lobes double, 6 outer ones subulate and thick, and the 6 inner ones oval and rather membranous. Seeds angular, shining, with a linear hylum. Stamens not seen.

*Stem-clasping-leaved Leandra.* Sh. 2 to 3 feet.

2 L. PAULINA (D. C. l. c.) branches terete, thickly beset with villi; leaves on very short petioles, broadly ovate, bluntly cordate at the base, acute at the apex, somewhat denticulately serrated, quintuple-nerved, very villous on both surfaces; heads of flowers dense, hairy, almost sessile along the short rachis; calyx very villous; inner lobes of calyx linear and glabrous, outer ones lanceolate and villous on the outside. h. S. Native of Brazil, in woods on the mountains between Rio Janeiro and St. Paul. *Melástoma Paulinum*, Schrank et Mart. mss. Upper leaves hispid from hairs, which are somewhat bulbous at the base, but clothed with villous tomentum beneath. Bractæas very villous on the outside, and smooth inside.

*St. Paul Leandra.* Sh. 2 to 3 feet.

3 L. UMBELLATA (D. C. l. c.) branches terete, and are, as well as the petioles, densely clothed with velvety down; leaves petiolate, ovate, acuminate, serrately ciliated, 7-nerved, clothed with velvety down on both surfaces; flowers in dense umbellate heads; bractæas oblong; calyx beset with glandular hairs, 6-lobed, bearing 6 appendages on the outside similar to the lobes. h. S. Native of Brazil, in woods, in the low lands in the province of Minas Geraes. *Melástoma umbellatum*, Schrank et Mart. mss. Petioles 14 lines long. Leaves 2-3 inches long, Peduncles and calyx thickly beset with capitate hairs. Lobes of calyx length of the tube. Petals linear, acute. Anthers linear, falcate. Connectives short. Genitals exserted.

*Umbellate-flowered Leandra.* Sh. 2 to 3 feet.

4 L. INVOLUCRATA (D. C. prod. 3. p. 154.) branches terete, and are, as well as the petioles, densely clothed with short velvety down; leaves petiolate, ovate, acuminate, serrately ciliated, 7-nerved, clothed with velvety down on both surfaces; flowers in dense heads; bractæas ovate; heads disposed in a terminal panicle, like those of the preceding species; calyx covered with glandular hairs, appendiculated with 5 lobes on the outside of the inner ones. h. S. Native of Brazil, in woods. *Melástoma involucratum*, Schrank et Mart. mss. Perhaps the same as *L. umbellata*, but the bractæas are broader at the apex; tube of calyx a little longer, lobes shorter, petals narrower, and the style is hairy at the base.

*Involucrated Leandra.* Sh. 2 to 3 feet.

5 L. SERICEA (D. C. l. c.) branches terete, and are, as well as

the peduncles and petioles, densely clothed with rusty villi; leaves oval-lanceolate, acuminate, ciliate serrated, quintuple nerved, scabrous from bristles above, but clothed with silky soft villi beneath; lateral nerves distant from the margin of the leaf; racemes terminal, very villous; heads on short peduncles; bracteas concave, ovate. *h. S.* Native of Brazil, in the province of Rio Janeiro. Osbeckia Brasila, Schrank, herb. *Leandra Raddii?* Mart. herb. Petals lanceolate. Tube of calyx very villous; lobes double, outer ones tooth-formed, inner ones ovate.

*Silky Leandra.* Shrub 3 to 6 feet.

6 *L. VILLOSA* (D. C. l. c.) branches terete, and are, as well as the petioles and peduncles, densely clothed with short hairs; leaves petiolate, elliptic-oblong, acuminate, attenuated at the base, quintuple-nerved; (lateral nerves approximating the margins,) denticulated, scabrous above from short scattered bristles, which are bulbous at the base, villous beneath, and rather foveolate; flowers in dense heads; the heads disposed in a thyse; bracteas glabrous on the outside; inner lobes of calyx membranous, exceeding the outer ones. *h. S.* Native of Brazil, at Rio Janeiro. Intermediate between *L. sericea* and *L. scabra*.

*Villous Leandra.* Shrub 3 to 6 feet.

7 *L. SCABRA* (D. C. l. c.) branches terete, and arc, as well as the peduncles and petioles, beset with longish retrograde stiff hairs; flowers in dense heads; bracteas glabrous inside; heads disposed in a crowded thyse; inner lobes of calyx membranous, shorter than the outer ones. *h. S.* Native of Brazil, in the provinces of St. Paul and Rio Janeiro, in woods on mountains. *Melastoma acutiflorum*, Schrank et Mart. herb. *L. melastomoides*, Raddi, l. c. p. 7. t. 8. Tube of calyx oblong, campanulate, hairy. Petals very acute. Style filiform, exserted.

*Scabrous Leandra.* Shrub 3 to 6 feet.

8 *L. ANGUSTIFOLIA* (D. C. l. c.) branches terete, and arc, as well as the petioles, clothed with short rufous down; leaves oblong-linear, 3-nerved, acuminate, ciliate serrated, scabrous from bristles above, villous beneath; heads axillary, sessile, few-flowered; bracteas linear; outer lobes of calyx subulate, villous; inner ones very short or hardly any. *h. S.* Native of Brazil. Flower-bud conical. Petals acuminate. Style exserted. Perhaps a species of *Clidemia*, belonging to section *Axillaria*.

*Narrow-leaved Leandra.* Shrub 2 to 3 feet.

9 *L. DU'RIA* (D. C. l. c.) branches rather tetragonal, and arc, as well as the panicles, petioles, and leaves, rather hispid from scattered bristles; leaves petiolate, oblong, acuminate both at the base and the apex, ciliated, and triple-nerved; nerves arising from about the sixth part of the length of the leaves; panicle short, terminal; flowers crowded on the tops of the branches. *h. S.* Native of Brazil, in woods between Rio Janeiro and Lorena. *Melastoma dubium*, Schrank et Mart. mss. Lobes of calyx double, very short, hardly distinguishable.

*Doubtful Leandra.* Shrub 3 to 6 feet.

10 *L. SYLVESTRIS* (D. C. l. c.) branches terete, and arc, as well as the panicles, petioles, and leaves, hispid; leaves petiolate, oval-oblong, acuminate at both ends, ciliated, entire, quintuple-nerved; panicle terminal, trifid at the base, divaricate; flowers bractless, approximating by threes; calyx ovate, hispid. *h. S.* Native of Brazil, in the province of Minas Geraes, in woods. *Melastoma silvestre*, Schrank et Mart. mss. Seeds small, angular, attenuated, shining. Lobes of calyx so short as hardly to be distinguishable.

*Wild Leandra.* Shrub 3 to 6 feet.

11 *L. HIRTA* (Raddi, l. c. p. 8.) leaves oblong-lanceolate, acuminate, crenulated, 3-nerved, pilose beneath; flowers in terminal bractless racemes. *h. S.* Native of Brazil, on Mount

Mandiocca near Rio Janeiro. Perhaps distinct from *L. sylvestre*.

*Hairy Leandra.* Shrub 2 to 3 feet.

SECT. II. LEANDROIDES (so named from the plant being like *Leandra* in habit, but whether it is a true species of the genus is doubtful). D. C. prod. 3. p. 155. Calyx 4-cleft; lobes double. Bracteas and calyxes clothed with stellate tomentum. Petals and genitals unknown.

12 *L. ? RACEMIFERA* (D. C. prod. 3. p. 155.) branches terete, and arc, as well as the petioles, densely clothed with branched tomentum; leaves on short petioles, oblong, acuminate, repandly subserrated, 5-nerved, or almost quintuple-nerved, glabrous above in the adult state, but scabrous from stellate down beneath; panicle terminal, elongated, racemose, oppositely branched; flowers crowded on the branchlets; calyxes very hairy, 4-cleft. *h. S.* Native of Brazil. *Melastoma racemifera*, Schrank et Mart. mss. Anthers 8, oblong, obtuse.

*Raceme-bearing Leandra.* Sh. 4 to 6 feet.

*Cult.* See *Melastoma* for culture and propagation, p. 764.

XLVII. TSCHUDYA (dedicated to M. le Baron de Tschudy, author of *Traite des Arbres coniferes et resineux*). D. C. prod. 3. p. 155.

LIN. SYST. *Decandria, Monogynia*. Tube of calyx globose; lobes 5, bristle-formed, small, permanent. Petals 5. Stamens 10, white; anthers oblong, without auricles, opening by one point at the apex. Ovarium free, bristly at the apex. Style filiform, 7-angled, 4-5-celled, base of style globose, membranous, perhaps indehiscent, 4-5-celled. Seeds numerous, small, minutely incurved, crowned by a cellular acute curved appendage.—Shrubs, with the habit of *Clidemia*, clothed with rufous hairs in every part. Branches terete. Leaves on short petioles, 5-nerved, oval, acuminate, toothed, having the nerves hairy on both surfaces. Thyse panicled, terminal. Flowers small, very hispid, sometimes 4-cleft and octandrous.

1 *T. VERTICILLATA* (D. C. l. c.) branches of panicle unequal, 6 in a whorl. *h. S.* Native of French Guiana, in woods at Yueri. *Melastoma verticillata*, Rich. herb. Panicle loose, beset with dark purple pili. Young fruit whitish. Flowers small, white.

*Whorled Tschudya.* Shrub 1 to 2 feet.

2 *T. RUFESCENS* (D. C. l. c.) branches of panicle opposite, rarely furnished with a small short branchlet; leaves serrulated. *h. S.* Native of Brazil and Guiana. *Melastoma heterocarpum*, Schrank et Mart. herb. *Melast. rufidula*, Rich. herb. Fruit whitish, smaller than a grain of pepper.

*Rufescent Tschudya.* Sh. 1 to 2 feet.

3 *T. ASPERIUSCULA* (D. C. l. c.) branches of panicle opposite, short; leaves nearly quite entire. *h. S.* Native of Cayenne, in woods. *Melastoma asperiuscula*, Rich. herb. Flowers white. Thyse narrower than in *T. rufescens*. Down short, rufous. Seeds not seen. Ovarium and base of style hairy.

*Roughish Tschudya.* Sh. 3 to 6 feet.

4 *T. PULVERULENTA* (D. C. l. c.) branches of panicle opposite, 3-5-flowered; leaves quite entire, and rather ciliated; down on the branches (of the panicle and on the leaves stellate). *h. S.* Native of Guiana, at Yuera, in woods. *Melastoma pulverulenta*, Rich. herb. Flowers small, 4-cleft, and sometimes the lower ones are 3-cleft. Seeds like those of the rest of the genus, but the habit of the plant is by no means similar. Ovarium hardly villous at the apex. Stamens not seen. Leaves membranous. Flowers white.

*Powdery Tschudya.* Shrub 5 to 6 feet.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

**XLVIII. CLIDEMIA** (in honour of Clidemi, an ancient Greek botanist). D. Don, in mem. soc. wern. 4. p. 306. D. C. prod. 3. p. 155.

**LIN. SYST. Decandria, Monogynia.** Tube of calyx ovate, naked, rarely bracteate at the base; lobes 5, permanent, narrow, acute. Petals 5, rarely 6. Stamens 10; anthers constricted at the base, and rather bauriculate, opening by one pore at the apex. Ovarium adnate to the calyx, usually crowned by a circle of bristles at the apex. Style filiform; stigma a pruinose dot. Capsule baccate, 5-celled. Seeds ovate or rather angular, not cochleate, nor appendiculated.—Hispid or hairy shrubs, native of South America. Leaves usually crenated, 3-7-nerved. Flowers axillary and terminal. This genus is easily distinguished from the rest of the genera of the present order by the habit, but the species are difficult to define. Perhaps the species with obtuse petals are separable from those with acute petals.

§ 1. *Axillares.* Flowers in axillary panicles or spikes.

\* Flowers crowded, almost sessile.

1 *C. AGGREGATA* (D. Don, in mem. soc. wern. 4. p. 309.) leaves elliptic, quite entire, acute at both ends, and are, as well as the branches, pilose; flowers axillary, verticillate, almost sessile. *h. S.* Native of Peru.

*Aggregate-flowered Clidemia.* Sh. 1 to 2 feet.

2 *C. SERICEA* (D. Don, l. c.) leaves oval, acute, crenated, 5-nerved, clothed with silky villi on both surfaces; flowers solitary, axillary, verticillate, scaly at the base. *h. S.* Native of Peru. The rest unknown.

*Silky Clidemia.* Sh. 2 to 3 feet.

3 *C. CONFERTA* (D. Don, l. c.) branches terete, densely clothed with retrograde villi; leaves on both petioles, oval, acute, nearly entire, villous beneath, and beset with short bristles above, 7-nerved; nerves crowded above the base of the leaves; panicles axillary, crowded, very short; tube of calyx very hairy. *h. S.* Native of Brazil, near Rio Janeiro, in woods. *Melastoma aggregatum*, Schrank et Mart. mss. Petioles an inch long, covered with spreading down. Setae long, yellow. Lobes of calyx 5, hardly distinct. Petals oval-lanceolate, flesh-coloured, but red in the middle. Anthers oval, furnished with filiform connectives. Style filiform.

*Crowded-flowered Clidemia.* Sh. 3 to 4 feet.

4 *C. RETROFILA* (D. C. l. c.) branches hairy, beset with rufous retrograde pili; petioles very hairy; leaves oval, acuminate, serrulated, quintuple-nerved, hairy or downy on both surfaces; nerves rather distant from the base; flowers in almost sessile clusters in the axils of the leaves; calyx hispid, 5-cleft. *h. S.* Native of Brazil. Petioles 5 lines long, rufous from spreading down. Lobes of calyx 5, setaceous.

*Bent-haired Clidemia.* Sh. 2 to 3 feet.

5 *C. MARGINATA* (D. C. l. c.) branches nearly terete, and are, as well as the petioles, clothed with small short powdery velvety down; leaves petiolate, elliptic, acuminate, ciliated, triple-nerved, besides the marginal nervules, downy beneath, but beset with scattered bristles above; racemes few-flowered, axillary, 3 times shorter than the petiole; calyx very hispid, 5-cleft. *h. S.* Native of Brazil, near Rio Janeiro, on the mountains in woods. *Melastoma marginata*, Desr. in Lam. dict. 4. p. 32. *Melast. Januarësis*, Schrank et Mart. mss. Flowers and fruit not sufficiently examined.

*Margined-leaved Clidemia.* Sh. 3 to 4 feet.

6 *C. AMYGDALOIDES* (D. C. l. c.) branches tetragonal, and are, as well as the petioles and panicles, clothed with stiff bristles; leaves petiolate, oblong, acuminate, 3-5-nerved, somewhat crenulated, villous on both surfaces; panicles axillary, short, few-flowered; calyx very hispid, 5-lobed; lobes bearing small stellate down on the inside. *h. S.* Native of Brazil, in

woods on mount Cercovado, near Rio Janeiro. *Melastoma amygdaloides*, Schrank et Mart. mss. Leaves almost triple-nerved, 3 inches long, and 8-9 lines broad. Petals white, oblongly triangular, acute.

*Almond-like Clidemia.* Sh. 4 to 6 feet.

7 *C. ? BRACHYSTACHYA* (D. C. l. c.) branches terete, and are, as well as the petioles, densely hispid; leaves petiolate, elongately linear, acuminate, 3-nerved, ciliate serrated, bristly on the middle nerve above, the rest glabrous, but covered with long bristles beneath; spikes hispid, axillary, shorter than the petioles. *h. S.* Native of Brazil, in the province of Rio Janeiro, in woods. *Rhexia spicata*, Schrank et Mart. mss. Very near *C. amygdaloides*. Fruit globose, hairy, crowned by the 5 short acute lobes of the calyx. Flowers not seen.

*Short-spiked Clidemia.* Sh. 1 to 2 feet.

8 *C. CONGLOMERATA* (D. C. l. c.) branches terete, hispid from thick branched hairs; petioles clothed with the same kind of hairs; leaves ovate, attenuated at the base, acuminate at the apex, irregularly crenated and ciliated, 5-nerved, glabrous except on the nerves, membranous; flowers in terminal and axillary, almost sessile clusters; calyx beset with violaceous hairs, with 5 lobes, each ending in a plumose bunch of bristles. *h. S.* Native of Cayenne, in woods. A very beautiful species, allied to *C. purpurea*. *Melastoma conglomerata*, Rich. herb.

*Conglomerate-flowered Clidemia.* Sh. 1 to 2 feet.

9 *C. ERYTHROPOGON* (D. C. prod. 3. p. 157.) branches terete, and are, as well as the petioles, hairy; leaves petiolate, oval-acuminate, serrulated, 5-nerved, beset with scattered stiff hairs on both surfaces; racemes axillary, almost sessile, 3-flowered; calyx very hispid from red bristles, with 6 setaceous lobes. *h. S.* Native of Jamaica. *Melastoma sessilifolium*, Spreng. syst. 2. p. 295. Petals and stamens not seen.

*Red-bearded Clidemia.* Sh. 3 to 4 ft.

\* \* *Peduncles axillary, 1-flowered.*

10 *C. CILIATA* (D. Don, mem. soc. wern. 4. p. 309.) leaves cordate, acute, crenated, almost sessile, pilose above, densely clothed with stellate tomentum beneath; calyx tomentose. *h. S.* Native of Peru. *Melastoma ciliata*, Pav. in herb. Lamb. but not of Desr. nor Rich. Perhaps belonging to a different section.

*Ciliated-leaved Clidemia.* Sh. 2 to 3 feet.

11 *C. CAPILLARIS* (D. Don, l. c. p. 308.) leaves elliptic, crenulated, 3-nerved, acuminate, clothed with silky villi on both surfaces, and on the branchlets; pedicels capillary, axillary, twin, 1-flowered. *h. S.* Native of Peru. *Melast. capillaris*, Pav. in herb. Lamb. but not of Swartz.

*Capillary-pedicelled Clidemia.* Sh. 2 to 3 feet.

\* \* \* *Peduncles axillary, bearing cymes or panicles of flowers.*

12 *C. EPIBATERIUM* (D. C. prod. 3. p. 157.) stem climbing, branched, terete, rooting, clothed with rufous hairs above, as well as the petioles; leaves petiolate, ovate, acuminate, obtuse at the base, 5-7-nerved, denticulated, rather pilose; flowers few, in axillary racemose cymes; calyx hispid. *h. S.* Native of Brazil, in the province of Rio Negro. *Melastoma Epibaterium*, Mart. herb. *Melast. volubile*, Schrank, mss. A very distinct species. Lobes of calyx bristly at the apex. Anthers bluntly auriculated at the base, opening by one pore at the apex. The name is derived from *επι*, upon, and *βαίω*, to walk, in allusion to the plant climbing upon others.

*Climbing Clidemia.* Sh. climbing.

13 *C. PETIOLATA* (D. C. l. c.) branches terete, and are, as well as the petioles, covered with rufous spreading hairs; leaves on long petioles, cordate-ovate, acuminate, 7-nerved, toothed, ciliated, with a few bristles above, but smoothish beneath;

flowers aggregate, almost sessile, few, hispid. *h. S.* Native of Guiana. *Melastoma petiolata*, Rich. herb. Easily distinguished from the other species in the leaves being cordate, and in the petioles being 1-2 inches long.

*Petiolate Clidemia*. Sh. 1 to 2 feet.

14 *C. HIRTA* (D. Don, in mem. wern. soc. 4. p. 309.) branches terete; petioles and panicles clothed with rufous villi; leaves ovate-lanceolate, somewhat attenuated at the base, and acuminate at the apex, denticulated, 5-nerved, densely pilose on the nerves, but sparingly so on the rest of the leaf; panicles axillary, trichotomous, few-flowered, hardly the length of the petioles; calyx hispid, with an ovate tube and setaceous lobes; petals obovate. *h. S.* Native of Jamaica. *Melastoma hirta*, Lin. spec. p. 559. Swartz, obs. p. 175. Sims, bot. mag. t. 1971. but not Desr. *Melast. rustica*, Forst. mss. There is a variety of this plant with 6-petalled dodecandrous flowers.

*Hairy Clidemia*. Sh. 1 to 2 feet.

15 *C. PETIOLARE* (Cham. et Schlecht. in Linnæa. 5. p. 562.) branches terete, silky at the apex; leaves ovate, acuminate, acute or obtuse at the base, 5-nerved, crenulately denticulated; cymes axillary, nearly sessile, trichotomous, beset with spreading hairs, shorter than the petioles; tube of calyx hispid, hemispherical, longer than the lobes, which are setaceous; petals elliptic. *h. S.* Native of Mexico, among bushes near Hacienda de La Laguna, &c. Leaves 4 inches long, and 2 broad. Like *C. hirta*.

*Petiolar Clidemia*. Sh. 1 to 2 feet.

16 *C. PAUCIFLORA* (D. C. l. c.) branches terete, as well as the panicles, petioles, and leaves, beset with long spreading stiff hairs; leaves on short petioles, ovate, acutish, rather cordate at the base, 5-nerved, ciliated, hardly crenulated; panicles terminal, few-flowered, oppositely branched; lobes of calyx 5, setaceous, shorter than the tube; calyx interspersed with bristles and short starry down. *h. S.* Native of Brazil, in the province of Bahia. *Melastoma pauciflora*, Desr. in Lam. dict. 4. p. 49. *Melast. cryptodon*, Schrank et Mart. Allied to *C. elegans*, but certainly distinct.

*Few-flowered Clidemia*. Sh. 1 to 2 feet.

17 *C. CRENATA* (D. C. l. c.) branches from compressed to terete, and are, as well as the panicles, petioles, and both sides of the leaves, hairy from long spreading pili; leaves petiolate, rather cordate at the base, broadly ovate, acuminate, crenated, ciliated, 5-nerved; panicle axillary, trichotomous, few-flowered, wideish, a little longer than the petiole; tube of calyx ovate, with subulate lobes; petals oblong. *h. S.* Native of Porto Rico, Brazil, Cuba, Trinidad, &c. *Melastoma crenata*, Vahl. ecl. amer. 3. p. 41. icon. pl. amer. 2. t. 22. *Melast. aristatum*, Mart. mss. *Clid. hirta*, D. Don, l. c.? There is no down between the hairs on the plant. Petals crenated, ex Rich. Perhaps not distinct from *Clid. crenata*, D. Don.

*Crenate-petalled Clidemia*. Sh. 2 to 3 feet.

18 *C. ELEGANS* (D. Don, l. c. p. 309.) branches from compressed to terete, and are, as well as the petioles, panicles, and both sides of the leaves, beset with long scattered stiff bristles; leaves cordate, acuminate, 5-nerved, ciliated, broadly crenated, crenæ rounded and crenulated; panicles axillary, trichotomous, few-flowered, longer than the petioles; calyx hispid, with an ovate tube, and setaceous lobes; petals obovate. *h. S.* Native of Cayenne, on walls; and in Brazil. *Melastoma elegans*, Aubl. guian. 1. p. 425. t. 167. Flowers small, white.

*Elegant Clidemia*. Fl. July, Aug. Clt. 1822. Shrub 1 to 2 feet.

19 *C. TILIÆFOLIA* (D. C. prod. 3. p. 158.) branches from compressed to terete, rather hispid, but at length glabrous; petioles clothed with brown hairs; leaves ovate, cordate at the base, acuminate at the apex, doubly crenated, ciliated, rather

pilose on both surfaces, 7-nerved; panicles axillary, trichotomous, few-flowered, longer than the petioles, loose, and are, as well as the calyxes, smoothish. *h. S.* Native of Brazil, at Para, in woods. *Melastoma tiliæfolium*, Schrank et Mart. mss. Leaves crenated, as in *C. elegans*.

*lime-tree-leaved Clidemia*. Sh. 2 to 3 feet.

20 *C. BLEPHARODES* (D. C. l. c.) shrubby; branchlets terete, and are, as well as the petioles, hispid; leaves petiolate, ovate, acuminate, quite entire, 3-nerved, ciliated, rather bristly; racemes somewhat capitate, lateral, pedunculate, hispid; bracteas ciliated; lobes of calyx setaceous, longer than the tube, which is campanulate and hispid; anthers oblong-linear. *h. S.* Native of Brazil, near Bananal and elsewhere. *Melastoma blepharodes*, Mart. herb. *Melast. Bananale*, Schrank, mss. Style long, filiform, not dilated at the apex. Petals of a rose purple-colour. Fruit unknown. Perhaps a proper genus.

*Eye-lash-bracteate Clidemia*. Sh. 1 to 2 feet.

21 *C. URCEOLATA* (D. C. l. c.) branches terete, and are, as well as the panicles, covered with glandular bristles and branched down; leaves petiolate, cordate, acuminate, serrately ciliated, 5-nerved, setose above, but clothed with stellate tomentum beneath; panicles terminal, oppositely branched; calyx hairy, urceolate, 5-cleft. *h. S.* Native on dry mountains about Rio Janeiro. *Melastoma urceolatum*, Schrank et Mart. mss. Petals obovate, rose-coloured. Allied to *C. umbonata*.

*Urceolate-calyxed Clidemia*. Sh. 1 to 2 feet.

22 *C. BULLOSA* (D. C. l. c.) shrubby; branches terete, and are, as well as the petioles, calyxes, and peduncles, clothed with long stiff hairs; leaves petiolate, ovate, acuminate, somewhat cordate at the base, 5-nerved, ciliated, serrately ciliated, covered with bullæ on the upper surface, and tomentum beneath; panicles axillary, terminal, loose-flowered; bracteas bristle-formed under the flower. *h. S.* Native of Brazil, at Para, in hedges. *Melastoma bullosum*, Schrank et Mart. mss. and perhaps the same as *Melast. bullosum* of Spreng. neue. entd. 2. p. 172. Calyx campanulate, short, with 5 short bristly teeth. Anthers oval, obtuse, opening by 1 pore. Flowers small, purple. Fruit unknown.

*Blistered-bristled Clidemia*. Sh. 2 to 3 feet.

23 *C. BISERRATA* (D. C. l. c.) branches terete, and are, as well as the panicles and petioles, clothed with branched stellate down, mixed with stiff glandular bristles; leaves petiolate, ovate, somewhat cordate at the base, acuminate at the apex, 5-nerved, doubly and unequally serrate-ciliated, beset with bristles on the upper surface, which are tumid at the base, but covered with branched down beneath, internixed with foveolate bristles; panicles axillary, and nearly terminal, with opposite divaricate branches; calyx ovate, acutely 5-lobed. *h. S.* Native of Brazil, in woods about Rio Janeiro. *Melastoma biserratum*, Schrank et Mart. mss. Very like *C. urceolata* and *C. umbonata*. Petals ovate, purple.

*Biserrate-leaved Clidemia*. Sh. 2 to 3 feet.

24 *C. UMBONATA* (D. C. l. c.) branches terete, and are, as well as the panicles, petioles, and under side of the leaves, clothed with stellate branched soft down; leaves petiolate, ovate, somewhat cordate, acuminate, ciliately serrated, covered with hairs on the upper surface, which are tumid at the base; panicle terminal, oppositely branched; calyx urceolate. *h. S.* Native of Brazil, in hedges at Nogueira. *Melastoma umbonatum*, Schrank et Mart. mss. Petals ovate, purple.

*Umbonate-fruited Clidemia*. Sh. 2 to 3 feet.

25 *C. PURPUREA* (D. Don, mem. soc. wern. 4. p. 308.) branches terete, hispid from spreading bristles, as well as the petioles; leaves broadly elliptic, acuminate, crenulated, 5-nerved, villous on both surfaces, but especially beneath, and when young they are purple, as well as the calyxes; peduncles axillary,

trichotomous, 3-flowered. *h. S.* Native of Peru. *Melástoma purpúrea*, Pav. in herb. Lamb. *M. purpuráscens*, Domb.

*Purple-leaved Clidemia.* Sh. 2 to 3 feet.

26 *C. DENTA'TA* (D. Don, l. c.) leaves oval, crenated, acuminate, 5-nerved, covered with rough hairs on both surfaces, as well as the stem; peduncles short, axillary, trichotomous, many flowered. *h. S.* Native of Peru. *Melástoma dentata*, Pav. in herb. Lamb.

*Toothed-leaved Clidemia.* Sh. 2 feet.

27 *C. JAPURÉ'NSIS* (D. C. prod. 3. p. 159.) branches nearly terete, and arc, as well as the petioles and panicles, hispid; leaves elliptic-oblong, acuminate, quite entire, membranous, rather pilose on both surfaces, and on the margins, 7-nerved; lateral nerves somewhat feathered from the middle to the base; panicles axillary, loose, shorter than the leaves; teeth of calyx setaceous, very short. *h. S.* Native of Brazil, in the woods of Japura. *Melástoma Japuré'ise*, Schrank et Mart. mss. Flowers small. Fruit globose, crowned by the teeth of the calyx. Seeds small, angular. Anthers nearly terete, obtuse, hardly tumid at the base.

*Japura Clidemia.* Sh. 2 feet.

28 *C. PLUMÓSA* (D. C. prod. 3. p. 159.) branches, petioles, peduncles, and calyxes woolly from rufous pili; leaves oval, rather cordate at the base, acuminate, crenulate, 5-7-nerved, pilose beneath, but especially on the nerves; panicles axillary, trichotomous; bracteas and calycine lobes plumose from purple bristles. *h. S.* Native of St. Domingo. *Melástoma plumosa*, Desr. in Lam. dict. 4. p. 32. Leaves 6-7-inches long, 3 broad, standing on petioles one inch long.

*Plumose-calyced Clidemia.* Sh. 2 to 3 feet.

29 *C. LATIFOLIA* (D. C. l. c.) branches hispid; leaves petiolate, broad-ovate, acuminate, denticulate, ciliate, 7-nerved, pilose on both surfaces, but especially on the nerves; panicles axillary, usually twin, trichotomous; bracteas setaceous; fruit spherical. *h. S.* Native of the West Indies. *Melástoma latifolia*, Desr. in Lam. dict. 4. p. 31.

*Broad-leaved Clidemia.* Sh. 4 to 6 feet.

30 *C. DIVERSIFÓLIA* (D. C. l. c.) branches terete, and arc, as well as the petioles, panicles, and under surface of the leaves, clothed with flocky powdery down; the leaves opposite each other are different in form, the one is large and broadly ovate, 7-nerved, and tapering abruptly into the petiole, the other is smaller and truly ovate, and almost sessile; panicles axillary, trichotomous, length of the smaller leaves; calyx with a globose tube, which is urceolate at the apex, and 5 subulate lobes. *h. S.* Native on the banks of the river Magdalena, near St. Bartholomew. *Melástoma diversifolia*, Bonpl. mel. t. 59. Fruit blue, 5-celled. Seeds cuneate. Petals small, white.

*Diverse-leaved Clidemia.* Sh. 4 to 6 feet.

\*\*\* *Peduncles axillary, spike-formed.*

31 *C. SPICÁTA* (D. C. l. c.) branches terete, and arc, as well as the petiole and panicles, hispid from elongated bristles, intermixed with stellate down; leaves petiolate, ovate, acuminate, serrated, obtuse at the base, 5-nerved, beset with stiff hairs on both surfaces; peduncles axillary, spicately racemose; pedicels opposite, short, 1-3-flowered; calyx hispid, with an ovate-globose tube, and setaceously acuminate lobes. *h. S.* Native of French Guiana, Brazil, Trinidad, &c. *Melástoma spicata*, Aubl. guian. l. p. 423. t. 165. Vahl. ecl. 3. p. 20. Meyer in act. bonn. 13. p. 792. Flowers white. Berry red.

*Spicate-racemed Clidemia.* Sh. 1 to 2 feet.

32 *C. PUSTULA'TA* (D. C. l. c.) branches terete, and arc, as well as the petioles, hairy from short glandular down; leaves ovate, acuminate, obtuse at the base, and nearly cordate, ciliate suberrated, 7-nerved, scabrous from bristles above,

and rather pustulate at the base of the bristles, but beset with foveolate fascicles of hairs beneath; panicles elongated, axillary, with their branches twice trifid or 3-flowered; calyx hispid, with lanceolate lobes, which are shorter than the tube. *h. S.* Native of Brazil, in the provinces of Rio Negro and Para, in woods. *Melástoma pustulatum*, Schrank et Mart. Habit almost of *C. spicata*, but the thyse is more loose, the lobes of the calyx are broader, and the hairs are different. Perhaps the same as *C. strigulosa*?

*Pustulate-leaved Clidemia.* Sh. 2 to 3 feet.

33 *C. STRIGILÓSA* (D. C. l. c.) branches rather tetragonal, and arc, as well as the petioles, pilose; leaves oblong, rather cordate at the base, acuminate, 5-nerved, 3 times longer than the petioles, rather denticulated, hispid above, and clothed with canescent tomentum beneath; racemes axillary, with short opposite 3-4-flowered branchlets; calyx hairy, with filiform teeth; petals oblong. *h. S.* Native of Jamaica. *Melástoma strigilosa*, Swartz, fl. ind. occ. p. 793. Berry roundish, hairy, 5-celled. Like *C. spicata*, but differs in the leaves being cordate at the base, and in the racemes being compound.

*Strigulose Clidemia.* Sh. 2 to 3 feet.

34 *C. CAPITELLÁTA* (D. Don, in mem. wern. soc. 4. p. 310.) branches terete, and arc, as well as the petioles, densely clothed with branched down intermixed with a few bristles; leaves petiolate, ovate, acuminate, 5-7-nerved, serrulate, very hairy above, and woolly beneath; peduncles axillary, bearing heads of flowers; lower heads of flowers opposite; flowers very hairy and tubular. *h. S.* Native of New Granada, in shady woods. *Melástoma capitellatum*, Bonpl. melast. p. 5. t. 3. Lobes of calyx 5, obtuse, very hispid on the outside, but glabrous inside. Style filiform. Berry blue, rather globose. Flowers white.

*Headed-flowered Clidemia.* Sh. 6 to 12 feet.

35 *C. NEGLECTA* (D. Don, l. c. p. 307) leaves ample, cordate, acuminate, crenated, 7-nerved, very hairy on both surfaces, as well as the stems; spikes elongated, axillary, drooping, simple or compound; calyx girded by 5 scales at the base. *h. S.* Native of Peru.

*Neglected Clidemia.* Sh. 3 to 4 feet.

§ 2. *Terminales* (from *terminus*, the end; in reference to the spikes or panicles of flowers being terminal). D. C. prod. 3. p. 160. *Spikes or panicles of flowers terminal. Flowers 5-petal- led, decandrous.*

\* *Thyrse spike-formed, terminal.*

36 *C. SPICÉFÓRMIS* (D. C. prod. 3. p. 160.) branches clothed with silky villi; leaves broadly elliptic, crenulate, triple-nerved, acute at both ends, clothed with silky villi beneath; racemes terminal, spike-formed; pedicels 3-flowered. *h. S.* Native of Peru. *Melástoma spicata*, Pav. in herb. Lamb. but not of Aubl. *Clid. spicata*, D. Don, l. c. p. 308. Evidently distinct from the species of the same name from Guiana.

*Spike-formed Clidemia.* Sh. 2 to 3 feet.

37 *C. DEPENDENS* (D. Don, in mem. wern. soc. 4. p. 307.) leaves elliptic, acuminate, crenated, 3-nerved, very hairy on both surfaces, as well as the stem; spikes terminal, drooping; calyxes sessile, each girded by 5 bracteas at the base. *h. S.* Native of Peru. *Melástoma dependens*, Pav. in herb. Lamb.

*Dependent-spiked Clidemia.* Sh. 2 to 3 feet.

38 *C. ERÓSTRÁTA* (D. C. prod. 3. p. 160.) shrub densely clothed in every part with stiff ferruginous hairs; leaves petiolate, broadly ovate, obtuse, crenated, 5-7-nerved; spikes terminating the branchlets; flowers sessile along the branchlets, in crowded whorles. *h. S.* Native of Brazil, at Coari. *Melástoma eróstratum*, Mart. et Schrank, mss. Allied to *C. spicata*, but differs in the leaves being obtuse, in the hairs being rufes-

cent, in the lobes of the calyx being small and oblong. Anthers oblong, falcate, each with a long connective. Style filiform.

*Beakless-anthered Clidemia.* Sh. 4 to 6 feet.

39 *C. CERAMICARPA* (D. C. l. c.) branches, petioles, and nerves of leaves on the under surface, clothed with adpressed silky villi; leaves ovate-oblong, acute, crenated, villous on both surfaces, 7-nerved; nerves rather feathered at the base; thyse subspicate, terminal, shorter than the leaves, and rather hispid from villi; branches 3-flowered; tube of calyx bluntly 8-ribbed, with a quite entire limb; petals 5, linear. *h. S.* Native of Brazil, in the province of Rio Negro, in the woods of Japura. *Melástoma cefamicarpum*, Schrank et Mart. mss. Anthers elongated. Seeds small, angular. Fruit globose, a little ribbed, hardly the size of a coriander.

*Ribbed-fruited Clidemia.* Shrub 2 to 3 feet.

40 *C. ? VERTICILLATA* (D. C. l. c.) branches tetragonal, densely clothed with villi; leaves petiolate, ovate-oblong, attenuated, denticulated, villous, scabrous above; racemes axillary, whorled along the rachis; calyx villous, with lanceolate-linear, short, reflexed lobes. *h. S.* Native of South America. *Melástoma verticillata*, Vahl. eclog. 1. p. 14. Berry globose, small. Petals lanceolate. Perhaps belonging to a separate section.

*Whorled-flowered Clidemia.* Sh. 2 to 3 feet.

**\*\* Thyse panicled, terminal.**

41 *C. ASTRÓTRICHA* (D. C. l. c.) branches from tetragonal to terete, and arc, as well as the petioles, panicles, and leaves, hispid; hairs nearly all bristle-formed and stellately branched at the apex, with a very few simple ones on the calyxes and teeth of the leaves; leaves ovate, acuminate, obtuse at the base, dentately serrated, 5-nerved; panicle terminal, having its branches opposite and elongated; teeth of calyx setaceous, not half so long as the tube. *h. S.* Native of Brazil, in Para. *Melástoma agréste*, Schrank et Mart. mss. but not of Aubl. Petals oval, obtuse. Anthers linear.

*Starry-haired Clidemia.* Sh. 3 to 4 feet.

42 *C. BERBICEANA* (D. C. l. c.) branchlets tetragonal, and arc, as well as the petioles and peduncles, clothed with soft woolly deciduous irregularly branched down; leaves on short petioles, oval, obtuse at the base, and ending in a short abrupt acumen at the apex, 5-nerved, bristly on both surfaces, but with soft velvety down on the nerves beneath; the margins irregularly and almost doubly crenated; panicle terminal, oppositely branched; calyx and bractæ smoothish. *h. S.* Native of Berbice. Leaves crenated, nearly as in *C. elegans*. Flowers small. Limb of calyx bluntly 5-toothed. Petals oval. Fruit unknown.

*Berbice Clidemia.* Sh. 2 to 3 feet.

43 *C. DICHOTOMA* (D. Don, mem. wern. soc. 4. p. 307.) leaves large, ovate, acuminate, serrated, 7-nerved, very villous on the under surface, as well as on the stems; panicle terminal, racemose. *h. S.* Native of Peru. *Melástoma dichotoma*, Pav. in herb. Lamb. but not of Desr.

*Dichotomous Clidemia.* Sh. 2 to 3 feet.

44 *C. PILOSA* (D. Don, l. c. p. 308.) leaves cordate, acuminate, crenulated, 7-nerved, very pilose on both surfaces, as well as on the stems; panicle small, terminal; peduncles usually 3-flowered. *h. S.* Native of Peru. *Melástoma pilosa*, Pav. in herb. Lamb. but not of Swartz.

*Pilose Clidemia.* Sh. 2 to 3 ft.

45 *C. TRISTIS* (D. Don, l. c. p. 307.) leaves cordate-oblong, crenulated, acuminate, 5-nerved, rough from pili above, but clothed with fuscous wool beneath; panicle terminal, woolly.

*h. S.* Native of Peru. *Melástoma tristis*, Pav. in herb. Lamb.

*Sad Clidemia.* Sh. 4 to 6 ft.

46 *C. AGRESTIS* (D. Don, l. c. p. 309.) stems and branches terete, and arc, as well as the petioles, panicles, and leaves, villous; leaves on short petioles, ovate-oblong, acuminate, somewhat serrated, 5-nerved; panicle terminal, oppositely branched; bractæ none or very small; calyx with a globose tube, and 5 short acute lobes. *h. S.* Native of Cayenne, on the banks of rivulets, and in hedges. *Melástoma agréste*, Aubl. guian. 1. p. 425. t. 166. Petals oval, white. Berry blue, villous.

*Field Clidemia.* Fl. Ju. Aug. Clt. 1822. Sh. 1 foot.

47 *C. REVERSA* (D. C. l. c.) branches, petioles, and peduncles densely clothed with reflexed stiff hairs; leaves petiolate, lanceolate-oblong, acuminate, crenulately serrated, hispid, 5-nerved; panicle terminal; tube of calyx subglobose, with lanceolate, acuminate lobes, which are about the length of the tube. *h. S.* Native of Brazil. *Melástoma reversum*, Ser. mss. Allied to *C. agréste*.

*Reverse-haired Clidemia.* Sh. 1 foot.

48 *C. ANISOPHYLLA* (D. C. l. c.) branches terete, and arc, as well as the petioles, peduncles, and calyxes hispid from long spreading distant hairs; the leaves that are opposite each other are very unequal in size; they are petiolate, oval-oblong, acuminate, ciliated, toothed, triple-nerved, besides the marginal nervules, beset with a few scattered pili above, hairy beneath, especially on the nerves; thyse panicled, terminal, bractless, native to the leaves; lobes of calyx plumose from bristles. *h. S.* Native of Guiana, where it is called *Tarimoutou*. *Melástoma strigosa*, Schrank et Mart. mss. Anthers elongated, acute. The genitals, have been seen. *four*

*Unifoliate-leaved Clidemia.* Sh. 1 to 2 feet.

49 *C. TRICHODES* (D. C. l. c.) branches terete, and arc, as well as the petioles, panicles, and leaves densely clothed with long crowded bristles; leaves petiolate, oval-oblong, 5-nerved, ending each in a long taper-point, quite entire, ciliated, with a few scattered bristles above; panicle terminal, oppositely branched, furnished with ovate bractæ at the origin of the branches and flowers, which are pilose on the outside. *h. S.* Native of Cayenne. Leaves 6-7 inches long and 2 broad. Lobes of calyx 5, short, very pilose. Berry blue, pilose at the apex. Seeds ovate. Petals not seen.

*Hairy Clidemia.* Sh. 2 to 3 feet.

50 *C. DEPAUPERATA* (D. C. l. c.) branches terete, and arc, as well as the peduncles and petioles, hispid from long spreading scattered rufous bristles; leaves on long petioles, oval, acuminate, 5-nerved, crenated, pilose on both surfaces; the crenæ blunt and crenulated, ciliated; panicle terminal, loose, very hispid, few-flowered; fruit hispid. *h. S.* Native of Guiana, in woods. *Melástoma depauperata*, Rich. herb. Leaves soft, spreading.

*Depauperated Clidemia.* Sh. 2 to 3 feet.

51 *C. LIMA* (D. C. l. c.) branchlets terete, and arc, as well as the peduncles, petioles, and calyxes, hispid from short thick adpressed scale-like strigæ; leaves petiolate, oval, acutish, 3-5-nerved, toothed, beset with bristles above, which are bullate at the base, and reticulately foveolate beneath; the nerves rough from bristles; thyse terminal, short; branches 3-flowered; calyx 5-toothed; petals lanceolate, short, acute. *h. S.* Native of the West Indies. *Melástoma Lima*, Desr. in Lam. dict. 4. p. 47. Style filiform, acutish. Ovarium bristly. Seeds unknown.

*Wrasp Clidemia.* Sh. 3 to 4 ft.

52 *C. APTERA* (D. C. l. c.) branches bluntly tetragonal, and arc, as well as the panicles, petioles, and under side of leaves, hairy from short, bristly, crowded, rufous down; leaves petiolate,

ovate or oblong, acuminate, obtuse at the base, and a little ciliated; nerves 5-7, somewhat feathered; panicle terminal, with opposite divaricate branches; calyx globose, very hairy, with 5 acute lobes, but the points being deciduous they at length become obtuse. *h. S.* Native of Brazil, in woods, in the province of St. Paul. *Melastoma apterum*, Schrank et Mart. mss. The whole plant is brown when dried.

*Wingless Clidemia.* Shrub 2 to 3 ft.

53 *C. PURPURA'SCENS* (D. C. l. c.) branchlets terete, and are as well as the panicles and petioles clothed with reflexed villi; leaves petiolate, oblong-lanceolate, acuminate, ciliated, hardly quite entire, 5-nerved; panicle terminal, rather loose, oppositely branched; calyx urceolate, hispid, 5-cleft, with the lobes glabrous on the inside. *h. S.* Native of Brazil, near Oeiras, in the province of Bahia. *Melastoma purpurascens*, Schrank et Mart. mss. But is different from *Melastoma purpurascens* of Aubl. in the flowers being nearly twice the size. Branches and calyxes brownish purple on the outside. Bractees linear. Petals and genitals unknown.

*Purplish Clidemia.* Shrub 3 to 4 feet.

54 *C. CARASSA'NA* (D. C. prod. 3. p. 162.) branches nearly terete, rather compressed, and are as well as the petioles, panicles, and under surface of leaves densely clothed with velvety stellate down; leaves on long petioles, oval, acuminate, scabrous on the upper surface from short, simple bristles, quintuple-nerved; panicle terminal; style much exerted, acute. *h. S.* Native of Brazil, on the high mountain called Carassa, in the province of Minas Geraes. *Melastoma Carassæ*, Schrank et Mart. mss. Petioles 12-15 lines. Ovary bristly at the apex.

*Carassa Clidemia.* Shrub 1 to 2 ft.

55 *C. BRACTEATA* (D. C. prod. 3. p. 162.) branches terete, and are as well as the panicles and petioles hairy from crowded, long, rufous bristles; leaves oval, rather cuneate at the base, acuminate at the apex, 5-nerved, almost quite entire, ciliated, beset with stiff hairs beneath; thyse panicled, terminal, with opposite branches, bearing dense heads of flowers at the apex, intermixed with ovate acute bractees. *h. S.* Native of Guiana, between Conana and Yueri. *Melastoma tristis*, Rich. herb. Flowers white.

*Bractee-flowered Clidemia.* Shrub 1 to 2 feet.

56 *C. MUTABILIS* (D. C. l. c.) branchlets terete, and are as well as the petioles and peduncles very villous from rufous, adpressed, strigose hairs; leaves oval, cuneate at the base, acuminate at the apex, quite entire, 5-nerved, clothed with adpressed hairs on both surfaces; thyse panicled, terminal, with opposite branches bearing heads of sessile bracteate flowers at the apex; calyx densely clothed with silky villi. *h. S.* Native of Guiana, in shady woods. *Melastoma mutabilis*, Rich. herb. Very nearly allied to *C. bracteatum*, but differs in the calyxes being silky, not hairy, and in changing to a greenish-glaucous colour on drying.

*Changeable-coloured Clidemia.* Shrub 1 to 2 feet.

57 *C. LAPPACEA* (D. C. l. c.) branches terete, and are as well as the petioles covered with somewhat adpressed, thick, strigose hairs; leaves oval, somewhat acuminate, 5-nerved, crenate, ciliated, beset with scattered bristles on both surfaces, but hairy on the nerves beneath; thyse panicled, terminal, short, with opposite branches, bearing heads of sessile bracteate flowers at the apex; fruit very hispid. *h. S.* Native of Guiana, in woods. *Melastoma lappacea*, Rich. herb. This species is nearly allied to the two preceding, but differs in the leaves being broadly crenate or somewhat bicrenate, and purple beneath.

*Burdock Clidemia.* Shrub 1 to 2 feet.

58 *C. VIOLACEA* (D. C. l. c.) branches terete, and are as well as the petioles, nerves of leaves, and calyxes, clothed with ad-

pressed silky villi; leaves on short petioles, ovate, acuminate, obtuse at the base, crenate, somewhat ciliated, quintuple-nerved, beset with scattered hairs between the nerves; thyse racemose, terminal, much shorter than the leaves, with crowded, 3-flowered branchlets; calyx densely clothed with hairs; petals oblong, obtuse. *h. S.* Native of Cayenne, in shady woods. *Melastoma violacea*, Rich. herb. Fruit globose, ribless, pilose, crowned by the limb of the calyx, which is very short and somewhat 5-toothed. Ovary pilose at the apex. Leaves purplish.

*Violaceous-leaved Clidemia.* Shrub 1 to 3 feet.

59 *C. COCCINEA* (D. C. l. c.) branches terete, and are as well as the petioles clothed with adpressed bristles; leaves ovate-oblong, acuminate, toothed, triple-nerved, besides the 2 marginal nervules, beset with scattered bristles, but with silky villi on the nerves; thyse terminal, panicled, beset with short hairs, with its branchlets opposite, and bearing 3 flowers each at the apex; calyx covered with short adpressed villi. *h. S.* Native of Guiana, in shady woods. *Melastoma coccinea*, Rich. herb. but not of Rich. in act. soc. hist. nat. par. Very like *C. violacea*, but the leaves are only purple beneath.

*Scarlet Clidemia.* Sh. 1 to 2 feet.

60 *C. LANATA* (D. C. l. c.) branches, petioles, both surfaces of leaves as well as the branches and calyxes densely clothed with woolly down; hairs some of them sessile and stellate, others bristle-like and stellate at the apex; leaves petiolate, ovate, terminating in short taper points, 3-nerved, besides the 2 marginal nervules, denticulated; panicle terminal, crowded with flowers, having its branches opposite; teeth of calyx 5, obtuse. *h. S.* Native of Guiana, Cuba, about the Havannah, and the Island of Trinidad. *Melastoma lanatum*, Lamb. herb. Flowers white, very fragrant. Petals obovate. Anthers linear, opening by 1 pore, bluntly bicarinate at the base. Ovary girded by a ring of bristles at the apex. Stigma somewhat capitate. A very distinct species.

*Woolly Clidemia.* Shrub 1 to 2 feet.

61 *C. OBSCURA* (D. C. l. c.) branchlets as well as the petioles, panicles, and under side of leaves densely clothed with rusty woolly down and small hairs; leaves petiolate, broadly ovate, acute, 5-7-nerved, quite entire, beset with pili above, which are bullate at the base; panicle terminal, with its branches opposite and crowded with flowers at the apex. *h. S.* Native of Peru, in frigid places. *Melastoma obscura*, Bonpl. mel. t. 52. Limb of calyx campanulate, bluntly 5-toothed. Petals obovate-roundish. Ovary half free from the calyx, furnished with 10 bristles at the apex. Stigma peltate. Berry 3-4-celled. Flowers white.

*Obscure Clidemia.* Shrub 2 to 3 feet.

62 *C. INVOLUCRATA* (D. C. prod. 3. p. 163.) branches terete, and are as well as the petioles hairy; leaves petiolate, oval, attenuated at the base, acuminate at the apex, toothed, ciliated, triple-nerved, besides the marginal nervules, pilose on both surfaces; thyse sessile, capitate, terminating the branchlets, bracteate or involucre by 2 leaves, hairy, very short. *h. S.* Native of Guiana, in woods. *Melastoma involucratum*, Rich. herb. Leaves thin, soft. Branches spreading. Heads of flowers a violaceous purple colour.

*Involucre Clidemia.* Shrub 2 feet.

\*\*\* *Panicles terminal, very hispid from purplish hairs.*

63 *C. RHODOPHON* (D. C. prod. 3. p. 163.) branchlets terete, and are as well as the petioles and nerves of leaves densely clothed with bristles; leaves beset with scattered bristles on both surfaces, petiolate, oblong, acuminate, serrated, ciliated, 3-nerved besides the marginal nervules; panicle terminal, much branched, divaricate, and are as well as the calyxes very hispid

from long purplish bristles. *h. S.* Native of Brazil, in the province of Para, in woods. *Melástoma rhodópogon*, Schrank et Mart. mss. This is a very showy species. Petals purplish or white. Stamens not seen. Style filiform. Lobes of calyx 5, narrow, acute, confused with the bristles.

*Red-bearded Clidemia.* Shrub 2 to 3 feet.

• • • • *Panicles terminal. Petals lanceolate. Bristles on the stems spreading, and very stiff.*

64 *C. XANTHOLASIA* (D. C. l. c.) branches terete, and are as well as the panicles and petioles hispid from long, spreading, stiff bristles; leaves petiolate, oblong, acute at the base, long-acuminate at the apex, 5-nerved, somewhat serrately ciliated, glabrous, except some bristles on the nerves beneath; panicle terminal; calyx urceolate, very hispid, bearing a few stellate soft hairs among the bristles. *h. S.* Native of Brazil, in the province of Rio Janeiro, on the mountains in shady places of woods. *Melástoma xantholasia*, Schrank et Mart. mss. Hairs on the panicles and calyx yellow.

*Yellow-haired Clidemia.* Shrub 2 to 3 feet.

65 *C. LONGIBARBS* (D. C. l. c.) branches nearly terete, and are as well as the panicles, petioles, and leaves, hispid from scattered, stiff, long bristles, intermixed with rufous down on the panicle; leaves oblong, petiolate, serrately ciliated, acuminate, obtuse at the base, 5-nerved; panicle terminal; bracteas linear, each ending in a bristle. *h. S.* Native of Brazil, in woods. *Melástoma longibarbe*, Schrank et Mart. mss. Petals lanceolate, acuminate. Anthers oblong-linear.

*Long-bearded Clidemia.* Shrub 2 to 3 feet.

66 *C. STENOPE'TALA* (D. C. l. c.) shrubby; branches somewhat tetragonal, densely clothed with retrograde bristles; leaves petiolate, ovate, acuminate, serrated, 5-nerved, villous on both surfaces as well as on the margins; panicle terminal; calyx clothed with spreading stiff hairs or bristles; petals 5, linear-lanceolate, very acute. *h. S.* Native of the interior of Brazil. *Melástoma stenopetalum*, Mart. et Schrank, mss. Lobes of calyx 5, narrow, acute. Flower-bud conical. Style filiform, not dilated at the apex, longer than the stamens. Anthers oblong, somewhat tuberculate at the base, obtuse at the apex, either opening by 1 or 2 pores. Fruit unknown.

*Narrow-petalled Clidemia.* Shrub 2 to 3 feet.

67 *C. GLOMERATA* (D. C. l. c.) branches, panicles, petioles, and under surface of leaves hispid from long stiff bristles, intermixed with small, stellate down; leaves petiolate, ovate, short-acuminate, obtuse at the base, 5-nerved, ciliated, somewhat crenulated, bristly above; panicle terminal, capitate, few-flowered. *h. S.* Native of Brazil, in woods. *Melástoma conglomeratum*, Schrank et Mart. mss. Calyx and peduncles beset with black bristles; upper surface of leaves with yellowish ones, and the branches with retrograde ones.

*Glomerate-flowered Clidemia.* Shrub 1 to 2 feet.

68 *C. ? NIANGA* (D. C. l. c.) suffruticose; branches tetragonal, and are as well as the petioles, peduncles, and calyxes hispid from deflexed spreading bristles; leaves on long petioles, ovate, hardly cordate at the base, long-acuminate, denticulated, 5-nerved; thyse panicle, terminal; flowers decandrous; lobes of calyx linear, ciliated with bristles, a little shorter than the tube; anthers beakless. *h. S.* Native of Brazil, in woods on Mount Cercovado near Rio Janeiro. *Rhéxia Nianga*, Mart. et Schrank, mss. Bristles stiff, purplish, intermixed with down. Petals an inch long. Leaves 4 inches long. Branches of thyse spreading or deflexed. Petals, according to the mss., white or very pale red. Fruit unknown. Perhaps a species of *Melástoma*. *Nianga* is the native name of the plant.

*Nianga Clidemia.* Shrub 1 to 3 feet.

69 *C. FOVEOLATA* (D. C. l. c.) branches nearly terete, and

are as well as the panicles, petioles, and leaves hispid from thick, spreading, stiff bristles; leaves petiolate, oval-oblong, blunt at the base, and somewhat cordate, acuminate at the apex, serrulated, ciliated, rather blistered above, 5-nerved, but bristly and foveolate beneath; panicle oblong, terminal; calyxes bearing stellate down among the bristles. *h. S.* Native of Brazil, in the province of Minas Geraes, in irrigated places of woods. *Melástoma foveolatum*, Schrank et Mart. mss. Hairs on the lower surface of the leaves diverging, disposed in 2 rows at the sides of the nerves. Petals lanceolate, acute.

*Foveolate-leaved Clidemia.* Shrub 2 to 3 feet.

70 *C. BISEPTENA* (D. C. prod. 3. p. 164.) branches from tetragonal to terete, and are as well as the panicles and petioles clothed with crowded, spreading, somewhat deflexed bristles; leaves on long petioles, ovate, blunt at the base, acute at the apex, toothed, ciliated, clothed with stiff villi on both surfaces, 7-nerved; panicles axillary and terminal, with opposite spreading branches; petals 7, linear-lanceolate, acute. *h. S.* Native of Brazil. *Melástoma biseptenatum*, Schrank et Mart. mss. Bristles long, rufous. Calyx hispid, 5-cleft. Style filiform. Anthers oblong, obtuse, said to be allied to *A. agræstis*.

*Biseptenate-flowered Clidemia.* Shrub 1 to 2 feet.

• • • • • *Panicles terminal, with the branches spreading, and bearing the flowers on one side only.*

71 *C. HETEROBASIS* (D. C. l. c.) branchlets somewhat tetragonal, and are as well as the panicles, petioles, and leaves, especially on the under surface, clothed with soft hairs or down; leaves on long petioles, ovate, unequally cordate at the base, acuminate, 7-nerved, acutely and unequally toothed, ciliated; panicle terminal; calyx rather glandular, hispid with 5 short, acuminate lobes. *h. S.* Native of Brazil, in the province of Para. *Melástoma heterobasis*, Mart. herb. *Melast. soleniferum*, Schrank, descr. Petioles 12-15 lines long. Flowers small. Anthers violaceous, obtuse. Allied to *C. secunda*, but truly distinct from it in the leaves being somewhat cordate at the base, in being toothed, not serrated, and in the hairs being soft, not bristly, &c.

*Unequal-based-leaved Clidemia.* Shrub.

72 *C. INTERMEDIA* (D. C. l. c.) branches terete, and are as well as the panicles, calyxes, petioles, and leaves clothed with adpressed bristles; leaves on long petioles, ovate, acuminate, obtuse at the base and somewhat cordate, ciliate serrated, 5-nerved; panicle terminal, with its branches spreading and bifid; flowers sessile, secund. *h. S.* Native of Brazil, in woods at Rio Negro. *Melástoma hispidum*, Mart. herb. Very like *C. secunda*, but differs in the leaves being of the form of those of *C. heterobasis*.

*Intermediate Clidemia.* Shrub.

73 *C. SECUNDFLORA* (D. C. l. c.) branchlets terete, and are as well as the calyxes, panicles, petioles, and leaves clothed with adpressed stiff villi; leaves petiolate, oval, acuminate, ciliate serrated, 5-nerved, or almost quintuple-nerved; panicle terminal, with its branches spreading and bifid; flowers sessile, secund. *h. S.* Native of Brazil, in woods, at Para, and Rio Negro. *Melástoma secundum*, Mart. et Schrank, mss. The habit of the plant and the inflorescence agrees with *C. lacernum*, but differs in the hairs being adpressed, not spreading, in the lobes of the calyx being entire, not ciliate jagged, and in the bracteas being linear-subulate, not almost wanting. Anthers obtuse.

*Secund-flowered Clidemia.* Shrub 4 to 5 feet.

74 *C. INÆQUALIFOLIA* (D. C. l. c.) branches from tetragonal to terete, and are as well as the petioles and panicles clothed with spreading hairs; leaves petiolate, oval, obtuse at the base, ending each in a long, narrow acumen at the apex, serrulated,

5-nerved, bristly above, but clothed with villi beneath, those opposite each other usually of a different size; panicles terminal. *h. S.* Native of Brazil, in woods, in the province of Para. *Melástoma inæqualifolium*, Schrank et Mart. mss. Leaves sometimes equal in size, sometimes very unequal, the larger ones 6-7 inches long, and the smaller ones 1-2 inches. Flowers small, 5-cleft. Style filiform, exserted. Anthers not auricled at the base.

*Unequal-leaved Clidemia.* Shrub 2 to 4 feet.

75 *C. LA'CERA* (D. C. l. c.) branches terete, and are as well as the petioles and peduncles hispid from long, scattered, spreading bristles; leaves petiolate, oval-lanceolate, acuminate, 5-nerved, denticulated, ciliated, hairy on both surfaces; branches of terminal panicle dichotomous; flowers sessile, secund; calyx with a globose tube; and 5 lobes, which are furnished with palmately disposed bristles at the apex. *h. S.* Native of New Granada, on Mount Quindiu, and at the town of Mariquita. *Melástoma lácera*, Bonpl. mel. t. 5. Petals oval, white. Berry 3-celled.

*Jagged-calyxed Clidemia.* Shrub 3 to 6 feet.

76 *C. SECUNDA* (D. Don, in mem. wern. soc. 4. p. 308.) leaves oval, acuminate, 5-nerved, crenulated, rounded at the base, very pilose on both surfaces as well as the stems; panicle terminal, divaricate, with bifid, many-flowered bracteas; flowers secund. *h. S.* Native of Peru. *Melástoma secunda*, Pav. in herb. Lamb.

*Side-flowered Clidemia.* Shrub 3 to 4 ft.

77 *C. LAMBERTIANA* (D. C. prod. 3. p. 164.) leaves ~~oblong, acute, 3-nerved, crenulated, very pilose on both surfaces as well as on the stems; panicle terminal, flowers sessile; calyx scaly at the base.~~ *h. S.* Native of Peru. *Melástoma crenata*, Pav. in herb. Lamb. but not of Vahl. *Clidemia crenata*, D. Don, mem. wern. soc. 4. p. 308. *Melástoma Lambertiana*, Ser. mss.

*Lambert's Clidemia.* Shrub.

*Cult.* The species of *Clidemia* are by no means showy, and on that account are not very desirable. Their culture and propagation are the same as that for *Melástoma*, see p. 764.

XLIX. MYRIASPORA (from *μυριας*, *myrias*, a myriad, and *σπορα*, *spora*, a seed; in reference to the innumerable seeds contained in the fruit). D. C. prod. 3. p. 165.

LIN. SYST. *Decándria, Monogynia.* Calyx very hispid, with an ovate-globose tube; limb closed when in a young state, and therefore constituting an ovate bud, but at length separating into 5 irregular broad lobes. Petals 5. Stamens 10; filaments short; anthers thick, rather obtuse, gibbous at the base. Style filiform. Free part of ovarium beset with bristles. Capsule baccate, ovate-globose, 5-celled. Seeds innumerable, ovate, imbedded in the pulp of the fruit.—Brazilian shrubs. Branches terete, hispid. Leaves petiolate, rather unequal at the base, quintuple-nerved, acuminate, dentately serrated, hispid on the nerves, the rest beset with scattered bristles. Peduncles axillary, 1-3, short. Fruit large, very hispid.

1 *M. EGENSE* (D. C. prod. 3. p. 165.) leaves oblong; lobes of calyx hispid on both sides. *h. S.* Native of Brazil, in woods, at Ega, in the province of Rio Negro. *Melástoma Egense*, Mart. herb. *Blackia Egensis*, Schrank, mss.

*Ega Myriaspora.* Shrub 3 to 6 feet.

2 *M. PAULENSE* (D. C. l. c.) leaves oval; lobes of calyx glabrous on the inside. *h. S.* Native of Brazil, in the province of Rio Negro. *Melástoma Paulense*, Schrank, mss. Perhaps only a broad-leaved variety of *M. Egensis*.

*St. Paul Myriaspora.* Shrub 4 to 6 feet.

*Cult.* See *Melástoma*, p. 764. for culture and propagation.

L. TOCOCA (*Tococo* is the name of *T. Guianensis* by the Indians of Guiana). Aubl. guian. 1. p. 438. D. C. prod. 3. p. 165. *Tococa* species, D. Don, in mem. wern. soc. 4. p. 303.—*Melástoma* species of authors.

LIN. SYST. *Decándria, Monogynia.* Tube of calyx oblong, glabrous, naked at the base; limb urceolate, permanent, 5-lobed: lobes broad, short, obtuse, usually ciliated. Petals 5, obovate. Stamens 10; anthers equal, furnished each with a very short or hardly evident connective, which is biauriculate at the base. Ovarium crowned by a circular line of bristles. Style cylindrical, crowned by a large, orbicularly peltate stigma. Capsule baccate, 5-celled. Seeds ovate, angular, with a linear hylum.—South American shrubs, hispid from thick hairs or bristles. Branches tetragonal. Leaves opposite, equal, 3-5-nerved. Petioles short, bristly, timid, or inflated at the apex into 2 bladders, which are open at the apex. Flowers white or rose-coloured, disposed in a thyrse composed of racemes.

1 *T. GUIANENSIS* (Aubl. l. c. t. 174.) branches tetragonal or compressed between the nodes, covered with bristles on the angles; leaves broadly ovate, acuminate, hardly crenulated, 5-nerved, bristly on the nerves and margins, and beset with scattered bristles above; petioles inflated above; panicle terminal; calyx rather pilose. *h. S.* Native of Guiana. *Melástoma physophora*, Vahl. cel. 1. p. 45. Poir. suppl. 3. p. 629. *Melast. Tococa*, Desr. in Lam. dict. 4. p. 39. Petiole hardly 3 lines long beneath the bladder, which is subglobose. Limb of calyx campanulate, with the teeth broad at the base and acute at the apex. Petals concave, rose-coloured. Berry oval, purple. *T. Aubletia*, D. Don, l. c.

*Guiana Tococa.* Fl. Aug. Sept. Clt. 1826. Sh. 3 to 4 ft.

2 *T. FORMICATA* (Mart. herb. ex D. C. prod. 3. p. 165.) branches somewhat tetragonally terete, beset with long, scattered bristles; leaves equal, oval, acuminate, 5-nerved, serrated, beset with bristles on the margins and on the nerves beneath, but with scattered bristles above; petioles inflated at the apex; panicle terminal; calyx glabrous. *h. S.* Native of Brazil, in the province of Goyaz, in woods. Very like the preceding species. Leaves 10 inches long. Petiole almost an inch long, beneath the bladder, which is ovate and erect. Lobes of calyx awned.

*Insect Tococa.* Shrub 3 to 4 feet.

3 *T. BULLIFERA* (Mart. et Schrank, mss. ex D. C. l. c.) branches terete, but tetragonal at the apex as well as the rachis, sparingly pilose; leaves elliptic-oblong, acuminate, ciliated, almost quite entire, 5-nerved, membranous, beset with minute, scattered bristles on both surfaces; petiole inflated into an elongated bladder; calyx rather pilose. *h. S.* Native of Brazil, in the province of Para, in woods. The rachis of the simple raceme nearly tetragonal. Petiole 4 lines long, beneath the bladder, which is nearly an inch long.

*Blister-bearing Tococa.* Shrub 2 to 3 feet.

4 *T. VESICULOSA* (D. C. prod. 3. p. 166.) stem beset with spreading pili; leaves hardly unequal, on long petioles, ovate, 5-nerved, acute, bearing 2 bladders at the apex of the petiole; cyme paniced, axillary, pedunculate. *h. S.* Native of Mexico. *Melástoma vesiculosa*, Moc. et Sesse, fl. mex. icon. ined. Flowers small, rose-coloured.

*Bladdery-petioled Tococa.* Shrub 2 feet.

5 *T. SANGUINEA* (D. Don, in mem. wern. soc. 4. p. 305.) the whole plant clothed with blood-coloured hairs; leaves cordate, oval, acuminate, 5-nerved, crenulated, densely clothed with stiff hairs on both surfaces as well as the stem; calyx furnished with scales at the base; filaments glandular; style short. *h. S.* Native of Peru.

*Bloody-haired Tococa.* Shrub 2 to 3 feet.

*Cult.* The plants of this genus are remarkable for bearing

bladders on their petioles. Their culture and propagation is the same as that recommended for *Melastoma*, see p. 764.

LI. MAIETA (the author does not explain the meaning of this name). Aubl. guian. 1. p. 443. but not of Vent. D. C. prod. 3. p. 166.—Tococa, spec. D. Don.—*Melastoma* spec. of authors.

LIN. SYST. *Decándria, Monogýnia*. Tube of calyx oblong-ovate, more or less hispid, and usually bracteate; lobes 5, subulate. Petals 5, obovate. Stamens 10. Anthers equal, each furnished with a very short connective, which is biauriculated behind. Ovarium glabrous above, and as if it were truncate. Style filiform; stigma capitate. Capsule baccate, 5-celled. Seeds ovate, angular.—American subshrubs, hispid from thick pili. Branches from compressed to terete. Leaves on short petioles, those opposite each other of unequal size, the largest of the two bladdery at the base of the limb; the bladders usually confluent. Flowers solitary or few in the axils of the leaves.

1 *M. GUIANENSIS* (Aubl. guian. 1. p. 443. t. 176.) branches and petioles beset with spreading bristles; leaves on short petioles, of unequal size, the larger ones ovate, acuminate, somewhat denticulated, 5-nerved, obtuse at the base, bearing a bladder at the base of the limb, the smaller ones oblong, without any bladder; flowers axillary, solitary, on short pedicels; teeth of calyx subulate, elongated; bractees 4, acuminate.  $\frac{1}{2}$ . S. Native of French Guiana, in woods. *Melastoma Maieta*, Desr. in Lam. dict. 4. p. 34. *Tococa Maieta*, D. Don, in mem. soc. 4. p. 303. Flowers white.

*Guiana Maieta*. Shrub 2 feet.

2 *M. HYPOPHYSCA* (D. C. prod. 3. p. 166.) branches and petioles beset with a few spreading bristles; leaves of unequal size, on short petioles, the larger ones oval, acuminate, somewhat serrulated, 5-nerved, obtuse at the base, bearing a bladder at the base of the limb, the smaller ones oval-oblong, acuminate, without any bladder; flowers axillary, numerous, almost sessile; teeth of calyx short, subulate; bractees 4, broad, each ending in a short acumen.  $\frac{1}{2}$ . S. Native of Brazil, in woods. *Melastoma Maieta* and *M. hypophýscum*, Schrank et Mart. mss. Very near *M. Guianensis*, but differs in the branches being more compressed and less bristly, but the calyxes are more bristly and teeth shorter.

*Under-bladder-leaved Maieta*. Shrub 2 to 3 feet.

3 *M. HETEROPHYLLA* (D. C. l. c.) branches and petioles hispid from spreading bristles; leaves of unequal size, the larger ones petiolate, bearing 2 bladders at the top of the petiole, oval-oblong, acuminate, the smaller leaves sessile, cordate, and stem-clasping, nearly orbicular, mucronate, not bladdery; cymes axillary, pedunculate, few-flowered.  $\frac{1}{2}$ . S. Native of Peru. *Melastoma heterophýlla*, Desr. in Lam. dict. 4. p. 43. *Tococa heterophýlla*, D. Don, l. c.

*Variable-leaved Maieta*. Shrub 2 to 3 feet.

Cult. See *Melastoma* for culture and propagation, p. 764.

LII. CALOPHYSA (καλος, *kalos*, pretty, and φύσα, *phýsa*, a bladder; in reference to stipular bladders at the base of the petioles). D. C. prod. 3. p. 166.

LIN. SYST. *Octándria, Monogýnia*. Tube of calyx oblong, enlarging with the fruit, and roundish, and therefore bottle-shaped; lobes 4, broad, short, plumosely ciliated from bristles. Petals 4, obovate. Stamens 8; filaments flat, tapering to the apex. Anthers oblong, without auricles. Style filiform, not capitate at the apex. Capsule baccate, 4-celled. Seeds ovate, angular?—A Brazilian shrub, allied to *Tococa*, but differs in the bladders not being at the apex of the petiole but at the base, apparently in place of stipulas, in the parts of the flowers being quaternary, not quinary, in the calyx being at length bottle-

shaped, in the anthers being without auricles, and in the stigma not being dilated.

1 *C. TOCOCOIDEA* (D. C. l. c.).  $\frac{1}{2}$ . S. Native of Brazil, in shady places. Branches terete, and are as well as the petioles beset with spreading, stiff bristles. Bladders roundish, one on each side at the base of the petiole. Leaves cordate, acute, 7-nerved, toothed, ciliated, beset with scattered bristles above, and with bristles on the nerves beneath, but glandular between the nerves. Cymes few-flowered, axillary, crowded, short.

*Tococa-like Calophysa*. Shrub.

Cult. See *Melastoma* for culture and propagation, p. 764.

LIII. SONERILA (*Sootli Soneri-ila* is the name of *S. maculata* in the Khassee language). Roxb. fl. ind. 1. p. 180. Wall. pl. asiat. rar. 2. t. 2. Blume in bot. zeit. 1831. no. 27. p. 489.

LIN. SYST. *Triándria, Monogýnia*. Tube of calyx oblong or somewhat trigonal, usually mucronate, adhering to the ovary; limb trifid, with the segments deciduous. Petals 3, ovate-lanceolate, acute. Stamens 3. Anthers linear-oblong, straightish, emarginate at the base, opening by 2 pores at the apex, without any appendages. Ovarium truncate at the apex, glabrous. Style filiform; stigma obtuse. Capsule turbinate, crowned by the margin of the calyx, which is thickened on the inside, 3-celled, 3-valved, valves opening only at the apex. Seeds cuneate, angular, of 2 forms.—Usually small shrubs, rarely annual plants. Branches terete. Leaves opposite, rarely scattered, those opposite each other are for the most part unequal in size, one of which is sometimes almost abortive, quite ~~lanceolate~~ toothed, membranous, hairy. Peduncles axillary and terminal, racemose or fasciculate, few or many-flowered. Flowers rose-coloured. ~~roundish~~ number of the parts of the flower is sufficient to distinguish this genus from all others of *Melastomaceæ*.

SECT. I. SONERILE (see genus for derivation). Blum. l. c. p. 490. Calyx hairy, hardly angular. Petals ovate, acute, broad at the base. Capsule turbinate, opening by 3 valves, which are bipartite at the apex.

1 *S. BEGONIFOLIA* (Blum. l. c.) stem herbaceous, hairy; leaves quintuple or septuple-nerved, obliquely cordate at the base, acute, quite entire, ciliated, scabrous above, but beset with small adpressed bristles beneath, those opposite each other unequal in size, one of them almost sessile and heart-shaped; racemes axillary and terminal, many-flowered; flowers sessile.  $\odot$ . S. Native of Java, at the river Tjarvia, in the province of Bantam. Flowers rose-coloured.

*Begonia-leaved Sonerila*. Pl. 1 foot.

2 *S. MOLUCCANA* (Roxb. fl. ind. 1. p. 182.) leaves in pairs, entire, having one minute and nearly round, the other unequally cordate; racemes umbelled.  $\odot$ . S. Native of the Moluccas. Flowers rose-coloured.

*Molucca Sonerila*. Pl. 1 foot.

3 *S. PAUCIFLORA* (Blum. l. c. p. 491.) suffruticose; stems beset with stiff hairs; leaves 3-nerved, besides the marginal nervules, oblong, acuminate, auriculate semi-cordate at the base, denticulated, and rather hairy, those opposite each other unequal in size, one of which is cordate and sessile; peduncles axillary, few-flowered.  $\frac{1}{2}$ . S. Native of Java, on the mountains. Flowers rose-coloured.

*Few-flowered Sonerila*. Shrub 1 to 2 feet.

SECT. II. TRIGONOCALÆ (from τρεις, *treis*, three, and γωνία, *gonia*, an angle; in reference to the trigonal capsule and calyx). Blum. l. c. Calyx glabrous, trigonal. Petals ovate-lanceolate, acute at both ends. Capsule turbinate, attenuated at the base, trigonal; valves 3, undivided, dehiscent. Leaves opposite, nearly equal, hardly oblique at the base.

4 *S. ERÉCTA* (Jacq. mal. misc. 1. no. 5. p. 7.) stem fruticose, with 2 opposite downy lines; leaves 3-nerved, lanceolate, acute at both ends, serrated, hairy; spikes terminal, few-flowered. *h. S.* Native of Pulg-Penang, in woods. Flowers red.

*Erect Sonerila.* Shrub 1 to 2 feet.

5 *S. SQUARRŌSA* (Wall. in Roxb. fl. ind. 1. p. 182. and pl. asiat. rar. 2. p. 1. t. 102.) stem suffruticose, erect, glabrous, almost simple, with numerous stipularly soft prickles; leaves crowded towards the top of the plant, cuneate-lanceolate, cuspidately serrated, smooth, tapering into the petioles, which are very short; racemes terminal and axillary; flowers secund. *u. S.* Native of the East Indies, growing among ferns on the Khassee mountains, where it is called *Tearanga*. Petals oval, acute, contracted at the base, rose-coloured. Anthers bilocular, opening on both sides along their whole length. ex Wall. l. c.

*Squarrose Sonerila.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

6 *S. ANGUSTIFŌLIA* (Roxb. fl. ind. 1. p. 182. Wall. pl. rar. asiat. 2. p. 1. t. 102.) stem suffruticose; leaves ovate-oblong, acuminate, nearly equal, ciliated, acute at the base, beset with simple hairs on both surfaces, as well as on the branches; racemes terminal and lateral, few-flowered. *u. S.* Native of the mountains, on the north-east border of Bengal. Flowers rose-coloured.

*Narrow-leaved Sonerila.* Pl.  $\frac{1}{2}$  to 1 foot.

7 *S. MACULATA* (Roxb. fl. ind. 1. p. 180.) stem short; branches recumbent, rooting at the apex, bristly; leaves on long petioles, unequally broad-ovate-cordate, acuminate, setosely serrulated: beset with small, white, elevated specks, from the centre of each rises a bristle; racemes axillary, spiral, hairy coloured peduncles. *u. S.* Native among the mountains upon the north-east border of Bengal, where it is used by the natives as a pot-herb. Its vernacular name in the Khassee language is *Sootli-Soneri-ila*. Rheed. mal. 9. p. 127. t. 65. Flowers rose-coloured.

*Spotted-leaved Sonerila.* Pl. recumbent.

8 *S. EMACULATA* (Roxb. fl. ind. 1. p. 181.) leaves unequally narrow-cordate, acute, bristly, but without spots, serrulated, ciliated. *u. H.* Native among the Khassee mountains, on the north-east border of Bengal. It differs from *S. maculata*, in the leaves being destitute of little round white dots, from which the bristles rise. It is also less robust than that plant, with longer peduncles to the racemes, but the flowers and capsules are alike.

*Spotless-leaved Sonerila.* Pl. 1 foot.

9 *S. TENUIFŌLIA* (Blum. l. c.) stem suffruticose, rough; leaves 3-nerved, opposite, one of which is smaller than the other, ovate-lanceolate, acuminate, obtuse, or rather cordate at the base, serrated, beset with scattered bristles above, rather glaucous beneath; peduncles terminal, 1-3-flowered. *h. S.* Native of Java, in woods. Flowers red.

*Fine-leaved Sonerila.* Sh. 1 to 2 feet.

*Cult.* For culture and propagation of the stove species, see *Melastoma*, p. 764.; but see *Centradenia*, p. 766. for that of the annual kinds. Rather pretty plants when in flower.

LIV. MEDINILLA (meaning unknown to us). Gaud. ined. ex D. C. prod. 3. p. 167. Blum. in bot. zeit. 1831. no. 29. p. 508.

LIN. SYST. *Octo-Decándria, Monogýnia*. Tube of calyx ovate or obovate, ribless, adhering to the ovary; limb truncate or obsoletely 4-5-toothed, rarely cleft irregularly, continuous with the tube. Petals 4-5, oval or obovate, obtuse or obliquely truncate, rather fleshy. Stamens 8-10, equal, or the alternate ones are smaller; anthers oblong-linear, arched, beaked, and opening by one pore at the apex; their connectives 2-lobed or bifid in front, but spur-formed behind, and confluent

with the anthers. Ovary glabrous at the apex, rarely downy. Style subulate, tumid at the base, crowned by a small obtuse stigma. Berry ovate-oblong, or ovate-globose, crowned by the limb of the calyx, 4-5-celled. Seeds oval, smoothish.—Smoothish shrubs, rarely covered with stellate down, sometimes sarmentose, and sometimes parasitic; branches terete or tetragonal. Leaves opposite or in whorls, petiolate or sessile (branches sometimes with a circle of tomentum or ramentæ at the insertion of the leaves), quite entire, rarely denticulated, nerved. Cymes or umbels simple and few-flowered, or disposed in many-flowered compound panicles or corymbs, axillary or terminal. Flowers very pale red; pedicels reddish.

SECT. I. CAMPTOPLACUNTIA (from *καμπύω*, *campto*, to bend, and *πλακούς πλακουντός*, *placous placountos*, a placenta; in reference to the placenta, which is bent). Blum. l. c. p. 509. Tube of calyx ovate; limb cylindrically tubular, somewhat truncate, rarely cleft. Semiferous receptacle bent in on both sides between the cells.—Smooth shrubs, with whorled petiolate leaves. Cymes few-flowered, axillary; pedicels bractless, and articulated at the base.

\* *Flowers octandrous.*

1 *M. QUADRIFŌLIA* (Blum. l. c. p. 508.) branchlets terete; leaves usually 4 in a whorl, rarely 3 or 5, cuneate-oblong, acute, triple-nerved. *h. S.* Native of Java, on Mounts Gede and Salak, in woods. *Melastoma quadrifolium*. Blum. bijdr. p. 1069.

*Red Medinilla.* Sh. 4 to 6 ft.

2 *M. ROSEA* (Gaud. in Freyc. voy. pt. bot. p. 484. t. 106.) branches bluntly tetragonal; leaves 3-4 in a whorl, oval, mucronate, triple-nerved. *h. S.* Native of Marianne Island. Tube of calyx obovate, exactly truncate. Peduncles axillary, 6-8-flowered. Flowers and berries rose-coloured.

*Rose-coloured-flowered Medinilla.* Sh. 4 to 6 ft.

3 *M. RADICANS* (Blum. l. c.) branches terete, rooting; leaves 3-7-nerved, oblong-lanceolate, acuminate at both ends, rather veiny. *h. S.* Native of Java. *Melastoma radicans*. Blum. bijdr. p. 1069.

*Rooting Medinilla.* Sh. 4 to 6 ft.

\* \* *Flowers decandrous.*

4 *M. PTEROCAULIA* (Blum. l. c. p. 509.) branches with membranous wings; leaves 4-8 in a whorl, oblong-lanceolate, acuminate, tapering into the petiole at the base, triple-nerved. *h. S.* Native of Java, in the provinces of Buitenzorg, Tjanjor, and Bantam, in woods on the mountains.

*Wing-stemmed Medinilla.* Sh. 3 to 6 ft.

5 *M. CRASSINERVIA* (Blum. l. c. p. 510.) branches terete; leaves 4 in a whorl, acute, rather cuneate at the base, triple-nerved, fleshy; peduncles usually 1-flowered. *h. S.* Native of the Island of Banda, on Mount Baudao.—Rumph. amb. 5. p. 67.?

*Thick-nerved-leaved Medinilla.* Sh. 4 to 6 ft.

6 *M. MACROCARPA* (Blum. l. c.) branches nearly terete; leaves 4 in a whorl, oval, acute, cuneate at the base, triple-nerved; limb of calyx irregularly cleft. *h. S.* Native of the Moluccas.—Rumph. amb. 5. p. 67. t. 35. f. 2.

*Long-fruited Medinilla.* Sh. 4 to 6 ft.

SECT. II. SARCOPLACUNTIA (*σαρξ σαρκος*, *sarx sarcos*, flesh, and *πλακούς πλακουντός*, *placous placountos*, a placenta; in reference to the placenta being fleshy). Blum. in bot. zeit. 1831. no. 29. p. 510. Tube of calyx obovate or nearly globose; limb short, truncate, or denticulated. Semiferous receptacle thick, fleshy, hence the berries are at length pulpy, with the seeds imbedded in the pulp.—Smooth shrubs, with opposite, rarely whorled, petiolate or sessile leaves. Peduncles axillary

and terminal, cymose, few or many flowered; pedicels bibracteate in the middle.

\* *Flowers few, cymose or subcorymbose.*

7 *M. LAURIFOLIA* (Blum. l. c. p. 511.) branchlets terete, warted; leaves opposite, rarely in threes, ovate, attenuated at both ends, triple-nerved, rather fleshy; peduncles axillary, exceeding the length of the petioles, usually 3-flowered; flowers decandrous or dodecandrous. *h. S.* Native of Java, on trees. *Melastoma laurifolium*, Blum. bijdr. p. 1069. *M. crassifolium*, Reinw. ined. *M. carneum*, Zippel. ined.

*Laurel-leaved* *Medinilla*. Sh. 4 to 6 ft.

8 *M. CRASSIFOLIA* (Blum. l. c.) branchlets terete, warted; leaves ovate-oblong, acuminate, obtuse at the base and emarginate, obsolete 3, rarely 5-nerved; umbels axillary, in simple or trifid corymbs; flowers decandrous. *h. S.* Native of Java, on Mount Salak on trees. *Melastoma crassifolium*, Blum. bijdr. p. 1075.

*Var. β, diaphana*, (Blum. l. c.) leaves larger, thinner, and somewhat 5-nerved. *h. S.* Native along with the species. *Melastoma diaphanum*, Blum. bijdr. p. 1075.

\* *Thick-leaved* *Medinilla*. Sh. 4 to 6 ft.

9 *M. RUBICUNDA* (Blum. l. c. p. 512.) branchlets? leaves opposite, on short petioles, oblong-ovate, acuminate, obtuse at the base, triple-nerved; cymes dichotomous, axillary; flowers octandrous. *h. S.* Native of Sumatra. *Melastoma rubicunda*, Jack, in Lin. trans. 14. p. 18. Pedicels and calyxes red. Corolla white.

*Reddish-calyxed* *Medinilla*. Sh. 2 to 3 ft.

10 *M. HASSELTII* (Blum. in bot. zeit. 1831. no. 30. p. 513.) branchlets terete, warted; leaves opposite, on short petioles, lanceolate-oblong, acuminate, somewhat cordate at the base, 3-nerved, fleshy; cymes branched, axillary; flowers octandrous. *h. S.* Native of Java, in the province of Bantam, about Harriang and Levebonger.

*Husselt's* *Medinilla*. Sh. 4 to 6 ft.

11 *M. SUCCULENTA* (Blum. l. c.) branchlets terete, warted; leaves opposite, sessile, ovate-oblong, acuminate, obtuse at the base, triple-nerved, fleshy; cymes branched, axillary; flowers octandrous. *h. S.* Native of Java, on trees, in humid woods. *Melastoma succulenta*, Blum. bijdr. p. 1070.

*Succulent-leaved* *Medinilla*. Sh. 4 to 6 ft.

12 *M. HYPERICIFOLIA* (Blum. l. c.) branchlets terete; leaves opposite, sessile, ovate-lanceolate, acuminate, rather cordate at the base; cymes a little branched; flowers decandrous, rarely octandrous. *h. S.* Native of Java, on trees on Mount Salak. *Melastoma hypericifolium*, Blum. bijdr. p. 1070. Flowers small.

*St. John's-wort-leaved* *Medinilla*. Sh. 4 to 6 ft.

\* \* *Flowers in terminal and axillary elongated panicles.*

13 *M. VERRUCOSA* (Blum. l. c. p. 514.) branches warted, when young tetragonal, when old terete; leaves opposite, sessile, oblong, subcordate, acuminate, finely denticulated towards the apex, quintuple-nerved; panicles terminal or axillary, drooping; flowers decandrous; calyx somewhat truncate. *h. S.* Native of Java, in shady places on Mount Salak. *Melastoma verrucosum*, Blum. bijdr. p. 1078.

*Warted-branched* *Medinilla*. Sh. 2 to 3 ft.

14 *M. ALPESTRIS* (Blum. l. c.) branchlets? leaves opposite, sessile, half stem-clasping, ovate-oblong, crenate, quintuple-nerved, purplish beneath; panicles terminal; flowers decandrous; calyx 5-toothed. *h. S.* Native of Sumatra, on high mountains. *Melastoma alpestris*, Jack, in Lin. trans. 14. p. 20. t. 1. f. 3. a. d. Corolla flesh-coloured. Anthers purple.

*Alp* *Medinilla*. Sh. 2 to 3 ft.

15 *M. KUHLII* (Blum. l. c.) branchlets when young 4-sided;

leaves opposite, on short petioles, elliptic-oblong, acuminate, bluntish at the base, triple-nerved, as well as with 2 marginal obsolete nervules; panicles axillary or terminal, elongated; flowers decandrous; calyx obsolete 5-toothed. *h. S.* Native of Java, on Mount Pangaranghu.

*Kuhl's* *Medinilla*. Sh. 4 to 6 ft.

16 *M. JAVANENSIS* (Blum. l. c. p. 515.) branches all 4-sided; leaves opposite, sessile, somewhat cordate, elliptic, rather acuminate, quintuple-nerved, quite entire; panicles terminal or axillary, divaricate, straight; flowers decandrous. *h. S.* Native of Java, in marshes and woods on the higher mountains. *Melastoma javanensis*, Blum. bijdr. p. 1078. *M. Epidendra*, Reinw. ined.

*Java* *Medinilla*. Sh. 4 to 6 ft.

17 *M. EXIMIA* (Blum. l. c.) branches irregularly 4-sided; leaves opposite, on short petioles, elliptic-ovate, acute at both ends, quintuple-nerved, quite entire; panicles terminal; flowers octandrous. *h. S.* Native of Sumatra, on the banks of rivers. *Melastoma eximia*, Jack, in Lin. trans. 14. p. 17. Leaves large. Flowers flesh-coloured, very beautiful; anthers purple, with the appendages yellow.

*Choice* *Medinilla*. Sh. 2 to 3 ft.

18 *M. SPECIOSA* (Blum. l. c.) branches 4-sided; angles winged; leaves almost sessile, 4 in a whorl, rarely opposite, ovate-oblong, attenuated at both ends, or obtuse at the base, 7-9-nerved, rarely quintuple-nerved; panicles terminal and axillary, nodding; flowers octandrous or decandrous. *h. S.* Native of the interior of Java, in humid woods, rarely parasitical on trunks of old trees; and of the Moluccas. *Melastoma eximium*, Blum. l. c. p. 512. but not of Jack.

*Shrew* *Medinilla*. Sh. 2 to 3 ft.

19 *M. INTERMEDIA* (Blum. l. c. p. 516.) branchlets obsolete tetragonal; leaves almost sessile, opposite, elliptic-oblong, acute or acuminate, obtuse at the base, quintuple-nerved; panicles elongated, terminal; flowers octandrous. *h. S.* Native of Java, on Mount Gede, near Tjichanjar.

*Intermediate* *Medinilla*. Sh. 4 to 6 ft.

20 *M. CRISPATA* (Blum. l. c. p. 517.) branches 4-sided; angles winged; leaves sessile, 4 in a whorl, oblong, narrow at the base, quintuple-nerved; cymes subcorymbose, axillary, and lateral from the falling of the leaves; flowers decandrous, rarely dodecandrous. *h. S.* Native of the Moluccas, in valleys and on the banks of rivers. *Melastoma crispatum*, Lin. spec. p. 560.—Rumph. amb. 5. p. 66. t. 35. f. 1. Flowers rather large. Fruit round, red.

*Curled* *Medinilla*. Sh. 4 to 6 ft.

SECT. III. *HYPERANTHE* (from ὑπὸν, *hypene*, a beard, and ἀνθος, *anthos*, a flower; in reference to the flower-buds, which are bearded with stellate down on the outside). Blum. bot. zeit. 1831. no. 30. p. 517. Tube of calyx obovate-oblong; limb short, 4-lobed. Petals trapeziform, alternate ones narrower than the others. Free part of the ovary clothed with stellate down. Seeds roughish.—A shrub, having its branchlets, peduncles, and leaves clothed with stellate tomentum, and with a different habit from the other species.

21 *M. VENOSA* (Blum. l. c. p. 518.) branchlets terete; leaves opposite, oval-oblong, those opposite each other usually of a different size, veiny, clothed with furfuraceous tomentum beneath, as well as on the branches; cymes pedunculate, terminal or lateral, involucreted by fugaceous bracteas. *h. S.* Native of Java, on trees on Mount Ternate. *Melastoma venosum*, Blume, bijdr. p. 1675. Flowers middle-sized, octandrous, flesh-coloured; pedicels red.

*Veiny-leaved* *Medinilla*. Sh. 4 to 6 ft.

SECT. IV. *DACTYLIOTA* (apparently derived from δακτυλοι, 5 G

*ductylos*, and *ouc wroc*, *ous otos*, an ear; but the application is unknown to us). Blum. in bot. zeit. 1831. no. 30. p. 518. Tube of calyx nearly globose; limb short, nearly quite entire. Style girded by an annular nectary.—A shrub, having its branches, peduncles, and under side of leaves clothed with furfaceous tomentum.

22 *M. BRACTEATA* (Blume, l. c. p. 519?) branchlets terete; leaves opposite, almost sessile, oblong, decurrent at the base, emarginate, finely denticulated, quintuple-nerved; cymes pedunculate, axillary and terminal, twice trifid, bracteate; flowers decandrous. *h. S.* Native of the Moluccas. *Axinæa bracteata*, Zippel. ined.

*Bracteate Medinilla.* Shrub 4 to 6 feet.

*Cult.* The species of *Medinilla* are very pretty when in flower; their culture and propagation are the same as for *Melastoma*, see p. 764. Vegetable mould is the best soil for them.

LV. *PACHYCENTRIA* (from *παχυς*, *pachys*, thick, and *κεντρον*, *keutron*, a spur; in reference to the thick fleshy spur-like appendages of the anthers called connectives). Blum. in bot. zeit. 1831. no. 30. p. 519.

*Lin. syst.* *Octándria*, *Monogýnia*. Tube of calyx cup-shaped, constricted beneath the middle; limb obsoletely 4-toothed. Petals 4, ovate, acuminate. Stamens 8, equal. Anthers oblong-linear, straightish, beaked, and opening by one pore at the apex, furnished at the base behind with a thick fleshy spur or connective each. Ovarium half adhering to the calyx, the free part conical and angular. Style filiform, furrowed, crowned by a small obtuse stigma. Berry globose, crowned by the constricted tube of the style. Seeds oval, smooth.—Smooth parasitical shrubs. Branches terete, but compressed at the ends, besprinkled with brown or dark purple dots, as well as the peduncles. Leaves opposite, petiolate, oblong, 3-nerved or somewhat triple-nerved, quite entire. Flowers in axillary and terminal corymbs, small, rose-coloured; pedicels bibracteate in the middle.

1 *P. CONSTRICTA* (Blum. l. c. p. 520.) leaves oval-oblong, bluntly acuminate, bluntnish and rather cordate at the base; panicles terminal or axillary, corymbosely many-flowered. *h. S.* Native of Java, on the roots of trees at the bottoms of the mountains. *Melastoma constrictum*, Blum. bijdr. p. 1072. Flowers red.

*Constricted-calyxed Pachycentria.* Sh.

2 *P. VARINGIÆFOLIA* (Blum. l. c.) leaves oval or elliptic-lanceolate, attenuated at both ends; corymbs terminal, few-flowered. *h. S.* Native of Java, on trees. *Melastoma varingiaefolium*, Blume, bijdr. p. 1071. Flowers red.

*Varingia-leaved Pachycentria.* Sh.

*Cult.* Being parasitical shrubs the species had better be treated in the manner of parasitical orchideous plants. Their propagation is the same as that for *Melastoma*, p. 764. by cuttings.

LVI. *POGONANTHERA* (from *πωγων*, *pogon*, a beard, and *ανθηρα*, *anthera*, an anther; in reference to the anthers being bearded behind). Blum. in bot. zeit. 1831. no. 30. p. 520.

*Lin. syst.* *Octándria*, *Monogýnia*. Tube of calyx cup-shaped, somewhat quadrangular, adhering to the ovary at the base; limb 4-toothed. Petals 4, lanceolate, acuminate, tumid on both sides in the middle, or furnished with a tooth. Stamens 8, nearly equal; anthers oblong, acute, straight, opening by one pore at the apex, bearded behind. Free part of ovary conical and hairy. Style filiform; stigma small, obtuse. Berry globose, crowned by the limb of the calyx, 4-celled, pulpy. Seeds oval, smooth.—Shrubs. Branches terete, and arc, as well as the peduncles and petioles, dotted from scales or scurf. Leaves opposite, petiolate, ovate-oblong, somewhat auricled at the base,

3 or somewhat 5-nerved, quite entire, glabrous. Flowers small, red, covered with resinous powder, disposed in terminal panicles.

1 *P. PULVERULENTA* (Blum. l. c. p. 521.) leaves ovate, obtuse, furnished with 2 tubercles at the base, 3-nerved, coriaceous; petals furnished with one tooth on each side. *h. S.* Native of Sumatra, in woods. *Melastoma pulverulentum*, Jack in Lin. trans. 14. p. 19. but not of Blume.

*Powdery-flowered Pogonanthera.* Sh. 1 to 2 feet.

2 *P. REFLEXA* (Blum. l. c.) leaves elliptic-oblong, bluntly acuminate, biarticulate at the base, somewhat 5-nerved, membranous; petals tumid on both sides. *h. S.* Native of Java, on trees. *Melastoma pulverulentum*, Blum. bijdr. p. 1072. *Melast. reflexa*, Reinw. ined.

*Reflexed Pogonanthera.* Sh.

*Cult.* See *Pachycentria* for culture and propagation.

LVII. *ALLOMORPHIA* (from *αλλος*, *allos*, various, and *μορφη*, *morphe*, form; habit in different situations). Blum. in bot. zeit. 1831. no. 30. p. 522.

*Lin. syst.* *Octándria*, *Monogýnia*. Tube of calyx oblong, tubular, adhering to the ovary at the base; limb 4-toothed. Petals 4, ovate, acute. Stamens 8, the alternate ones a little shorter than the others. Anthers linear, acute, straight, emarginate at the base, inappendiculate. Style filiform; stigma simple. Fruit dry, ovate-oblong, 4-celled, clothed by the calyx.—Shrub erect. Branches 4-sided, covered with ferruginous tomentum. Leaves opposite, on long petioles, ovate, quite entire, glabrous, 5-nerved. Panicle small, terminal, with divaricate branches. Flowers minute, pale red.

1 *A. EXIGUA* (Blum. l. c. p. 525.) *h. S.* Native of Pulo-Penang. *Melastoma exiguum*, Jack in Lin. trans. 14. p. 10.

*Small Allomorphia.* Sh.  $\frac{1}{2}$  to 1 foot.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

LVIII. *HUBERIA* (dedicated by De Candolle to Francis Huber, author of *mémoires sur l'influence de l'air dans la germination*, 1 vol. 8vo. Geneva, 1801, and other works; and Peter Huber his son, author of a history of the Formica, and other insects). D. C. prod. 3. p. 167.

*Lin. syst.* *Octo-Decándria*, *Monogýnia*. Tube of calyx oblong, constricted at the apex; limb 4-5-lobed. Petals 4-5, obovate. Stamens 8-10; anthers oblong-linear, with 1 or 2 spur-formed bristles, rising from the back at the base. Ovary adnate to the calyx, with the free part conical. Style filiform, acutish. Capsule baccate, 4-5-celled. Seeds unknown.—Smooth Brazilian shrubs. Young branches compressed or tetragonal. Leaves petiolate, oval, or oblong, 3-nerved. Cymes terminal.

§ 1. *Anthers furnished with one bristle at the base.*

1 *H. SEMISERRATA* (D. C. prod. 3. p. 167.) branches tetragonal; leaves lanceolate, acuminate, 3-nerved, quite entire at the base, serrated in the upper part; raceme simple, terminal; lobes of calyx lanceolate-linear, acute, hardly shorter than the 4-winged tube. *h. S.* Native of Brazil, in the province of St. Paul, in marshes in woods. *Rhéxia semiserrata*, Schrank et Mart. mss. Petals white, ovate, acuminate. Anthers yellow, equal in length with the filaments. Flowers an inch in diameter. Fruit unknown.

*Half-serrated-leaved Hubertia.* Sh. 4 to 6 feet.

2 *H. LAURINA* (D. C. l. c.) branchlets compressed; leaves oblong, quite entire, rather coriaceous, 3-nerved, lateral nerves almost marginal; cymes corymbose, many-flowered; tube of calyx with 8 stripes, rather angular; fruit roundish; calyx permanent. *h. S.* Native of Brazil. D. C. coll. mem. 1. t. 9. *Melastoma laurinum*, Ser. mss. Leaves size and form of those

of *Laurus nobilis*, and at first sight apparently feather-nerved. The fruit is like that of a clove. Flowers white.

*Laurel-like Huberia.* Sh. 4 to 6 feet.

3 II. *OVALIFOLIA* (D. C. l. c.) branchlets rather compressed; leaves petiolate, oval, acute, quite entire, 3-nerved, besides the marginal nervules, which are hardly conspicuous; lateral nerves remote from the margin; cymes terminal, corymbose; calyx urceolate, elongated, caescent from rather flocky down; limb bluntly 4-lobed. *h. S.* Native of Brazil, where it was collected by Prince de Neuwied. Petals oblong-obovate, white, according to the dried specimens. Anthers furnished with a bristle-like spur, a little above the base on the back.

*Oval-leaved Huberia.* Sh. 3 to 6 feet.

§ 2. *Anthers furnished with 2 bristles at the base, rising from the back.*—These species probably do not properly belong to *Huberia*.—*Maiëta*, Vent. choix. p. 32. but not of Aubl.

4 II. *ANNULATA* (Vent. choix. t. 32.) stem and branches terete, and a little striated; leaves lanceolate, cordate at the base, somewhat acuminate at the apex, petiolate, glabrous above, puberulous beneath; flowers disposed in paniced corymbs, axillary, few, octandrous; calyx tubular, rather campanulate, with 4 oblong segments, which are about the length of the tube. *h. S.* Native of Java. *Maiëta annulata*, Vent. choix. t. 32. Petals obovate. Genitals longer than the corolla. Anthers large, acute, falcate. Style filiform, crowned by a stigma, which is hardly thicker. Berry 4-celled.

*Annular Huberia.* Sh. 3 to 6 feet.

5 H. *ARGENTEA* (D. C. prod. 3. p. 168.) branches from compressed to terete, clothed with brown furfuraceous scales; leaves oblong, attenuated at the base, obtuse at the apex, quite entire, 3-nerved, coriaceous, shining above, and covered with white furfuraceous scales beneath; panicle terminal, coarctate; flowers small, decandrous; calyx cup-shaped, 5-toothed, scurfy on the outside. *h. S.* Native of South America, near Santa Fe de Bogota. Petals 5, yellow. Berry 5-celled, about the size of a coriander seed. *Maiëta argentea*, Vent. choix. p. 34. in a note.

*Silvery Huberia.* Sh.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

LIX. *OCHTHOCHARIS* (from *ὄχθος*, *ochthos*, a river side, and *χαίρω*, *chairō*, to delight in; inhabits river banks). Blum. in bot. zeit. 1831. no. 30. p. 523.

LIN. SYST. *Dicandria*, *Monogynia*. Tube of calyx obovate, adhering to the ovarium; limb continuous, with the tube obsoletely 4-toothed, permanent. Petals 5, ovate, acuminate. Stamens 10, equal. Anthers oblong, obtuse at both ends, straight, opening by a pore at the apex, ending in a spur-formed bristle at the base behind. Ovarium truncate and glabrous at the apex. Style subulate; stigma simple. Capsule globose, broadly umbilicated, dry, 3-celled, opening irregularly. Seeds angular, cuneiform.—A glabrous shrub. Branches terete, extreme ones compressed. Leaves opposite, petiolate, oval-lanceolate, denticulated, triple-nerved. Cymes branched, axillary. Flowers small, of a flesh-colour.

1 O. *JAVANICA* (Blum. l. c. p. 523.) *h. S.* Native of the west of Java, at the river Panimbang.

*Java Ochthocharis.* Sh. 3 to 6 feet.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

LX. *CALYCOGONIUM* (from *καλύξ*, *kalyx*, a calyx, and *γωνία*, *gonia*, an angle; calyx angular). D. C. prod. 3. p. 168.—*Calycópteris*, Rich. herb. but not of Lam.

LIN. SYST. *Octo-Dicandria*, *Monogynia*. Tube of calyx subglobose, 4-5-gonal; angles acute, continuous with the middle

nerve of the lobes, but rather accrete after flowering; lobes 4-5, spreading, oblong-linear, longer than the tube. Petals 4-5, obovate. Stamens 8-10, equal; anthers oblong, opening by one pore at the apex, without any auricles at the base, and with the connectives hardly evident. Stigma dot-formed. Berry roundish, 4-5-angled, crowned by the lobes of the calyx, 4-5-celled. Seeds ovate, angular, with a linear hylum.—Shrubs, natives of St. Domingo. Branches terete, clothed with rufescent soft flocky stellate tomentum, as well as the petioles and under side of the leaves. Leaves 3-5-nerved, on short petioles, ovate-oblong, obtuse and rather cordate at the base, quite entire, glabrous above. Flowers 1-3-together, terminal, white, on short pedicels. Calyx beset with stellate down, appearing as if it were dotted.

1 C. *STELLATUM* (D. C. prod. 3. p. 168.) branches terete, and arc, as well as the petioles and under side of the leaves, clothed with crowded white stellate down. *h. S.* Native of St. Domingo. *Melastoma calycópteris*, Rich. in Bonpl. mel. t. 42. *Melast. stellata*, Vahl. ined. *Melast. scabrosum*, Bert. in herb. Balb. Leaves 3-nerved, rarely somewhat 5-nerved, the 2 inner nerves rising a little above the base, and therefore the leaves are almost triple-nerved. Flowers 4 or 5 cleft in the same specimen.

*Stellate-haired Calycogonium.* Sh. 1 to 2 feet.

2 C. *GLABRUM* (D. C. l. c.) branches nearly terete, glabrous; leaves petiolate, ovate, acuminate at both ends, somewhat repandly denticulated, triple-nerved, rather coriaceous, glabrous; pedicels terminal, 1-flowered, usually solitary, hardly longer than the petioles; tube of calyx oblong, bluntly tetragonal, scabrous from stellate down; lobes 4, subulate. *h. S.* Native of the south of Jamaica, on the high mountains. *Melastoma glabrata*, Swartz, fl. ind. occ. p. 806. Berry black, 4-celled, crowned by the calyx.

*Glabrous Calycogonium.* Sh. 1 to 2 feet.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

LXI. *OSSÆA* (dedicated by De Candolle to Don Antonio de la Ossa, formerly director of the botanic garden at the Havana, in Cuba). D. C. prod. 3. p. 168.

LIN. SYST. *Octandria*, *Monogynia*. Tube of calyx ovate, adhering to the ovarium, but not drawn out beyond it; lobes 4, short, acute. Petals 4, lanceolate, acute. Stamens 8, short; anthers hardly auricled at the base. Ovarium smoothish at the apex. Style filiform; stigma simple. Berry 4-celled, crowned by the lobes of the calyx. Seeds ovate, angular.—American shrubs. Leaves 3-5-nerved. Flowers small, rising from the axils of the leaves, or from the old leaves.

\* *Flowers axillary, sessile.*

1 O. *SCALPTA* (D. C. prod. 3. p. 168.) branches terete, and arc, as well as the petioles and nerves of leaves, scabrous from powdery branched rufous down; leaves petiolate, oblong, obtuse at the base, acutish at the apex, quite entire, 5-nerved, rather pilose; flowers on short pedicels, few together, axillary; calyx rather globose, covered with powdery grains; petals lanceolate, acuminate, awned. *h. S.* Native of St. Domingo. *Melastoma acutipétala*, Rich. in Bonpl. melast. t. 38. *Melast. oxypétalum*, Spreng. syst. 3. p. 303. *Maiëta scalpta*, Vent. choix. t. 33. *Melast. glomerata*, Vahl. ined. Berry bluish, small, globose, 4-celled. Flowers small. Filaments of stamens broadish.

*Scalp Ossæa.* Sh. 2 feet.

2 O. *SCABROSA* (D. C. prod. 3. p. 169.) stem hairy; branches terete, hairy; leaves ovate, attenuated, denticulated, 3-nerved, scabrous from papillæ, petiolate; flowers much crowded, sessile, octandrous; calyx hairy, 4-cleft; hind segments subulate

and minute; petals 4, larger than the calyx, lanceolate, acute, white; filaments jointed; stigma blunt; berry minute, roundish, 4-celled, rufous. *h. S.* Native of Jamaica, on the higher mountains. *Melastoma scabrōsa*, Lin. spec. p. 558. Swartz, obs. p. 173.

*Scabrous Ossæa.* Sh. 1 to 2 feet.

**\*\* Pedicels axillary or lateral, crowded, 1-flowered.**

3 *O. LATERIFLORA* (D. C. l. c.) glabrous; branches tetragonal, but at length terete; leaves petiolate, obovate, acuminate, setaceous somewhat serrated, triple-nerved; pedicels aggregate, rising beneath the leaves, short, 1-flowered; calyx truncate, rather strigose; petals 4, ovate, attenuated. *h. S.* Native of Montserrat, on the mountains. *Melastoma lateriflora*, Vahl. ecl. Anthers oblong, obtuse. Stigma subcapitate. Berry globose, beset with scattered strigæ.

*Side-flowered Ossæa.* Sh. 1 to 2 feet.

4 *O. SPARSIFLORA* (D. C. l. c.) branches nearly terete, and are, as well as the young leaves, rough from deciduous adpressed strigæ when young, but as the strigæ fall off, the parts soon become glabrous; leaves petiolate, oval-oblong, acuminate at both ends, triple-nerved, with revolute margins; pedicels numerous, 1-flowered, short, rising in fascicles from the axils of the old leaves; calyx truncate; petals 4, lanceolate, acute. *h. S.* Native of Guadaloupe, in woods on the mountains. *Melastoma sparsiflora*, Rich. herb. Flowers very small, acute, pale. Calyx dotted from small strigæ.

*Scattered-flowered Ossæa.* Sh. 3 to 6 feet.

5 *O. FLAVESCENS* (D. C. l. c.) branches bluntly tetragonal, nearly terete, scabrous from adpressed bristles when young, but at length becoming glabrous; leaves petiolate, ovate, acuminate at both ends, quintuple-nerved, crenulated, glabrous, except the nerves, which are bristly beneath; pedicels axillary, 1-flowered, short, quite glabrous, rising in fascicles from the axils of the old leaves; calyxes with repand margins; petals lanceolate, acute, rather velvety on the outside. *h. S.* Native of French Guiana, in woods about Sinemari. *Melastoma flavescens*, Aubl. guian. 1. p. 523. t. 164. Leaves yellowish, smooth. Flowers small, white, agreeing in disposition to those of *Lorèya arborescens*.

*Yellowish Ossæa.* Sh. 2 to 3 feet.

**\*\*\* Thyrse axillary. In this section the anthers open by a broad almost 2-celled pore, and therefore nearly agreeing with the genus CREMANIUM.**

6 *O. MULTIFLORA* (D. C. prod. 3. p. 169.) quite glabrous; branches bluntly tetragonal; leaves petiolate, oblong, attenuated, bluntish, triple-nerved, with callous serratures; thyrse axillary, shorter than the leaves; calyx campanulate, hardly 4-toothed; petals 4, oval, acute. *h. S.* Native of St. Domingo. *Melastoma multiflora*, Desr. in Lam. dict. 4. p. 35. Rich. in Bonpl. mel. t. 37. Flowers small, white. Anthers obconical, opening in a bilabiate manner by a pore of 2 cells, which has a bicameral dissepiment. Stigma dilated.

*Many-flowered Ossæa.* Sh. 3 to 4 feet.

7 *O. ACUMINATA* (D. C. l. c.) quite glabrous; branches tetragonally compressed; leaves petiolate, oblong, tapering to both ends, very acute, with callous serratures, triple-nerved; thyrse axillary, shorter than the leaves; calyx ovate, hardly 4-toothed; petals 4, lanceolate, acute. *h. S.* Native of St. Domingo. *Melastoma micranthum*, Bert. herb. but not of Swartz. Very like *O. multiflora*, but is easily distinguished from that plant in the leaves and petals being acuminate.

*Acuminate-leaved Ossæa.* Sh. 3 to 6 feet.

8 *O. PURPURA SCENS* (D. C. l. c.) quite glabrous; branches bluntly tetragonal; leaves petiolate, oblong, tapering to the base and apex, triple-nerved, serrated; serratures small, ciliæ-

formed; thyrse axillary and lateral, tripartite; calyx minutely and acutely 4-toothed; petals 4, roundish. *h. S.* Native of Jamaica, on the high mountains. *Melastoma purpurascens*, Swartz, fl. ind. occ. p. 804. Anthers obtuse, perforated at the apex. Stigma blunt, angular. Berry 4-celled.

*Purplish Ossæa.* Sh. 3 to 6 feet.

9 *O. AMYGDALINA* (D. C. l. c.) quite glabrous; branches nearly terete; leaves petiolate, lanceolate, attenuated at the base, acuminate at the apex, denticulated, triple-nerved; cymes loosish, few-flowered, rising from the axils of the old leaves beneath the young leaves; calyx rather globose, bluntly 4-toothed; petals roundish. *h. S.* Native of Porto Rico. *Melastoma amygdalina*, Desr. in Lam. dict. 4. p. 35. Rich. in Bonpl. mel. t. 36. where the description is good, but in the figure the berry is represented falsely as 5-celled. It hardly differs from *O. purpurascens*, unless in the calycine teeth being very obtuse.

*Almond-like Ossæa.* Sh. 3 to 6 feet.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

**LXII. SAGRÆA** (dedicated to Don Ramon de la Sagra, of Havana, in Cuba, director of the Botanic Garden at Havana). D. C. prod. 3. p. 170.

**LIN. SYST.** *Octandria, Monogynia* Tube of calyx adhering to the ovary, but not drawn out beyond it; lobes 4, short, permanent. Petals 4, oval. Stamens 8; anthers hardly auricled at the base. Ovary smoothish at the apex. Style filiform; stigma obtuse. Capsule baccate, 4-celled. Seeds small, ovate-angular.—American shrubs. Leaves 3-7-nerved. Flowers rising from the axils of the old leaves after they have fallen, as well as from the axils of those that are standing.

**\* Flowers crowded in the axils of the leaves, sessile, or on short pedicels.**

1 *S. COLUMNÆFOLIA* (D. C. prod. 3. p. 170.) branches terete, and are, as well as both surfaces of leaves and calyxes, very villos; leaves nearly sessile, elliptic, bluntish, crenulated, 5-nerved; flowers axillary, sessile, in crowded whorls; calyx tubular, hairy, 4-toothed; petals oblong, obtuse. *h. S.* Native of Peru. *Melastoma columnæfolium*, Schrank, mss. Very like the following species, but the leaves are almost obtuse, not acuminate, very hairy on both surfaces.

*Columna-leaved Sagraea.* Sh. 2 to 3 feet.

2 *S. SESSILIFLORA* (D. C. l. c.) branches terete, densely clothed with rufous hairs; leaves almost sessile, ovate, acuminate, crenulated, 7-nerved, ciliated, densely clothed with stiff hairs above, and with villi beneath; flowers almost sessile, crowded in the axils of the leaves; calyx cylindrical, tubular, hairy; petals oval, obtuse. *h. S.* Native of Brazil and Guiana, in grassy meadows. The down and hairs on every part of the plant are simple, and somewhat incurved. Petals small, rose-coloured. Berry 4-celled. Seeds ovoid. *Melastoma rubra*, Rich. in Bonpl. mel. t. 39. and perhaps the same as *Melastoma rubra*. Aubl. guian. 1. p. 416. p. 161. but he says the flowers are decandrous, which is most probably wrong. *Melast. sessiliflora*, Vahl. ecl. amer. 1. p. 49. icon. amer. t. 18. *Clidemia heteromalla*, D. Don, in mem. wern. soc. 4. p. 310.

*Sessile-flowered Sagraea.* Sh. 1 to 2 ft.

3 *S. FASCICULARIS* (D. C. l. c.) branchlets tetragonal, hispid; petioles scabrous from hairs; leaves ovate, acute both at the base and apex, entire, 3-nerved, besides the 2 marginal nervules, scabrous from hairs, but with the nerves hispid on the under surface; pedicels short, 1-flowered, crowded beneath the leaves; tube of calyx 4, acute, erect, permanent; petals roundish. *h. S.* Native of the interior of Jamaica, in woods on the mountains. *Melastoma fasciculæris*, Swartz, fl. ind. occ. p.

801. Flowers white. Anthers acuminate. Stigma obtuse. Berry roundish.

*Fascicular-flowered Sagræa.* Shrub.

4 *S. SCABRIDA* (D. C. l. c.) branches nearly terete, and are, as well as the petioles, beset with crowded bristles; leaves ovate, acute at both ends, triple-nerved, besides the 2 marginal nervules, ciliated, entire, scabrous from bristles on both surfaces, but especially on the nerves; pedicels short, 1-flowered, rising in bundles from the axils of the fallen leaves, and are, as well as the calyxes, quite glabrous; limb of calyx bluntly and broadly 4-toothed. *h. S.* Native of St. Domingo. *Melastoma ramiflorum*, Spreng. syst. 2. p. 295. Allied to *S. fascicularis*.

*Scabrous Sagræa.* Shrub 1 to 2 feet.

• • Flowers disposed in axillary cymes or panicles.

5 *S. GUADALUPE'NSIS* (D. C. l. c.) branches tetragonal, and are as well as the petioles smoothish, but when young clothed with rufous velvety down; leaves petiolate, ovate, acuminate, quintuple-nerved, serrately ciliated; racemes axillary, erect, capillary, with short, 1-3 flowered branchlets; berry globose, rather pilose, crowned by the 4 erect teeth of the calyx. *h. S.* Native of Guadalupe, frequent. Perhaps the *Melastoma acinodendron* of Lin. spec. 558. ? but that is said to be decandrous. Compare Plum. ed. Burm. t. 142. f. 2. Fruit violaceous, hardly the size of a red currant.

*Guadalupe Sagræa.* Shrub 1 to 2 feet.

6 *S. CAPILLARIS* (D. C. l. c.) branches tetragonal, and are as well as the petioles glabrous, or rather velvety in the young state when examined by a lens; leaves petiolate, oblong, long-acuminate, 3-nerved, quite glabrous, pale beneath, quite entire; peduncles axillary, capillary, 3-flowered, somewhat reclinate; berry ovate, hispid from scattered, short bristles, crowned by the straight, acute lobes of the calyx. *h. S.* Native of Jamaica. *Melastoma capillaris*, Swartz, fl. ind. occ. p. 808. Flowers small.

*Capillary-peduncled Sagræa.* Shrub 1 to 2 feet.

7 *S. HIRTELLA* (D. C. prod. 3. p. 171.) branches nearly terete, hispid from scattered bristles; leaves on short petioles, ovate-lanceolate, acuminate, 3-nerved, entire, pale beneath and pilose on the nerves and margins; peduncles axillary, very short, 3-flowered; calyx very minutely 4-toothed; petals lanceolate, acuminate. *h. S.* Native of Jamaica, on the mountains. *Melastoma hirtella*, Swartz, fl. ind. occ. p. 810. Anthers oblong and bifid, according to Swartz. Stigma obtuse. Berry 4-celled, hispid, dark purple. Seeds roundish.

*Hairy Sagræa.* Shrub 3 to 6 feet.

8 *S. UMBRÖSA* (D. C. l. c.) branches 4-furrowed, and are as well as the petioles hispid from long spreading bristles; leaves petiolate, broadly ovate, acuminate, serrulated, ciliated, 5-7-nerved, very pilose on the nerves, the rest beset with scattered pili; panicles axillary, loose, trichotomous, rather hispid, length of petioles; calyx globose, hairy, with 4 short teeth; petals obovate. *h. S.* Native of the West Indies, particularly in St. Christopher and Trinidad. *Melastoma umbrösa*, Swartz, fl. ind. occ. 817. Vahl. dec. amer. 2. t. 29. There are varieties of this with hispid and very hispid branches, and middle-sized and large leaves. Berry globose, hairy, blackish, small, 4-celled. Petioles 1 and 1½ inch long.

*Shaded Sagræa.* Shrub 3 to 6 feet.

9 *S. BERTE'RII* (D. C. l. c.) branches terete, and are as well as the petioles, panicles, and calyxes densely clothed with loose spreading bristles; leaves ovate, obtuse at the base, acuminate at the apex, 5-7-nerved, serrulated, villous on both surfaces, but especially on the nerves; panicles axillary, longer than the petioles, having their branches whorled; lobes of calyx 4, seta-

ceous, rather longer than the tube. *h. S.* Native of Jamaica. *Melastoma umbrösum*, Spreng. syst. 2. p. 304. but not of Swartz.

*Bertero's Sagræa.* Shrub 3 to 6 feet.

10 *S. DOMINGE'NSIS* (D. C. l. c.) branchlets terete, and are as well as the petioles and peduncles clothed with short, simple, rufescent rather reflexed hairs; leaves petiolate, ovate, acuminate, serrulated, 5-nerved, most hairy on the nerves; panicles axillary, trichotomous, a little longer than the petioles; tube of calyx rather globose, with 4 very short acute teeth. *h. S.* Native of St. Domingo. *Melastoma pilösum*, Spreng. syst. 2. p. 304. Flowers small, white.

*St. Domingo Sagræa.* Shrub 3 to 6 feet.

11 *S. TETRAGONA* (D. C. l. c.) branches acutely tetragonal, and are as well as the petioles thickly clothed with velvety rufescent spreading hairs; leaves petiolate, oval, acuminate, 5-nerved, or perhaps quintuple-nerved, somewhat denticulated, beset with a few scattered bristles above, rather hairy beneath, but especially on the nerves; panicles axillary, racemose, twice the length of the petioles; calyx rather hairy, with a globose tube and 4 very short, acute teeth. *h. S.* Native of Dominique, in woods. Flowers small.

*Tetragonal-branched Sagræa.* Shrub 3 to 6 feet.

12 *S. PILÖSA* (D. C. l. c.) branches terete, and are as well as the peduncles and petioles clothed with rusty hairs; leaves petiolate, oblong, acute, 5-nerved, glabrous above and pilose beneath, but especially on the nerves; panicles axillary, racemose, with trifid branchlets; calycine teeth 4, very minute; petals roundish, reflexed. *h. S.* Native of Jamaica, in woods on the mountains. *Melastoma pilösa*, Swartz, fl. ind. occ. p. 819. Petals spirally marked with red at the base. Berry hairy, roundish, 4-celled.

*Pilose Sagræa.* Shrub 3 to 6 feet.

13 *S. MICROPHYLLA* (D. C. l. c.) branchlets tetragonal, and are as well as the petioles hairy; leaves ovate, on short petioles, obtuse, rather denticulated, hispid above, and clothed with rusty tomentum beneath, 3-nerved; peduncles axillary, trifid; calyx hairy, with 4 very short teeth. *h. S.* Native of the south of Jamaica. *Melastoma microphylla*, Swartz, fl. ind. occ. p. 813. but not of Spreng. This species comes very near to *S. hirsuta*, but differs in the leaves being obtuse and smaller, in the flowers being smaller, in the pedicels being usually simple, and lastly in the berries being red, not dark purple.

*Small-leaved Sagræa.* Shrub 2 feet.

14 *S. HIRSU'TA* (D. C. l. c.) branches terete, and are as well as the petioles, peduncles, and calyxes beset with purplish, stiff hairs; leaves oblong-lanceolate, acuminate, denticulated, 3-nerved, very hairy on the nerves beneath, the rest beset with scattered pili; peduncles axillary, trifid; calyx ovate, with 4 linear teeth. *h. S.* Native of the south of Jamaica, on the mountains. *Melastoma hirsuta*, Swartz, fl. ind. occ. p. 811. Petals ovate, acute, white, small. Berry dark purple, globose, hairy, 4-celled.

*Hairy Sagræa.* Shrub 2 feet.

15 *S. RARIFLÖRA* (D. C. l. c.) branches terete, pubescent; leaves oval, rather cordate, long-acuminate, petiolate, ciliated, usually 7-nerved; racemes axillary, few-flowered; flowers minute, octandrous; calyx pilose, with 4 very short teeth; petals oval; style longer than the stamens; berry minute, globose, 3-celled. *h. S.* Native of South America, in the province of Cumana, at Mount Caripe. *Melastoma rariflora*, Bonpl. mel. t. 50. This is a doubtful species, from the flowers being described as octandrous; but in the figure the calyx is 5-lobed, and therefore the flowers would be decandrous. Flowers white.

*Few-flowered Sagræa.* Shrub 4 to 6 feet.

*Cult.* For culture and propagation see *Melastoma*, 764.

**LXIII. DISSOCHÆTA** (from *δισσος*, *dissos*, double, and *χατη*, *chaite*, a bristle; in reference to the connectives of the anthers being furnished with 2 bristles on their back, near the base). Blume, in bot. zeit. 1831. no. 28. p. 492.

**LIN. SYST.** *Octándria, Monogýnia*. Tube of calyx oblong, obscurely tetragonal, adhering to the ovarium; limb drawn out beyond the ovarium, for the most part obsoletely 4-toothed, permanent. Petals 4. Stamens 4, but sometimes 8; when this last is the case, the alternate ones are sterile. Anthers oblong-linear, opening by 1 pore, usually beaked and arched, rarely blunt and straight, furnished each with a lamellate, 2-awned, rarely undivided connective on the back, near the base. Style filiform, clavate. Stigma a pruinose dot. Berry elliptic-globose, nearly dry, crowned by the calyx, 4-celled, indehiscent. Seeds cuneated, angular.—Sarmentose shrubs, with the branches, peduncles, and under side of leaves clothed with starry down, sometimes thickly and sometimes thinly, according to the species. Leaves petiolate, elliptic-oblong, quite entire, somewhat 5-nerved, glabrous above, for the most part of a different colour beneath. Inflorescence paniced, terminal, or axillary. Flowers pale red, blue, or white. Habit of the genus *Oleisporum*.

**SECT. I. DISSOCHÆTÆ** (see genus for derivation). Blum. in bot. zeit. 1831. no. 28. p. 493. Limb of calyx cup-shaped, somewhat 4-toothed. Petals ovate-oblong, obtuse, or bluntnish. Anthers fixed by the base or by the back. Connectives bifid or entire. Ovarium rather silky from stellate down at the apex.

\* *Flowers tetrandrous*.

1 *D. FALLAX* (Blume, l. c.) leaves 5-nerved, ovate-oblong, acuminate, rather cordate, clothed with rusty, scurfy tomentum beneath; panicles terminal; calyx nearly quite entire; anthers fixed beneath the middle, having their connectives undivided. *h. S.* Native of Sumatra and Java, in woods, and among bushes. *Melastoma fallax*, Jack, in Lin. trans. 11. p. 13. *Melast. Reinwardtianum*, Blume, bijdr. p. 1069. *Melast. diffusa*, Reinwardt, ined. Flowers white.

*Fallacious* Dissochæta. Sh. sarmentose.

2 *D. INTERMEDIA* (Blum. l. c.) leaves 5-nerved, ovate-oblong, acuminate, somewhat cordate at the base, clothed with pale scurfy ochraceous tomentum beneath; panicles terminal and axillary, much branched; calyx almost quite entire; anthers fixed by the base, having their connectives ending in 2 bristles. *h. S.* Native of Java, in woods, on the chains of mountains called Pangaranghu and Gegerbinting. Flowers white? *Melastoma fallax*, Blum. bijdr. p. 1068.

*Var. β*; leaves clothed with rusty tomentum beneath; panicles loose. *h. S.* Native of Java, on the mountains of Megamendong and Pulu-sarie.

*Intermediate* Dissochæta. Shrub sarmentose.

3 *D. MONTICOLA* (Blum. l. c. p. 494.) leaves like those of the preceding species; panicles terminal, simple, hardly branched. *h. S.* Native of Java, on the calcareous mountains of Kuripan and Seribu.

*Mountain-born* Dissochæta. Shrub sarmentose.

4 *D. LEPROSA* (Blum. l. c.) leaves 5-nerved, ovate-oblong, acuminate, somewhat cordate at the base, clothed with scurfy rusty tomentum beneath; panicles loose, axillary, and terminal; calyx 4-toothed; connectives of anthers furnished with 2 bristles each. *h. S.* Native of Java, on mounts Salak and Gede. *Melastoma leprosum*, Blum. bijdr. p. 1068. Flowers larger than those of the preceding species.

*Leprous* Dissochæta. Shrub sarmentose.

\* \* *Flowers octandrous, with the alternate anthers sterile.*

5 *D. BRACTEATA* (Blum. l. c. p. 495.) leaves 5-nerved, ovate, acuminate, cordate at the base, clothed with stellate down beneath; panicles terminal; bractæas petiolate, ovate, membranous; calyx almost quite entire; connectives of anthers furnished with 2 bristles each. *h. S.* Native of Pulo Penang. *Melastoma bracteatum*, Jacq. in Lin. trans. 14. p. 9. Flowers pale rose-coloured.

*Bracteate* Dissochæta. Shrub sarmentose.

6 *D. VACCILLANS* (Blum. l. c.) leaves 3-nerved, as well as with 2 marginal nervules, ovate-oblong, acuminate, rounded at the base, cordate, of the same colour on both surfaces, smoothish above, but with a little scattered, scurfy down beneath; panicles terminal; calyxes quite entire; anthers straight, with their connectives furnished with 2 bristles. *h. S.* Native of Java, in woods on the mountains of Seribu, in the province of Buitenzorg. Flowers rose-coloured, middle-sized.

*Var. β*; leaves narrower, and with longer taper points; flowers smaller and white. *h. S.* In woods, at the base of Mount Salak.

*Vacillating-anthered* Dissochæta. Shrub sarmentose.

7 *D. FUSCA* (Blum. in bot. zeit. 1831. no. 29. p. 497.) leaves 3 nerved, as well as with 2 marginal nervules, long-acuminate, rounded at the base, clothed with greenish brown, stellate, rather silky down beneath; panicles terminal; calyx nearly quite entire; anthers falcate, having their connectives furnished with 2 bristles each. *h. S.* Native of Java, in woods on mountains of Salak and Gede. *Melastoma fuscum* var. Blum. bijdr. 1074. var. *γ*, D. C. prod. 3. p. 150. Flowers small, rose-coloured.

*Var. β, ferruginea* (Blum. l. c.) leaves clothed with pale rusty stellate down beneath; panicles axillary and terminal. *h. S.* Native of Java, in the province of Bantam.

*Var. γ, obtuso-acuminata* (Blum. l. c.) leaves terminated by a blunt acumen, clothed with stellate down beneath. *h. S.* Native of Java, in the province of Buitenzorg, about Tjampia.

*Fuscous* Dissochæta. Shrub sarmentose.

8 *D. VELUTINA* (Blum. l. c.) leaves 3-nerved, as well as with 2 marginal nervules, elliptic-oblong, cuspidate, usually obliquely rounded at the base, clothed with stellate and simple ochraceous rather silky down beneath; panicles axillary and terminal, rather corymbose; calyx almost quite entire; connectives of anthers furnished with 2 bristles each. *h. S.* Native of Java, in the province of Bantam. Panicle more contracted than in *D. vacillans*.

*Velvety* Dissochæta. Shrub sarmentose.

9 *D. GRACILIS* (Blum. l. c. p. 498.) leaves 3-nerved, elliptic-oblong, acuminate, rounded at the base, glabrous; panicles terminal, axillary, loose; bractæas linear, caducous; calyxes obsoletely 4-toothed; anthers straight, blunt at the apex, attenuated at the base, having their connectives furnished with 2 bristles each. *h. S.* Native of Sumatra and of Java, in the low lands. *Melastoma gracilis*, Jack, in Lin. trans. 14. p. 14. *Melast. vacillans*, var. *δ, pallens*, Blum. bijdr. p. 1074. *Melast. alba*, Reinw. ined. Flowers pale blue.

*Slender* Dissochæta. Shrub sarmentose.

10 *D. INAPPENDICULATA* (Blum. l. c. p. 499.) leaves 3-nerved, besides 2 marginal nervules, ovate-oblong, long-acuminate, rounded at the base, brownish-green beneath, and clothed with stellate scurfy pili; panicles terminal; calyx almost quite entire; anthers fixed by the base, each furnished with a triangular, inappendiculate connective. *h. S.* Native of Java, in the western part. *Melastoma vacillans*, var. *α*, Blum. bijdr. p. 1474. D. C. prod. 3. p. 150. Flowers rose-coloured, middle-sized.

*Var. β, purpurascens* (Blum. l. c.) leaves densely beset with

ochraceous dots beneath, and purplish wool. *h*. S. Java, on Mount Magamendong.

*Var. γ, tomentosa* (Blum. l. c.) leaves densely clothed with ochraceous tomentum beneath; panicles axillary and terminal. *h*. S. Java, in the province of Bantam.

*Inappendiculated*-anthered *Dissochæta*. Sh. sarmentose.

11 *D. RETICULATA* (Blum. l. c.) leaves 3-nerved, besides the 2 marginal nervules, ovate-oblong, acuminate, rounded at the base, or somewhat cordate, reticulated beneath and covered with ochraceous dots; panicles terminal; calyx almost quite entire; anthers fixed by the back, furnished with somewhat rhomboid, inappendiculate connectives. *h*. S. Native of Java, in woods, on the mountains in the province of Bantam.

*Reticulated-leaved* *Dissochæta*. Shrub sarmentose.

12 *D. SAGITTATA* (Blum. l. c. p. 500.) leaves 3-nerved, besides the lateral nervules, oblong or oblong-lanceolate, cuspidate, rounded at the base, clothed with rusty tomentum beneath; panicles axillary and terminal; calyx 4-toothed; anthers fixed by the base, having their connectives sagittate or furnished with 2 short bristles each. *h*. S. Native of Java, in shady woods, in the province of Bantam.

*Sagittate-connective* *Dissochæta*. Sh. sarmentose.

\* \* \* *Flowers octandrous, with all the anthers fertile.*

13 *D. PALLIDA* (Blum. l. c.) leaves 5-nerved, ovate, acuminate, somewhat cordate at the base, beset with scattered stellate scales; panicles axillary and terminal; anthers fixed above the base, with their connectives furnished with 2 bristles each. *h*. S. Native of the Malay islands. *Melastoma pallida*, Jack, in Lin. trans. 14. p. 12. Flowers white.

*Pale* *Dissochæta*. Shrub sarmentose.

14 *D. NEMOROSA*; shrub clothed with rusty villi; leaves ovate-lanceolate, 5-nerved; peduncles axillary, usually solitary; stamens unequal; anthers sessile, furnished with 2 bristles at the base, and with fringed appendages in front; fruit 4-celled. *h*. S. Native of Sumatra and Pulo-Nias. Flowers large, flesh-coloured.

*Grove* *Dissochæta*. Shrub 2 feet.

SECT. II. *DIPLECTRIÆ* (from *δίς*, *dis*, twice, and *πλεκτρον*, *plectron*, a spur; in reference to the anthers being furnished with 2 auricles or 2 spurs behind). Blum. in bot. zeit. 1831. no. 29. p. 501. Limb of calyx cylindrical, truncate, continuous with the tube. Anthers fixed by the base, curled in front, and furnished with 2 short auricles behind. Ovarium glabrous at the apex.

15 *D. DIVARICATA*; leaves 3-nerved, ovate, acute, downy beneath, glabrous and shining in front; branches clothed with rusty tomentum; panicles terminal, divaricate; calyx urceolate, truncate, and is as well as the peduncles tomentose; anthers almost sessile. *h*. S. Native of the East Indies. *Melastoma divaricatum*, Willd. spec. 2. p. 596. Berry about the size of a grain of pepper.

*Divaricate-panicled* *Dissochæta*. Shrub sarmentose.

16 *D. GLAUCA* (Blum. in bot. zeit. 1831. no. 29. p. 501.) leaves 3-nerved, besides the 2 marginal nervules, oblong, cordate, bluntly acuminate, clothed with scurfy, stellate down beneath as well as the branchlets, and panicles which are terminal; stamens 6-8, 4 of which are only fertile. *h*. S. Native of Pulo Penang and of Java. *Melastoma glauca*, Jack, in Lin. trans. 14. p. 15. Flowers pale blue.

*Glaucous* *Dissochæta*. Shrub sarmentose.

17 *D. CYANOCAERPA* (Blum. l. c.) branchlets and petioles beset with scattered simple bristles; leaves 3-nerved, besides the 2 marginal nervules, ovate-oblong, acuminate, cordate at the base; stamens 8, the 4 alternate ones barren. *h*. S. Native of Java,

in woods, on the higher mountains, where it is called by the natives *Tjalunt-jung-aroy*. Flowers as well as berries blue.

*Blue-fruited* *Dissochæta*. Shrub sarmentose.

*Cult.* For culture and propagation see *Melastoma*, p. 764. The species are all elegant when in flower.

LXIV. *APLECTRUM* (*a*, priv. and *πλεκτρον*, *plectron*, a spur; anthers without spurs or connectives). Blum. in bot. zeit. 1831. no. 29. p. 502.

LIN. SYST. *Octândria*, *Monogynia*. Tube of calyx ovate-globose, adhering to the ovarium; limb drawn out beyond the ovarium, truncate, or obsoletely 4-toothed. Petals 4, ovate, acute, or bluntish. Stamens 8, the 4 alternate ones sterile. Anthers ovate, obtuse at both ends, opening by 1 pore at the apex, inappendiculate at the base. Ovarium glabrous, crowned by 4 crests. Style filiform; stigma a pruinose dot. Berry nearly globose, crowned by the calyx, 4-celled, many-seeded. Seeds cuneiform.—Sarmentose smoothish shrubs, with the habit of *Dissochæta*. Leaves petiolate, elliptic-oblong, quite entire, 5-nerved. Inflorescence panicled, axillary, and terminal. Flowers small, white.

1 *A. VIMINALE* (Blum. l. c.) leaves 5-nerved, cordate-oblong, or ovate, bluntly acuminate, clothed with stellate down beneath; panicles trichotomous, axillary, and terminal; bractæas oblong, ciliated; petioles furnished with 1 or 2 bristles. *h*. S. Native of Java and Sumatra, in shady places. *Melastoma viminale*, Jack, in Lin. trans. 14. p. 16. Blum. bijdr. p. 1073.

*Twiggy* *Aplectrum*. Shrub sarmentose.

2 *A. ROSTRATUM* (Blum. l. c.) leaves 3-nerved, besides the 2 marginal nervules, ovate-oblong, each ending in a long blunt acumen, rounded at the base, glabrous; racemes axillary and terminal, almost simple; bractæas oval, ciliated; petioles often bristly. *h*. S. Native of Java, on the mountains of Scribu. *Melastoma rostratum*, Blum. bijdr. p. 1074.

*Beaked* *Aplectrum*. Shrub sarmentose.

3 *A. STIPULARE* (Blum. l. c. p. 505.) leaves 5-nerved, ovate-oblong, bluntly acuminate, somewhat cordate at the base, glabrous; panicle terminal, corymbose; bractæas linear; petioles bristly. *h*. S. Native of Java, on the mountains of Salak. *Melastoma stipulare*, Blum. bijdr. p. 1075.

*Stipular* *Aplectrum*. Shrub sarmentose.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

LXV. *TETRAZYGIA* (from *τετρα*, *tetra*, four, and *ζυγος*, *zygos*, a yoke; in reference to the quaternary number of the parts of the flower). Rich. herb. D. C. prod. 3. p. 172.

LIN. SYST. *Tetra-Octândria*, *Monogynia*. Tube of calyx globose or urceolate; limb drawn out beyond the ovarium, permanent, with 4 short teeth. Petals 4, obovate. Stamens 4-8, equal. Anthers linear, obtuse at the base, opening by a pore at the apex. Ovarium glabrous. Style filiform. Stigma dot-formed. Capsule baccate, 4-celled. Seeds numerous, cuneated, angular, shining, with a linear hylum.—West Indian shrubs, with the branches, petioles, and under side of leaves scurfy or lepidotted. Leaves ovate or oblong, discoloured beneath, 3-nerved, petiolate. Cyme trichotomous, terminal. Flowers white, bractless.

SECT. I. *TETRASTEMON* (from *τετρα*, *tetra*, four, and *σθημων*, *stemon*, a stamen; stamens 4.). D. C. prod. 3. p. 172. Stamens 4. Thyrses panicle-formed. Perhaps this section is sufficient to constitute a new genus.

1 *T. TETRANDRIA* (D. C. prod. 3. p. 172.) branchlets tetragonal, glabrous, and are as well as the petioles rusty; leaves petiolate, oblong, obtuse, somewhat cordate at the base, acute at the apex, with revolute quite entire margins, 3-nerved, clothed

with small, lepidotted down beneath as well as on the peduncles and calyxes; thyse panicled, many-flowered. *h. S.* Native of Jamaica, on the highest mountains, and of Guadaloupe. *Melastoma tetrandra*, Swartz, fl. ind. occ. p. 795. but not *M. tetrándrum* of Spreng. syst. Flowers small, white, tetrandrous.

*Tetrandrous Tetrazygia.* Shrub 3 to 6 feet.

SECT. II. OCTOSTEMON (from *οκτώ*, *octo*, eight, and *στέμον*, *stemon*, a stamen; stamens 8.). D. C. prod. 3. p. 172. Stamens 8. Thyse corymb-formed.

2 *T. DISCOLOR* (D. C. prod. 3. p. 172.) branches bluntly tetragonal; petioles, panicles, and under side of leaves clothed with flocky, short, white, stellate down; leaves repandly denticulated, oval, acuminate, 5-nerved; glabrous above; cyme paniculately corymbose, trichotomous, terminal; teeth of calyx short, obtuse; petals oval, retuse. *h. S.* Native of the West Indies, Guadaloupe, Martinico, St. Vincent, Mont Serrat, &c. *Melastoma discolor*, Lin. spec. p. 560. Jacq. amer. t. 130. t. 84. Rich. in Bonpl. mel. t. 34. *Melast. acuminata*, Vahl. ecl. 1. t. 7. *Melast. elæagnoides*, Sieb. fl. trin. no. 61. Flowers cream-coloured.

*Two-coloured-leaved Tetrazygia.* Shrub 4 to 6 feet.

3 *T. ELÆAGNOIDES* (D. C. l. c.) branches nearly terete, and are as well as the petioles and under side of leaves clothed with adpressed, rufescent, lepidotted, rather powdery down; leaves oblong, 3-nerved, attenuated at both ends, glabrous above, rather coriaceous; cymes twice trifid, terminal; limb of calyx urceolate, obscurely 4-toothed. *h. S.* Native of the West Indies. *Melastoma elæagnoides*, Swartz, fl. ind. occ. p. 815. Vahl. icon. pl. amer. 2. t. 28. Rich. in Bonpl. rhex. t. 13. Petals white, obovate. Berries bluish black, bottle-shaped, from being crowned by the permanent neck of the calyx.

*Elæagnus-like Tetrazygia.* Shrub 3 to 10 feet.

4 *T. ANGUSTIFOLIA* (D. C. l. c.) branches terete, and are as well as the petioles and under side of leaves clothed with velvety, minute, stellate down; leaves linear-lanceolate, with revolute, quite entire margins, 3-nerved, beset with yellowish dots above; lateral nerves approximating the margin of leaf; cymes paniculately corymbose, trichotomous; calyx rather globose, with the limb slightly 4-toothed. *h. S.* Native of the West Indies, particularly of Montserrat, Trinidad, Guadaloupe, &c. *Melastoma angustifolia*, Swartz, fl. ind. occ. p. 799. Rich. in Bonpl. mel. t. 10. Vahl. dec. amer. 3. t. 26. Petals from white to pale red, obovate. Flowers one-half smaller than those of *T. elæagnoides*. Fruit nearly globose, not bottle-shaped.

*Narrow-leaved Tetrazygia.* Shrub 4 to 6 feet.

5 *T. CROTONIFOLIA* (D. C. l. c.) branches terete, hispid; leaves sessile, cordate, lanceolate, denticulated, 3-5-nerved, glabrous above, and rather muricated, clothed with white down or tomentum beneath; panicles terminal, few-flowered; calyx rather campanulate, 4-toothed. *h. S.* Native of St. Domingo. *Melast. crotonifolia*, Desr. in Lam. dict. 4. p. 43. Petals 4, oval, purple. Fruit ovate, glabrous, crowned by the calyx. The habit of the plant is between that of *Heterotrichum* and *Tetrazygia*.

*Croton-leaved Tetrazygia.* Sh. 3 to 6 feet.

*Cult.* See *Melastoma* for culture and propagation, p. 764.

LXVI. HETEROTRICHUM (from *ἕτερος*, *heteros*, variable, and *τριχός*, *thrix trichos*, a hair; the plants are clothed with variable hairs, some stellate and soft, and others simple and bristly intermixed). D. C. prod. 3. p. 173.

LIN. SYST. *Deca-Icosándria*, *Monogýnia*. Tube of calyx ovate-globose; limb 5-8-cleft, with the lobes permanent and broad at the base, and elongated and subulate at the apex. Pe-

tals 5-8, oval. Stamens 12-16, equal; filaments glabrous; anthers oblong, hardly gibbous at the base, opening by one pore at the apex. Ovarium glabrous, umbilicate at the apex. Style cylindrical; stigma a pruinose dot. Capsule baccate, 5-6-celled, globose, crowned by the calyx. Seeds unknown.—Shrubs, natives of St. Domingo. Branches terete, and are, as well as the petioles, panicles, and calyxes beset with stiff bristles and stellate down intermixed. Leaves petiolate, bristly above, and hispid on the nerves beneath, but velvety between the nerves. Cymes terminal, trichotomous, umbellate. Flowers white or purple. The torus in *H. octònum* is easily separated from the calyx, forming a tunic around the ovary, toothed at the apex. Perhaps in all.

1 *H. ANGUSTIFOLIUM* (D. C. prod. 3. p. 173.) branches, petioles, and peduncles, as well as under side of leaves and calyxes, clothed with short stellate white tomentum, intermixed with stiff rufous spreading bristles; leaves oblong, obtuse at the base, acuminate at the apex, rugosely crenulated, beset with bristles on the upper surface, which are tumid at the base, triple-nerved; cymes divaricate, trichotomous, terminal; tube of calyx ovate, having the lobes of the limb dilated and rounded at the base, and ending each in a subulate mucrone. *h. S.* Native of St. Domingo and Martinique. *Melastoma hirta*, Desr. in Lam. dict. 4. p. 43. but not of others. *Melast. Berteroianum*, Ser. mss.—Plum. ed. Burm. t. 141. Perhaps the same as *Melast. pallens* of Spreng. syst. Petals ovate, acutish. Anthers oblong, bluntly subgibbous at the base. Axils of nerves bearded.

*Narrow-leaved Heterotrichum.* Sh. 3 to 6 feet.

2 *H. NIVEUM* (D. C. l. c.) branches, petioles, pedicels, and under side of leaves, beset with blackish rigid bristles, intermixed with white stellate down; leaves cordate, acuminate, scabrous from bristles above, 7-nerved; panicle loose; flowers 6-cleft. *h. S.* Native of St. Domingo. *Melastoma nivea*, Desr. in Lam. dict. 4. p. 42. Very nearly allied to the following species, but differs in the down being white, as in the preceding species, and in the flowers being 6-cleft and dodecandrous.

*White Heterotrichum.* Sh. 6 to 8 feet.

3 *H. PATENS* (D. C. l. c.) branches, petioles, peduncles, and calyxes, beset with glandular bristles, intermixed with stellate down; leaves cordate, acuminate, somewhat denticulated, 7-nerved, rather scabrous above, but clothed with white velvety down beneath; cymes terminal, loose; flowers 6-8-cleft; lobes of calyx spreading. *h. S.* Native of St. Domingo. *Melastoma patens*, Swartz, fl. ind. occ. 2. p. 791. *Melast. lappacea*, Desr. in Lam. dict. 4. p. 42. *Melast. grandiflorum*, Spreng. in herb. Balb. but not of Aubl. Flowers pale red or whitish. Berry sweet, but insipid.

*Spreading Heterotrichum.* Shrub 6 feet.

4 *H. OCTONUM* (D. C. l. c.) branches, petioles, and peduncles beset with long, spreading, reflexed bristles, intermixed with short, stellate down; leaves cordate, acuminate, 5-7-nerved, hispid above from simple, toothed bristles, but clothed with stellate down beneath; thyse panicled, terminal; teeth of calyx 8, subulate, short, permanent, incurved. *h. S.* Native of South America, on Mount Quindiu, near the river Guada. *Melastoma octona*, Bonpl. mel. t. 4. Petals 4, white. Torus separable from the calyx, forming an 8-toothed tunic around the ovary.

*Eight-cleft-calyxed Heterotrichum.* Sh. 6 to 9 feet.

5 *H. NOVENNERNIVUM* (D. C. l. c.) branches, petioles, and peduncles beset with glandular bristles, intermixed with grey stellate tomentum; leaves ovate, rather cordate at the base, acuminate at the apex, ciliate serrulated, 9-nerved, rough from blisters above, and velvety beneath from white stellate down; thyse panicled, loose, terminal; calyx clothed with white tomentum, having 5, erectish lobes. *h. S.* Native of Brazil. Petals oblong.

*Nine-nerved-leaved Heterotrichum.* Sh. 6 feet.

*Cult.* For culture and propagation see *Melastoma*, p. 764.

**LXVII. CONOSTEGIA** (from *κωνος*, *konos*, a cone, and *στεγη*, *stege*, a covering; in reference to the conical calyptriform calyx falling off in one piece). D. Don, in mem. soc. wern. 4. p. 316. Ser. mss. D. C. prod. 3. p. 173.—*Melastoma calyptrata*, Bonpl. mel.—*Calycotomus* and *Bruguiera*, Rich. ined.

**LIN. SYST.** *Deca-Icosándria*, *Monogynia*. Tube of calyx adnate to the ovarium; limb undivided, conical, form of a calyptra, cut round (f. 112. b.), or irregularly ruptured at the base through æstivation, and therefore falling off in one piece (f. 112. a.). Petals 5-6. Stamens 10-16. Anthers usually biauriculate at the base. Stigma capitate or peltate. Capsule baccate, 3-8-celled. Seeds ovoid, angular.—Trees or shrubs, for the most part natives of South America. Leaves petiolate. Thyse panicled, terminal. Flowers usually white.

**SECT. I. ERIOSTEGIA** (from *εριον*, *erion*, wool, and *στεγη*, *stege*, a covering; calyx woolly). Flower-bud globose, hispid, abruptly acuminate.

1 *C. MUTISII* (Ser. mss. ex D. C. prod. 3. p. 174.) branches, petioles, peduncles, and calyxes hairy; leaves large, cordate-oval, rather acuminate, denticulate, 7-9-nerved, glabrous above, but rather pilose on the nerves beneath; peduncles terminal, usually 3-flowered; flower-bud ovate-globose, abruptly acuminate, and regularly cut round at the base. *h. S.* Native of South America, on Mount Quindiu, at the altitude of 2300 feet. *Melastoma Mutisii*, Bonpl. mel. 1. p. 136. t. 58. Calyx large, hairy. Bractees linear-subulate. Petals 5, white, oval. The flowers are said to be polyandrous in the character given by Bonpland, and decandrous in the French description. Stigma simple.

*Mutis's Conostegia.* Tree 20 feet.

**SECT. II. EUCONOSTEGIA** (this section contains what are supposed to be the true species of the genus). Flower-bud ovate, blunt at the apex or acutish, glabrous or a little velvety.

2 *C. EXTINGTORIA* (D. Don, in mem. wern. soc. 4. p. 316.) branches bluntly tetragonal, rather terete, and arc, as well as the petioles, leaves, and panicles, clothed with adpressed rusty down; leaves oval-oblong, long-acuminate, quintuple-nerved, with repandly denticulate margins, glabrous and shining above; panicle terminal; flower-bud conical and acute at the apex, cut round about in the middle. *h. S.* Native of New Granada, in temperate places near Mariquita. *Melastoma extingtorium*, Bonpl. mel. t. 57. Petals 6, obovate, white. Stamens 20. Berry 5-celled.

*Spoiled Conostegia.* Tree 24 feet.

3 *C. DISCOLOR* (D. C. prod. 3. p. 174.) branches nearly terete, and arc, as well as the petioles, peduncles, and under side of leaves, clothed with short rusty down; leaves oval, attenuated at the base, acuminate at the apex, quite entire, 5-nerved, besides the marginal nervules; thyse terminal, panicled, loose; calyx glabrous after opening, urceolate, truncate, globose at the base. *h. S.* Native of St. Domingo. *Melastoma tetrádrum*, Spreng. syst. 2. p. 305. exclusive of the synonymes.

*Two-coloured-leaved Conostegia.* Tree 12 to 20 feet.

4 *C. PROCERA* (D. Don, l. c.) glabrous; branches bluntly tetragonal; leaves oval-lanceolate, acuminate, entire, triple-nerved, bearded in the axils of the nerves beneath; thyse panicled, terminal, loose; flower-bud ovate, acuminate, cut round in the middle. *h. S.* Native of Jamaica, on the mountains. *Melast. procera*, Swartz, fl. ind. occ. p. 764. Bonpl. mel. t. 51. Perhaps Swartz's plant under this name is the same as Bonpland's, although Swartz says the leaves of his plant are glabrous,

and sometimes rusty beneath, the stigma capitate, and the flowers decandrous; Bonpland says, his plant has dodecandrous flowers, nerves of leaves bearded, and an acute stigma. Flowers white. (f. 112.)

*Tall Conostegia.* Tree 12 to 30 feet.

5 *C. BALBISIANA* (Ser. mss. ex D. C. prod. 3. p. 174.) quite glabrous; branches bluntly tetragonal; leaves oval, rather oblong, hardly acuminate, quite entire, triple-nerved, besides the marginal nervules; thyse panicled, terminal, elongated, having its branchlets 3-flowered; flower-bud ovate, acutish, at length cut round about. *h. S.* Native of Jamaica. Flowers twice the size of those of *C. calyptrata*. Perhaps the same as *Melastoma procera*, Swartz, but not of Bonpl. ? Base of calyx campanulate, rather urceolate, truncate. Stamens 12. Style not thickened at the apex. Berry 8-celled.

*Balbis's Conostegia.* Tree 20 feet.

6 *C. SUBHirsuta* (D. C. prod. 3. p. 174.) branchlets tetragonal, and arc, as well as the peduncles and nerves of leaves, densely clothed with rusty branched down; leaves oval, somewhat attenuated at the base, abruptly acuminate at the apex, quite entire, 5-nerved, glabrous on both surfaces, except the nerves on the under surface; thyse panicled, terminal, few-flowered; calyx ovoid, after separating hemispherical truncate and glabrous at the base. *h. S.* Native of Cuba, about the Havanah, and of Guadalupe. *Bruguiera*, Rich. herb. This species is very distinct in the hairiness, form of the leaves and calyxes. Petals 8-10, obovate-oblong. Berry 12-celled. Stigma peltate.

*Rather-hairy Conostegia.* Tree 20 feet.

7 *C. CALYPTRA-TA* (D. Don, l. c.) smoothish; branches tetragonal, and arc, as well as the petioles, panicles, and nerves of leaves on the under side, clothed with scurly down; leaves on long petioles, oval-oblong, long-acuminate, glabrous above, somewhat denticulate, 3-nerved, besides the 2 small lateral nervules; thyse panicled, terminal, loose; flower-bud ovate, obtuse at the base, rather acutish at the apex, cut round about in the middle. *h. S.* Native of mountain woods in Guadalupe, Martinique, and Montserrat, &c. *Melastoma calyptrata*, Desr. in Lam. dict. 4. p. 51. Rich. in Bonpl. mel. t. 46. Vahl. ecl. 1. p. 40. Flowers white.

*Calyptrate-calyxed Conostegia.* Sh. 6 to 8 feet.

8 *C. CORNIFOLIA* (Ser. mss. ex D. C. prod. 3. p. 175.) quite glabrous; branches nearly terete; leaves petiolate, oval, short-acuminate, quite entire, 3-nerved, besides the marginal nervules; thyse panicled, terminal, loose; flower-bud ovate, obtuse at the base, rather acutish at the apex, sometimes cut round about in the middle, and sometimes opening irregularly by 2 valves. *h. S.* Native of Martinique. There is a small-leaved variety found on the mountains, and a large-leaved variety in the woods. *Melastoma cornifolia*, Desr. in Lam. dict. 4. p. 51. Rich. in Bonpl. mel. t. 41. *Melast. picta*, Vahl. ecl. 3. p. 15. ex Ser. Petals 5, white, obtuse. Stamens 10. Berry 4-celled.

*Dog-wood-leaved Conostegia.* Tree 20 feet.

9 *C. SEMICRENATA* (Ser. mss. ex D. C. prod. 3. p. 175.) glabrous; branches nearly terete; leaves oblong, long-acuminate, repandly crenate in the upper part, 3-nerved, rusty beneath in the adult state; thyse panicled, terminal, loose; flower-bud oval, attenuated at the base, acutish at the apex; tube of calyx

FIG. 112.

2 *A. AGRIMONIODES* (H. B. et Kunth, nov. gen. amer. 6. p. 231.) flowers alternate, spicate, lower ones remote; stem erect; leaflets oblong, coarsely serrated, glabrous, when young pubescent beneath.  $\frac{1}{2}$ . F. Native of Mexico, in cold places near Tianguillo. Allied to *A. Lappacea*.

*Agrimony-like* Acæna. Pl.  $\frac{1}{2}$  foot.

3 *A. ELONGATA* (Lin. mant. 200.) flowers disposed in elongated spicate racemes; stems ascending; leaflets oblong, serrated, pubescent beneath.  $\frac{1}{2}$ . F. Native of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 252.

*Elongated* Acæna. • Shrub 1 foot?

4 *A. LATEBROSA* (Ait. hort. kew. 1. p. 16.) flowers disposed in elongated spikes; peduncles scape-formed; stems procumbent; leaflets oblong, cut, hoary beneath.  $\frac{1}{2}$ . H. Native of the Cape of Good Hope. *Agrimonia decumbens*, Lin. fil. suppl. 251. *Ancistrum decumbens*, Thunb. fl. cap. 1. p. 142. *Ancistrum latebræsum*, Gært. fruct. 1. t. 32.

*Dark* Acæna. Fl. April, June. Clt. 1774. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  feet.

5 *A. PINNATIFIDA* (Ruiz et Pav. fl. per. 1. p. 68. t. 104. f. 1. b.) plant silky; flowers crowded into cylindrical spikes, lower ones rather remote; stem erect; leaves of 3-5 pairs of deeply 3-5-parted leaflets, with the segments linear; flowers pentandrous or decandrous.  $\frac{1}{2}$ . F. Native of the hills of Chili and the Straits of Magellan. Lindl. bot. reg. t. 1271. Fruit covered with glochidate bristles.

*Pinnatifid-leaved* Acæna. Fl. May, June. Clt. 1822. Pl.  $\frac{1}{2}$  foot.

6 *A. INCISA* (Lindl. bot. reg. no. 1271.) plant erect and silky; leaves of 6-7 pairs of oblong, cuneated, deeply serrated leaflets; heads of flowers spicate, lower flowers remote.  $\frac{1}{2}$ . H. Native of Chili, at the baths of Collina near the limits of the snow.

*Cut-leaved* Acæna. Pl.  $\frac{1}{2}$  foot.

7 *A. MYRIOPHYLLA* (Lindl. bot. reg. no. 1271.) erect, pubescent; leaves of 7-9 pairs of linear deeply pinnatifid leaflets; the segments very narrow and silky beneath; spikes cylindrical, interrupted at the base; fruit ovate, tomentose, glochidate.  $\frac{1}{2}$ . F. Native of Chili, about Mendoza.

*Myriad-leaved* Acæna. Pl.  $\frac{1}{2}$  foot.

8 *A. SERICEA* (Jacq. fil. eclog. 1. t. 55.) flowers collected into globose heads; stems decumbent; leaflets obovate, deeply toothed, pubescent, silky on the back.  $\frac{1}{2}$ . F. Native of New Spain, at Port Desire. *Potèrium australe*, Sal. prod. 2. p. 360. *Ancistrum acórna*, Lag. nov. spec. p. 7. no. 100. ex Rœm. et Schultes.

*Silky* Acæna. Pl.  $\frac{1}{2}$  foot.

9 *A. OVINA* (Cunningh. in Fields' new south wales, p. 358.) plant covered with white hairs; leaflets deeply cut, pinnatifid; segments oblong, obtuse; spikes oblong; lower flowers remote; stem reclinate, somewhat demersed.  $\frac{1}{2}$ . H. Native of New Holland, frequent on the moist lands of Bathurst.

*Sheep-fodder* Acæna. Fl. June, July. Pl. reclinate.

SECT. II. *ANCISTRUM* (from *ανκιστρος*, *ancistros*, a fish-hook; in reference to the bristles of the calyx, which terminate in hooked points). Forst. gen. t. 2. Lam. ill. p. 22. D. C. prod. 2. p. 592. Calyx tubular, ending at the apex in 4-5 bristles, which are glochidate at the apex.

10 *A. SANGUISORBE* (Vahl. enum. 1. p. 294.) spikes globose; stems decumbent; leaves remote; leaflets 7 pairs, cuneated, serrated, silky beneath.  $\frac{1}{2}$ . H. Native of New Zealand. *Ancistrum anserinæfolium*, Forst. l. c. *Ancistrum diandrum*, Forst. prod. no. 52. *Ancistrum decumbens*, Gært. fr. t. 32. *Ancistrum Sanguisorbæ*, Lin. fil. suppl. 189. Bristles of calyx 4. Stigma pencil-formed?

*Burnet* Acæna. Fl. June. Clt. 1796. Pl. decumbent.

VOL. II.

11 *A. OVALIFOLIA* (Ruiz et Pav. fl. per. 1. p. 67. t. 103. f. c.) spikes globose; stems creeping; leaves with 4-5 pairs of oblong and somewhat cuneated leaflets, which are villous beneath.  $\frac{1}{2}$ . H. Native of Peru, in humid shady places. *Ancistrum repens*, Vent. hort. cels. t. 5.

*Oval-leaved* Acæna. Fl. May, June. Clt. 1802. Pl. cr.

12 *A. SARMENTOSA* (Carm. in Lin. trans. 11. p. 20.) spikes globose; stems creeping; leaves of 4-5 pairs of sharply serrated leaflets, which are glabrous and veiny above, but silky beneath; stipulas undivided.  $\frac{1}{2}$ . H. Native of the Island of Tristan d'Acugna. *Ancistrum sarmentosum*, Pet. Th. fl. p. 44. Calyx 4-awned. Stamens 2.

*Sarmentose* Acæna. Pl. creeping.

13 *A. ARGENTEA* (Ruiz et Pav. fl. per. 1. p. 67. t. 103. f. b.) spikes globose; stems creeping; leaves of 3-4 pairs of ovate-oblong serrated leaflets, which are silky beneath.  $\frac{1}{2}$ . H. Native of Chili, in bogs and fields. *Ancistrum argenteum*, H. B. et Kunth, nov. gen. amer. 6. p. 230. Calyx villous outside.

*Silvery* Acæna. Fl. May, June. Clt. 1822. Pl. creeping.

14 *A. ADSCENDENS* (Vahl. enum. 1. p. 297.) spikes globose; stems decumbent; leaves with 5-7 pairs of oblong and obovate serrated smoothish leaflets.  $\frac{1}{2}$ . H. Native of the Straits of Magellan. *Ancistrum humile*, Pers. ench. 1. p. 30. *Ancistrum lævigatum*, Lag. nov. spec. p. 7.

*Ascending* Acæna. Fl. May, June. Clt. 1822. Pl.  $\frac{1}{2}$  foot.

15 *A. LÆVIGATA* (Ait. hort. kew. 1. p. 68.) terminal spikes cylindrical, lower ones globose; stems decumbent; leaflets oval, deeply crenated, glabrous above, and canescent beneath.  $\frac{1}{2}$ . H. Native of the Straits of Magellan.

*Smooth* Acæna. Fl. June, Aug. Clt. 1790. Pl. dec.

16 *A. MAGELLANICA* (Vahl. enum. 1. p. 297.) spikes of flowers globose; stems erect, glabrous; leaves with 6 pairs of obovate, deeply serrated trifid leaflets, which are canescent beneath.  $\frac{1}{2}$ . H. Native of the Straits of Magellan. *Ancistrum Magellanicum*, Lam. ill. t. 22. f. 2.

*Magellan* Acæna. Pl.  $\frac{1}{2}$  foot.

17 *A. TRIFIDA* (Ruiz et Pav. fl. per. 1. p. 67. t. 104. f. c.) spikes globose; stems erect, and are, as well as the leaflets, clothed with canescent tomentum; leaflets 7-8 pairs, cuneiform, 3-5 cleft.  $\frac{1}{2}$ . H. Native of Chili, in pastures.

*Trifid-leaftletted* Acæna. Pl.  $\frac{1}{2}$  to 1 foot.

18 *A. LUCIDA* (Vahl. enum. 1. p. 296.) spikes ovate-oblong; leaflets 8-9 pairs, 3-5-parted, villous beneath, with the segments linear.  $\frac{1}{2}$ . H. Native of the Falkland Islands. *Ancistrum lucidum*, Lam. ill. t. 22. f. 3. Calyx 4-awned, pilose outside.

*Shining-leaved* Acæna. Fl. May, June. Clt. 1777. Pl.  $\frac{1}{2}$  ft.

19 *A. PUMILA* (Vahl. enum. 1. p. 298.) spikes terete; peduncles scape-formed; stems demersed; leaflets 11-12 pairs, oval, crenate-serrated, quite glabrous, shining above.  $\frac{1}{2}$ . H. Native of the Straits of Magellan. The fruit is said to be armed; if such be the case this species belongs to the first section, *Eucæna*.

*Dwarf* Acæna. Pl.  $\frac{1}{4}$  foot.

20 *A. CYLINDRISTACHIA* (Ruiz et Pav. fl. per. 1. p. 68. t. 104. f. 2.) spikes cylindrical; peduncles scape-formed; stems demersed; leaflets 10-11 pairs, oblong, serrated, silky beneath.  $\frac{1}{2}$ . H. Native of Peru, on the cold hills of Tarma. Calyx 4-awned.

*Cylindrical-spiked* Acæna. Pl.  $\frac{1}{2}$  foot.

*Cult.* The species are of easy culture, and are increased by dividing or by seed. A dry situation and sandy soil suit them best.

VII. *SANGUISORBA* (from *sanguis*, blood, and *sorbeo*, to absorb; the *S. officinalis* was formerly supposed to be a power-

ful vulnerary). Lin. gen. no. 146. Lam. ill. t. 85.—Pimpinella species of Tourn. inst. t. 68. Gærtn. fruct. 1. p. 161. t. 32.

LIN. SYST. *Tetrándria, Monogýnia*. Flowers hermaphrodite. Calyx 4-cleft (f. 79. b.), furnished with two scales on the outside at the base (f. 79. a.). Petals wanting. Stamens 4 (f. 79. c.). Carpels 2, inclosed within the tube of the calyx. Style pencil-formed at the apex. Seed inverted.—Perennial herbs, with impari-pinnate leaves and small flowers, crowded into very dense, globose, ovate or cylindrical spikes, the flowers expanding from the top.

\* *Stamens equal in length to the calyx, or shorter.*

1 *S. OFFICINÁLIS* (Lin. spec. 169.) spikes ovate; stamens equal in length to the calyx; calyxes and leaves glabrous; leaflets ovate, rather cordate.  $\mathcal{U}$ . II. Native of Europe, in meadows and woods. In Britain in moist meadows, particularly in a chalky and limestone soil; in marly soil about Stafford; in Cambridgeshire at King's-hedges, Whitwell, Ditton, &c.; in Bedfordshire at Bromham, Fenslake, and Cow Meadows; in Oxfordshire at Isley, Cowley, and Binsey. In Scotland in low moist meadows near Dumfries, but by no means common. Smith, engl. bot. 1312. Oed. fl. dan. t. 97. Mart. fl. rust. t. 142. Flowers dark purple. The plant makes good fodder when young.

*Var.  $\beta$ , auriculata* (All. ped. no. 292.) leaflets each furnished with a foliaceous stipel, and hence auriculated.  $\mathcal{U}$ . II. Native of Savoy, Switzerland, Piedmont, &c. S. Sabáuda, Mill. dict. no. 2.—Boec. mus. 19. t. 9. Spikes cylindrical.

*Var.  $\gamma$ , Hispanica* (Mill. dict. no. 3.) leaflets 4 pairs, pale green above and hairy beneath; spikes of flowers reddish. Miller regards both these varieties as specifically distinct.

*Officinal* Burnet. Fl. June, Aug. Britain. Pl. 3 to 4 feet.

2 *S. CÁRNEA* (Fisch. hort. gor. ex Link. enum. 1. p. 144.) spikes nearly globose; stamens shorter than the calyx; bracteas ciliated; calyx pubescent; leaves glabrous; leaflets oblong-lanceolate, cordate at the base, crenate-toothed.  $\mathcal{U}$ . II. Native of Siberia in many places. S. rubra, Schrank, fl. mon. p. 144. t. 69. Leaflets 2 inches long; flowers dark red.

*Flesh-coloured-flowered* Burnet. Fl. June, Aug. Clt. 1821. Pl. 3 to 4 feet.

3 *S. ANDERSONII*; spikes cylindrical; stamens about equal in length to the calyx or a little shorter; bracteas ciliated; calyx glabrous; leaves glabrous; leaflets ovate-lanceolate, cordate, deeply serrated, those of the upper leaves nearly sessile, and those of the lower ones petiolulate and stipulate.  $\mathcal{U}$ . II. Native of Siberia? Grown in the Chelsea botanic garden.

*Anderson's* Burnet. Fl. July, Aug. Clt. ? Pl. 3 to 4 feet.

\*\* *Stamens exserted.*

4 *S. MAURITÁNICA* (Desf. atl. 1. p. 142.) spikes ovate-cylindrical; stamens exserted; calyxes wrinkled; leaflets lanceolate, profoundly serrated, villous beneath, as well as the stem.  $\mathcal{U}$ . H. Native of Algiers, in hedges.—Moris. oxon. sect. 8. t. 18. f. 4. Spikes greenish.

*Mauritanian* Burnet. Fl. July, Aug. Clt. 1810. Pl. 3 to 4 ft.

5 *S. TENUIFÓLIA* (Fisch. hort. gor. ex Link. enum. 1. p. 144.) spikes cylindrical; stamens exserted; bracteas ciliated; leaflets

glabrous, oblong-lanceolate, nearly sessile, and serrated.  $\mathcal{U}$ . H. Native of Dahuria and China. Spikes of flowers red. Leaflets of the lower leaves petiolulate and stipulate.

*Thin-leaved* Burnet. Fl. June, Aug. Clt. 1820. Pl. 3 to 4 ft.

6 *S. MÉDIA* (Lin. spec. 169.) spikes ovate-cylindrical; stamens but little exserted; bracteas and leaves glabrous; leaflets ovate, rather cordate, toothed.  $\mathcal{U}$ . II. Native of North America from Canada to Carolina, and of Siberia.—Moris. oxon. sect. 8. t. 18. f. 8. Spikes red, not so round as those of *S. officinalis*.

*Middle* Burnet. Fl. July, Sept. Clt. 1785. Pl. 3 to 4 ft.

7 *S. ALPINA* (Bunge in Led. fl. ros. alt. ill. t. 90. fl. alt. 1. p. 142.) spikes elongated, cylindrical, drooping; stamens much exserted; bracteas and calyxes hairy; leaves glabrous; leaflets cordate-oblong, petiolulate, coarsely serrated.  $\mathcal{U}$ . II. Native of Siberia, about fountains. Spikes yellowish.

*Alpine* Burnet. Fl. July, Sept. Pl. 3 to 4 feet.

8 *S. NEGLECTA* (G. Don, in Loud. hort. brit. p. 42.) spikes cylindrical; stamens much exserted; calyx glabrous; bracteas ciliated; leaflets glabrous, lanceolate, serrated.  $\mathcal{U}$ . H. Native of Siberia? Spikes of flowers white. Anthers dark.

*Neglected* Burnet. Fl. July, Sept. Clt. 1800. Pl. 3 to 4 ft.

9 *S. CANADÉNSIS* (Lin. spec. 169.) spikes long, cylindrical; stamens much exserted; bracteas and leaves glabrous; leaflets ovate-oblong, rather cordate at the base, coarsely serrated.  $\mathcal{U}$ . II. Native of North America from Canada to New York, in humid places.—Corn. can. p. 175. t. 174.—Barrel. icon. rar. 18. t. 739.—Morris. oxon. sect. 8. t. 18. f. 12. Spikes long, slender, white. There is besides this white kind, a long, red, spiked, American Burnet, having the spikes 3 or 4 inches long, while those of the present plant are not above 2 inches long. It is probably a species of which we know nothing.

*Canadian* Burnet. Fl. July, Sep. Clt. 1633. Pl. 2 to 3 ft.

*Cult.* All the species of *Sanguisorba* are of the easiest culture; they grow in any common soil, and are readily increased by dividing the plants at the root.

VIII. POTERIUM (from *poterium*, a cup; the *P. sanguisorba* is infused in drinks). Lin. gen. no. 1069. Lam. ill. t. 777. D. C. prod. 2. p. 594.—Pimpinella species, Tourn. Gærtn.—Pimpinella, Adans. fam. 2. p. 293.

LIN. SYST. *Monœcia, Polyándria* or *Polygámia, Monœcia*. Flowers monœcious or polygamous. Calyx furnished with 3 scales at the base, having the tube contracted at the apex, and the limb 4-parted. Petals wanting. Stamens 20-30. Ovaries 2, terminated each by a filiform style, crowned by a pencil-formed stigma. Akenia dry, 1-seeded, inclosed in the indurated calyx. Seed inverted.—Herbs or subshrubs, with impari-pinnate leaves and serrated leaflets. Flowers collected into dense globose or cylindrical spikes.

SECT. I. LEIOPOTERIUM (from *λειος*, *leios*, smooth, and *poterium*; in reference to the smooth fruit of the species contained in this section). D. C. prod. 2. p. 594. Fruit (tube of calyx) smooth, somewhat baccate. Spikes cylindrical. Stems shrubby.

1 *P. SPINOSUM* (Lin. spec. 1411.) shrubby; branches rather villous, ultimate ones terminating in spines; leaflets smoothish, serrated; spikes oblong.  $\mathcal{U}$ . G. Native of the islands of the Archipelago, about Constantinople, on Mount Lebanon, Natolia, &c.—Moris. oxon. sect. 8. t. 18. f. 5.—Sab. hort. 2. t. 73. Leaves small. Flowers greenish. Fruit baccate, nearly as in the rose.

*Var.  $\beta$ , crispum* (D. C. prod. 2. p. 594.) leaflets smaller, nearly entire, rather tomentose beneath, with revolute curled margins.  $\mathcal{U}$ . G. Native of sterile places.

*Var. γ, inérme* (D. C. l. c.) branches elongated, unarmed, beset with spreading hairs; leaflets flat, serrated, glabrous above and rather villous beneath. *h. H.* This variety is probably occasioned by culture.

*Spiny Burnet.* Fl. April, Aug. Clt. 1595. Sh. 2 to 3 ft.

2 *P. CAUDA'TUM* (Ait. hort. kew. 3. p. 354.) shrubby; branches unarmed; petioles, peduncles, and under surface of leaves villous; spikes elongated, cylindrical. *h. G.* Native of the Canary Islands. Sims, bot. mag. 2341. Coll. hort. rip. 112. t. 40. Flowers dioecious, sometimes 6-cleft and trigynous, greenish.

*Tailed Burnet.* Fl. Jan. April. Clt. 1779. Shrub 2 to 3 ft.

SECT. II. *RUTIDOPOTERIUM* (from *pute*, *rutis*, a wrinkle, and *poterium*; in reference to the wrinkled or warted fruit of the species contained in the section). D. C. prod. 2. p. 594. Fruit (tube of calyx) wrinkled or tuberculated. Spikes globose. Stems herbaceous or frutescent at the very base.

3 *P. ANCISTROIDES* (Desf. atl. 2. p. 346. t. 251.) suffruticose at the base; branches angular, decumbent; leaflets 4-5 pairs, ovate-roundish, villous on the nerves beneath. *h. F.* Native of the north of Africa, in the fissures of rocks near Tlemcen, and at the foot of Mount Lebanon. Fruit wrinkled.

*Ancistrum-like Burnet.* Shrub procumbent.

4 *P. SANGUISORBA* (Lin. spec. 1411.) herbaceous; stems and leaves glabrous; leaflets ovate-roundish; lower flowers of the head male, upper ones female. *γ. H.* Native of Europe, in high dry pastures on a calcareous soil; plentiful in the chalky counties of England. Smith, engl. bot. 869. Cam. epit. 777. Curt. lond. 2. t. 64. Mart. fl. rust. t. 69. Pimpinella Sanguisorba, Gaertn. fruct. 1. p. 162. t. 32. Pimpinella polystemon, Hall. helv. no. 706. Flowers greenish or purplish. Stipulas cut. Root fusiform. The *burnet* was originally brought into notice by Roëque, a commercial gardener at Walham Green, near London, who found means to procure the patronage of the Dublin and other societies to this plant, which being a novelty, attracted the attention, and called forth the eulogies of Arthur Young, and other leading agriculturists of the day. Miller, however, at the time observed, that whoever will give themselves the trouble to examine the grounds where it naturally grows, will find the plants left uneaten by the cattle when the grass about them has been cropped to the roots; besides, in wet winters and on strong land, the plants are of short duration, and therefore very unfit for the purpose of pasture or hay; nor is the produce sufficient to tempt any persons of skill to engage in its culture. Mr. Curtis says of *burnet*, that it is one of those plants which has for some years past been attempted to be introduced into agriculture, but not answering the farmer's expectation, is now in a great degree laid aside. Cattle are said not to be fond of it; nor is its produce sufficient to answer the expence attending its culture.

*Var. β, puberulum* (D. C. prod. 2. p. 594.) stems and leaves puberulous. *γ. H.* Native of the south of France.

*Common Burnet.* Fl. June, July. Britain. Pl. 1 to 2 feet.

5 *P. POLYGAMUM* (Waldst. et Kit. pl. rar. hung. 2. p. 198.) herbaceous; stems angular, and are, as well as the leaves, glabrous; leaflets ovate-oblong; lower flowers of the heads male, middle ones hermaphrodite, upper ones female. *γ. H.* Native of Hungary, in dry situations. Heads greenish or purplish.

*Polygamous Burnet.* Fl. July. Clt. 1803. Pl. 1 to 2 feet.

6 *P. AGRIMONIFOLIUM* (Cav. elench. hort. madr. 1803.) herbaceous; stems nearly terete, covered with glandular down; leaflets oblong, with smaller ones sometimes intermixed. *γ. H.* Native of Spain, in Granada.

*Var. β, hybridum* (Lin. spec. 1411.) leaflets oval or ovate.

*γ. H.* Native of the south of France.—Barrel. icon. 632. Pimpinella agrimonioides, Mor. oxon. sect. 8. t. 18. f. 9. Leaves like those of agrimony, sweet-scented.

*Agrimony-leaved Burnet.* Fl. July, Aug. Clt. 1822. Pl. 2 ft.

7 *P. VILLOSUM* (Sibth. et Smith, fl. græc. t. 942. ex prod. 2. p. 238.) herbaceous; stems angular from furrows, hairy; leaflets oblong, deeply toothed. *γ. H.* Native about Constantinople. Pimpinella orientalis villosissimus, Tourn. cor. 8.

*Villous Burnet.* Pl. 1 to 2 feet.

8 *P. VERRUCOSUM* (Link. in litt.) very like *P. sanguisorba*, and differs only in the warted fruit. *γ. H.* Native of? Flowers greenish.

*Warted-fruited Burnet.* Fl. July. Clt. 1828. Pl. 1 to 2 ft.

9 *P. AÑNUM* (Nutt. mss. in Hook. fl. bor. amer. p. 198.) herbaceous, annual, glabrous; stem erect, dichotomous; leaves with 4-5 pairs of ovate, deeply pectinately pinnate leaflets, having the segments very narrow-linear; heads oval, unisexual? *γ. H.* Native of North America, on the grand rapids of the Columbia river, and on the plains of the Multnomak, and of Louisiana on the Red river.

*Annual Burnet.* Pl. 1 to 2 feet.

*Cult.* The hardy herbaceous kinds of *burnet* will grow in any common soil, and are best increased by seeds, as most of them are little better than biennial plants. The shrubby species, or those belonging to the first section, thrive best in a light rich soil, and young cuttings root readily in the same kind of soil under a hand-glass.

IX. CLIFFORTIA (this name was given by Eichrodt in honour of George Cliffort, the first patron of Linnaeus, a merchant of Amsterdam; a catalogue of whose garden at Hartecamp was published by Linnaeus under the title of Hortus Cliffortianus, Amst. 1737. fol.) Lin. gen. no. 1133. Lam. ill. t. 827. D. C. prod. 2. p. 595.—Cliffortia and Morilandia, Neck. elem. no. 765 and 766. Nénax, Gaertn. fruct. 1. t. 132.

LIN. SYST. *Dicæia, Polyándria.* Flowers dioecious. Tube of calyx urceolate; limb 3-parted (f. 80. a.). Petals wanting. Stamens about 30 in the male flowers (f. 80. b.). Ovaries 2 in the female flowers. Styles 2. Stigmas elongated, feathery, bearded. Akenia 1-2, covered by the calyx, dry, indehiscent, 1-seeded. Seed erect. Cotyledons oblong, foliaceous.—Shrubs, all natives of the Cape of Good Hope. The leaves are truly trifoliate, but the form is variable. Stipulas (f. 80. d.) adhering to the petioles, which are exceedingly short. Flowers insignificant, axillary, almost sessile.

§ 1. *Multinerviæ* (*multus*, many, and *nervus*, a nerve; leaves with many nerves). D. C. prod. 2. p. 595. Leaflets solitary, many-nerved at the base. Stipulas simple, but the leaves, although said to be solitary, are probably composed of 3-joined leaflets, furnished with a stipula on each side (f. 80. d.).

1 *C. ILICIFOLIA* (Lin. spec. 1469.) leaves roundish-elliptic, stem-clasping, glabrous, stiff, somewhat 3-lobed, and spiny-toothed at the apex. *h. G.* Native of the Cape of Good Hope, as are also all the following.—Dill. hort. elth. t. 31. f. 35. Lin. hort. cliff. t. 30. Filaments white; anthers yellow. (f. 80.)

*Holly-leaved Cliffortia.* Fl. May, Sept. Clt. 1714. Shrub 2 to 3 ft.

FIG. 80.

2 *C. CORDIFOLIA* (Lam. dict. 2. p. 47.) leaves ovate, ending in a spine, half stem-clasping, glabrous, stiff, quite entire, or furnished with a spine-like tooth towards the apex. *h. G.* Burch. cat. afr. austr. no. 792.

*Heart-leaved Cliffortia.* Fl. June, July. Clt. 1820. Shrub 2 to 3 feet.

3 *C. TRIDENTATA* (Willd. spec. 4. p. 838.) leaves oblong-cuneiform, entire, and tridentate, nerved, pubescent beneath. *h. G.* *C. ruscifolia*, Thunb. prod. 93? Berg. cap. 354.

*Tridentate-leaved Cliffortia.* Fl. May, Sept. Shrub.

4 *C. RUSCIFOLIA* (Lin. spec. 1469.) leaves lanceolate, glabrous, nerved, ending in a spine, entire or furnished with a spine-like tooth on each side. *h. G.* Lin. hort. cliff. t. 31. *C. arachnoidea*, Lodd. bot. cab. t. 260.—Pluk. alm. 297. f. 2. There are varieties of this species with glabrous and pubescent branches.

*Butcher's-broom-leaved Cliffortia.* Fl. June, July. Clt. 1752. Shrub 2 to 3 feet.

5 *C. GRAMINEA* (Lin. fil. suppl. 429.) leaves linear, acuminate, 3-nerved, glabrous, quite entire or remotely setaceously serrated; stipulas large, 3-nerved, adnate to the broad petiole, and drawn out in 2 lobes. *h. G.* Sieb. pl. exsicc. cap. no. 86.

*Grass-leaved Cliffortia.* Shrub 2 feet.

§ 2. *Dichopterae* (from *δῆχα*, *dicha*, double, and *πτερον*, *pteron*, a wing; in reference to bifid stipulas). *D. C. prod. 2. p. 595.* *Leaflets 1-nerved, solitary at first sight. Stipulas bifid; or the leaves perhaps trifoliate, bistipulate, the lateral leaflets small and tooth-formed.*

6 *C. ODORATA* (Lin. fil. suppl. 431.) leaves ovate, obtuse, serrated, plicately veined, villous beneath. *h. G.* Willd. spec. 4. p. 857.

*Sweet-scented Cliffortia.* Shrub 2 to 3 feet.

7 *C. SERRATA* (Reichb. ex Spreng. syst. add. p. 209.) leaves spatulate-lanceolate, cuspidately serrated, glabrous; stipulas permanent, imbricated, ovate; branches flexuous, twiggy. *h. G.* *C. serrata*, Thunb. prod. 2. p. 93. is perhaps the same.

*Serrated-leaved Cliffortia.* Shrub 2 feet.

8 *C. SPICATA* (Reichb. ex Spreng. syst. add. p. 209.) stem simple, hairy; leaves lanceolate, subverticillate, erect; spikes dense, terminal, leafy. *h. G.*

*Spicate Cliffortia.* Shrub.

9 *C. FERRUGINEA* (Lin. fil. suppl. 429.) leaves lanceolate, tapering to the base, setaceously serrated, striated, glabrous. *h. G.* *C. herberifolia*, Lam. dict. 1. p. 48. Stipulas setaceous, bifid, ferruginous ex Willd. but villous ex Lam.

*Rusty Cliffortia.* Shrub prostrate.

10 *C. FILICULIS* (Schlecht. et Cham. in Linnæa. 2. p. 33.) trailing; leaves cuneate-obovate, tridentate, with villously ciliated edges, veinless above; flowers monœcious. *h. G.* Stems rooting.

*Thread-stemmed Cliffortia.* Shrub creeping.

11 *C. CUNEATA* (Ait. hort. kew. 3. p. 413.) leaves cuneiform, truncate, 3-5-toothed at the apex, striately veined, glabrous on both surfaces. *h. G.*

*Cuneate-leaved Cliffortia.* Fl. April, May. Clt. 1787. Sh. 2 to 3 feet.

§ 3. *Tenuifoliae* (from *tenuis*, thin, and *folium*, a leaf; leaves all fine and filiform). *D. C. prod. 2. p. 596.* *Leaflets 3, subulate, linear or oblong, lateral ones sometimes the shortest, but much like the middle ones, cauline ones usually all abortive, the young or new ones disposed in fascicles in the axils of the stipulas.*

12 *C. STROBILIFERA* (Lin. syst. 749.) leaflets linear, acute,

glabrous, with scabrous margins, in fascicles in the axils of the stipulas. *h. G.* Pluk. alm. t. 275. f. 2. Stipulas connate in one, bifid. Sometimes there are strobile-formed galls on the branches, whence the specific name.

*Strobile-bearing Cliffortia.* Fl. May, June. Clt. 1818. Sh. 2 to 3 feet.

13 *C. ERICÆFOLIA* (Lin. fil. suppl. 430.) leaflets terete, sulcate, glabrous, in fascicles. *h. G.*

*Heath-leaved Cliffortia.* Shrub 2 to 3 feet.

14 *C. SERPYLLIFOLIA* (Schlecht. et Cham. in Linnæa. 2. p. 34.) leaves cuneate-spatulate, awnless, quite glabrous; flowers monœcious. *h. G.*

*Wild-thyme-leaved Cliffortia.* Shrub 1½ foot.

15 *C. TERETIFOLIA* (Thunb. prod. p. 93.) leaflets terete, subulate, incurved, glabrous, in fascicles. *h. G.*

*Terete-leaved Cliffortia.* Shrub 1 to 2 feet.

16 *C. FILIFOLIA* (Lin. fil. suppl. 430.) leaflets filiform, trigonal, glabrous, in fascicles. *h. G.* *Nenax aceròsa*, Gaertn. fruct. 1. p. 165. t. 32. f. 7.

*Thread-leaved Cliffortia.* Shrub 1 to 2 feet.

17 *C. JUNIPERINA* (Lin. fil. suppl. 430.) leaflets subulate, glabrous, mucronate, in fascicles. *h. G.* A much branched shrub. Flowers axillary, sessile. The three leaflets are equal among themselves.

*Juniper-like Cliffortia.* Shrub 3 feet.

18 *S. SARMENTOSA* (Lin. mant. 299.) leaflets linear, villous, in fascicles; branches clothed with velvety pubescence. *h. G.*

*Sarmentose Cliffortia.* Clt. 1793. Shrub straggling.

19 *C. FALCATA* (Lin. fil. suppl. 431.) leaflets linear, mucronate, nearly falcate, in fascicles, and are, as well as the branches, glabrous. *h. G.* This species is usually confounded with the last, but differs from it in being glabrous.

*Falcate-leaved Cliffortia.* Fl. June, July. Clt. 1818. Shrub 1 to 2 feet.

§ 4. *Latifoliae* (from *latus*, broad, and *folium*, a leaf; leaflets broad). *D. C. prod. 2. p. 596.* *Leaflets 3, oval or obcordate, usually dissimilar in shape, lateral leaflets stipule-formed. Stipulas small.*

20 *C. TERNA'TA* (Lin. fil. suppl. 430.) leaflets oval-oblong, acute, all nearly equal in size and shape, and are, as well as the branchlets, pilose. *h. G.* *C. polygonifolia*, Lin. spec. 1470. hort. cliff. 501. t. 32. Young leaves in fascicles.

*Ternate-leaved Cliffortia.* Fl. June, July. Clt. 1818. Shrub 2 to 3 feet.

21 *C. TRIFOLIATA* (Lin. spec. 1470.) leaflets in fascicles, veiny, pilose, lateral ones lanceolate, quite entire, middle one obovate, tridentate. *h. G.* Pluk. alm. t. 319. f. 4.

*Trifoliate Cliffortia.* Fl. April, July. Clt. 1752. Shrub proc.

22 *C. OBCORDATA* (Lin. fil. suppl. 429.) leaflets veinless, glabrous, lateral ones roundish-elliptic, middle one obcordate; branches pubescent. *h. G.* Willd. spec. 2. p. 842.

*Obcordate-leaftletted Cliffortia.* Fl. June, Aug. Clt. 1790. Shrub 2 to 3 feet.

23 *C. OBLIQUA* (Spreng. neue. entd. 2. p. 174.) leaflets veiny, quite glabrous, crenulated, lateral ones roundish, obliquely cordate, middle one obcordate; branches glabrous. *h. G.*

*Oblique-leaved Cliffortia.* Fl. June, July. Clt. 1816. Sh. 2 to 3 feet.

24 *C. DENTATA* (Willd. spec. 4. p. 842.) leaflets obovate, glabrous, veiny, a little toothed at the apex, middle one tridentate; branches pubescent. *h. G.* Allied to *C. obcordata*.

*Toothed-leaved Cliffortia.* Fl. June, July. Shrub 2 to 3 ft.

§ 5. *Bifoliolae* (*bis*, two, *foliola*, leaflets; leaves composed of

two opposite leaflets without any middle one). *D. C. prod.* 2. p. 596. *Stipulas small. Leaves of 2 opposite leaflets from the middle one being abortive, lateral ones large. Petiole wanting.*

25 *C. CRENA'TA* (Lin. fil. suppl. 430.) leaflets 2-3, orbicular, adpressed, denticulated, 7-nerved, glabrous. *h. G.* Perhaps belonging to the preceding section.

*Crenate-leaved Cliffortia.* Fl. July, Aug. Clt: 1791. Sh. 2 to 3 feet.

26 *C. PULCHE'LLA* (Lin. fil. suppl. 430.) leaflets 2, orbicular, adpressed, many-nerved, entire, with somewhat erose margins. *h. G.* Willd. spec. 4. p. 839.

*Neat Cliffortia.* Fl. April, May. Clt. 1795. Shrub 1½ ft.

27 *C. CINE'REA* (Thunb. prod. p. 93.) leaflets connate, ovate, trigonal, hoary-tomentose. *h. G.* Perhaps belonging to a different section.

*Grey Cliffortia.* Fl. June, July. Clt. 1800. Pl. 2 feet.

*Cult.* The species of *Cliffortia* are plants of singular habit, and only deserve to be cultivated on that account. They thrive well in an equal mixture of loam and peat. Cuttings of young wood root freely in sand, under a bell-glass.

ORDER LXXXV. POMACEÆ (this order contains trees agreeing in important characters with the *apple* and *pear*). Juss. gen. p. 334. Rich. anal. fr. p. 33. Lindl. Lin. trans. 13. p. 93. introd. nat. ord. p. 83.—Rosaceæ, Tribe VIII. Pomaceæ, *D. C. prod.* 2. p. 626.

Calyx superior, 5-toothed (f. 83. a. f. 81. a.), the odd segment posterior. Petals 5 (f. 83. b. f. 84. f.), unguiculate, inserted in the throat of the calyx, the odd one anterior. Stamens indefinite, inserted in a ring in the throat of the calyx (f. 83. e. f. 84. b.). Ovaries from 1-5 (f. 82. e. f. 83. c.), adhering more or less to the sides of the calyx (f. 83. c.) and to each other. Ovula usually 2, collateral, ascending, very rarely solitary. Styles from 1-5 (f. 82. d.), having simple stigmas. Fruit a pome, 1-5-celled (f. 81. a. f. 82. d. f. 84. g.), seldom spuriously 10-celled, with the endocarp either cartilaginous, spongy, or bony. Seeds ascending, solitary. Albumen none. Embryo erect, with flat cotyledons or convolute ones as in *Chamæmêlis*, and a short, conical radicle. This order is composed of trees or shrubs, with alternate, stipulate, simple, or compound leaves, and terminal cymes of white or pink flowers. *Pomaceæ* is closely allied to *Rosaceæ*, from which it differs in the adhesion of the ovary to the sides of the calyx, and more or less with each other. Their fruit is always a pome, that is, it is made up of a fleshy calyx, adhering to fleshy or bony ovaria, containing a definite number of seeds. *Pomaceæ* is peculiarly distinguished by their ovula being in pairs and side by side, while *Rosaceæ*, when they have 2 or more ascending ovula, always have them placed one above another. Cultivated plants of this order are apt to produce monstrous flowers, which sometimes depart in a remarkable degree from their normal group. Prussic acid exists in *Cotonæster microphylla*, a plant of this order. The fruit as an article of food, and the flowers for their beauty, are the chief peculiarities of this order. The *apple*, the *pear*, the *medlar*, the *quince*, the *service*, the *rowan-tree*, the *mountain-ash*, are all well known, either for their beauty or their use. The wood of the *pear-tree* is almost as hard as box, for which it is

even substituted by wood engravers. The timber of the *bean-tree* (*Pyrus Aria*) is invaluable for axle-trees. The bark of *Photinia dubia* is used for dyeing scarlet in Nipaul. Malic acid is contained in considerable quantities in *apples*; it is also almost the sole acidifying principle of the berries of the *mountain-ash*, the *rowan* or *rhodon-tree* (*Pyrus Aucuparia*).

#### Synopsis of the genera.

1 CRATÆGUS. Calyx urceolate, 5-cleft. Petals orbicular. Ovary 2-5-celled. Styles 2-5, glabrous. Pome fleshy, ovate, containing a bony putamen.

2 RAPHIOLEPIS. Limb of calyx funnel-shaped, deciduous. Ovary 2-celled, 2-styled. Pome with a thickened closed disk and a chartaceous putamen, containing 2 gibbous seeds.

3 CHAMÆMELIS. Calyx truncate, with 5 little teeth. Petals small, erose. Stamens 10-15. Ovary 1-celled. Style 1. Ovula 2, erect.

4 PHOTINIA. Calyx 5-toothed. Petals reflexed. Ovary villous, 2-celled. Styles 2, glabrous. Pericarp 2-celled, inclosed in the fleshy calyx.

5 ERIOBOTRYA. Calyx woolly, 5-toothed. Petals bearded. Styles 5, pilose, inclosed. Pome closed, 3-5-celled (f. 81. a.).

6 COTONÆSTER. Flowers polygamous. Calyx turbinate, bluntly 5-toothed. Petals short. Stamens length of the calyx-teeth. Styles glabrous, shorter than the stamens. Carpels 2-3, parietal, biovulate, inclosed in the calyx.

7 AMELANCHIER. Calyx 5-cleft (f. 82. c.). Petals lanceolate (f. 82. a.). Stamens rather shorter than the calyx. Ovary of 10 cells or of 5 bipartite ones (f. 82. c.), with a solitary ovulum in each partition. Styles 5 (f. 82. d.), joined at the base. Mature pome 3-5-celled (f. 82. d.). Seeds 3-5; endocarp cartilaginous.

8 ME'SPILUS. Calyx 5-cleft (f. 83. a.); the segments foliaceous. Petals nearly orbicular (f. 83. b.). Disk large, filled with honey. Styles 2-5, glabrous. Pome turbinate, open at the apex, 5-celled; endocarp bony.

9 OSTEOMELIS. Calyx 5-cleft. Petals oblong. Styles exserted, length of stamens, bearded below. Ovary 5-celled; cells 1-seeded. Pome closed, woolly; endocarp bony.

10 PYRUS. Calyx urceolate, 5-lobed. Petals roundish. Styles usually 5, rarely 2-3. Pome closed, 5-celled; cells cartilaginous. Seeds 2 in each cell.

11 CYDONIA. Calyx 5-cleft (f. 84. a.). Petals orbicular (f. 84. f.). Styles 5. Pome closed, 5-celled (f. 84. g.). Cells cartilaginous, many-seeded. Seeds covered with pulp.

+ Genera doubtful whether they belong to the present order.

12 DICALYX. Flowers superior, 2-3-bracteate. Calyx 5-cleft. Corolla 4-parted. Stamens inserted in the base of the corolla. Styles 2. Drupe baccate, containing a 1-3-celled putamen.

13 PYRENARIA. Calyx inferior, 5-sepaled. Stamens numerous, free, hypogynous and somewhat adnate to the base of the

petals. Styles 5. Pome globose, 5-celled; cells covered with papery membranes, containing 2 bony, 1-seeded nuts each.

I. CRATÆGUS (from *κρατος*, *cratos*, strength; in reference to the hardness and strength of the wood). Lindl. in Lin. trans. 13. p. 105. D. C. prod. 2. p. 626.—Cratægus and Mespilus species of other authors.

LIN. SYST. *Icosándria*, *Di-Pentagýnia*. Calyx with an urceolate tube and a 5-cleft limb. Petals orbicular, spreading. Ovary 2-5-celled. Styles 2-5, glabrous. Pome fleshy, ovate, closed by the calycine teeth or the thickened disk, containing a bony putamen.—Thorny shrubs or trees, with angular or toothed leaves and terminal corymbs of usually white flowers. Bractæas subulate, deciduous.

§ 1. *Leaves toothed or nearly entire, never angularly lobed.*

1 C. PYRACANTHA (Pers. ench. 2. p. 37.) leaves glabrous, evergreen, ovate-lanceolate; lobes of calyx blunt; styles 5. *h. H.* Native of the south of Europe, in uncultivated places and in hedges. *Méspilus pyracantha*, Lin. spec. 685. Pall. fl. ross. 1. p. 29. t. 13. f. 2.—Duham. arb. 2. t. 20. no. 2.—Lob. icon. 2. p. 182. f. 1. Flowers white. Fruit about the size of a pea, disposed in cymes, of a beautiful scarlet colour, remaining on the tree nearly all the winter, whence it is called *Buisson ardent* by the French, as also its Greek name *Pyracantha*, which signifies *fire-thorn*. The shrub being evergreen is well adapted for planting against walls or houses, where the green leaves and red fruit have a fine appearance all the winter.

*Pyracantha* or Evergreen Thorn. Fl. May. Clt. 1629. Sh. 10 to 20 feet.

2 C. CRENULATA (Roxb. mss. Lindl. in Lin. trans. 13. p. 106.) leaves ovate-oblong, crenulated, glabrous, shining, retuse at the apex and mucronulate; peduncles lateral, aggregate, elongated, 1 or many-flowered; styles 5. *h. H.* Native of Nipaul. *Méspilus crenulata*, D. Don, prod. p. 238. Allied to *C. pyracantha*. Styles glabrous. Fruit 5-celled, 5-seeded. Leaves probably permanent.

*Crenulated* Evergreen Thorn. Fl. May, Ju. Clt. 1822. Tr.

3 C. CRUS-GALLI (Lin. spec. 632.) leaves obovate-cuneiform, nearly sessile, shining, glabrous, falling off late in the autumn; lobes of calyx lanceolate, subserrated; styles 2. *h. H.* Native of North America. Wats. dend. brit. t. 56. *Méspilus crús-gállí*, Poir. dict. 4. p. 441. Hort. angl. t. 13. Mill. fig. 178. f. 2. *C. lucida*, Wangh. amer. t. 17. f. 42. *Méspilus lucida*, Ehrh. Flowers white tinged with red; anthers red. Fruit scarlet, eatable. Stipulas linear. Spines very long.

*Var. a, splendens* (D. C. prod. 2. p. 626.) leaves obovate-cuneiform. Ait. hort. kew. 2. p. 170.—Pluk. alm. t. 46. f. 1.

*Var. β, pyracanthifolia*; leaves oblong-lanceolate, somewhat cuneiform. Ait. l. c. *Méspilus lucida*, Dum. Cours. bot. cult. ed. 2. vol. 5. p. 448.

*Var. γ, salicifolia* (D. C. prod. l. c.) leaves oblong-lanceolate, rather cuneiform. Ait. l. c.

*Var. δ, linearis* (D. C. prod. 2. p. 626.) leaves linear-lanceolate; spines few, shortish. *h. H.* *Méspilus linearis*, Desf. arbr. 2. p. 156. Poir. suppl. 4. p. 70. Styles 1-2. Fruit yellow?

*Var. ε, nana* (D. C. prod. 2. p. 626.) leaves oval-lanceolate, paler beneath. *h. H.* *Méspilus nana*, Dum. Cours. suppl. p. 386. Branches rather tomentose. Perhaps this is a proper species.

*Cockspur* Thorn. Fl. May, Ju. Clt. 1691. Tr. 10 to 30 ft.

4 C. SUBSPINOSA (D. C. prod. 2. p. 626.) leaves oval, ovate, or obovate, crenate-toothed, glabrous, coriaceous, on short petioles; racemes ovate, terminal; calyx glabrous, with the lobes acute. *h. H.* Native of Chili. *Méspilus subspínosa*, herb.

Vent. Branches unarmed, obviously so in the specimen examined. Fruit one half the size of a pea, nearly dry.

*Subspinose* Hawthorn. Tree.

5 C. PUNCTATA (Ait. hort. kew. 2. p. 169.) leaves obovate-cuneiform, glabrous, serrated; calyxes rather villous, with the lobes subulate and entire. *h. H.* Native of North America. Jacq. hort. vind. 1. and 28. Wats. dend. brit. t. 57. *Méspilus cuneifolia*, Ehgh. beit. 3. t. 21. Flowers white. There are varieties of this species with either yellow or red fruit, which are usually dotted. The Indians of the west coast of America make wedges of the wood for splitting trees.

*Dotted-fruited* Hawthorn. Fl. May, June. Clt. 1746. Tr. 15 to 20 feet.

6 C. ELLIPTICA (Ait. hort. kew. 2. p. 168.) leaves elliptic, unequally serrated, glabrous; petioles and calyxes glandular; pome globose, 5-seeded. *h. H.* Native of North America. Flowers white. Fruit red.

*Elliptic* leaved Hawthorn. Fl. May, June. Clt. 1765. Tr. 15 to 20 feet.

7 C. PRUNIFOLIA (Bosc. ined. D. C. prod. 2. p. 627.) leaves broad-ovate, unequally serrated, glabrous; petioles rather glandular; lobes of calyx glandularly serrated; peduncles and calyxes rather villous. *h. H.* Native of North America. *Méspilus prunifolia*, Poir. dict. 4. p. 443. Flowers white. Fruit 2-seeded.

*Plum-leaved* Hawthorn. Fl. May, June. Clt. 1818. Tree 15 to 20 feet.

8 C. PRUNELLIFOLIA (Bosc. ined. ex D. C. prod. 2. p. 627.) leaves oval-elliptic, attenuated at both ends, serrated, glabrous; branches rather villous. *h. H.* Native country as well as flowers unknown. Habit referrible to *Prunus spinosa*.

*Prunella-leaved* Hawthorn. Fl. May, June. Tree.

9 C. LATIFOLIA (Pers. ench. 2. p. 37.) leaves obovate, unequally serrated, rather plicate, and rather villous on the nerves beneath; stipulas and lobes of calyx linear and slightly toothed; corymbs villous. *h. H.* Native of North America. Fruit oval, red.

*Broad-leaved* Hawthorn. Fl. May, Ju. Clt. 1820. Tr. 20 ft.

10 C. PARVIFOLIA (Ait. hort. kew. 2. p. 169.) leaves obovate-cuneiform, deeply serrated, pubescent; flowers usually solitary; branches and calyxes villous; stipulas setaceous; lobes of calyx serrated; fruit rather turbinate, 5-seeded. *h. H.* Native of North America. Wats. dend. brit. 65. *Méspilus axillaris*, Pers. l. c. *Méspilus tomentosa*, Poir. l. c. *Méspilus xanthocarpus*, Lin. fil. suppl. 254. *C. tomentosa*, Lin. spec. 682. Trew. chrh. t. 17. Flowers small, white. Fruit yellow.

*Small-leaved* or Gooseberry-leaved Hawthorn. Fl. May, June. Clt. 1704. Shrub 6 feet.

11 C. OVALIFOLIA (Horn. hort. hafn. suppl. p. 52.) leaves oval, serrated, rather pilose on both surfaces, shining above; stipulas half cordate, deeply serrated, glandular. *h. H.* Native of North America. Allied to *C. crús-gállí*, according to the author.

*Oval-leaved* Hawthorn. Fl. May, June. Clt. 1810. Tree 10 to 20 feet.

12 C. GLAUCA (Wall. cat. 673.) leaves elliptic, tapering to both ends, acute, serrulated at the apex, downy and glaucous beneath, but glabrous above; corymbs terminal, many-flowered; calyx woolly. *h. H.* Native of Nipaul and Kamaon. Flowers white.

*Glaucous* Hawthorn. Tree 20 feet.

13 C. FLEXUOSA (Poir. suppl. 4. p. 73.) leaves obovate, sharply toothed, pubescent on both surfaces; corymbs small, tomentose; branches flexuous. *h. H.* Native of Carolina. Fruit of a reddish yellow colour. Spines very long, blackish.

*Flexuous* Hawthorn. Shrub 6 to 10 feet.

14 *C. LUTEA* (Poir. suppl. 4. p. 72.) leaves ovate, pubescent, acute at both ends, glandularly serrated; corymbs tomentose.  $\frac{1}{2}$ . H. Native country unknown. Spines long and strong. Fruit yellow.

*Yellow-fruited Hawthorn.* Shrub 6 to 10 feet.

+ *Species belonging to the above division but are not sufficiently known.*

15 *C. ALPINA* (Mill. dict. no. 3.) leaves oblong-ovate, serrated, green on both surfaces, on short petioles.  $\frac{1}{2}$ . H. Native on Mount Baldo and other Italian mountains. Fruit of an obscure brown colour.

*Alpine Hawthorn.* Fl. May, June. Clt.? Tr. 20 to 30 ft.

16 *C. LUCIDA* (Mill. dict. no. 6.) leaves lanceolate, serrated, shining, paler beneath; spines very long.  $\frac{1}{2}$ . H. Native of North America. Flowers corymbose, of a pale red.

*Shining-leaved Hawthorn.* Fl. May, Ju. Clt.? Sh. 8 to 10 ft.

17 *C. PAUCIFLORA* (Pers. ench. 2. p. 37.) leaves ovate-lanceolate, crenated, pubescent; flowers solitary.  $\frac{1}{2}$ . H. Native of Switzerland, about Lausanne. *Mespilus pauciflora*, Poir. dict. 4. p. 441.

*Few-flowered Hawthorn.* Tree.

18 *C. UNILATERALIS* (Pers. ench. 2. p. 37.) leaves cuneated, or oblong-lanceolate, obtuse, crenated; corymbs unilateral.  $\frac{1}{2}$ . H. Native of Carolina. (ex herb. Lamb.)

*Unilateral-flowered Hawthorn.* Tree.

19 *C. MAURA* (Lin. fil. suppl. 253.) leaves oblong, toothed at the apex; corymbs branched; stipulas wanting.  $\frac{1}{2}$ . H. Native of Mauritania. Spines none. Stature and appearance of the common *hawthorn*; also the flowers are like it.

*Var.  $\beta$ , diversifolia* (Pers. ench. 2. p. 37.) leaves lanceolate, obtuse, quite entire and cuneately trifid, serrated, glabrous, on long petioles; corymbs lateral.  $\frac{1}{2}$ . H. Native of the north of Africa.

*Moors' Hawthorn.* Tree 10 to 14 feet.

## § 2. Leaves variously lobed or cut.

20 *C. APIIFOLIA* (Mich. fl. bor. amer. 1. p. 287. but not of Med.) leaves deltoid, deeply lobed; lobes acute, deeply toothed; pedicels of corymb usually simple, and are as well as the oblong tube of the calyx villous; calycine lobes rather serrated.  $\frac{1}{2}$ . H. Native of Virginia and Carolina, in humid woods. *C. oxycantha*, Walt. car. p. 147. ex Willd. Flowers white. Fruit scarlet. This shrub is admirably adapted for hedges, and is used for that purpose in some parts of North America.

*Parsley-leaved Hawthorn.* Fl. May, June. Clt. 1812. Sh. 8 to 10 feet.

21 *C. PYRIFOLIA* (Ait. hort. kew. 2. p. 168.) leaves ovate-elliptic, deeply serrated, rather plicate and somewhat hairy; calyxes rather villous, with the lobes linear-lanceolate, and serrated; flowers trigynous.  $\frac{1}{2}$ . H. Native of North America, from Pennsylvania to Carolina, in woods and among rocks. Wats. dend. brit. 61. *C. leucophæos*, Moench. Weis. p. 31. t. 2. ex Willd. *C. edulis*, Hort. The tree is either thorny or unarmed.

*Pear-leaved Hawthorn.* Fl. June. Clt. 1765. Sh. 6 to 10 ft.

22 *C. GLANDULOSA* (Willd. spec. 2. p. 1002. but not of Michx.) leaves obovate-cuneiform, angular, glabrous, shining; petioles, stipulas, and calyxes glandular; fruit oval, 5-seeded.  $\frac{1}{2}$ . H. Native of North America. Lodd. bot. cab. 1012. Wats. dend. 58. *Mespilus rotundifolia*, Ehrh. Beitr. 3. p. 20. Fruit scarlet. Flowers white.

*Glandular Hawthorn.* Fl. May, Ju. Clt. 1750. Tr. 12 to 20 ft.

23 *C. SPATULATA* (Michx. fl. bor. amer. 1. p. 288.) leaves small, in fascicles, narrowed a long way at the base, somewhat spatulate and trifid; corymbs few-flowered; pedicels short; calyxes tomentose.  $\frac{1}{2}$ . H. Native of Virginia and Carolina, in woods. Lodd. bot. cab. 1261. Spines strong.

*Spatulate-leaved Hawthorn.* Fl. May, June. Clt. 1806. Tree 8 to 12 feet.

24 *C. TURBINATA* (Pursh, fl. amer. sept. suppl. 735.) unarmed, glabrous; leaves obovate-cuneated, deeply serrated; corymbs few-flowered; pedicels short; fruit turbinate.  $\frac{1}{2}$ . H. Native of Carolina and Virginia. Said by the author to be allied to *C. spatulata*, but is omitted by Nuttall.

*Turbinate-fruited Hawthorn.* Fl. May, Ju. Tree.

25 *C. COCCINEA* (Lin. spec. 682.) leaves ovate, cordate, deeply angled, glabrous, acutely serrated; petioles and calyxes pubescent and glandular; petals orbicular; flowers pentagynous.  $\frac{1}{2}$ . H. Native of North America, from Canada to Carolina, in hedges and woods. Wats. dend. brit. t. 62.—Pluk. alm. t. 46. f. 4. Hort. ang. t. 13. f. 1.? Flowers white. Fruit pear-shaped, red, and eatable.

*Scarlet-fruited Hawthorn.* Fl. May, June. Clt. 1683. Tr. 20 to 30 feet.

26 *C. CORDATA* (Mill. fig. t. 179.) leaves ovate, cordate, deeply angled, glabrous; petioles and calyxes glandless; flowers pentagynous.  $\frac{1}{2}$ . H. Native of North America, from Canada to Virginia, in hedges and among rocks. Wats. dend. brit. t. 63. Lindl. bot. reg. 1151. *C. populifolia*, Walt. car. 147. *Mespilus acerifolia*, Poir. dict. 4. p. 412. *Mespilus phanopyrum*, Lin. fil. suppl. 254. Flowers white. Fruit round, red, containing 2 seeds.

*Cordate-leaved Hawthorn.* Fl. May, June. Clt. 1738. Sh. 6 to 10 feet.

27 *C. SANGUINEA* (Pall. fl. ross. 1. p. 25. t. 11.) spinose; leaves obovate, cuneated at the base, somewhat 7-lobed, opaque and pubescent on both surfaces; stipulas serrated; petioles and calyxes glandless; fruit 2-4-seeded.  $\frac{1}{2}$ . H. Native of Siberia, about the edges of rivulets. *C. oxycantha*, Pall. itin. 2. p. 199. *Cratægus*, Gmel. fl. sib. 3. p. 176. no. 12. exclusive of the synonyms. Flowers rather large, white. Fruit globose, scarlet, or yellow, for the most part 4-seeded.

*Bloody-fruited Hawthorn.* Fl. May, June. Tr. 12 to 20 ft.

28 *C. ALTA* (Bosc. ined. ex D. C. prod. 2. p. 628.) leaves pubescent beneath; petioles, unequally serrated or lobed, rather in loose corymbs.  $\frac{1}{2}$ . H. Native country unknown. *Mespilus lobata*, Poir. suppl. 4. p. 71. Flowers white.

*Lobed-leaved Hawthorn.* Fl. May, Ju. Clt.? Tr. 10 to 20 ft.

29 *C. PURPUREA* (Bosc. ined. ex D. C. prod. 2. p. 628.) leaves broadly lobed, ovate, cuneated at the base, serrated, glabrous or pubescent beneath; stipulas rather circinnate; serratures glandular.  $\frac{1}{2}$ . H. Native country unknown. Wats. dend. brit. 60. Branches dark purple. Flowers white.

*Purple-branched Hawthorn.* Fl. May, June. Clt. 1822. Tree 20 to 30 feet.

30 *C. FLORENTINA* (Zucc. obs. 1. no. 72.) leaves ovate-oblong, cordate at the base, deeply serrated, tomentose beneath as well as on the calyxes; fruit ovate-globose, 5-seeded, smooth; lobes of calyx deciduous.  $\frac{1}{2}$ . H. Native about Florence. *Mespilus Florentina*, Bert. amæn. 29. *Pyrus cratægifolia*, Sav. alb. tosc. 1. p. 169. Flowers white.

*Florentine Hawthorn.* Fl. May, Ju. Clt. 1800. Tr. 20 to 30 ft.

31 *C. NIGRA* (Waldst. et Kit. pl. rar. hung. 1. t. 61.) leaves lobately sinuated, serrated, truncate and somewhat cuneated at the base, clothed with hoary villi beneath; stipulas oblong, deeply serrated; calyxes villous, with the segments a little toothed.  $\frac{1}{2}$ . H. Native of Hungary. Wats. dend. 64. *Mespilus nigra*, Willd. enum. 524. Flowers white, pentagynous. Fruit black.

*Black-fruited Hawthorn.* Fl. My. Ju. Clt. 1819. Tr. 10 to 20 ft.

32 *C. PENTAGYNA* (Waldst. et Kit. in Willd. spec. 2. p. 1006.) leaves ovate, usually trifid, serrated, villous in the axils of the

veins beneath; peduncles and calyxes pubescent; lobes of calyx rounded. *h. H.* Native of Hungary. Flowers white, pentagynous. Allied to *C. oxyacantha*.

*Pentagynous Hawthorn.* Fl. May, June. Clt. 1820. Tree 10 to 20 feet.

33 *C. FLA'VA* (Ait. hort. kew. 2. p. 169.) leaves obovate-cuneiform, somewhat lobate, crenate-serrated; petioles short; stipulas cordate, and are as well as the calyxes glandular; flowers usually solitary; berries turbinate, 4-seeded. *h. H.* Native from Virginia to Carolina and the island of Orleans, in the St. Lawrence. Wats. dend. brit. t. 59. *C. glandulosa*, Mich. fl. bor. amer. 1. p. 288. *C. Caroliniana*, Poir. dict. 4. p. 442. *Mespilus Michauxii*, Pers. ench. 2. p. 38. Petioles winged from the decurrent base of the leaves. Fruit yellow, edible.

*Yellow-fruited Hawthorn.* Fl. May, June. Clt. 1724. Tr. 12 to 20 feet.

34 *C. FISSA* (Bosc. ined. ex D. C. prod. 2. p. 628.) leaves broadly ovate, deeply lobed, serrated, glabrous on both surfaces, decurrent down the petioles, which are glandless. *h. H.* Native country unknown. *Mespilus fissa*, Poir. suppl. 4. p. 72.

*Cleft-leaved Hawthorn.* Fl. May, June. Clt. 1810. Tree 12 to 20 feet.

35 *C. MOROCCA'NA* (Pers. ench. 2. p. 37.) leaves cuneate, 3-lobed and pinnatifid, glabrous and glandless; stipulas subpalmately cut; corymbs terminal, glabrous; pedicels elongated; lobes of calyx blunt; flowers digynous. *h. H.* Native of Mauritania. Perhaps distinct from *C. Maïra*.

*Morocco Hawthorn.* Fl. May, Ju. Clt. 1822. Tr. 15 to 20 ft.

36 *C. OXYCA'NTHA* (Lin. spec. 683.) leaves obovate-cuneiform, trifid or pinnatifid, glabrous and shining; flowers corymbose, monogynous, digynous and trigynous; calyxes glandless, acute. *h. H.* Native of Europe, in thickets, hedges, copses, and in high open fields; plentiful in Britain. Fl. dan. 634. Jacq. austr. t. 292. f. 2. *Mespilus oxyacantha*, Gaertn. fruct. 2. p. 24. t. 87. *Sorbus aculeata*, Cord. hist. 176. Flowers white, occasionally pink, sweet-scented. Fruit mealy, insipid, dark red, occasionally yellow; its cells as many as the styles. The *May* or *Common Hawthorn* is a very variable plant.

*Var. a, obtusata* (D. C. prod. 2. p. 628.) leaves somewhat obovate, 3-lobed, serrated, the same colour on both surfaces; flowers with 1, 2, or 3 styles. *Mespilus oxyacantha integrifolia*, Wallr. sched. 219. *C. oxyacanthoides*, Thuill. fl. par. 245. Lindl. bot. reg. 1128. D. C. fl. fr. 4. p. 433. *C. oxyacantha*, Oed. fl. dan. 634.

*Var. β, vulgaris* (D. C. l. c.) leaves ovate, cuneate at the base, deeply trifid or pinnatifid, the same colour on both surfaces; lobes acute, diverging, a little serrated; flowers with 1-2-3 styles. *Mespilus oxyacantha* of most authors.

*Var. γ, laciniata* (Wallr. sched. 219.). *C. oxyacantha*, D. C. fl. fr. 4. p. 433. *C. monogyna* of most authors, Blackw. herb. 149. Bull. herb. t. 333. f. B. E. F. *C. elegans*, Poir. *C. rosca*, Hort. *Mespilus intermedia*, Poir. *C. laciniata*, Besser.

*Var. δ, monostyla* (D. C. prod. 2. p. 628.) leaves obovate-cuneiform, trifid or jagged, discoloured beneath, at length coriaceous; flowers constantly monogynous; stigma peltate. *Mespilus monogyna*, Wallr. sched. 221. *C. monogyna*, Jacq. aust. t. 229. f. 1. *Mespilus apiifolia*, Med. gesch. 82. *C. Mespilus oxyacantha*, Smith, engl. bot. 2504.—Fl. dan. 1162. *var. a, flore pleno*. Flowers double white.

The *hawthorn* is also called *white thorn* and *may*; in France *Aubepine*; in Germany, *hagedorn*; in Italy *branco spino*. It is a native shrub of great importance, and is also introduced into narrow plantations as an undergrowth. It will not grow, however, under the drip of trees, and therefore, in a profitable point of view, is only to be considered

as affording impenetrable, close, durable, and easily raised fences, called quickset hedges, and it bears clipping to any extent. The timber of such plants as grow singly and attain a tolerable size, is valued by the millwright and turner, and the roots by the cabinet maker. It is often spoiled, Sang observes, through inattention after cutting; if it be allowed to lie in entire logs or trunks, it soon heats and becomes quite brittle and worthless; it therefore ought to be cut up instantly into planks and laid to dry. The *thorn* will not thrive in a wet soil, nor one very hard and poor, much elevated or much shaded; a free deep loam in an airy situation suits it best. The seeds or haws of the *thorn* do not vegetate until the second year after sowing, unless they have been laid up in a heap mixed with earth immediately after gathering, and turned several times, and sown in a bed the next spring; under such treatment many of them will vegetate the same year. The plants should remain in the seed-bed for two years, and afterwards planted out in nursery rows, where they may remain for two or three years before they are planted for hedges. The best quickset hedges are formed by planting them in two rows, about a foot or a foot and a half apart. The hedges two or three years after planting ought to be clipped once or twice every year, in order to keep them in shape and thicken them, and they should be kept perfectly clear of weeds, at least for the few first years.

*Sharp-spined* or *Common Hawthorn*, *White-thorn*, or *May*. Fl. May, June. Britain. Shrub 10 to 20 feet.

37 *C. KYRTOSTYLA* (Fing. in Schlecht. Linnæa. 4. p. 379. t. 3. f. 1.) thorny; leaves 3-lobed, toothed, glabrous on both surfaces or ciliated on the nerves beneath; flowers corymbose, monogynous; style deflexed; calyx hairy, with the segments oblong, acuminate, spreading and obtuse at the apex; fruit oblong, foveolate at the base, containing a 1-seeded, ovate-oblong, brownish nut, which is convex on the back, and 3-4-furrowed. *h. H.* Native of Europe.

*Curved-styled Hawthorn.* Fl. May. Tree 10 to 20 feet.

38 *C. MONOGYNA* (Fing. in Schlecht. Linnæa. 2. p. 380. t. 3. f. 2.) thorny; leaves 3-parted, toothed, ciliated at the base on the petioles and nerves beneath; flowers corymbose, for the most part monogynous; style straight; calyx glabrous, or a little ciliated, with oblong, acuminate, reflexed, obtuse segments; fruit globose, containing 1 or 2 oblong-ovate brown nuts, with 2 furrows on the back of each. *h. H.* Native of Europe.

*Monogynous Hawthorn.* Fl. May. Tree 10 to 20 feet.

39 *C. HETEROPHYLLA* (Flugg. ann. mus. 12. p. 423. t. 38.) leaves heterous, falling off very late in the season, cuneiform-lanceolate, somewhat 3-lobed or pinnatifid at the apex; lobes subserrated, acute; corymbs many-flowered, glabrous; lobes of calyx acuminate; flowers monogynous. *h. H.* Native probably of North America. Lindl. bot. reg. 1161. Flowers white.

*Variable-leaved Hawthorn.* Fl. May, June. Clt. 1816. Tree 10 to 20 feet.

40 *C. AZAROLIS* (Lin. spec. 683.) leaves pubescent, cuneate at the base, trifid; lobes obtuse, coarsely few-toothed; branches, corymbs, and calyxes pubescent; lobes of calyx obtuse; flowers with 1-2-3 styles. *h. H.* Native of the south of France and Italy. Andr. bot. rep. 579. *Pyrus Azaralis*, Scop. carn. no. 597. *Mespilus Azarolis*, All. pedem. 1809.—J. Bauh. hist. 1. p. 67. Flowers white, sweet-scented. Fruit globose, red, usually 2-seeded; hence the common name of the tree at Montpellier *Pommettes de deux closes*. The fruit when fully ripe has an agreeable taste, for which it is esteemed in Italy and the Levant, where it is served up in the dessert.

*Azarole Hawthorn.* Fl. May, Ju. Clt. 1640. Tr. 15 to 20 ft.

41 *C. ORIENTALIS* (Bosc. ined. ex D. C. prod. 2. p. 629.) leaves 3-lobed, pubescent beneath; lobes ovate, deeply toothed at the apex, the middle one trifid; stipulas broad, cut; branches

clothed with hoary tomentum.  $\frac{1}{2}$ . II. Native of the Levant. *Méspilus orientális*, Poir. suppl. 4. p. 72.

*Oriental Azarole*. Fl. May, Ju. Clt. 1810. Tr. 12 to 20 ft.

42 *C. ARONIA* (Bosc. ined. ex D. C. l. c.) leaves pubescent beneath, cuneated at the base, trifid; lobes obtuse, entire or 3-toothed; teeth obtuse, mucronate; branches pubescent.  $\frac{1}{2}$ . H. Native of the Levant. *Méspilus Aronia*, Willd. enum. suppl. C. Azarölus  $\beta$ , Willd. spec.—Pocock. cr. t. 85. The fruit is said to be yellow.

*Aronia Azarole*. Fl. May, Ju. Clt. 1810. Tr. 12 to 20 ft.

43 *C. TANACETIFOLIA* (Pers. ench. 2. p. 38.) leaves deeply pinnatifid, downy; lobes oblong, acute, few-toothed; flowers pentagynous; calycine lobes acutish, reflexed, hairy; fruit globose.  $\frac{1}{2}$ . II. Native of the Levant. Andr. bot. rep. t. 591. *Méspilus tanacetifolia*, Poir. dict. 4. p. 440. Smith, exot. bot. 85. Flowers white. Fruit greenish yellow.

*Var.  $\beta$ , Taúrica* (D. C. prod. 2. p. 629.) fruit brick-coloured.  $\frac{1}{2}$ . H. Native of Tauria, on hills. C. orientális, Bieb. fl. taur. 1. p. 389. Perhaps *Méspilus Celsiana*, Dum. Cours. suppl. p. 286.

*Tunzy-leaved Azarole*. Fl. May, June. Clt. 1789. Tree 12 to 20 feet.

44 *C. ODORATISSIMA*; leaves deeply pinnatifid, pubescent; lobes lanceolate, acute, serrated; flowers pentagynous, corymbose; calycine segments ovate; fruit globular.  $\frac{1}{2}$ . II. Native of the Crimea. *Méspilus tanacetifolia*, Andr. bot. rep. 590. Flowers white, very sweet-scented. Fruit yellow, large.

*Sweet-scented Azarole*. Fl. May, June. Tree 10 to 20 feet.

45 *C. LACINIA'TA* (Ucria ex herb. Moricand, D. C. prod. 2. p. 629.) leaves deeply pinnatifid, downy; lobes oblong, acute, few-toothed at the apex; calycine lobes acutish, reflexed, hairy; fruit elliptic.  $\frac{1}{2}$ . II. Native of Sicily, on mountains. Flowers white.

*Jagged-leaved Azarole*. Fl. May, June. Clt. 1816. Shrub 6 to 10 feet.

46 *C. MELANOCA'RPA* (Bieb. fl. taur. 1. p. 386.) leaves usually trifid, serrated in front, acutish at the base; flowers usually pentagynous; calycine lobes acute, reflexed, villous.  $\frac{1}{2}$ . II. Native of Tauria, in mountain woods. Flowers white. Fruit black. Allied to *C. oxyacantha*.

*Black-fruited Hawthorn*. Fl. May, June. Clt. 1820. Tree 10 to 20 feet.

† *Species belonging to the last division of the genus, but are not sufficiently known.*

47 *C. MEXICA'NA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 629.) leaves oval, acute, serrated or cut at the apex, ciliated at the base; flowers corymbose; lobes of calyx acute; fruit obovate, 5-seeded.  $\frac{1}{2}$ . H. Native of Mexico. Fruit yellowish, 12-15 lines long. Branches spiny.

*Mexican Hawthorn*. Fl. May, June. Clt. 1823. Tree.

48 *C. LEVIGATA* (D. C. prod. 2. p. 630.) leaves cuneated, toothed, 3-lobed at the apex, quite glabrous on both surfaces; corymbs subumbellate; lobes of calyx obtuse, reflexed; fruit glabrous, 2-seeded.  $\frac{1}{2}$ . H. Native of the Vosges. *Méspilus lævigata*, Poir. l. c.

*Smooth Hawthorn*. Fl. May, June. Tree.

49 *C. VIRIDIS* (Lin. spec. 683.) leaves ovate-lanceolate, somewhat 3-lobed, serrated, glabrous; stipulas semicordate; stem unarmed.  $\frac{1}{2}$ . II. Native of Carolina. Perhaps a variety of *C. coccinea*.

*Green Hawthorn*. Fl. May, Ju. Clt. 1810. Tree 10 to 20 ft.

50 *C. TRI'LOBA* (Pers. ench. 2. p. 37.) leaves cuneiform, villous, tridentate at the apex; calyxes acute, and are, as well as the peduncles, tomentose; fruit 2-seeded.  $\frac{1}{2}$ . H. Native of Barbary.

*Three-lobed-leaved Hawthorn*. Tree.

VOL. II.

51 *OLIVERIA'NA* (Bosc. ined. ex D. C. prod. 2. p. 630.) glabrous? leaves cuneiform at the base, and deeply lobed at the apex; lobes obtuse, almost entire; spines subulate, straight.  $\frac{1}{2}$ . H. Native of Asia Minor. Branches dark brown. Flowers white.

*Oliver's Hawthorn*. Fl. May, Ju. Clt. 1820. Tree 10 to 20 ft.

52 *C. POIRETIA'NA* (D. C. prod. 2. p. 630.) leaves ovate, rather coriaceous, cut, and somewhat lobed, glabrous; stipulas linear-subulate; spines strong, and very long.  $\frac{1}{2}$ . H. Native country unknown. *Méspilus linearis*, Poir. suppl. t. p. 72. Flowers white.

*Poiret's Hawthorn*. Fl. May, Ju. Clt. 1810. Tree 20 ft.

53 *C. DISSECTA* (D. C. prod. 2. p. 630.) leaves sessile, glabrous, green, trifid; lateral lobes deeply toothed, middle one 3-lobed; lobules toothed; branches unarmed, rather tomentose.  $\frac{1}{2}$ . H. Native of Persia. *Méspilus dissecta*, Dum. Cours. bot. cult. ed. 2. vol. 5. p. 456. Flowers white.

*Dissected-leaved Hawthorn*. Fl. May, June. Tree.

54 *C. PECTINA'TA* (Bosc. ined. D. C. prod. 2. p. 630.) leaves pinnatifid, running along the petiole, green; lobes 5, deeply toothed.  $\frac{1}{2}$ . II. Native of Persia. Allied to *C. tanacetifolia* and *C. Oliveriana*.

*Pectinate-leaved Hawthorn*. Fl. May, July. Tree 20 feet.

N.B.—There are numerous other garden species, but all remain undescribed.

1 *C. trifoliata*, Bosc. 2 *C. quinquelobata*, Bosc. 3 *C. odorata*, Bosc. 4 *C. obovata*, Bosc. 5 *C. flavescens*, Bosc. 6 *C. flabellata*, Bosc. 7 *C. Carpatica*, Lodd. cat. 8 *C. florida*, Lodd. cat.

*Cult.* The species of *hawthorn* are well fitted for shrubberies or plantations. They are easily propagated by budding or grafting on the common hawthorn. They are all very ornamental when in blossom. The seeds do not vegetate till the second spring after sowing.

II. RHAPHIOLEPIS (from  $\rho\alpha\phi\iota\varsigma$ , *rhapfis*, a needle, and  $\lambda\epsilon\pi\iota\varsigma$ , *lepis*, a scale; in reference to the narrow subulate bracteas). Lindl. in bot. reg. t. 468. and Lin. trans. 13. p. 105. D. C. prod. 2. p. 630.

LIN. SYST. *Icosandria*, *Digynia* Limb of calyx funnel-shaped, deciduous. Filaments filiform. Ovary 2-celled, 2-styled. Pome closed by a thickened disk, containing a chartaceous putamen. Seeds 2, gibbous; the testa very thick and coriaceous.—Trees, natives of China, with evergreen, crenulated, coriaceous, reticulated leaves. Racemes terminal, usually beset with permanent scale-like bracteas. Petals white, but with the filaments usually red.

1 *R. INDICA* (Lindl. in Lin. trans. 13. p. 105.) leaves ovate, acuminate at both ends; petals ovate, acute; stamens shorter than the calyx.  $\frac{1}{2}$ . F. Native of India and China. *Cratægus Indica*, Lin. spec. 683. Sims, bot. mag. 1726. Schrank, hort. mon. t. 66. Leaves broad. Bracteas subulate, deciduous. Petals white. Filaments red.

*Indian Hawthorn*. Fl. Feb. Aug. Clt. 1806. Tree.

2 *R. LOUREIRI* (Spreng. syst. 2. p. 508.) leaves lanceolate, unequally serrated, glabrous; flowers corymbose; petals roundish.  $\frac{1}{2}$ . F. Native of Cochinchina. *Cratægus Indica*, Lour. coch. p. 319. Fruit eatable.

*Loureiro's Indian Hawthorn*. Tree 30 feet.

3 *R. PNEOSTEMON* (Lindl. coll. no. 3. in a note.) leaves lanceolate, acuminate at both ends; petals roundish; stamens spreading, longer than the calyx.  $\frac{1}{2}$ . F. Native of China. *R. Indica*, Ker. bot. reg. 468. Petals white. Filaments brown.

*Brown-stamened Indian-hawthorn*. Fl. Feb. May. Clt. 1820. Shrub 3 to 6 feet.

4 H

4 *R. RU'BRA* (Lindl. coll. no. 3. t. 3.) leaves ovate-lanceolate, acuminate at both ends; petals lanceolate; stamens straight, longer than the calyx. *h. F.* Native of Cochinchina and China. *Crataegus rubra*, Lour. coch. p. 320. *Mespilus Sinensis*, Poir. Flowers reddish.

*Red Indian Hawthorn.* Fl. Feb. May. Clt. 1820. Tree 30 feet.

5 *R. SALICIFOLIA* (Lindl. coll. p. 3. in a note, bot. reg. 652.) leaves long, lanceolate; petals lanceolate, about equal in length to the teeth of the calyx; stamens coarctate, shorter than the calyx. *h. F.* Native of China. Racemes paniced. Petals and filaments white.

*Willow-leaved Indian Hawthorn.* Fl. Feb. May. Clt. 1821. Shrub 3 to 6 feet.

6 *R. SPIRALIS*; leaves cuneate-oblong, acute, serrated, coriaceous, smooth; racemes terminal, simple, and the pedicels furnished with twisted bractes; flowers digynous; calyx villous at the base. *h. F.* Native of China. *Mespilus spiralis*, Blum. bijdr. p. 1102.

*Spiral-bracted Indian Hawthorn.* Tree.

† *Names of species which occur in the gardens, but are most probably identical with some of the above.*

1 *R. latifolia*, Lodd. cat. 2 *R. laevis*, Lodd. cat.

*Cult.* The species of *Raphiolepis* grow freely in a mixture of loam, peat, and sand. Ripened cuttings strike root readily if planted in sand, with a hand-glass placed over them. Some of the species stand our winters very well against a south wall, in the open air, when covered by mats in severe weather.

III. *CHAMÆMELIS* (from *χαμαί*, *chamai*, on the ground, and *μήλον*, *melon*, an apple; in reference to the dwarfness of the shrub, and with a fruit resembling the apple). Lindl. in Lin. trans. 13. p. 164. t. 11. D. C. prod. 2. p. 631.

LIN. SYST. *Icosándria*, *Monogýnia*. Calyx truncate, 5-toothed. Petals 5, small, erect, erose. Filaments filiform, 10-15. Ovary inferior, 1-celled. Style 1. Pome closed, baccate, containing a 1-celled, 1-seeded, bony nut, having a distinct suture. — A shrub, with simple, coriaceous, shining, obsolete crenated, evergreen leaves, axillary deciduous stipulas, and racemes of flowers, which are leafy at the base.

1 *C. CORIACEA* (Lindl. l. c.) *h. G.* Native of Madeira, on the sea cliffs to the eastward of Funchall, about a mile out of the town, along the Canico road.

*Coriaceous-leaved Chamæmelis.* Shrub 3 to 4 feet.

*Cult.* See *Raphiolepis* for culture and propagation.

IV. *PHOTINIA* (from *φωτεινός*, *photinos*, shining; in reference to the leaves). Lindl. in Lin. trans. 13. p. 103. D. C. prod. 2. p. 631.

LIN. SYST. *Icosándria*, *Digýnia*. Calyx 5-toothed. Petals reflexed. Ovary semi-adherent, villous, 2-celled. Styles 2, glabrous. Pericarp 2-celled, inclosed in the fleshy calyx; testa cartilaginous. — Trees, with simple, coriaceous, evergreen, serrated or quite entire leaves. Flowers white, disposed in terminal corymbose panicles. Fruit small, smooth.

1 *P. SERRULATA* (Lindl. l. c.) leaves oblong, acute, serrulated; pedicels longer than the calyx. *h. F.* Native of Japan and China. *Crataegus glabra*, Thunb. jap. 205. Sims, bot. mag. 2105. Lodd. bot. cab. 248. Colla, hort. rip. t. 36. Leaf-buds large, red.

*Serrulated-leaved Photinia.* Fl. April, July. Clt. 1804. Tree 10 to 20 feet.

2 *P. ARBUTIFOLIA* (Lindl. l. c.) leaves oblong-lanceolate, acute, distantly serrated; pedicels longer than the calyx. *h. F.* Native of California. Petioles red, six times shorter than the leaf.

Lindl. bot. reg. 491. *Crataegus arbutifolia*, Ait. hort. kew. ed. 2. vol. 3. p. 202.

*Arbutus-leaved Photinia.* Fl. July, Aug. Clt. 1796. Tree 10 to 20 feet.

3 *P. INTEGRIFOLIA* (Lindl. l. c.) leaves elliptic, acuminate, quite entire; panicle diffuse. *h. F.* Native of Nipaul. *Pyrus integerrima*, Wall. ex D. Don, prod. fl. nep. 237. Pedicels bractless. Ovary 3-celled; cells biovulate.

*Entire-leaved Photinia.* Clt. 1820. Tree 20 feet.

4 *P. DUBIA* (Lindl. l. c. p. 104. t. 10.) leaves lanceolate, distantly serrated; panicle corymbose, pilose. *h. F.* Native of Nipaul. *Mespilus Bengalensis*, Roxb. *Mespilus tinctoria*, D. Don, prod. fl. nep. 238. *Crataegus Shicōla*, Hamilt. mss. Fruit 2-celled. Seed one, large, clothed with a loose testa. Fruit 1-celled from abortion, and 2-seeded; hence it is nearly allied to *Raphiolepis* ex D. Don, l. c. The bark of this tree is used in Nipaul to dye cotton red. Hamilt.

*Doubtful Photinia.* Clt. 1821. Tree 20 feet.

5 *P. BENGALENSIS* (Wall. mss. in Lin. soc. herb.) leaves broad, elliptic-lanceolate, glabrous, distantly toothed, tapering to both ends; panicle thyrsoid, terminal; calyx downy. *h. F.* Native of Bengal. Flowers white.

*Bengal Photinia.* Tree.

6 *P. SIEBOLDI*; leaves cuneate-oblong, obtuse, serrated from the middle to the apex, coriaceous, smooth above, but when in a young state tomentose beneath, as well as the corymbs and calyxes; flowers semidigynous. *h. F.* Native of China. *Mespilus Sieboldi*, Blum. bijdr. 1102.

*Siebold's Photinia.* Tree.

7 *P. LAEVIS* (D. C. prod. 2. p. 631.) leaves ovate, acuminate, serrated; umbel of flowers nearly simple. *h. F.* Native of Japan. *Crataegus laevis*, Thunb. fl. jap. 204.

*Smooth Photinia.* Tree 20 feet.

8 *P. VILLOSA* (D. C. prod. 2. p. 631.) leaves oblong, acuminate, serrated, villous; umbel of flowers compound; pedicels villous; fruit villous. *h. F.* Native of Japan. *Crataegus villosa*, Thunb. jap. 204. Fruit villous.

*Villous Photinia.* Tree.

*Cult.* Trees with fine large shining leaves, and corymbs of whitish flowers, worthy of a place in any garden. For their culture and propagation see *Raphiolepis*.

V. *ERIOBOTRYA* (from *ερίον*, *erion*, wool, and *βοτρυς*, *botrys*, a bunch of grapes; in reference to the bunch of fruit and flowers, which are woolly). Lindl. in Lin. trans. 13. p. 102. D. C. prod. 2. p. 631.

LIN. SYST. *Icosándria*, *Pentagýnia*. Calyx woolly, bluntly 5-toothed. Petals bearded. Stamens erect, length of the calycine teeth. Styles 5, filiform, inclosed, pilose. Pome (f. 81. a.) closed, 3-5-celled. Chalaza none. Radicle inclosed between base of the cotyledons. — Small trees, with tomentose branches, broad simply serrated leaves, which are woolly beneath; woolly compound terminal racemes of flowers, and subulate deciduous bractes. Flowers small, white.

1 *E. JAPONICA* (Lindl. l. c.) leaves broad, rather wrinkled, elliptic, serrated, tapering at the base, tomentose beneath; lobes of calyx rounded. *h. F.* Native of Japan and China. *Mespilus Japonica*, Thunb. jap. 206. Vent. malm. t. 19. Ker. bot. reg. 365. Hort. trans. 3. t. 11. Dekin, ann. gen. sc. ph. 2. p. 368. t. 32. *Crataegus Bibas*, Lour. coch. p. 319. — Pluk. alm. t. 371. f. 2. Fruit middle-sized, pear-shaped, yellow, downy, disposed in large pendulous bunches; their taste approaches that of the apple. The loquat when it is intended to produce fruit is grafted on the *Mespilus vulgaris*. It is considered a frame or half hardy tree, but to ripen its fruit with flavour it should have the temperature of the stove; in which, if planted

in a border of rich soil, it will add to the variety of the dessert. Sir Joseph Banks (Hort. trans. vol. 1.) considers it as equally good with that of the mango. Lord Bagot, who has fruited the plant in a very superior manner for several years, at Blithfield, gives the following outline of his practice. "The plan I have usually followed has been to give it a winter (out of doors) during the months of July, August, and September, and about the middle of October, to replace it in a very warm situation in the tan. This summer, however, I was obliged to alter my mode; for just at the moment when I was going to put it out for its winter, it became covered with at least twenty bunches of the finest flowers possible. I was therefore obliged to let it remain where it was. The present year's treatment, therefore, is an exception to the former practice; under that, it usually breaks into flower about the end of December, and the fruit becomes ripe in March or April. The last time my plant was in fruit, Sir William Coke, who had resided many years in Ceylon, says, that he was in the constant habit of eating very large quantities of the fruit daily in that island, but that he had never tasted any so good, and with so much flavour, as those produced in my garden."

*Japan or Common Loquat.* Fl. Oct. Clt. 1787. Tree 10 to 20 feet.

2 *E. ELLIPTICA* (Lindl. l. c.) leaves flat, elliptic, obscurely toothed, naked above, and clothed with deciduous tomentum beneath, rounded at the base; thyse compound, terminal, clothed with fulvous tomentum; calycine lobes oblong. *h. F.* Native of Nipaul. *Méspilus Cuila*, Hamilt. mss. in D. Don, prod. fl. nep. p. 238. Flowers white. Fruit downy, yellow.

*Elliptic-leaved Loquat.* Clt. 1823. Tree 30 feet.

3 *E. CORDATA* (Lindl. l. c.) leaves cordate, obtuse, serrated. *h. F.* Native of Peru. *Méspilus lanuginosa*, Ruiz et Pav. fl. per. t. 425. f. 1. *Cratægus ferruginea*, Pers. ench. 2. p. 372. Leaves clothed with rusty villi beneath. Fruit round, glabrous.

*Cordate-leaved Loquat.* Tree.

4 *E. OBTUSIFOLIA* (D. C. prod. 2. p. 632.) leaves ovate, obtuse, serrated, glabrous, glaucous beneath; flowers corymbose, pubescent. *h. F.* Native of Peru. *Cratægus obtusifolia*, Pers. ench. 2. p. 37.

*Obtuse-leaved Loquat.* Tree.

5 *E. ? CHINENSIS*; leaves ovate-oblong, acute, serrulated, rather villous on the middle nerve beneath; peduncles axillary, crowded, villous; calyxes villous; flowers pentagynous. *h. F.* Native of China. *Méspilus Chinensis*, Blum. bijdr. 1102.

*China Loquat.* Tree.

*Cult.* See *Raphiölepis* for culture and propagation.

VI. COTONEASTER (from *Cotoncum*, the Quince-tree, and *aster*, an affixed signification, like; similar downy leaves). Medik. gesch. bot. 1793. Lindl. in Lin. trans. 13. p. 101. D. C. prod. 2. p. 632.

LIN. SYST. *Icosándria, Di-Trigýnia*. Flowers polygamous from abortion. Calyx turbinate, bluntly 5-toothed. Petals short, erect. Stamens length of the teeth of the calyx. Styles glabrous, shorter than the stamens. Carpels 2-3, parietal, biovulate, inclosed in the calyx.—Shrubs, with simple quite entire leaves, which are generally woolly beneath. Corymbs lateral,

FIG. 81.

spreading, furnished with deciduous subulate bracteas. Petals small, permanent.

• *Leaves deciduous.*

1 *C. VULGARIS* (Lindl. l. c.) leaves oval, rounded at the base, tomentose beneath; calyxes and peduncles glabrous; peduncles dichotomous, few-flowered. *h. II.* Native of Europe and Siberia, on hills. In North Wales, upon the cliffs of Llandudno, at Ormeshead. Hook. in engl. bot. suppl. t. 2713. *Méspilus Cotoneaster*, Lin. spec. 686. Fl. dan. 112. Pall. fl. ross. 1. t. 14. Flowers reddish. Fruit first green, then yellow, then red, and finally black.

*Var. α, erythrocárpa* (Led. fl. alt. 2. p. 219.) fruit red when mature.

*Var. β, melanocárpa* (Led. l. c.) fruit black when ripe. *Méspilus Cotoneaster*, Pall. fl. ross. 1. p. 30. t. 14. *Méspilus melanocárpa*, Fisch. in litt.

*Var. γ, depréssa* (Fries. nov. succ. p. 9.) shrub rather thorny; leaves lanceolate, acutish; fruit of 4 carpels. *h. II.* Native of Sweden, on rocks near Warberg.

*Common Cotoneaster.* Fl. April, May. Clt. 1656. Shrub 3 to 5 feet.

2 *C. UNIFLORA* (Bunge in Led. fl. ross. alt. ill. t. 269.) leaves oblong, attenuated at both ends, glabrous above, and pubescent beneath; peduncles very short, 1-flowered, and are, as well as the calyxes, glabrous. *h. II.* Native of Siberia, in subalpine places. *Uva-ursi*, Pall. itin. 2. p. 568. Petals greenish white. Styles 3. Pome globose, red.

*One-flowered Cotoneaster.* Fl. June. Shrub 2 to 3 feet.

3 *C. MULTIFLORA* (Bunge in Led. fl. ross. alt. ill. t. 274.) leaves roundish-oval, attenuated at the base, rounded at the apex, emarginate or with a mucrone, rather puberulous beneath, quite glabrous above; peduncles dichotomous, many-flowered, longer than the leaves, and are, as well as the calyxes, glabrous. *h. II.* Native of Siberia, in the Soongarian desert, among rocks on the mountains of Tschingis-tau and Dschigilen. Pome oblong, purple, 2-3-seeded.

*Many-flowered Cotoneaster.* Shrub 3 to 5 feet.

4 *C. TOMENTOSA* (Lindl. l. c.) leaves elliptic, obtuse at both ends, tomentose beneath; calyx and peduncles woolly. *h. H.* Native of the south of Europe, on the Alps. *Méspilus tomentosa*, Willd. spec. 2. p. 1012. but not of Lam. *Méspilus eriocárpa*, D. C. fl. fr. synop. and suppl. no. 3691.

*Tomentose Cotoneaster.* Fl. April, May. Clt. 1759. Shrub 3 to 6 feet.

5 *C. AFFINIS* (Lindl. l. c.) leaves ovate or obovate, mucronulate, attenuated at the base, woolly beneath, as well as the petioles, peduncles, and calyxes; peduncles lateral, corymbose, twice-forked, many-flowered. *h. II.* Native of Nipaul, about Chitlong. *Méspilus integerrima*, Hamilt. mss. *Méspilus affinis*, D. Don, prod. fl. nep. p. 238.

*Allied Cotoneaster.* Fl. Ap. May. Clt. 1828. Sh. 3 to 4 feet.

6 *C. ACUMINATA* (Lindl. l. c. t. 9.) leaves ovate, acuminate, pubescent on both surfaces; calyxes and peduncles pubescent; peduncles usually 3-flowered. *h. H.* Native of Nipaul. Peduncles shorter than those of the preceding species, 1-2, somewhat reflexed. *Méspilus acuminata*, Lodd. bot. cab. 919.

*Acuminate-leaved Cotoneaster.* Fl. April, May. Clt. 1820. Shrub 3 to 5 feet.

7 *C. BACILLARIS* (Wall. ined. Lindl. bot. reg. no. 1229.) leaves obovate, drawn down into the petiole, glabrous; cymes many-flowered, divaricate, and are, as well as the branches, pilose. *h. F.* Native of Kamaon.

*Rod Cotoneaster.* Shrub.

8 *C. OBTUSA* (Wall. ined. ex Lindl. bot. reg. no. 1229.) leaves ovate or obovate, glabrous beneath; cymes crowded, many-

flowered, and are, as well as the branches, glabrous. *h. H.* Native of the mountains of Nipaul and Kamaon.

*Obtus-leaved Cotoneaster.* Shrub.

9 *C. LAXIFLORA* (Jacq. ex Lindl. bot. reg. 1305.) leaves oblong, obtuse at both ends, woolly beneath; cymes paniced, pilose; calyxes quite smooth. *h. H.* Native country unknown. Flowers pink.

*Loose-flowered Cotoneaster.* Fl. April. Clt. 1826. Shrub 3 to 5 feet.

10 *C. FRIGIDA* (Wall. ex Lindl. bot. reg. 1229.) leaves oval-lanceolate, tomentose beneath; cymes woolly, many-flowered. *h. H.* Native of Gosaingsthan. Flowers white. Fruit spherical, red.

*Frigid Cotoneaster.* Fl. April, May. Clt. 1824. Shrub 10 ft.

• • *Leaves evergreen.*

11 *C. ROTUNDIFOLIA* (Wall. cat. Lindl. bot. reg. no. 1229.) leaves roundish, pilose beneath, evergreen; peduncles 1-flowered. *h. H.* Native of Gosaingsthan. *Cot. microphylla*  $\beta$ , *Uva-ursi*, Lindl. bot. reg. 1187. *C. Uva-ursi*, Hort. ex Loud. hort. brit. p. 480. Flowers white.

*Round-leaved Cotoneaster.* Fl. April, May. Clt. 1825. Shrub 3 to 4 feet.

12 *C. MICROPHYLLA* (Wall. ex Lindl. bot. reg. 1114.) leaves oblong-cuneated, pubescent beneath, evergreen; peduncles usually 1-flowered. *h. H.* Native of Gosaingsthan. Flowers white.

*Small-leaved Cotoneaster.* Fl. April, May. Clt. 1824. Shrub 3 to 4 feet.

13 *C. BUXIFOLIA* (Wall. cat. ex Lindl. bot. reg. 1229.) leaves ovate, woolly beneath, evergreen; peduncles 3-flowered, woolly. *h. H.* Native of Neelgherry. Flowers white.

*Box-leaved Cotoneaster.* Fl. Ap. May. Clt. 1824. Sh. 3 to 4 ft.

*Cult.* All the species of *Cotoneaster* are well fitted for shrub-beries; they are easily increased by laying down the branches or by cuttings, which should be planted in a sheltered situation, with a hand-glass placed over them; they are also propagated by separating the suckers from the roots or by seeds.

VII. AMELANCHIER (the Savoy name of the *medlar*). Medik. gesch. 1792. Lindl. in Lin. trans. 13. p. 100. D. C. prod. 2. p. 632.

LIN. SYST. *Icosándria*, *Pentagýnia*. Calyx 5-cleft (f. 82. c.). Petals lanceolate (f. 82. a.). Stamens rather shorter than the calyx. Ovarium of 10 cells, or of 5 bipartite ones (f. 82. e.). Ovula 10, solitary in the partitions of the cells. Styles 5 (f. 82. d.), joined together a little at the base. Pome (f. 82. d.), when mature 3-5-celled. Seeds 3-5; endocarp cartilaginous.—Small trees, with simple, serrated, deciduous leaves, and racemes of white flowers. Bractees linear-lanceolate, deciduous.

1 *A. VULGARIS* (Mœnch. meth. 682.) leaves roundish-oval, bluntish, pubescent beneath, at length glabrous. *h. H.* Native of Europe, in rugged places. *Mespilus Amelanchier*, Lin. spec. 685. Jacq. fl. aust. t. 300. Sims, bot. mag. t. 430. Mill. fig. 178. f. 1. *Pyrus Amelanchier*, Willd. spec. 2. p. 1015. *Arónia rotundifolia*, Pers. ench. 2. p. 39. *Crataegus rotundifolia*, Lam. *Sorbus Amelanchier*, Crantz. Pome dark purple.

*Common Amelanchier.* Fl. Apr. May. Clt. 1596. Sh. 3 to 4 ft.

FIG. 82.

2 *A. BOTRYAPIUM* (D. C. prod. 2. p. 632.) leaves oblong-elliptic, cuspidate, when young rather villous, but at length glabrous. *h. H.* Native throughout Canada, Newfoundland, and Virginia; plentiful in the higher parts of the Columbia. *A. grandiflora*, Dougl. mss. *Mespilus Canadensis*, Lin. spec. 185. *Crataegus racemosa*, Lam. dict. 1. p. 84. *Pyrus botryapium*, Lin. fil. suppl. 255. *Arónia botryapium*, Pers. ench. 2. p. 39. *Mespilus arborea*, Michx. arb. fr. ed. gall. vol. 2. p. 70. t. 66. Pome purple.

*Grape-pear* or Canadian Medlar. Fl. April, May. Clt. 1746. Shrub 6 to 8 feet.

3 *A. OVATA* (D. C. prod. 2. p. 632.) leaves roundish-elliptic, acute, when young rather velvety beneath, but when in an adult state glabrous; racemes coarctate; petals obovate; calyx pubescent. *h. H.* Native of North America, throughout Canada, from Lake Huron to the Saskatchewan and Mackenzie rivers, and as far as the Rocky Mountains. *Crataegus spicata*, Lam. dict. 1. p. 84. *Pyrus ovalis*, Willd. spec. 2. p. 1014. *Arónia ovalis*, Pers. ench. 2. p. 40. *Mespilus Amelanchier*, Walt. car. p. 184.?

*Var.  $\beta$ , semi-integrifolia* (Hook, fl. bor. amer. p. 201.) leaves for the most part serrated at the apex. *h. H.* Native about the Grand Rapids and at Fort Vancouver, on the Columbia, and on the high grounds of the Multnomak river.

*Var.  $\gamma$ , subcordata* (D. C. prod. 2. p. 632.) leaves rather cordate at the base. *h. H.* Native on the mountains of New York. *Arónia subcordata*, Rafin. in litt. *Malus microcarpa*, Rafin. dec.

Dr. Richardson observes that the *A. ovalis* "abounds on the sandy plains of the Saskatchewan. Its wood, named by the Crees *Meesassquat-ahick*, is prized for making arrows and pipe-stems, and is thence termed by the Canadian voyagers *Bois de flèche*. Its berries, about the size of a pea, are the finest fruit in the country, and are used by the Crees under the name of *Meesasscootom-meen*, both in a fresh and dried state. They make a pleasant addition to pemmican, and make excellent puddings, very little inferior to plum-pudding."

*Oval-leaved Amelanchier.* Fl. Ap. May. Clt. 1800. Sh. 6 to 8 ft.

4 *A. SANGUINEA* (D. C. prod. 2. p. 633.) leaves oblong, rounded at both ends, sharply serrated, always naked; bractees and stipulas feathery; racemes capitate; calyx glabrous on the outside. *h. H.* Native of North America, in Canada, Hudson's Bay, Columbia, Lake Huron, Newfoundland, plains of the Saskatchewan. Lindl. bot. reg. 1171. *Pyrus sanguinea*, Pursh, fl. amer. sept. 1. p. 240. *Arónia sanguinea*, Nutt. *Mespilus Canadensis  $\gamma$ , rotundifolia*, Michx. fl. bor. amer. 1. p. 391. Fruit blackish purple, eatable. The leaves are hairy when young. It differs principally from *A. botryapium* in the fewer flowers, much shorter raceme, and shorter, broader, and more ovate petals.

*Bloody-fruited Amelanchier.* Fl. April, May. Clt. 1800. Shrub 4 to 8 feet.

*Cult.* See *Cotoneaster* for culture and propagation.

VIII. MESPILUS (from *μεσος*, *mesos*, the half, and *πιλος*, *pilos*, a bullet; fruit resembling half a bullet). Lindl. in Lin. trans. 13. p. 99. D. C. prod. 2. p. 633.—*Mespilus* species of Lin. and others.—*Mespilophora* species of Neck.

LIN. SYST. *Icosándria*, *Di-Pentagýnia*. Calyx 5-cleft (f. 83. a.), the segments foliaceous (f. 83. a.). Petals nearly orbicular (f. 83. b. g.). Disk large, full of honey. Styles 2-5 (f. 83. f.), glabrous. Pome turbinate, open, 5-celled. Endocarp bony. In a wild state the trees are furnished with spines, but in the cultivated state they are unarmed. Leaves lanceolate, serrulated, deciduous. Flowers large, nearly sessile, usually solitary, white. Bractees permanent.

1 *M. GERMANICA* (Lin. spec. 684.) leaves lanceolate, undivided, a little downy, but most so beneath; flowers solitary. *h. H.* Native of Europe and Siberia, in woods and among bushes; in England, in all the hedges about Minshill, Cheshire; about Ashburnham, Sussex, truly wild. Smith, engl. bot. 1523. Gært. fr. 2. p. 43. t. 87. Duham. arbr. 2. t. 4. Pall. fl. ross. t. 13. f. 1.

*Var. α, sylvestris* (Mill. dict. n. 1.) thorny; fruit small.—Wild Medlar, *Neflier du bois*. Fruit obovate, middle-sized, dry, and worthless.

*Var. β, stricta* (D. C. prod. 2. p. 633.) unarmed; leaves doubly serrated. Ait. hort. kew. 2. p. 172.

*Var. γ, diffusa* (D. C. prod. 2. p. 633.) unarmed; leaves almost entire. Ait. l. c. Duham. arb. fr. 1. t. 3. Seeds usually abortive. The following garden medlars belong to this variety:

1 *Blue's large medlar*.

2 *Dutch medlar, common, large Dutch, broad-leaved Dutch, large-fruited, large German, neflier à gros fruit, neflier de Hollande à gros fruit*. Fruit large, oblate. The largest of any, but not so good as the following.

3 *Nottingham medlar, common, small-fruited, narrow-leaved Dutch*. Fruit obovate, middle-sized. This is the best of all the medlars.

4 *Stonless medlar, neflier sans noyau, neflier sans pépins, French medlar*. Fruit small, obovate, of little merit.

*Use*.—The medlar is eaten raw in a state of incipient decay; its taste and flavour are peculiar, and by some much esteemed.

*Propagation*.—By seeds, by layers, or by grafting on seedlings of their own species, or on any kind of plant of *Pomaceæ*. Miller observes that if the stones are taken out of the fruit as soon as it is ripe, and immediately planted, they will come up the following spring and make good plants in two years. He prefers raising from seed to grafting on the *Crataegus*. Forsyth says, "those who wish to keep the sorts true, should propagate them by grafting on their own stocks."

*Soil*.—The soil in which the medlar thrives best is a loamy rich earth, rather moist than dry, but not on a wet bottom.

*Final planting*.—The medlar, like the quince, is usually grown as standards or espaliers; the former may be planted from 20 to 30, and the latter from 15 to 20 feet apart.

*Mode of bearing*.—On small spurs at the ends and sides of the branches.

*Pruning*.—Forsyth recommends the same sort of treatment as for the quince. Cut out all the dead and cankered wood, and keep the tree thin of branches, when it is desired to have large fruit. Care is requisite to train standards with tall stems. Espaliers will require a summer and winter pruning, as in the apple tree.

*German or Common Medlar*. Fl. May, July. Britain. Tree 10 to 20 feet.

FIG. 83.

2 *M. SMITHII* (D. C. prod. 2. p. 633.) leaves oblong, elliptic, serrated, pubescent on the nerves beneath; flowers usually solitary.

*h. H.* Native country unknown. *M. grandiflora*, Smith, exot. bot. 1. p. 33. t. 18. Flowers white, one half smaller than those of the common medlar. Stipulas of the sterile branches large and foliaceous.

*Smith's Medlar*. Fl. May, Ju. Clt.? Tree 20 feet.

*Cult*. For culture and propagation see common medlar.

*melon*, an apple; in reference to the bony endocarp). Lindl. in Lin. trans. 13. p. 98. t. 8. D. C. prod. 2. p. 633.

*LIN. SYST. Icosándria, Pentagynia*. Calyx 5-cleft. Petals oblong, flat, spreading. Stamens erect. Styles 5, exserted, length of stamens, bearded below, permanent. Ovary 5-celled: cells 1-seeded. Pome closed, woolly; endocarp bony.—A shrub with pinnate leaves, entire leaflets, and opposite subulate bractes under the calyxes.

1 *O. ANTHYLLIDIFOLIA* (Lindl. l. c.). *h. G.* Native of the Sandwich Islands. *Pyrus anthyllidifolia*, Smith, in Rees' cycl. no. 29. Flowers subcorymbose. Fruit small, crowned by the styles and calyx.

*Kidney-vetch-leaved Osteomelis*. Shrub 4 to 6 feet.

*Cult*. A mixture of loam and peat will suit this shrub, and ripened cuttings will probably root if planted in a pot of sand, with a hand-glass placed over them. But the best and surest method of increasing it, when it shall be introduced to the gardens, would be to graft it on the *Cydônia Japonica*.

X. *PYRUS* (*peren*, Celtic for the pear). Lindl. in Lin. trans. 13. p. 97. D. C. prod. 2. p. 633.—*Pyrus*, *Malus* and *Sorbus*, Tourn.—*Pyrus* and *Sorbus*, Lin.—*Pyróphorum* and *Apyróphorum*, Neck.

*LIN. SYST. Icosándria, Pentagynia*. Calyx with an urceolate tube, and a 5-lobed limb. Petals roundish. Styles usually 5, rarely 2 or 3. Pome closed, 5-celled; putamen cartilaginous. Seeds 2 in each cell; testa cartilaginous.—Trees or shrubs, with simple or pinnate leaves, and terminal, many-flowered cymes. Bractes subulate, deciduous.

*SECT. I. PYRÓPHORUM* (from *pyrus*, a pear, and *phoreo*, to bear; the trees contained in this section bear pears). D. C. prod. 2. p. 633. Petals flat, spreading. Styles 5, free. Pome more or less turbinate or nearly globose, never umbilicate at the base, as in the apple section. Pedicels simple, umbellate. Leaves simple, glandless.

1 *P. COMMUNIS* (Lin. spec. 686.) leaves ovate, serrated, glabrous on both surfaces, as well as the buds and branches; peduncles umbellate. *h. H.* Native of Europe, in woods and hedges; plentiful in some parts of Britain. Smith, engl. bot. 1784. *P. A'chas*, Gært. fruct. 2. p. 44. t. 87. *P. sylvestris*, Dod. pempt. 800. *Pyráster*, Ray, syn. 452. The tree is thorny in a wild state, but unarmed in the cultivated state.

*Var. α, A'chas* (Wallr. sched. 213.) thorny; leaves ovate, acuminate, quite entire, on long petioles, when young woolly as well as the calyx, but at length becoming smooth; pome drawn out at the base. *h. H.* Wild pear or iron pear.

*Var. β, pyraster* (Wallr. sched. p. 214.) thorny; leaves roundish, acute, sharply serrated, when young glabrous as well as the calyxes; pome rounded at the base. *h. H.* Gært. fruct. 2. t. 87. f. 2.

The pear tree is called *poirier* in French, *birnbaum* in German, and *pero* in Italian. In its wild state, the pear is a thorny tree, with upright branches, tending to a pyramidal form, in which it differs materially from the apple tree. The twigs or spray hang down; the flowers in terminal villous corymbs, produced from wood of the preceding year, or from buds gradually formed on that of several years' growth, on the extremities of very short protruding shoots, technically spurs. It is found in a wild state in Britain, and abundantly in France and Germany, as well as other parts of Europe, not excepting Russia, as far as latitude 51°. It grows in almost any soil. The cultivated tree differs from the apple, not only in having a tendency to the pyramidal form, but also in being more apt to send out tap roots, in being as a seedling plant much longer in coming into bearing, and when on its own root, or grafted on a wild pear stock, of being much longer lived. In a dry soil it will exist

**Propagation.**—The *pear* may be propagated by layers or suckers, but not easily by cuttings. These modes, however, are productive of very indifferent plants, and are justly rejected in favour of raising from seed, and grafting or budding.

**From seed.**—This mode is adopted either for the purpose of obtaining new varieties, or for producing *pear* stocks; in the former case the same principles of selection or crossing are to be followed as in raising seedling apples, between which and the *pear* tree the chief difference is, that the latter requires a longer period, nearly double, to come into bearing.

**In raising pears for stocks**, the seeds from perry-makers are generally made use of, but the most proper are those from the wild *pears*, as likely to produce plants more hardy and durable. There is, however, less difference between the *pear* stocks or those raised from the cultivated fruit and wild *pear* stocks, than there is between the free apple and crab stocks. The seeds being procured, may be sown and afterwards treated as directed for seedling crab or apple-tree stocks.

**By grafting and budding.**—The most common stocks on which the *pear* is grafted, are the common *pear* and wild *pear*; the *pear*, is, however, dwarfed and brought earlier into a bearing state by grafting or budding on the quince or white-thorn. The *pear* will also succeed well on the whitebeam, medlar, service, or apple, but stocks of the wild *pear* and quince are in most general use. *Pears*, on free stocks, grow most luxuriantly in good soil and on a dry bottom, those on wild *pear* stocks grow less rapidly, but are deemed more durable, and will thrive on the poorest soil, if a hardy variety and not over pruned. "On the quince," Miller observes, "breaking *pears* are rendered gritty and stony; but the melting sorts are much improved; trees on these stocks may be planted in a moist soil with more success than those on the wild *pear* stocks or thorns." On the thorn, *pears* come very early into bearing, continue prolific, and in respect to soil will thrive well on a strong clay, which is unsuitable both to those on quinces or wild *pears*, but it is supposed to have an unfavourable influence on the fruit, in rendering it smaller and hard; and the graft or buds require to be inserted very low, that the moisture of the earth may tend to favour the swelling or enlargement of the diameter of the stock, which does not increase proportionably to, nor ever attains, the same size as the stem of the *pear*. The free and wild *pear* stocks are to be planted in nursery rows at the same distances as recommended for free or wild apples; and the quince and thorn at the same distance as the Paradise stocks and creeper apples; in other respects the management is the same as for the apple.

**Choice of sorts.**—Select from the catalogue given, according to purpose and quality.

**Choice of plants.**—Abercrombie takes trees at one year from the graft, and thence to the sixth year or older. Forsyth says "I would advise those who intend to plant *pear* trees, instead of choosing young ones, to look out for the oldest that they can find in the nursery, and with strong stems."

**Soil and site.**—"A dry deep loam," Abercrombie observes, "is accounted the best soil for the *pear*-tree, when the stock is of its own species; on a quince stock it wants a moist soil, without which it will not prosper. Gravel is a good sub-soil, where the incumbent mould is suitable. Cold clay is a bad sub-soil; to prevent fruit trees from striking into it, slates may be laid just under the roots. For wall trees the soil should be made good to the depth of 2 or 3 feet; for orchard trees 18 inches may do. *Pear* trees, on their own stocks, will thrive on land, where apples will not even live; supposing the plants to be hardy varieties, little removed from wild *pears*, and to have room to grow freely as standards. 'To the more choice of the early autumn and prime winter *pears*, assign south-east, or west

walls." Knight and M'Phail recommend a strong, deep, loamy soil, and the latter a high wall for training the better sorts.

*Final planting* is performed any time, in mild weather, from October to March; standards are placed from 25 to 40 feet apart every way; half standards from 20 to 30 feet; and dwarf standards, in borders, from 15 to 20 feet from stem to stem. Wall and espalier trees are planted from 15 to 30 feet, according as they may have been grafted or budded on *pear* or quince stocks.

*Mode of bearing*.—As in the apple tree, "The *pear* tree," M'Phail observes, "does not produce blossoms on the former year's wood, as several other sorts of trees do. Its blossom-buds are formed upon spurs growing out of wood not younger than one year old, and consequently, projecting spurs all over the tree must be left for that purpose."—"In some *pears*," Mr. Knight observes, "the fruit grows only on the inside of those branches which are exposed to the sun and air; in others it occupies every part of the tree."

*Pruning and training standards*.—"Permit these to extend on all sides freely. Several years may elapse before any cross-placed, very irregular, or crowded branches, dead or worn out bearers, require pruning, which give in winter or spring. Keep the head moderately open in the middle." "Pruning," Knight observes, "is not often wanted in the culture of the *pear* tree, which is rarely much encumbered with superfluous branches; but in some kinds, whose form of growth resembles the apple tree, it will sometimes be found beneficial."

*Wall trees and espaliers* will require a summer and winter pruning.

*Summer pruning*.—"While the spray is young and soft, but not until the wood-shoots can be distinguished from spurs, rub off the foreright, the disorderly, spongy, and superfluous shoots of the year, rather than let them grow woody, so as to require the knife. Retain some of the most promising, well-placed, lateral, and terminal shoots, always keeping a leader to each main branch, where the space will permit. Leave the greater number on young trees not fully supplied with branches. Train in these at their full length all summer, in order to have a choice of young wood in the winter pruning. Occasionally, on old trees, or others where any considerable vacancy occurs, some principal contiguous shoot may be shortened in June to a few eyes, for a supply of several new shoots the same season."

*Winter pruning* "may be performed any time from the beginning of November until the beginning of April. If on young trees or others a further increase of branches is necessary to fill up either the prescribed space or any casual vacancy, retain some principal shoots of last summer, to be trained for that purpose. As, however, many young shoots will have arisen on the wood branches and bearers, of which a great part are abundant and disorderly, but which have received some regulation in the summer pruning, we must now cut these out close to the mother branches, while we are preserving the best in the more open parts. Examine the parent branches, and if any are very irregular or defective in growth, either cut them out close, or prune them to some eligible lateral to supply the place; or if any branches be over extended, they may be pruned in to such a lateral, or to a good fruit-bud. Cut out the least regular of the too crowded, also any casually declined bearers, with decayed, cankered, and dead wood. The retained supply of laterals and terminals should be laid in as much at length as the limits allow, in order to furnish a more abundant quantity of fruit-buds. During both courses of pruning, be particularly careful to preserve all the orderly fruit spurs, emitted at the sides and ends of the bearers; if, however, any large, rugged, projecting spurs, and woody barren stumps or snags occur, cut them clean away close to the branches, which will

render the bearers more productive of fruit-buds, and regular in appearance. As each tree is pruned, nail or tie the branches or shoots to the wall or trellis. If afterwards, in consequence of either pruning out improper or decayed wood, or of former insufficient training, there are any material vacuities or irregularities in the arrangement, unmail the misplaced and contiguous branches and lay them in order."

Mr. Knight's mode of training the *pear* tree is as follows:—"A young *pear* stock, which had two lateral branches upon each side, and was about 6 feet high, was planted against a wall early in the spring of 1810; and it was grafted in each of its lateral branches, two of which sprang out of the stem, about 4 feet from the ground, and the others at the summit in the following year. The shoots these grafts produced were about a foot long, were trained downwards, the undermost nearly perpendicular, and the uppermost just below the horizontal line, placing them at such distances, that the leaves of one shoot did not at all shade those of another. In the next year the same mode of training was continued, and the year following I obtained an abundant crop of fruit.

"An old St. Germain *pear* tree, of the spurious kind, had been trained in a fan-form against a north-west wall in my garden, and the central branches, as usually happens in old trees thus trained, had long reached the top of the wall, and had become wholly unproductive. The other branches afforded but very little fruit, and that never acquiring maturity, was consequently of no value, so that it was necessary to change the variety as well as to render the tree productive. To attain these purposes, every branch which did not want at least 20 degrees of being perpendicular, was taken out at its base, and the spurs upon every other branch, which I intended to retain, were taken off closely with the saw and chisel. Into these branches, at their subdivisions, grafts were inserted at different distances from the root, and some so near the extremities of the branches, that the tree extended as widely in the autumn after it was grafted, as it did in the preceding year. The grafts were also so disposed, that every part of the space the tree previously covered, was equally well supplied with young wood. As soon in the succeeding summer as the young shoots had attained sufficient length, they were trained almost perpendicularly downwards, between the larger branches and the wall to which they were nailed. The most perpendicular remaining branch upon each side was grafted about 4 feet below the top of the wall, which is 12 feet high, and the young shoots, which the grafts upon these afforded, were trained inwards, and bent down to occupy the space from which the old central branches had been taken away, and therefore very little vacant space any where remained in the end of the first autumn. A few blossoms, but not any fruit, were produced by several of the grafts in the succeeding spring; but in the following year and subsequently I have had abundant crops, equally dispersed over every part of the tree."

*Heading down and pruning old pear trees*.—"The method of pruning *pear* trees," Forsyth observes, "is very different from that practised for apple trees in general. The constant practice has been to have great spurs, as big as a man's arm, standing out from the walls, from a foot to 18 inches or upwards." The constant cutting of these spurs, he says, brings on the canker, and the fruit produced is small, spotted, and kernelly. Forsyth's practice with such trees was to cut them down, and renew the soil at their roots, and he refers to a *beurré pear*, restored from an inch and a half of bark, which, in 1796, bore 450 fine large pears, &c.

C. Harrison and various other gardeners adopt a mode of keeping only short spurs, by which much larger fruit is produced. According to this plan, each spur bears only once, when it is cut out, and succeeded by an embryo bud at its base.

This bud, at the end of the first season, is no more than a leaf-bud, but at the end of the second summer it has become a blossom-bud, and bears the third summer. Some useful observations on the management of pear-trees, in correspondence with the above, will be found in various parts of the Caledonian Horticultural Society's memoirs.

*Insects, diseases, &c.*—The pear-tree is liable to the attacks of the same insects as the apple-tree, and the fruit of the summer kinds, when ripe, is liable to be eaten by birds, wasps, &c. which must be kept off by shooting, hanging bottles of water, and other usual preventatives. For other points of culture, and gathering, and storing, see the apple.

*Common Pear.* Fl. April. Britain. Tree 20 to 30 feet.

2 *P. BOLLWYLLERIANA* (D. C. fl. fr. suppl. p. 530.) leaves ovate, coarsely serrated, tomentose beneath and on the buds, when young velvety above, but glabrous in the adult state; corymbs many-flowered. *h. H.* Native country unknown, but cultivated in the gardens around Bollwyller, a town in Alsace, in the time of Bauhin, whence the trivial name. *P. Bollwylleriæna*, J. Bauh. hist. 1. p. 59. with a figure. *P. Pollvèria*, Lin. mant. 244. Lodd. bot. cab. 1009. Koop. pomol. 2. p. 38. t. 4. ex Reich. Fruit turbinate, small, orange-yellow. Flowers white.

*Bollwyllarian Pear.* Fl. April. Clt. 1786. Tree 20 feet.

3 *P. SALVIFOLIA* (D. C. prod. 2. p. 634.) leaves lanceolate, quite entire, tomentose beneath, when young velvety above, but in the adult state glabrous; buds tomentose. *h. H.* Native of France, about Aurelia. *Cœnomānum sylvêstris et cûlta*, D. C. fl. fr. p. 531. in a note. Poirier sauger, D. Ourch. in bibl. phys. econ. mai. 1817. p. 299. Branches thick. Fruit large, elongated, and very useful for making perry. Flowers white.

*Sage-leaved or Aurelian pear.* Fl. April, May. France. Tree 20 to 30 feet.

4 *P. AMYGDALIFORMIS* (Vill. cat. strash. 322. D. C. suppl. p. 531.) thorny; leaves oblong, acute, quite entire, tomentose beneath, when young velvety above, but in the adult state glabrous, 6 times longer than the petioles; buds tomentose; flowers corymbose. *h. H.* Native of Provence and Dauphiny, in woods. *P. sylvêstris*, Magn. bot. 215. *P. salicifolia*, Lois. not. 79. Flowers white.

*Almond-formed Pear.* Fl. April, May. Clt. 1810. Tree 10 to 20 feet.

5 *P. ELEAGNIFOLIA* (Pall. nov. act. petr. 7. 1789. p. 355.) leaves oblong-lanceolate, acute, quite entire, tomentose on both surfaces, hardly longer than the petioles; flowers corymbose. *h. H.* Native of Iberia, Tauria, and Caucasus. *P. orientalis*, Horn. suppl. 52. *P. eleagnifolia*, Steud. nom. Flowers white.

*Eleagnis-leaved Pear.* Fl. April, May. Clt. 1800. Tree 20 feet.

6 *P. SALICIFOLIA* (Lin. suppl. 255.) leaves linear-lanceolate, acute, quite entire, hoary, clothed with white tomentum beneath, about 3 times the length of the petioles; buds clothed with white tomentum; corymbs few-flowered. *h. H.* Native of Siberia and Caucasus. Ker. bot. reg. 514. Pall. itin. 3. p. 734. t. N. f. 3. fl. ross. 1. t. 9. Flowers white, on short pedicels, corymbose, never solitary.

*Willow-leaved Pear.* Fl. April, May. Clt. 1780. Tree 6 to 12 feet.

7 *P. INDICA* (Colebr. Wall. pl. rar. asiat. 2. t. 172.) leaves ovate or ovate-cordate, acute, serrulated, glabrous, white beneath as well as the petioles and calyxes; claws of petals shorter than the calyx; umbels sessile, few-flowered; styles villous at the base. *h. H.* Native of the mountains of Silhet, in Bengal. Flowers white. Fruit with an austere taste, about the size of the wild pear. Leaves lobed in the young plants.

*Indian Pear.* Tree 20 feet.

8 *P. CUNEIFOLIA* (Guss. pl. rar. p. 202.) leaves oblong-oval, crenulated at the base, when young clothed with floccose down beneath, but in the adult state glaucescent and smooth; peduncles corymbose, clothed with woolly tomentum when young as well as the calyxes; teeth of calyx lanceolate; petals obcordate; fruit globose. *h. H.* Native of Calabria, on hills. Fruit sour. Flowers white or pale red. Allied to *P. parviflora*, Desf. and *P. salicifolia*.

*Wedge-leaved Pear.* Fl. Mar. April. Tree.

9 *P. LANATA* (D. Don, prod. fl. nep. 237.) leaves broadly elliptic, acuminate, doubly serrated, clothed with white wool beneath as well as on the branches; corymbs terminal, compound, woolly; calycine lobes ovate, acuminate, *h. H.* Native of Nipaul, in Sirinagur. Perhaps referrible to Sect. III. *Aria*.

*Woolly Pear.* Fl. May, June. Clt. 1818. Tree 20 feet.

10 *P. CRENATA* (D. Don, prod. fl. nep. p. 237.) leaves ovate, acutely crenated, on long petioles, glabrous above, but when young clothed with white tomentum beneath as well as the branches; corymbs simple, woolly; calycine lobes ovate, acutish. *h. H.* Native of Upper Nipaul, at Suembu. This species comes near to *P. Bollwylleriæna*, but differs in the leaves of that species being shorter and broader, serrated, not crenated, and in the flowers being more numerous.

*Crenate-leaved Pear.* Fl. May. Clt. 1820. Tree 20 feet.

11 *P. NUSSIA* (Hamilt. ex D. Don, l. c.) leaves elliptic, mucronate, coriaceous, crenulated, glabrous, but when young woolly beneath, as well as the branches; corymbs terminal, paniced, covered with white woolly down; pome spherical. *h. H.* Native of the higher mountains of Nipaul. Fruit small, about the size of that of *P. arbutifolia*.

*Nussia Pear.* Tree 20 feet.

12 *P. VARIOLOSA* (Wall. cat. 680.) leaves ovate, acuminate, crenated, glabrous in the adult state, on long petioles, when young clothed with yellowish tomentum beneath; umbels terminal; pedicels and calyxes woolly. *h. H.* Native of Nipaul and Kamaon. Flowers white. Fruit nearly globose, not umbilicate at the base.

*Variolose Pear.* Fl. April, May. Tree 20 feet.

13 *P. PASHIA* (Hamilt. ex herb. Lin. soc.) leaves ovate, acuminate, rather cordate at the base, crenated or serrated, glabrous in the adult state, but downy beneath when young, as well as the petioles, pedicels, and calyxes; cymes terminal; fruit globular. *h. H.* Native of Narainhetty.

*Pashia Pear-tree.* Tree 10 to 20 feet.

14 *P. SINENSIS* (Lindl. hort. trans. 6. p. 396. bot. reg. 1248.) leaves cordate, apiculated, shining, serrated, when young pubescent beneath; peduncles corymbose; calyx glabrous inside; fruit warted, bony. *h. H.* Native of China and Cochin-china. *Ri vulgo Nas*, Kœmpf. amœn. 800. *Pyrus communis*, Loir. cochin. p. 321. Flowers white. This tree is called indiscriminately *Chinese pear*, *sandy pear*, or *snow pear*. Fruit gritty.

*Chinese Pear.* Fl. April, May. Clt. 1820. Tree 15 to 20 feet.

15 *P. SINICA* (Thouin, mem. mus. 1. p. 170. t. 9.) leaves ovate-oblong, rather crenated, acutish, clothed with white pubescence beneath, but glabrous and shining above; buds white from pubescence; flowers corymbose; fruit nearly globose. *h. H.* Native of mount Sinai. Wats. dendr. 49. *P. Sinai*, Desf. arb. 2. p. 144. Duham. ed. nov. 6. t. 57. *P. Persica*, Pers. ench. 2. p. 40. Much branched, diffuse. Leaves minutely crenulated, falling off late in the autumn. Flowers white.

*Mount Sinai Pear.* Fl. April, May. Clt. 1820. Tree 20 ft.

16 *P. NIVALIS* (Lin. fl. suppl. 253.) leaves oval, quite entire, obtuse, mucronate, clothed with white silky down beneath; corymbs terminal; fruit globose. *h. H.* Native of the Alps of

Austria. Jacq. austr. 2. t. 107. Flowers white. Fruit very acid, but when ripe and becoming putrid, very sweet.

*Snow Pear.* Fl. April, May. Tree 6 to 10 feet.

17 *P. MICHAXII* (Bosc, in Poir. suppl. 4. p. 432.) leaves oval, quite entire, acutish, glabrous on both surfaces, and shining above; peduncles usually twin, when bearing the fruit thick and woody; fruit globose.  $\frac{1}{2}$ . H. Native of North America.

*Michaux's Pear.* Fl. April. Tree 20 feet.

18 *P. PARVIFLORA* (Desf. cor. 78. t. 58.) leaves ovate, quite entire, hoary beneath; corymbs terminal; fruit globose.  $\frac{1}{2}$ . H. Native of Candia. *P. sylvestris* Crética, C. Bauh. pin. p. 439. Tourn. cor. 43. Flowers red.

*Small-flowered Pear.* Tree 20 to 30 feet.

SECT. II. *MA'LUS* (*mel* or *mal*, Celtic, for the apple, which the Greeks have rendered *μηλον*, and the Latins *malus*). Tourn. inst. t. 406. Petals flat, spreading. Styles 5, somewhat connected at the base. Pome usually globose and depressed, always umbilicate at the base. Pedicels simple, umbellate. Leaves simple, glandless.

19 *P. ACÉRBA* (D. C. prod. 2. p. 635.) leaves ovate, acute, crenated, quite glabrous when young, as well as the calycine tube; flowers corymbose.  $\frac{1}{2}$ . H. Native of Europe, in woods and hedges. *P. Málus austera*, Wallr. sched. 215. *Málus acérba*, Merat, fl. par. 187. D. C. suppl. 530. *P. málus sylvestris*, Fl. dan. 1101. *P. Málus*, Smith, engl. bot. 179. Flowers white tinged with red. There are numerous varieties with acerb fruit; they are commonly called *cider apples*, and in French *pommier à cidre*. The fruit of the *wild apple* is globose, yellowish, with a tinge of red, very acid, and astringent, yet there are several varieties among the *wild crabs*, some of them of excellent flavour when baked with plenty of sugar, even surpassing many cultivated apples. The expressed juice of any of them, called *verjuice*, is used to cure sprains and scalds, being often kept by good housewives in the country for that purpose.

*Sour or Wild Apple or Crab.* Fl. March, April. Britain. Tree 15 to 20 feet.

20 *P. MA'LUS* (Lin. spec. 686.) leaves ovate or elliptic, acute, serrated, clothed with white down beneath, as well as on the calyxes, petioles, &c.; flowers corymbose; styles glabrous.  $\frac{1}{2}$ . H. Native of Europe, in woods, hedges, and parks; plentiful in Britain. *Málus mitis*, Wallr. sched. 215. Flowers umbellate, beautifully variegated with white and rose-colour, and slightly fragrant.

The *apple tree* is called *pomme* and *pommier doux* or *pommier à couteau* in France, *apfel* in German, and *pomo* or *melo* in Italian. It has the branches more horizontal than the pear tree; the flowers terminate in umbels, produced from the wood of the preceding year, but more generally from very short shoots or spurs from wood of two years' growth. The fruit in its wild state is termed a crab. It is a native of most countries of Europe in its wild state, and the improved varieties form an important branch of culture in Britain, France, and Germany, for the kitchen, the table, and for the manufacture of cider. From whence we received the cultivated *apple* is unknown, but in all probability it was introduced by the Romans, to whom 22 varieties were known in Pliny's time, and afterwards the stock of varieties greatly increased at the Norman conquest. According to Stow, *carps* and *pepins* were brought into England by Mascal, who wrote on fruit trees in 1572.

The *apple tree* is supposed by some to attain to a great age. Haller mentions some trees in Herefordshire that attained 1000 years, and were highly prolific; but Mr. Knight considers 200 years as the ordinary duration of a healthy tree grafted on a

crab stock, and planted in a strong tenacious soil. Speechly (Hints, 58.) mentions a tree in an orchard at Burton-joyce near Nottingham, of about 60 years old, with branches extending from 7 to 9 yards round the bole, which in 1792 produced upwards of 100 pecks of apples. Of all the different fruits that are produced in Britain, none can be brought to so high a degree of perfection, with so little trouble; and of no other is there so many excellent varieties in general cultivation, calculated for almost every soil, situation, and climate, which our island affords. Very good apples are grown in the Highlands and Orkneys, and even in the Shetland Islands (Cal. hort. mem. vol. 2.), as well as in Devonshire and Cornwall; some sorts are ripe in the beginning of July, and others which ripen later will keep till June. Unlike other fruits, those which ripen latest are the best.

*Use.*—For pies, tarts, sauces, and the dessert, the use of the *apple* is familiar to every one. The fermented juice forms cider, a substitute both for grape wine and malt liquor. In confectionary it is used for comfits, marmelades, jellies, pastes and tarts, &c. In medicine, verjuice or the juice of crabs is used for sprains, and as an astringent and repellent, and, with the proper addition of sugar, Withering thinks a very grateful liquor might be made with it, little inferior to Rhenish wine. Lightfoot affirms, mixed with cultivated apples, or even alone, if thoroughly ripe, it will make a sound masculine wine. The apple when ripe is laxative; the juice is excellent in dysentery; boiled or roasted apples fortify a weak stomach. Scopoli recovered from a weakness of the stomach and indigestion from using them, and they are equally efficacious in putrid and malignant fevers, with the juice of lemons or currants. In perfumery, the pulp of apples, beat up with lard, forms pomatum; and Bosc observes (N. cours d'Agriculture, &c.) that the prolonged stratification of apples with elder-flowers, in a close vessel, gives the former an odour of musk, extremely agreeable. In dyeing, the bark produces a yellow colour, and in general economy the wood of the tree is used for turning, and various purposes where hardness, compactness, and variegation of colour are objects.

*Criterion of a good apple.*—Apples for the table are characterized by firm juicy flesh, elevated poignant flavour, regular form, and beautiful colouring; those for kitchen use by the property of falling, as it is technically termed, or forming in general a pulpy mass of equal consistency, when baked or boiled. Some sorts of apples have the property of falling when green, as the *Keswick*, *Carlisle*, *Hanthonden*, and other codlins; and some only after being ripe, as the *Russet* tribe. Those which have this property when green are particularly valuable for affording sauces to geese early in the season, and for succeeding the gooseberry in tarts. For cider an apple must possess a considerable degree of astringency, with or without firmness of pulp or richness of juice. The best kinds, Knight says, are often tough, dry, and fibrous; and the *Siberian Harvey*, which he recommends as one of the very best cider-apples, is unfit either for culinary purposes or the table. Mr. Knight has found that the specific gravity of the juice of any apple recently expressed indicates with very considerable accuracy the strength of the future cider. Considering the various uses of the apple, it may be regarded as a fruit of more use and benefit to the public in general than all the other fruits the produce of this island.

*Varieties.*—Tusser in 1573 mentions in his list of fruits "apples of all sorts." Parkinson in 1629 enumerates 57 sorts. Evelyn about 30 years afterwards says (Pomona pref.), "it was through the plain industry of one Harris, a fruiterer to Henry VIII. that the fields and environs of about 20 towns in Kent only, were planted with fruit from Flanders, to the universal benefit and improvement of the county." Gibson (Churches of Dove and Homelacy,) mentions that Lord Scudamore, ambassador to the court of France in the time of Charles I., collected in

Normandy scions of cider-apples, and when he returned to England encouraged the grafting them throughout the county of Hereford. Hartlip in 1566 speaks of one who had 200 sorts of apples, and "verily believes that there are nearly 500 sorts in this island." Ray in 1688 selected from the information of the most skilful gardeners about London a list of 78 sorts. Succeeding writers have been enabled greatly to increase the list, partly from the almost continual accession of sorts received from the continent during intervals of peace, but principally from the great numbers raised from seeds. A variety of *apple*, like those of most other plants, appears only to have a limited duration; and hence on taking a retrospective view of the lists of sorts given by Parkinson, Evelyn, and other authors, many of them are not now to be found, or are so degenerated or diseased as no longer to deserve the attention of the planter. "The *moil*," Mr. Knight observes, "and its successful rival the *red-streak*, with the *musts* and *golden-pippin*, are in the last stage of decay, and the *stire* and *fox-whelp* are hastening rapidly after them." After making a great variety of experiments for several years, and after many attempts to propagate every old variety of the *apple*, this author observes (Treat. on Apple and Pear, 15.), "I think I am justified in the conclusion, that all plants of this species, however propagated from the same stock, partake in some degree of the same life, and will attend the progress of that life in the habits of its youth, its maturity, and its decay, though they will not be any way affected by any incidental injuries the parent tree may sustain after they are detached from it." Mr. Knight next directed his attention to raising new varieties from seeds, and has by crossing one sort with another, and by having constantly several thousands of seedlings rearing, from which as they show fruit, to select the best sorts, succeeded in producing several new varieties of apples, much esteemed for the table and the press. Of several of these sorts, and those obtained, accounts will be found in the work above quoted, and in Horticultural Transactions. Several eminent horticulturists in different districts are now engaged in a similar manner, and there can be little doubt a great and valuable accession will be constantly made to this class of fruits. Some, however, as Williamson (Hort. trans. 3. p. 291.) and Speechly (Hints, 188.) consider that the deterioration of the *apple* and other fruits may be owing to the climate, and that the return of genial summers would restore to us from old trees as good fruit as heretofore.

A numerous list of varieties may be considered as puzzling to the inexperienced person, who has to select for a garden or an orchard; but if each of these varieties were correctly figured and described, including the character and habits of the tree, as well as the leaves, roots, blossoms, and fruit, the list could not be too extensive of a fruit so universally grown and liked as the *apple*; for almost every garden and orchard differs in soil, climate, aspect or situation; and, consequently, to be planted in the best manner, must require a corresponding difference in the varieties of each species of fruit with which it is to be planted. Sabine, however, (Hort. trans. 3. p. 263.) considers, that the stock of *apples* requires reduction rather than increase, and observes that one of the chief objects to which the attention of the Horticultural Society is at present directed, is to make a judicious selection. A great variety of *apple* trees in a bearing state may be seen in different nurseries both in Britain and Ireland, but especially near London; from these in the autumn the fruit may be tasted from the trees, and either young plants newly worked or plants in a state of bearing fixed on, and marked to be taken up at the proper season. The advantages of this mode, especially to such as possess but a small garden, are too obvious to require comment.

The only catalogue of *apples* which can be depended upon for accuracy yet published, is that by the Horticultural Society of

London in the present year, which none but a public body could have brought to such perfection. It is as follows.

The columns explain 1. The prevailing colour. 2. The usual form. 3. The average size. 4. The use, whether for table, kitchen, or cider. 5. The quality. 6. The usual season of perfection. The abbreviations employed are as follows:

1. *Prevailing colour*.—p. pale; d. dark; y. yellow; r. red; g. green; rus. russet; str. streaked; br. brownish.

2. *Form*.—Pea. pearmain-shaped; i. e. of the form of a truncated cone; calv. calville-shaped, when the ribs of the fruit are particularly prominent; ob. oblate; obl. oblong; ro. roundish; rou. round; con. conical; ro.-obl. roundish-oblong; ov. ovate; ov.-obl. ovate-oblong; obo. obovate.

3. *Size*.—1. very large; 2. middle-sized; 3. small.

4. *Use*.—T. table; K. kitchen; C. cider.

5. *Quality*.—1. first-rate; 2. second-rate; 3. indifferent or bad.

6. *Season, times of ripening*.—The months of ripening are placed in numbers beginning at Jan. for the 1st, and so on to December, the 12th.

*Propagation and culture.*—The *apple*, like most other hardy trees, may be propagated by seeds, cuttings, suckers, layers, and by engrafting and budding; by seeds to obtain new varieties, and stocks, and by other modes for continuing such as are in esteem.

*By seeds.*—The first business here is the choice of seeds, which should be taken from fruits having the properties it is desired to perpetuate or improve in the greatest degree. The sorts of apples proper for crossing or reciprocal impregnation, appear to be those which have a great many qualities in common, and some different qualities. Thus the *golden-pippin* has been crossed by other *pippins* or *rennets*, and not by *calvils* or *codlings*. A small-sized apple, crossed by a large sort, will be more certain of producing a new variety than the above mode; but will be almost equally certain of producing a variety destitute of valuable qualities; the qualities of parents of so opposite natures being as it were crudely jumbled together in the offspring. Mr. Knight's mode of cutting out the stamens of the blossoms to be impregnated, and afterwards when the stigmas are mature, introducing the pollen of that intended for the male parent, is unquestionably the most scientific mode of performing the operation. In this way he produced those excellent apples, the *Downton*, *red and yellow Ingestrie*, and *Grange pippins* from the same parents; viz. the seed of the *orange-pippin* impregnated by the pollen of the *golden-pippin*. The *Bringwood-pippin* he produced from the *golden-pippin*, dusted with the pollen of the *golden-harvey apple*.

The seeds may be sown in autumn in light earth, covered an inch, and either in pots or beds. The end of the first year they should be transplanted into nursery rows, from six inches to a foot apart every way. Afterwards they should be removed to where they are to produce fruit, and for this purpose the greater the distance between the plants the better. It should not be less than 6 or 8 feet every way. The quickest way of bringing them into a bearing state, Williams, of Pitmaston, considers, (Hort. trans. 1. p. 333.) is to let the plants be furnished with lateral shoots from the ground upwards; so disposed as that the leaves of the upper shoots may not shade those situated underneath, pruning away only trifling shoots. This mode of treatment occurred to him on reflecting on Mr. Knight's theory of the circulation of the sap. Observing the change in the appearance of the leaves of his seedling plants, as the trees advanced in growth, he thought it might be possible to hasten the progress of the plants, and procure that peculiar organization of the leaf necessary to the formation of blossom-buds at a much earlier age. He, in consequence, adopted the mode above described, and succeeded in procuring fruit from seedling *apples* at four, five, and six years of age, instead of waiting eight, ten, and even fifteen years, which must be the case by the usual mode of planting close, and pruning to naked stems. Macdonald, an eminent Scotch horticulturist, has also succeeded in obtaining fruit from seedlings at an early period by grafting, already stated as one of the uses of that mode of propagation. In 1808, he selected some blossoms of the *non-pareil*, which he impregnated with the pollen of the *golden-pippin* and of the *Newton-pippin*. When the apples were fully ripe, he selected some of the best, from which he took the seeds and sowed them in pots, which he placed in a frame. He had eight or nine seedlings, which he transplanted into the open ground in the spring of 1809. In 1811, he picked out a few of the strongest plants and put them singly into pots. In spring, 1812, he observed one of the plants showing fruit-buds. He took a few of the twigs and grafted them on a healthy stock on a wall, and in 1813 he had a few apples. This year (1816) his seedlings yielded several dozens, and also his grafts; and he mentions that the apples from the grafts are the largest. He is of opinion that in giving names to seedlings raised in Scotland

the word *Scotch* should be mentioned. Ringing has also been recommended by various authors as inducing precocity, and particularly by Hempel, (Hort. trans. 1. appendix,) who says he has proved it experimentally. A very common practice among those who raise fruit trees from seed is, in the second or third season to select such plants only as have broad and roundish leaves, throwing away the rest, experience having taught that the former more frequently produce fruit of improved quality, or at least larger, than those plants which have narrow-pointed leaves. The width and thickness of the leaf, Mr. Knight observes, "generally indicate the size of the future apple, but will by no means convey any correct idea of the merits of the future fruit. Where these have the character of high cultivation, the qualities of the fruit will be far removed from those of the native species, but the apple may be insipid or highly flavoured, green, or deeply coloured, and of course well or ill calculated to answer the purposes of the planter. An early blossom in the spring, and an early change of colour in the autumnal leaf, would naturally be supposed to indicate a fruit of early maturity; but I have never been able to discover any criterion of this kind on which the smallest dependence can be placed. The leaves of some varieties will become yellow and fall off, leaving the fruit green and immature; and the leaves in other kinds will retain their verdure long after the fruit has perished. The plants whose buds in the annual wood are full and prominent, are usually more productive than those whose buds are small and shrunk in the bark; but their future produce will depend much on the power the blossoms possess of bearing the cold, and this power varies in the different varieties, and can only be known from experience. Those which produce their leaves and blossoms rather early in the spring are generally to be preferred, for though they are more exposed to injury from frost, they less frequently suffer from the attacks of insects, the more common cause of failure. The disposition to vegetate early or late in the spring, is, like almost every other quality in the *apple* tree, transferred in different degrees to its offspring; and the planter must therefore seek those qualities in the parent tree which he wishes to find in the future seedling plants. The most effective method I have been able to discover of obtaining such fruits as vegetate very early in the spring has been by introducing the pollen of the *Siberian crab* into the blossom of a rich and early *apple*, and by transferring in the same manner the pollen of the *apple* to the *Siberian crab*. The leaf and habit of many of the plants that I have thus obtained possess much of the character of the *apple*, whilst they vegetate as early in the spring as the *Siberian crab*, and I possess at least two plants of this family." Abercrombie observes, "as the *codling* is a sort found to change very little from seed, or not for the worse, new plants of it are sometimes raised by sowing the kernels, not by way of experiment for a new uncertain variety, but with some dependence in having a good sort resembling the parent."

*By cuttings.*—Every variety of *apple* may be grown from cuttings, though some with much greater facility than others. All those of the *Burknott* and *codling* tribes grow as well this way as by any other, and some allege that the trees so raised are not liable to canker (Hort. trans. 1. p. 120.), which is supposed to be owing to their putting out no tap root, but spreading their numerous fibres from the knots or burrs horizontally. Even the *golden-pippin* may be continued in this way, and the trees have remained seven years in perfect health, when grafts taken not only from the trees, but from the very branch, part of which was divided into cuttings, cankered in two or three years. "All *apple* trees raised in this way," Bigg observes, "from healthy one-year old branches, with blossom-buds upon them, will continue to go on bearing the finest fruit in a small compass for many years. Such trees are peculiarly proper for forcing, and not liable to canker" (Hort. trans. 1. p. 65.). The cuttings are

to be chosen from young wood of horizontal or oblique branches, rather than from upright ones; from six to eight inches or more in length, with a small portion of old wood at the lower end. Cut off the tip of the shoot, and all the buds, excepting two or three next the tip or upper extremity; then smooth the sections at the lower end, and insert three or four inches in sandy loam, pressing the earth firmly to them, watering and covering them with a hand-glass. The proper time for this operation is early in February, and the glass should not be touched, excepting to give water, till the shoots have sprung an inch or two. Shade during the mid-day sun, and begin to harden by giving air in July; finally, remove the glass in August, and in October transplant to nursery rows, or in pots according to future intention. With the *Burknot* all that is necessary is to plant the cuttings in a shady border, and treat them like those of the gooseberry or currant.

*By layers.*—The success of this mode of propagation may be considered as certain; but it has nothing peculiar in its application to the *apple*. The after treatment of the plants is the same with that for those originated by the following or foregoing modes.

*By suckers.*—This mode is generally confined to the *Paradise* and *creeping apple* for stocks.

*By grafting and inoculation.*—This may be said to be the universal practice in propagating the *apple*. The first consideration is the choice of stocks; of these there are five sorts in common use;—*seedling apples*, used for full standards and riders or wall standards; *seedling crabs*, for standards and half standards; *codling apples*, from layers or cuttings for dwarfs and espaliers; *Paradise apples*, from layers or cuttings for low dwarfs and trained trees; *creeper apples*, from layers or cuttings for the best dwarfs or bushes.

*Stocks of seedling apples.*—The seeds should be selected from the fruit of vigorous growing young or middle-aged healthy trees; but when wanted in larger quantities they are procured from cider makers; private propagators will adopt the first mode. The sowing and after treatment is the same as for *seedling crabs*.

*Seedling crabs.*—"A preference," Mr. Knight observes, "has generally and justly been given to *apple* stocks raised from seed of the native kind or *crab*, as being more hardy and durable than those produced from the *apple*. The offspring of some varieties of the *crab*, particularly of those introduced from Siberia, vegetate much earlier in the spring than other trees of the same genus; and hence the inexperienced planter will probably be led to suppose that such stocks would accelerate the vegetation of other varieties in the spring, and tend to produce an early maturity of the fruit in autumn. In this, however, he will be disappointed. The office of the stock is, in every sense of the word, subservient, and it acts only in obedience to the impulse it receives from the branches; the only qualities, therefore, which are wanting to form a perfect stock are vigour and hardiness."

*Seed sowing and culture.*—In collecting the seeds to sow, it must be remembered that the habits, as well as the diseases, of plants are often hereditary, and attention should be paid to the state of the tree from which seeds are taken; it should be large and of free growth, and rather in a growing state than one of maturity or decay. The *crab* trees, which stand in cultivated grounds, generally grow more freely, and attain a larger stature than those in hedges or woods, and therefore appear to claim preference. The seed should be taken from the fruit before it is ground for vinegar, and sown in beds of good mould an inch deep. From these the plants should be removed in the following autumn to the nursery, and planted in rows at three feet distance from each other, and 18 inches between each plant.

Being here properly protected from cattle and hares, they may remain till they become large enough to be planted out, the ground being regularly worked and kept free from weeds. Rev. J. Venables (Hort. soc. trans. vol. 1. ser. 2. p. 39.) has never found a satisfactory reason why the pips of the best apples should produce most frequently trees little better than the *crab*, while other products of our gardens are not deteriorated from the parent stock. It would seem that much of the peculiar flavour of fruit depends upon the leaf, and whatever determines the first organization of this member of the tree, must have considerable influence on its produce. In the growth of those seeds furnished with albumen, the albumen is converted into a substance resembling sugar, and this saccharine material affords the first nourishment to the growing plant, and supports it till the radicles spread and are enabled to draw a supply of aliment from the earth; but as the apple pip is destitute of albumen, we may easily discover the source from which this deficiency is to be supplied. It was evidently intended that the apple itself decaying on the ground, and enriching the soil around the pips with its saccharine juices, should supply the young tree with its earliest nutriment. When, therefore, we separate the pips from the apple for the purpose of sowing, we deprive the seedling of a material part of its appropriate nourishment, and consequently raise a tree in no way resembling the qualities of its parent. We have no account of the manner in which the best *apples* and *pears* were raised in the 15th and 17th centuries, and possibly the best fruits of those days may have been a selection from numbers raised of an inferior quality. It is probable that we owe some of our best fruits more to the undisturbed production of nature than to the operations of art. An apple has fallen from some tree, and lain unobserved, the fruit has decayed on the spot, and enriched the ground; and, from the soil thus peculiarly prepared by nature, has sprung up a tree, whose produce has proved of peculiar excellence and flavour. According to the above theory, apples should be sown instead of pips, or pips of one sort introduced into the fruit of another, and then sown, or the ground manured with rotten apples. The seedling from this mode of sowing will be more likely to produce fruit of superior flavour than by sowing the pips alone.

*Codling stocks* are raised chiefly from layers, which at the end of the season are taken off and planted in nursery rows, 2 feet between the rows, and 1 foot from plant to plant.

*Paradise stocks*, or as they are called by the French, *Doucia stocks*, are raised from either layers or suckers; and stocks raised from *creeping apples*, so named from their aptitude to throw out suckers, or the *Dutch Paradise*, chiefly from the latter mode. They may be planted in nursery rows, somewhat closer than the *codling stocks*.

All stocks require to stand in the nursery till they are from half an inch to an inch thick at the height at which they are to be grafted; such as are intended for full standards or riders will, in general, require to grow three or four years before they are fit for this operation; those for half standards two years, and those for dwarfs one year. The ground between them must be kept clear of weeds, and stirred every winter; the side shoots of the plants, at least to the height at which they are intended to be grafted, rubbed off as they appear, and all suckers carefully removed. Where budding is adopted, the stocks may be worked at nearly half the diameter of stem requisite for grafting; and stocks for dwarfs, planted in autumn or spring, may be inoculated the succeeding summer. No great advantage, however, is gained by this practice, as such plants require to stand at least another year before they have produced their bud-shoots.

*Soil and situation of the nursery.*—"A difference of opinion appears to have always prevailed respecting the quality of the soil pro-

per for a nursery. Some have preferred a very poor, and others a very rich soil; and both perhaps are almost equally wrong. The advocates for the poor soil appear to me to have been misled by transferring the feelings of animals to plants, and inferring that a change from want to abundance must be agreeable and beneficial to both. But plants in a very poor soil become stunted and unhealthy, and do not readily acquire habits of vigorous growth when removed from it. In a soil which has been highly manured the growth of young *apple* trees is extremely rapid, and their appearance, during 2 or 3 years, generally indicates the utmost exuberance of health and vigour. These are, however, usually the forerunners of disease, and the 'canker's desolating tooth' blasts the hopes of the planter. In choosing the situation for a nursery, too much shelter or exposure should be equally avoided, and a soil nearly similar to that in which the trees are afterwards to grow should be selected where it can be obtained. Pasture ground or unmanured meadow should be preferred to old tillage, and a loan of moderate strength, and of considerable depth, to all other soils." (Treat. on Appl. and Pear.)

*Grafting*.—The first business is to select the scions. At whatever season scions are to be inserted, Mr. Knight observes, "the branches which are to form them should be taken from the parent stock during the winter, and not later than the end of the preceding year; for if the buds have begun to vegetate in the smallest degree, and they begin with the increasing influence of the sun, the vigour of the shoots, during the first season, will be diminished, and the grafts will not succeed with equal certainty; though a graft of the *apple* tree very rarely fails, unless by accidental injury or great want of skill in the operator. The amputated branches must be kept alive till wanted, by having the end of each planted in the ground a few inches deep in a shady situation." Stocks destined to form standard trees may either be grafted at the usual height at which the lateral branches are allowed to diverge, which is commonly six feet, or they may be grafted near the ground, and a single shoot trained from the grafts, so as to form the stem of the tree. The propriety of grafting near the ground or at the height of six or seven feet, will depend on the kind of fruit to be propagated, whether it be quite new, and just beginning to bear, or a middle-aged variety. In new and luxuriant varieties, and these only should be propagated, it will be advantageous to graft when the stocks are three years old, as the growth of such will be more rapid, smooth, and upright than that of the *crab*, and there will be no danger of their being injured by beginning to bear too early. "Middle-aged varieties will be most successfully propagated by planting stocks of six or seven feet high, and letting them remain ungrafted till they become firmly rooted in the places in which the trees are to stand. One graft only should be inserted in each stock; for when more are used they are apt to divide when loaded with fruit, and to cleave the stock, having no natural bond or connexion with each other. When the stocks are too large for a single scion, I would recommend that the grafts be inserted in the branches, and not in the principal stem." This practice is not uncommon in various parts of England, and in general use in Germany with free stocks, where, however, they often neglect to graft the trees, and thus, as Mr. Neill observes, produce an endless variety of sorts, some good, but most of them little better than *crabs*. Stocks intended to form half-standards are grafted at three or four feet from the ground, and those for dwarfs at eight or ten inches or lower. Miller and Knight agree in recommending to graft near the ground, where lasting and vigorous trees are wanted; but the practice of the continental gardeners, and the opinions of some in this country, are in favour of leaving a stem below the graft of not less than a foot in length. A kind of grafting generally adopted for mo-

derate sized stocks is the whip or tongue method, or the new mode of saddle-grafting adopted by Mr. Knight; and the general time for the *apple* is in the end of February and the greater part of March. Much depends on the season and situation; the guiding principle is to make choice of the time when the sap of the stock is in full motion, while that of the scions, from having been previously cut off and placed in the shade, is less so. The common season for budding the *apple* is July, and there is nothing peculiar to this tree in performing that operation.

*Transplanting grafted trees in the nursery*.—"It has been recommended," Knight observes, "to remove grafted trees once or twice during the time they remain in the nursery, under the idea of increasing the number of their roots, but I think this practice only eligible with trees which do not readily grow when transplanted. I have always found the growth of young *apple* trees to be much retarded, and a premature disposition to blossom to be brought on by it; and I could not afterwards observe those trees which had been twice removed grow better than others. It has also been supposed that many small roots, proceeding immediately from the trunk, are in the future growth of the tree to be preferred to a few which are large; but as the large roots of necessity branch into small, which consequently extend to a greater distance, the advantages of more transplantations than from the seed-bed to the nursery, and thence to the garden or orchard, may reasonably be questioned."

*The choice of sorts* depends upon the object in view. The first thing an inexperienced gardener has to do is to consider the various uses of the apple, and then determine what is wanted, according to family, market, or other purpose to be supplied; the next thing is to consider how those wants are to be supplied in his given soil, situation, and circumstances; and the last thing is to study the catalogue of sorts, and to select accordingly. Another source of choice is, as may respect the soil, situation, and climate of the garden or orchard, in which they are to be planted, or the character, whether of dwarfs, espaliers, or wall-trees, which they are to assume there. The winter and spring table apples may require a south wall in one district, while in another they may attain equal maturity as standards or espaliers. Where there is ample room a selection of large sorts, as the *Alexander* and *Baltimore* apples, or of such as are the most beautifully coloured, as the *violet*, *carnation*, &c. may be made to gratify the eye; or where room is wanting, useful sorts and great bearers are to be preferred, as the *golden* and *ribston pippin*, *summer pearmain*, *codlins*, *grey russet*, *summer* and *winter Calvilles*, &c. In general small sized fruit, as the *Harveys* and *Granges*, are to be preferred for standards, as less likely to break down the branches of the trees, or be shaken down by winds, middling sorts for walls and dwarfs, and the largest of all for espaliers. In respect to a soil liable to produce canker, sorts raised from cuttings may be desirable, as the *Burknot* and *codling* tribe; and where an occupier of a garden has only a short interest therein, such as come into immediate bearing, as the *Burknotts* and others from cuttings, and the *Hanthondean*, *Apius's apple*, and other short-lived dwarf sorts on *Paradise* or *creeping* stocks, may deserve the preference. On the contrary, where a plantation is made on freehold property, or with a view to posterity, new varieties on *crab* or free stocks should always be chosen, as the *Grange*, *Ingestrie*, *Harvey*, &c. Some excellent sorts will grow and produce crops every where, as the *Hanthondean*, *codling*, and *Ribston pippin*; the latter of which, Nicol says, will grow at John O'Groat's house, and may be planted in Cornwall; others are shy bearers in cold situations, as the *Newtown pippin* of America, &c.

*Choice of plants for planting*.—This depends in some degree on the object in view, the richness of the soil, and the shelter.

Young trees are more likely to succeed in exposed sites and poor soils, but the *apple* will bear transplanting at a greater age than any other fruit tree. It may be planted in open weather from November till February.

*Soil and site for permanent planting.*—Any common soil, neither extremely sandy, gravelly, nor clayey, on a dry subsoil, and with a free exposure, will suit the *apple*. On wet hilly subsoils it will do no good, but after being planted a few years will become cankered, and get covered with moss. When fruit trees must be planted on such soils they should first be rendered as dry as possible by under-draining; next provision must be made for carrying off the rain water by surface gutters; and, lastly, the ground should not be trenched above a foot deep, and the trees planted rather in hillocks of earth above the surface than in pits dug into it. There is no point of more importance than shallow trenching and shallow planting in cold wet soils, in which deep pits and deep pulverization only serve to aggravate their natural evils of moisture and cold. See Sang. in cal. hort. mem. 4. p. 140. "The *apple* tree," Mr. Knight observes, "attains its largest stature in a deep strong loam or marly clay; but it will thrive in all rich soils, which are neither very sandy nor wet at bottom. It succeeds best," he adds, "in situations which are neither high nor remarkably low. In the former its blossoms are frequently injured by cold winds, and in the latter by spring frosts, particularly when the trees are planted in the lowest part of a confined valley. A south or south-east aspect is generally preferred on account of the turbulence of the west, and the coldness of north winds; but orchards succeed well in all aspects, and where the violence of the west wind is broken by an intervening rise of ground, south-west aspect will be found equal to any." "All the sorts of *apple* trees," Abercrombie observes, "may be planted in any good common soil, with a free exposure, whether that of a garden, orchard, or field, so that the ground be neither very low, nor excessively wet, nor subject to inundation in winter. Avoid as far as possible very strong clayey and gravelly soils."

*Mode of bearing.*—"In all the varieties of the common *apple* the mode of bearing is upon small, terminal, and lateral spurs, or short robust shoots, from half an inch to two inches long, which spring from the younger branches of two or more years' growth, appearing first at the extremity, and extending gradually down the side, the same bearing branches and fruit spurs continue many years fruitful." Abercrombie.

*Pruning.*—"As, from the mode of bearing, *apple* trees do not admit of shortening in the general bearers, it should only be practised occasionally; first, where any extend out of limits, or grow irregular or deformed; and secondly, a good shoot contiguous to a vacant space is shortened to a few eyes, to obtain an additional supply of young wood from the lower buds of this shoot for filling up the vacancy. But to shorten without such a motive is not merely cutting away of the first and principal bearing part of the branches, but also occasions their putting forth many strong useless wood-shoots, where fruit-spurs would otherwise arise; and both effects greatly tend to retard the trees in bearing, whereas the fertile branches being cultivated to their natural length, shoot moderately, and have fruit-spurs quite to the extremity." Abercrombie.

*Espaliers and wall-trees* require a summer and winter pruning.

*The summer pruning.*—"Train in the young shoots of the same year which are likely to be wanted in the figure, and re-trench them where ill placed or too numerous; for as the trees continue bearing many years on the same branches, they only require occasional supplies of young wood; therefore begin in May or June to pinch off or cut out all foreright, ill placed, and superfluous shoots, retaining only some of the promising laterals

in the more vacant parts, with a leader to each branch; train in these between the mother-branches at their full length all summer, or where any vacancy occurs some strong contiguous shoot may be shortened, in June, to a few eyes to furnish several laterals the same season. Keep the shoots in all parts closely trained, both to preserve the regularity of the espalier, and to admit the air and sun to the advancing fruit."

"The winter pruning may be performed from November till the beginning of April. This comprehends the regulation of the wood branches, the bearers, and the young shoots. First examine the new shoots trained in the preceding summer, and, if too abundant, retain only a competency of well-placed and promising laterals, to furnish vacant parts with a leading shoot to each parent branch. Continue these mostly at their full length, as far as there is room. Cut out close the superabundant and irregular young shoots, and where any of the elder branches appear unfruitful, cankered, or decayed, cut them either clean out, or prune short to some good lateral, as may seem expedient. Also prune into order any branches which are very irregular or too extended. Carefully preserve all the eligible natural fruit spurs, but remove all unfruitful stumps or snags, and large projecting rugged branches. As each espalier is pruned, let the old and new branches be laid in at convenient distances according to the size of the fruit, 4, 5, or 6 inches asunder, and neatly tied or nailed to the wall or trellis."—Abercrombie.

*Heading down apple-trees* that are much cankered, is strongly recommended by Forsyth, who gives an example of one after it had been headed down four years, which bore plenty of fine fruit. The point at which it was headed down was within 18 inches of the soil, and under it on the stump were two large wounds, made by cutting out a cankered part, and which, being covered with the composition, were soon nearly filled up with sound wood. Very little pruning is at first given to trees so cut, but afterwards a regular succession of bearing wood is kept up by removing such as have borne three or four years. Thus, one branch which has done bearing is cut off, and succeeded by another, and when that is tired also, it is cut off and replaced by a third, and so on.

*Grafting old apple-trees* of indifferent sorts with superior varieties, is an obvious and long tried improvement. In this case, if the tree is a standard, it is only headed down to standard height; in old subjects, most commonly the branches only are cut over within a foot or two of the trunk, and then grafted in the crown or cleft manner.

*On fertilising the blossoms of pear and apple-trees.*—An almost general unproductiveness, as to the fruit of the superior varieties of *pear* and *apple-trees*, has long been a subject of complaint with horticulturists, both in south and north Britain. The Rev. George Swayne (Hort. trans. 5. p. 208.) has a tree of the *Gansell's bergamot pear*, which had for a long time baffled all his attempts to alter its unfertile habits. The tree had all the appearance of health and sufficient luxuriance, and produced a profusion of blossoms at the proper season, but has never borne more than three or four pears in any one year. Before the blossoms expanded, he cut off all the flowers in each corymb, except the lower three, in this tree, and another tree of the *brown beurré*. He grafted these trees of at least three-fourths of all their flower-buds. On the *beurré* this operation subsequently appeared to have the best effect, for there was scarcely an instance in which the remaining blossoms did not set, which afterwards produced a fine crop of pears. But on the *Gansell*, although the blossoms at first seemed to set, and many of them did not fall till Midsummer, yet not a single pear arrived at maturity. By dissecting many of the largest which fell off last, it was plain that the kernels had not been impregnated, indicating

some imperfections in the essential parts of the blossom. In the following spring, he impregnated the stigmas of many of the flowers with the pollen of the *beurré pear*, and most of them came to perfection and produced large well-formed fruit. The cross impregnation had not produced any change in the appearance of the fruit, nor was any difference in flavour discovered. Before he impregnated the blossoms, he cut off all the buds in the corymb, except the three lowest ones, as in the former year. Whether the result of the above-detailed experiments be such as to authorise an expectation that artificial assistance in vegetable fecundation will hereafter become of so much importance to gardeners in the instances just alluded to, as in those at present recognised of the cucumber, the melon, the hautbois strawberry, &c. must be left to others to ascertain.

*Injuries, insects, diseases, &c.*—The misletoe (*Viscum album*) is frequently, through negligence, suffered to injure trees in orchards, and different species of mosses and lichens those of gardens. "Moss," Mr. Knight observes, "appears to constitute a symptomatic rather than a primary disease in fruit trees; it is often brought on by a damp or uncultivated soil, by the age of the variety of fruit, and by the want of air and light, in closely planted, unpruned orchards. In these cases it can only be destroyed by removing the cause to which it owes its existence."

*Blight.*—Whatever deranges and destroys the organization of the blossoms, and prevents the setting of the fruit, is in general termed a blight, whether produced by insects, parasitical plants, or an excess of heat or cold, drought or moisture. One of the most injurious insects with which the *apple* tree has been visited is the *Aphis lanigera* of Lin., the *Eriosoma mali* of Leach, woolly aphis, apple-bug, or American blight. "The eriosomata," Leach observes, "form what are called improperly galls on the stalks of trees, near their joints and knobs, which are in fact excrescences, caused by the efforts of nature to repair the damage done to the old trees by the perforation of those insects, whose bodies are covered with white down." *Sam. cutym.*—There is no way of getting rid of these insects, but cleaning them off with a brush and water, together with amputation when it has been some time at work; but even this will not do unless resorted to at an early stage of its progress. The caterpillars of many species of butterfly and moth, and the larvæ of various other genera of the hemiptera and lepidoptera, &c. as *Scarabæus*, *Curculia*, &c., attack the *apple* tree in common with other fruit-trees; and on a large scale it is difficult, if not impracticable, to avoid their injurious effects. Burning straw or other materials under the trees has been long recommended; but the principal thing to be relied on is regimen; that is, judicious subsoil and surface soil, culture and pruning.

*Ripening the fruit.*—Berard, in an essay on the ripening of fruits, which gained the prize of the French Academy of Sciences in 1821, found that the loss of carbon is essential to the ripening of fruit; that this carbon combines with the oxygen of the air, and forms carbonic acid, and that when the fruit is placed in an atmosphere deprived of oxygen, this function becomes suspended, and the ripening is stopped. Hence it results, that most fruits may be preserved during a certain period, by gathering them a few days before they are ripe, and placing them in an atmosphere free from oxygen. The most simple process for effecting this consists in placing at the bottom of a bottle, a paste formed of lime, sulphate of iron, and water; then introduce the fruit, so as they may rest detached from the bottom of the bottle and from each other, and cork the bottle and cover it with cement. Peaches, plums, and apricots have been kept in this way for a month, and apples for three months. (Journ. R. Inst. xi p. 396.) Dudit of Mazeres, has found that one-third of boiled apple-pulp, baked with two-thirds of flour, having

been properly fermented with yeast for twelve hours, makes a very excellent bread, full of eyes, and extremely palatable and light.—*New Monthly Mag.* June, 1821.

*Storing the fruit.*—The fruit-room ought to be well ventilated, and for this purpose it ought to have a fire-place. The fruit-room was formerly a mere loft, where fruit was kept on the floor in common with onions, with no proper means of separation. Now, however, they are regularly fitted up either with shelves, on which to place sieves of different sorts of fruit, or with close shelves, for jars or boxes, &c., according to the various modes adopted for preserving them. The room may be of any form, but one long and narrow is generally best adapted for ventilation, and heating or drying when necessary by a flue. The system of shelves may be placed along one side, and may be raised to the height of six feet or more, according to the number wanted. These shelves are formed of open work, on which to place the sieves of fruit, each of which should be numbered, in order to know the kind of fruit contained in each.

*Apple-tree.* Fl. April. Britain. Tree 3 to 30 feet.

21 *P. dioica* (Willd. arb. 263. spec. 5. p. 1018.) leaves oval, serrated, clothed with tomentum beneath as well as on the calyxes; flowers usually solitary, dioecious from abortion; petals linear, length of calyx; styles glabrous.  $\frac{1}{2}$ . H. Native country unknown, but cultivated in gardens, and perhaps has originated from the *Pyrus Malus*. *P. apétala*, Munch. hausv. 5. p. 247. *Malus dioica*, Audub. cat.

*Dioecious Apple-tree.* Fl. April, May. Clt. 1818. Tree 10 to 20 feet.

22 *P. ASTRACANICA* (D. C. prod. 2. p. 635.) leaves oval-oblong, acute, somewhat doubly serrated, pale beneath and villous on the nerves, glabrous above, with the rachis puberulous.  $\frac{1}{2}$ . II. Native about Astracan. *Malus Astracànica*, Dum. Cours. ed. 2. vol. 5. p. 426. Perhaps only a variety of *P. Malus*.

*Astracan Apple-tree.* Fl. April, May. Clt. 1810. Tree 15 to 20 feet.

23 *P. SPECTABILIS* (Ait. hort. kew. 2. p. 175.) leaves oval-oblong, serrated, glabrous as well as the calycine tube; umbels sessile, many-flowered; petals ovate, unguiculate; styles woolly at the base.  $\frac{1}{2}$ . II. Native of China. Curt. bot. mag. 267. *Malus spectabilis*, Desf. arbr. 2. p. 141. *Malus Sinensis*, Dum. Cours. ed. 2. vol. 5. p. 429. When it blossoms in perfection no tree can be more showy than the Chinese *apple* tree. The flowers are large, of a pale red, when open semidouble, and the buds are of a deeper hue.

*Showy or Chinese Apple-tree.* Fl. April, May. Clt. 1780. Tree 20 to 30 feet.

24 *P. FRUNIFOLIA* (Willd. spec. 2. p. 1018.) leaves ovate, acuminate, serrated, quite glabrous as well as the calyx; peduncles pubescent; styles woolly at the base.  $\frac{1}{2}$ . H. Native of Siberia? *Pyrus Malus*  $\beta$ . Ait. hort. kew. 2. p. 175. *Malus hybrida*, Desf. arb. 2. p. 141.? Mill. fig. t. 269. The leaves resemble those of the cherry tree; they are on long petioles. The flowers are white, much like those of the pear tree. The fruit is globose, when ripe yellowish coloured, but red on the side exposed to the sun, of an austere taste, decaying like the fruit of the medlar, and then more palatable.

*Plum-leaved or Siberian Crab.* Fl. April, May. Clt. 1758. Tree 20 to 30 feet.

25 *P. BACCATA* (Lin. mant. 75.) leaves ovate, acute, equally serrated, glabrous, length of petioles; peduncles crowded; lobes of calyx deciduous.  $\frac{1}{2}$ . II. Native of Siberia and Dahuria. Wats. dend. t. 51. Pall. fl. ross. t. 10. *Malus baccata*, Desf. arb. 2. p. 141.—Amm. ruth. t. 31. Flowers white. Fruit roundish, yellow tinged with red, about the size of a cherry; the pulp is red, and is used for making quasar punch in Siberia.

*Berried or Small-fruited Crab-tree.* Fl. Apr. May. Clt. 1784. Tree 15 to 20 feet.

26 *P. QUINQUEFLOÏA* (Hamilt. ex Lin. soc. herb.) leaves elliptic, acute, downy on the nerves and petioles; pedicels elongated, sessile, 5-6-together, axillary; calycine segments subulate.  $\frac{1}{2}$  H. Native of Chitlong. Flowers white?

*Five-flowered Crab-tree.* Tree.

27 *P. SIEVERSI* (Led. fl. alt. 2. p. 222.) leaves ovate, rather tomentose; flowers umbellate.  $\frac{1}{2}$  H. Native of Siberia, at the river Uldschar, in the Kirghisean Steppe. *P. nova* species, Sievers, in Pall. nord. beytr. 7. p. 292. A bush with many stems rising from the same root. Fruit very acid.

*Sievers's Crab-tree.* Fl. April, May. Tree 8 to 12 feet.

28 *P. CORONARIA* (Lin. spec. 687.) leaves broad-ovate, rounded at the base, serrated, and rather angular, smooth; peduncles corymbose, glabrous.  $\frac{1}{2}$  H. Native of North America, from Pennsylvania to Carolina. Sims, bot. mag. 2009. Wats. dendr. brit. icop. *Malus coronaria*, Mill. Flowers red, and with a very fragrant odour. The fruit is small, sour, and unfit for any thing but to make vinegar of.

*Garland or Sweet-scented Crab-tree.* Fl. May. Clt. 1724. Tree 20 feet.

29 *P. ANGUSTIFOLIA* (Ait. hort. kew. 2. p. 276.) leaves oblong-lanceolate, dentately-serrated, tapering to the base, shining; peduncles corymbose.  $\frac{1}{2}$  H. Native of Carolina, in woods. Wats. dendr. brit. 132. Lindl. bot. reg. 1207. *P. coronaria*, Wang. amer. 61. t. 21. f. 47. *Malus sempervirens*, Desf. arbr. 2. p. 141. Flowers reddish.

*Narrow-leaved Crab-tree.* Fl. My. Clt. 1750. Tr. 10 to 20 ft.

SECT. III. *A'RIA* (*Aria* is a name given by Theophrastus to a tree, probably from the name of a place, as many places bear that name). D. C. prod. 2. p. 635. Petals spreading, flat. Styles usually 2 or 3. Pome globose. Flowers disposed in racemose corymbs; peduncles branched. Leaves simple, glandless, clothed with white tomentum beneath.

30 *P. A'RIA* (Ehrh. Beitr. 4. p. 20.) leaves elliptic, cut, serrated, clothed with adpressed white tomentum beneath; corymbs flat; styles about 2.  $\frac{1}{2}$  H. Native of Europe and Siberia, in groves; in Britain, in mountains on a chalky soil, and in the fissures of limestone rocks. Smith, engl. bot. 1858. *Crataegus A'ria*, Lin. spec. 681. Fl. dan. t. 302. *Mespilus A'ria*, Scop. *Sorbus A'ria*, Crantz. austr. 1. p. 2. f. 2.—Bauh. hist. 1. p. 65. Young branches very white and downy. Leaves doubly serrated, sometimes with several marginal lobes. Flowers white, in corymbose compound tufts. Fruit globular, scarlet, dotted, mealy, acid, and astringent.

*Var. a, obtusifolia* (D. C. prod. 2. p. 636.) leaves flat, oval, obtuse, simply serrated, glabrous above in the adult state.  $\frac{1}{2}$  H. Fl. dan. t. 302. *P. A'ria ovalis*, Hortul.

*Var. b, acutifolia* (D. C. l. c.) leaves oval, stiff, acute at both ends, concave, doubly serrated, grey, cobwebbed above.  $\frac{1}{2}$  H. *Crataegus longifolia*, Duham. ed. nov. 4. t. 34. *P. alpina*, Willd. enum. 527.

*Var. c, undulata* (Lindl. hort. trans. 7. p. 234.) leaves flat, oval-lanceolate, broad, undulated, unequally and deeply serrated, acuminate, cobwebbed above.

*Var. d, angustifolia* (Lindl. l. c.) leaves oval, obtuse, concave, somewhat simply serrated, woolly above.

*Var. e, rugosa* (Lindl. l. c.) leaves large, ovate-elliptic, doubly serrated, shining above and wrinkled, white beneath.

*Var. f, Crética* (Lindl. l. c.) leaves flat, orbicularly elliptic, crenate-serrated, retuse, cuneate at the base, smooth above and hoary beneath; branches cobwebbed. *P. A'ria rotundifolia*, Hortul. *P. Græca*, Hortul.

*Var. g, bullata* (Lindl. l. c.) leaves concave, elliptic, acu-

minated, blistered, coarsely serrated at the apex, entire at the base. *P. A'ria acuminata*, Hortul.

*Aria or Common White Beam-tree or White Wild Pear.* Fl. May. Brit. Tree 20 to 30 feet.

31 *P. EDULIS* (Willd. enum. p. 527.) leaves oblong, cuneate at the base, unequally and doubly serrated, tomentose beneath; flowers corymbose.  $\frac{1}{2}$  H. Native of France. Wats. dendr. brit. t. 52. *Crataegus edulis*, Hort. *P. intermedia*, var. *angustifolia*, D. C. prod. 2. p. 636.—Flowers white. Fruit red, sapid, and edible.

*Edible-fruited White Beam-tree.* Fl. May. Clt.? Tree 20 to 30 feet.

32 *P. INTERMEDIA* (Ehrh. Beitr. 4. p. 20.) leaves ovate, deeply lobed and toothed, clothed with white adpressed tomentum beneath; corymbs flat.  $\frac{1}{2}$  H. Native of Europe, especially towards the north. In Britain on the walls of Castle Dinas y bran, Denbighshire. *Crataegus A'ria*  $\beta$ , Lin. spec. 681. *Crataegus Scandica*, Wahl. fl. ups. 165. *Sorbus hybrida*, Huds. 216. With. 461. *P. hybrida*, Smith, fl. brit. p. 534. Flowers white. Fruit red, edible.

*Var. a, latifolia* (D. C. prod. 2. p. 636.) leaves broad-ovate.  $\frac{1}{2}$  H. Native of France. *Crataegus latifolia*, Poir. 4. p. 444. Duham. arb. 1. t. 80. *Sorbus latifolia*, Pers. *Crataegus dentata*, Thuill. fl. par.

*Intermediate White Beam-tree.* Fl. My. Wales. Tr. 20 to 30 ft.

33 *P. VESTITA* (Wall. cat. 679.) leaves, cymes, and young branches clothed with white tomentum; leaves elliptic or obovate-elliptic, acuminate, serrated towards the apex; corymbs branched, terminal.  $\frac{1}{2}$  H. Native of Nipaul and Kamaon. Flowers white. Fruit red? Habit of *P. A'ria*.

*Clothed White Beam-tree.* Tree 20 to 30 feet.

34 *P. KAMAONENSIS* (Wall. cat. no. 678.) leaves oblong, pinatifidly lobed and serrated, acuminate, clothed with white down beneath; corymbs, young branches, and petioles tomentose; fruit pear-shaped, about the size of a common medlar, red.  $\frac{1}{2}$  H. Native of Kamaon and Sirmore. Flowers small, white.

*Kamaon White Beam-tree.* Tree 20 to 30 feet.

SECT. IV. *TORMINARIA* (from *tormina*, gripings; the fruit of *P. torminalis* was supposed to cure gripings and dysentery by their astringency). D. C. prod. 2. p. 636. Petals spreading, flat, rather unguiculate. Styles 2-5, connected together, glabrous. Pome turbinate at the base, rather dry, truncate at the apex in consequence of the calycine lobes being deciduous. Leaves lobately angular, glabrous when in the adult state. Flowers corymbose; peduncles branched.

35 *P. TORMINALIS* (Ehrh. Beitr. 6. p. 92.) leaves ovate, somewhat cordate, deeply lobed; lobes serrated, acute, lower ones spreading; when young downy beneath, but in the adult state glabrous.  $\frac{1}{2}$  H. Native of Europe, in woods and hedges. In England chiefly in the midland and southern counties. *Crataegus torminalis*, Lin. spec. 681. Smith, engl. bot. t. 298. Fl. dan. 798. Jacq. aust. t. 443. *Sorbus torminalis*, Crantz. aust. p. 85. Flowers white, numerous, in large terminal downy corymbose panicles. Styles 3-4 or 5. The fruit is not much larger than that of the *hawthorn*, becomes agreeably acid and wholesome after the frost has touched it, and may sometimes be seen in the London fruit-shops. Ray prefers its flavour to the *true service*, which latter is now become obsolete.

*Gripping or Common Wild Service-tree.* Fl. Ap. May. Brit. Tr. 30 to 40 ft.

36 *P. RIVULARIS* (Dougl. mss. Hook. fl. bor. amer. p. 203. t. 68.) leaves ovate, entire, and angularly somewhat 3-lobed, rather acuminate, acutely serrated, pubescent beneath; corymbs terminal, simple; calyxes hairy, and densely tomentose inside; styles 3-4, connected at the base.  $\frac{1}{2}$  H. Native of Nootka

Sound, and other parts of the north-west coast of America. Petals roundish, white. Pome small, hardly half an inch long, subglobose, red or yellow. The wood is employed for making wedges, and is so hard as to be susceptible of a fine polish. The fruit is used as an article of food, and is called in the language of the Chenook tribe of Indians *Pow-itch*.

*River-side Wild Service-tree.* Fl. Ap. May. Tree 15 to 20 ft.

SECT. V. *ERIÓLOBUS* (from *ερion*, *erion*, wool, and *λοβος*, *lobos*, a lobe; in reference to the woolly lobes of the calyx). D. C. prod. 2. p. 636. Petals spreading, flat, somewhat unguiculate, rather tridentate at the apex. Styles 5, elongated, rather connected, very hairy at the base. Pome globose, glabrous, crowned by the calycine lobes, which are clothed with tomentum.

37 *P. TRILOBATA* (D. C. prod. 2. p. 636.) leaves palmately-lobed, glabrous; middle lobe 3-lobed, lateral ones usually 2-lobed; lobules serrated.  $\frac{1}{2}$ . H. Native of Mount Lebanon. *Cratægus trilobata*, Labill. dec. 4. p. 15. t. 10. Poir. suppl. 1. p. 291. Flowers white.

*Three-lobed-leaved Service-tree.* Fl. May, June. Clt. 1810. Tree 20 feet.

SECT. VI. *SÓRBUS* (from the Celtic *sormel*, composed of *sor*, wild, and *mel*, an apple; wild apple). Lin. gen. no. 623. Petals spreading, flat or concave. Styles 2-5. Pome globose or turbinate. Leaves impari-pinnate. Flowers corymbose; peduncles branched.

38 *P. AURICULATA* (D. C. prod. 2. p. 636.) leaves of 3 pairs of leaflets, hairy beneath, the lower 2 or 4 leaflets distinct, but the ultimate ones are joined into one large, ovate, crenated leaflet.  $\frac{1}{2}$ . H. Native of Egypt. *Sórbus auriculata*, Pers. ench. 2. p. 39. Corymb compact. Flowers white. Perhaps only a variety of *Sórbus pinnatifida*.

*Auricled-leaved Service-tree or Mountain-ash.* Fl. May. Clt. 1800. Tree 20 to 30 feet.

39 *P. PINNATIFIDA* (Ehrh. Beitr. 6. p. 93. Smith, engl. bot. 2331.) leaves deeply pinnatifid or half pinnate, clothed with hoary down beneath, as well as the petioles and peduncles; styles about 3.  $\frac{1}{2}$ . H. Native of Gothland and Thuringia, in mountain woods. In the Western Isles of Scotland on the mountains, particularly in rocky situations on Cairn na Callich, and other mountains at the north end of the Isle of Arran. *P. hybrida*, Smith, fl. brit. p. 534. but not of Willd. spec. 2. p. 1022. *Sórbus hybrida*, Lin. spec. p. 684. Lin. fil. fasc. 11. t. 6. Fl. dan. t. 301. *Cratægus Aria* γ *Fénica*, Lin. spec. ed. 2. p. 167. Flowers cymose, cream-coloured. Pome globose, red. This species is an intermediate plant between *P. aucuparia* and *P. Aria*.

*Var. β, arbutuscula* (Poir. suppl. 5. p. 164. under *Sórbus*.) dwarf; leaflets nearly glabrous, obtuse, outer ones usually confluent.  $\frac{1}{2}$ . H. Native of Germany. This is a variety either of *P. pinnatifida* or *P. aucuparia*.

*Pinnatifid-leaved Service-tree or Mountain-ash.* Fl. May. Scotland. Tree 20 to 30 feet.

40 *P. MICROCARPA* (D. C. prod. 2. p. 636.) leaves pinnate, glabrous, as well as the petioles; leaflets acuminate, unequally and deeply serrated, the serratures ending in a setaceous mucrone; pome globose, red.  $\frac{1}{2}$ . H. Native of North America, from Carolina to New York. *Sórbus aucuparia* α, Michx. fl. bor. amer. 2. p. 291. *Sórbus micrantha*, Dum. Cours. ed. 2. vol. 5. p. 464. *Sórbus microcarpa*, Pursh. fl. amer. sept. 1. p. 341. Flowers whitish.

*Small-fruited Mountain-ash.* Fl. May, June. Tree 12 ft.

41 *P. SAMBUCIFOLIA* (Cham. in Linnæa. 2. p. 36.) leaves with 5 pairs of ovate, lanceolate, sharply serrated, acuminate leaflets, which are pilose on the nerves and margins, and bearded at the

apex; stipulas clothed with rufous villi.  $\frac{1}{2}$ . H. Native of Kamtschatka.

*Elder-leaved Mountain-ash.* Shrub.

42 *P. AUCCUPARIA* (Gærtn. fruct. 2. p. 45. t. 87.) leaves pinnate, downy beneath when young; leaflets uniform, serrated, glabrous; buds and peduncles downy; pomes globose.  $\frac{1}{2}$ . H. Native of Europe and Siberia, in mountains, woods, and hedges; plentiful in some parts of Britain. *Sórbus aucuparia*, Lin. spec. 683. Crantz. aust. 2. p. 49. t. 1. f. 4. Smith, engl. bot. t. 337. Mill. fig. t. 43. Fl. dan. 1034. *Mespilus aucuparia*, All. Flowers white, numerous, with a light almond-like scent; petals concave. Fruit small, globose, scarlet, very juicy, sour, and bitter; they are eaten in some parts of Scotland and Wales, and afford an agreeable fermented liquor, and by distillation a strong spirit; soaked in water to extract some of its bitterness, and then boiled with sugar, makes a kind of jelly, which is tolerably flavoured. Birds of the thrush kind devour them with avidity, and our mountain-ash trees planted for ornament in most parts of England are thus unfortunately stripped early in autumn of their produce. The *mountain-ash* in profitable planting is chiefly valuable as a nurse tree, growing very fast when young, and enduring the most severe exposure. The timber is used by wheel-wrights, and for other common country purposes; the bark is used by tanners, and the berries afford a dye. As an undergrowth it affords tolerable poles and hoops. It will grow in any soil, dry or wet, and as to situation, it is found on the sea shore, and near the tops of the highest mountains. It seems to thrive best on the sides of moist rocky dells and dingles. In the days of superstition the *mountain-ash* was considered as an object of great veneration. It is even to be found at this day growing in the neighbourhood of Druidical circles of stones in Scotland. The *roddon* tree was formerly in Scotland especially famous as a protection against charms and witchcraft. The tree is called in Scotland *rhodon* or *roddon* tree, *roan* tree, and *rantry*. In England *mountain-ash*, *quick-bean*, *witchen* or *whitten*. In Germany the fowlers' bait-springs or nooses of hair, are suspended in the woods, with these berries attached to them to entice the red-wings and field-fares, whence the specific name *aucuparia*.

*Fowlers' or Common Mountain-ash or Roan-tree.* Fl. May. Britain. Tree 20 to 40 feet.

43 *P. AMERICANA* (D. C. prod. 2. p. 637.) leaves pinnate; leaflets oblong, acute, almost equally serrated, at length quite glabrous; pomes globose (purple, Pursh; fulvous, Torrey).  $\frac{1}{2}$ . H. Native of North America, in Canada and throughout the woody country; Newfoundland; on the north-west coast, and in the subalpine prairies of the high mountains. Wats. dend. brit. t. 54. Flowers white.

*American Mountain-ash.* Fl. May. Clt. 1782. Tr. 15 to 20 ft.

44 *P. FOLIOLOSA* (Wall. cat. 677. pl. asiat. rar. 2. p. 81. t. 189.) leaves pinnate, with 7-8 pairs of elliptic-lanceolate, mucronate leaflets, which are serrated at the apex, pubescent beneath; cymes branched, terminal, pubescent.  $\frac{1}{2}$ . H. Native of Nipaul. Flowers white. Pome small, obovate-roundish, red.

*Leafy Mountain-ash.* Tree 20 feet.

45 *P. URSI'NA* (Wall. cat. 675.) leaves pinnate, with numerous pairs of leaflets; leaflets lanceolate, blunt at both ends, mucronate at the apex and cuspidately serrated, rusty beneath; corymbs, branches, rachis, and nerves of leaves clothed with rusty villi.  $\frac{1}{2}$ . H. Native of Nipaul, Kamaon, and Gosaings-than. Pomes globular, red, about the size of those of the *common mountain-ash*.

*Batger's Mountain-ash.* Tree.

46 *P. DOMESTICA* (Smith, engl. bot. t. 350.) leaves pinnate; leaflets uniform, serrated towards the points, clothed with deciduous cottony down beneath; buds glabrous, clammy, acumi-

nated; flowers paniced; fruit pear-shaped. *h. II.* Native of Europe, in mountainous parts. In England in the mountainous parts of Cornwall; also in the moorlands of Staffordshire. *P. Sôrbus*, Gartn. fruct. 2. p. 45. t. 87. *Sôrbus domestica*, Lin. spec. 684. Crantz. stirp. fasc. 2. p. 48. t. 2. f. 3. Jacq. fl. aust. t. 447. Flowers about the size of those of the *hawthorn*, cream-coloured. Styles usually 5. The *true service-tree* is of slow growth, and, according to Kroker, does not come into bearing before it is 60 years old. The fruit is obovate, about an inch in length, reddish spotted, extremely austere, causing a most painful and durable irritation in the throat if tasted in an unripe state; but when mellowed by frost or keeping, it becomes brown, soft, and eatable, resembling a medlar, though to most people less agreeable. It is common in Italy, and ripens at Genoa in September, where it is esteemed good in dysentery and fluxes. The wood, which is very hard, is held in repute for making mathematical rulers and excisemen's gauging sticks. In Italy they have many varieties obtained from seeds; but those generally known in this country are only three; the pear-shaped, the apple-shaped, and berry-shaped. The tree is recommended by Forsyth and Abercrombie to be grown as a standard at 20 or 30 feet distance, and to be pruned and otherwise treated like the apple and pear. It may also be grafted in the same manner on the same kind of stocks, or it may be propagated by seeds, cuttings, or layers, but the first mode is preferable. It is late in the autumn before the fruit can be gathered; after it is collected wipe it dry, and lay it on dry straw, spread on the open shelves of the fruit room, and in about a month it will become mellow and fit for use.

*Domestic or True Service-tree.* Fl. May. Britain. Tree 20 to 60 feet.

47 *P. LANUGINOSA* (D. C. prod. 2. p. 637.) leaves pinnate; leaflets serrated, clothed with cottony down beneath, as well as the petioles and buds; pomes globose. *h. II.* Native of Hungary? *Sôrbus lanuginosa*, Kit. in litt. Flowers whitish.

*Woolly Service-tree.* Fl. May. Tree 20 to 30 feet.

48 *P. SPURIA* (D. C. prod. 2. p. 637.) leaves pinnate, of 3 pairs of leaflets, hairy beneath; leaflets ovate, crenated, terminal one the largest; rachis glanduliferous above. *h. II.* Native country unknown. *Pyrus hybrida*, Mœnch. weiss. t. 6. ex Willd. spec. 2. p. 1022. *Sôrbus spuria*, Pers. ench. 2. p. 39. *Mespilus sorbifolia*, Poir. suppl. 4. p. 72. Flowers white. Fruit red. This tree is perhaps a hybrid between *P. aucuparia* and *P. arbutifolia*. Styles 5. Probably referrible to the following section.

*Spurious Service-tree.* Fl. May. Clt. 1800. Tree 20 to 30 ft.

SECT. VII. *ADENORHACHIS* (from *ἀδην*, *aden*, a gland, and *ραχίς*, *rachis*, the spine of the back; in reference to the rachis of the leaves bearing glands). D. C. prod. 2. p. 637. Petals spreading, unguiculate, with the limbs concave. Styles 2-5. Pome globose. Leaves simple, bearing glands along the rachis on the upper side. Flowers corymbose. Peduncles branched.

49 *P. ARBUTIFOLIA* (Lin. fil. suppl. 256.) leaves obovate-oblong, acute, crenate-serrate, downy beneath, as well as the calyxes; corymbs few-flowered, shorter than the leaves; fruit pear-shaped. *h. H.* Native of North America, throughout Canada from Lake Huron to the Saskatchewan, Newfoundland, &c. *Crataegus pyrifolia*, Lam. dict. 1. p. 83. *Arônia pyrifolia*, Pers. ench. 2. p. 39. *Crataegus serratus*, Poir. suppl. 1. p. 292. *Mespilus arbutifolia*, Lin. spec. 685. Smith, arb. t. 86. *Mespilus arbutifolia a erythrocarpa*, Michx. fl. bor. amer. 1. p. 292. Mill. fig. t. 109. Flowers white. Pome red.

*Var. β, intermedia* (Lindl. hort. trans. 7. p. 229.) fruit globose, brown. *h. H.*

VOL. II.

*Var. γ, serotina* (Lindl. l. c.) leaves shining, velvety beneath; fruit late, partly-coloured. *h. H.*

*Arbutus-leaved Pyrus.* Fl. May. Clt. 1700. Sh. 4 to 6 ft. 50 *P. FLORIBUNDA* (Lindl. hort. trans. 7. p. 230.) branches cinereous, reclinate; leaves oblong-lanceolate, acute, on long petioles, tomentose beneath, as well as the calyxes; fruit spherical; corymbs many-flowered, longer than the leaves. *h. II.* Native of North America? Lindl. bot. reg. 1006. Flowers white. Fruit black.

*Bundle-flowered Pyrus.* Fl. May, June. Shrub.

51 *P. DEPRESSA* (Lindl. l. c. p. 230.) stems humble, reclinate; leaves oblong, obtuse, tomentose beneath, as well as the calyxes; fruit pear-shaped; corymbs length of the leaves. *h. II.* Native of North America. Flowers white. Fruit dark purple.

*Depressed Pyrus.* Fl. May. Shrub 1 to 2 feet.

52 *P. MELANOCARPA* (Willd. enum. p. 525.) stem humble, erect, glabrous; leaves oblong, acute, shining, serrated, glabrous beneath, as well as the calyxes and peduncles; fruit roundish-turbinate. *h. II.* Native of North America, from Canada to Virginia, and on the mountains of Carolina. *P. arbutifolia β*, Willd. spec. 2. p. 1013. *Arônia arbutifolia*, Pers. ench. 2. p. 39. Corymbs more crowded than those of the last species, and the pomes are black. Flowers white.

*Var. β, subpubescens* (Lindl. hort. trans. 7. p. 232.) leaves when young tomentose beneath, but glabrous in the adult state.

*Black-fruited Pyrus.* Fl. May, June. Clt. 1700. Sh. 2 ft.

53 *P. PUBENS* (Lindl. hort. trans. 7. p. 232.) stem erect; branches pubescent; leaves oblong or obovate, abruptly acuminate, smooth; fruit spherical, and are, as well as the calyxes, quite glabrous; corymbs loose, many-flowered; fruit with a glabrous disk. *h. H.* Native of North America. Flowers white. Fruit round, large, dark purple. Both this and the following have the robust foliage and habit of *P. chamaemepilus*.

*Downy Pyrus.* Clt. 1810. Shrub 4 to 5 feet.

54 *P. GRANDIFOLIA* (Lindl. l. c.) stem erect, and is, as well as the branches, smoothish; leaves oblong or obovate, acute, glabrous; fruit spherical, and are, as well as the calyxes, glabrous; corymbs few-flowered, coarctate; fruit with a villous disk. *h. H.* Native of North America. Lindl. bot. reg. 1154. Flowers white. Fruit dark purple.

*Great-leaved Pyrus.* Clt. 1810. Shrub 4 to 5 feet.

SECT. VIII. *CHAMEMESPILUS* (*chamæ* in botany usually signifies false, and *Mespilus*, the medlar; false medlar). D. C. prod. 2. p. 637. Petals erect, connivent, concave. Styles 2. Pome ovate. Leaves simple, glandless. Flowers disposed in capitate corymbs.

55 *P. CHAMEMESPILUS* (Lindl. in Lin. trans. 13. p. 98.) leaves ovate, serrated, glabrous. *h. II.* Native of Europe, in mountainous parts. *Crataegus chamaemepilus*, Jacq. aust. t. 231. hort. vind. 243. *Mespilus chamaemepilus*, Lin. spec. 685. *Sôrbus chamaemepilus*, Crantz aust. 83. t. 1. f. 3. Leaves clothed with deciduous down when young. Flowers reddish. Fruit round, red.

*Bastard-Medlar or Quince.* Fl. May, June. Clt. 1683. Shrub 5 to 6 feet.

† *Species not sufficiently known.*

56 *P. ? ALNIFOLIA* (Lindl. l. c.) glabrous; leaves roundish, toothed at the apex, feather-nerved, rather glaucous beneath; raceme simple, elongated. *h. H.* Native of North America, at Fort Mandan. Pome black, sugary.

*Alder-leaved Pyrus.* Shrub.

57 *P. TOMENTOSA* (D. C. prod. 2. p. 637.) leaves oval-lanceolate, rather crenulated, on short petioles, clothed with white tomentum beneath, as well as the branchlets, and with cinereous

villi above. *h. H.* Native of Siberia. *Malus tomentosa*, Dum. Cours. ed. 2. vol. 5. p. 438. Said to be allied to *P. baccata*, but the flowers as well as the fruit are unknown.

*Tomentose Pyrus.* Tree.

58 *P. RUSICUNDA* (Hoffmans. verz. 1824. p. 192.) leaves ovate, acuminate, glabrous; pome like that of *P. Malus*, yellow on one side, and red on the other, covered with a kind of glaucous bloom. *h. H.* Native country unknown.

*Reddish Pyrus.* Tree.

*Cult.* All the species of *Pyrus* are either trees or large shrubs. They are both useful and ornamental; free growers thrive in any soil, and may be planted in shrubberies, or to stand singly. They may be raised from seeds, cuttings, layers, or by engrafting the rarer on the commoner sorts.

**XI. CYDONIA** (so named from being a native near Cydon in Candia). Tourn. inst. 632. t. 405. Pers. ench. 2. p. 40. D. C. prod. 2. p. 638.—*Pyrus* species of Lin. and others.

*Lin. syst. Icosandria, Pentagynia.* Calyx 5-cleft (f. 84. a.). Petals orbicular (f. 84. f.). Stamens erect (f. 84. b.). Styles 5. Pome closed (f. 84. g.), 5-celled; cells cartilaginous, many-seeded. Seeds covered with mucilaginous pulp.—Trees, with undivided, quite entire, or serrated leaves, and large flowers, which are either solitary, or few together in a kind of umbel.

**SECT. I. CYDONIA** (see genus for derivation). Lindl. in Lin. trans. 13. p. 97. Lobes of calyx rather foliaceous, and serrated. Stamens disposed in a single series.

1 *C. VULGARIS* (Pers. ench. 2. p. 40.) leaves ovate, blunt at the base, quite entire, clothed with white tomentum beneath, as well as the calyxes and pedicels; flowers few, in a kind of umbel. *h. H.* Native of the south of Europe, among rocks and in hedges. *Pyrus Cydonia*, Lin. spec. 687. Jacq. austr. t. 342. Woodv. med. bot. t. 79. *Cydonia Europæa*, Savi, alb. tosc. 1. p. 90. The *Quince-tree* is low, much branched, and generally crooked and distorted. The flowers are large, white, or pale red, and appear in May. The fruit varying in shape in the different varieties, globular, oblong, ovate or obovate; it has a peculiar and rather pleasant apple-smell, and an austere taste. It is mentioned by Tusser in 1753, but has never been very much cultivated.

*Use.*—The fruit is not eaten raw, but stewed, or in pies or tarts along with apples it is much esteemed. In confectionary it forms an excellent marmalade and syrup. When apples are flat and have lost their flavour, Forsyth observes, a quince or two in a pie or pudding will add a quickness. In medicine the expressed juice, repeatedly taken in small quantities, is said to be cooling, astringent, and stomachic, &c. A mucilage, prepared from the seeds, was formerly much in use, but is now supplanted by the simple gums. The fruit taken in small quantity is supposed to restrain vomiting and alvine fluxes. In nursery-gardens the plants are much used as stocks for the pear.

*The varieties of the quince* are as follow:—

1 *Common quince, coignassier commun.* This and the two following are often confused with each other; it is very probable that from seeds of either sort varieties have been, and still may be, obtained, some of which would produce apple-shaped, and some pear-shaped fruit.

2 *Apple-shaped quince, coignassier maliforme, coignassier*

*pomiforme.* *Cyd. vulgaris a maliformis*, Mill. dict. no. 2. Fruit nearly globose, of the same quality as the last.

3 *Pear-shaped quince, coignassier pyriforme.* *Cyd. vulgaris γ oblonga*, Mill. dict. no. 1. Leaves oval or oblong; fruit pear-shaped, of the same quality as the two last species.

4 *Portugal quince, coignassier de Portugal.* *Cyd. vulgaris*, var. *β Lusitânica*, Mill. dict. no. 3. This is a good sort, and distinct from the preceding kinds; it does not become, however, except in very favourable seasons, of so deep an orange; its leaves are broader; its growth less contracted, consequently it is the best sort for grafting pears upon.

5 *Orange quince.* This and the following possess characters differing so little from what may be found among sub-varieties of the others, that they are scarcely worth distinguishing.

6 *Large-fruited quince, coignassier à gros fruit.*

*Propagation.*—Generally by layers, but also by cuttings, and approved sorts may be perpetuated by grafting. In propagating for stocks nothing more is necessary than removing the lower shoots from the larger, so as to preserve a clean stem as high as the graft; but for fruit-bearing trees it is necessary to train the stem to a rod till it has attained 4 or 5 feet in height, and can support itself upright.

*Soil and site.*—The quince prefers a soft moist soil, and rather shady or at least a sheltered situation. It is seldom planted but as a standard in the orchard, or to grow singly in the garden, and a very few trees are sufficient for any family.

*Time of planting, the mode of bearing,* and all the other particulars are the same as for the apple and pear.

*Common Quince.* Fl. May, June. Clt. 1573. Tree 20 feet.

2 *C. SUMBOSHIA* (Hamilt. in D. Don, prod. fl. nep. p. 237.) leaves cordate, oval, mucronate, quite entire, clothed with white tomentum beneath, as well as the branchlets and calyxes; stipulas elliptic, acute, glandularly serrated; peduncles solitary, terminal, tomentose; calycine segments oblong; pome attenuated at the base. *h. H.* Native of Nipaul, where it is called in the Nawarice language *Sumboshi-swa*, and *Bhee* in that of Sirinigur. Very like *Cydonia vulgaris*.

*Sumboshi or Nipaul Quince.* Fl. May, June. Tree 20 feet.

3 *C. SINENSIS* (Thouin, in ann. mus. 19. p. 145. t. 8 and t. 9.) leaves ovate, acuminate at both ends, acutely serrated, when young rather villous, but in the adult state glabrous, as well as the calyxes; stipulas oblong-linear, glandularly serrated. *h. H.* Native of China. *Pyrus Sinensis*, Poir. suppl. 4. p. 452. Flowers white. Fruit egg-shaped, large, hard, and nearly dry, greenish. Seeds about 30 in each cell, many of which are abortive. This appears to be an intermediate plant between the last and the following.

*Chinese Quince.* Fl. May, June. Clt. 1818. Tree 20 feet.

**SECT. II. CHÆNOMÈLES** (from *χαίρω*, *chaino*, to open, and *μήλον*, *melon*, an apple; when the plant was first so called, the fruit examined was split at the top, from some cause or other; perhaps from heat). Lindl. l. c. Lobes of calyx short, obtuse, and quite entire. Stamens inserted in 2 series.

4 *C. JAPONICA* (Pers. ench. 2. p. 40.) leaves oval, somewhat cuneated, crenate-serrated, quite glabrous on both surfaces, as well as the calyxes; stipulas reniform, serrated. *h. H.* Native of Japan. *Pyrus Japonica*, Thunb. fl. jap. p. 207. Curt. bot. mag. t. 622. Moris, fl. consp. t. 1. p. Chaenomèles Japonica, Lindl. l. c. Flowers deep scarlet, solitary, or 2-3 together. A very ornamental plant. There is also a white flowered variety, which is also very ornamental.

*Japan Quince.* Fl. year. Clt. 1815. Shrub 4 to 6 feet.

*Cult.* All the species of *quince* are very ornamental when in blossom. The three first species answer well to be planted as standards singly in any conspicuous situation. The *C. Japonica*

is one of the most elegant hardy shrubs yet introduced to our gardens, as it produces its beautiful scarlet flowers the greater part of the year. It is a very proper plant for training against a wall. All the species may be increased by ripened cuttings off the roots, planted in a sheltered situation, with a hand-glass placed over them. They are also to be increased by grafting the one on the other, or on any of the plants contained in the present order.

† *Genera doubtful whether they belong to the present order.*

**XII. DICALYX** (from *dis*, double, and *καλὺς*, *kalyx*, a calyx; so named in consequence of the calyx being calyculated by bracteas, which assume the appearance of an outer calyx.) Lour. coch. p. 663. Blume, bijdr. 1116. Decàdia, Lour. Sariàva, Reinwdt.

**LIN. SYST.** *Icosándria, Digýnia*. Flowers superior. Calyx 5-cleft, permanent, calyculated by 2-3 bracteas. Corolla deeply 4-parted. Stamens numerous, inserted in the base of the corolla. Ovary inferior, 3-celled; cells many-seeded. Seeds pendulous. Styles 2, crowned by obtuse trigonal stigmas. Drupe baccate, containing a 1-3-celled nut; nut 1-seeded, 2 of the cells being usually vacant. Seeds albuminous. Embryo linear, somewhat incurved, inverted.

1 *D. TINCTORIUS* (Blum. bijdr. 1116.) leaves oblong, acuminate, rounded at the base or acutish, finely serrulated, smooth, rather pubescent at the ribs beneath, as well as the tips of the branches and peduncles; peduncles crowded, short, axillary; fruit smooth. *h. S.* Native of Java, in mountain woods.

*Var. β*; leaves smaller, very much acuminate, acute at the base, sharply serrated, covered with strigose down on the middle nerve beneath, as well as the branches. Perhaps a species.

*Dyer's Dicalyx.* Tree 20 feet.

2 *D. ODORATISSIMUS* (Blum. bijdr. p. 1116.) leaves elliptic-oblong, large, acute at both ends, but rather bluntish at the apex, coarsely and obtusely serrated, glabrous; panicles axillary, rather tomentose; fruit smooth. *h. S.* Native of Java, on the mountains. Flowers white.

*Very-sweet-scented Dicalyx.* Tree 30 feet.

3 *D. ALUMINOSUS* (Blum. bijdr. 1117.) leaves oblong-lanceolate, acuminate at both ends, bluntish at the apex, glabrous, with blunt exserted serratures; panicles axillary, finely tomentose; fruit smooth. *h. S.* Native of Java and Cochin-china. Decàdia *aluminosa*, Lour. coch. 315. Flowers small white. The wood and leaves are much used in dyeing by the natives of Cochin-china.

*Aluminous Dicalyx.* Tree.

4 *D. COSTATUS* (Blum. bijdr. 1117.) leaves oblong, tapering to both ends, smooth, finely serrulated; spikes short, axillary; fruit ribbed. *h. S.* Native of Java, on the mountains of Burangrang. Flowers white.

*Ribbed Dicalyx.* Tree.

5 *D. JAVAÏCUS* (Blum. bijdr. 1117.) leaves elliptic-oblong, acuminate, acute at the base, finely serrulated above the middle, smooth, rather pubescent on the veins beneath; spikes panicled, axillary, and terminal, and are, as well as the branches, densely tomentose. *h. S.* Native of Java, on the mountains.

*Java Dicalyx.* Tree.

6 *D. SALACENSIS* (Blum. bijdr. 1118.) leaves elliptic-oblong, acute at both ends, finely serrulated, and are, as well as the branches, quite glabrous; spikes simple or branched, axillary and terminal, short, densely tomentose. *h. S.* Native of Java, on Mount Salak. Flowers white.

*Salak Dicalyx.* Tree.

7 *D. SESSILIFOLIUS* (Blum. bijdr. 1118.) leaves nearly sessile, oval, acute at both ends, finely serrulated, and are, as well as the branches, glabrous; spikes branched, axillary and terminal,

rather tomentose; fruit smooth. *h. S.* Native of Java, on the top of Mount Gede. Flowers white.

*Sessile-leaved Dicalyx.* Tree.

8 *D. SPICATUS* (Blum. bijdr. 1118.) leaves lanceolate, acuminate at both ends, quite entire or serrulated, and are, as well as the branches, glabrous; spikes axillary and terminal, simple or branched, clothed with silky tomentum; fruit ovate, glabrous. *h. S.* Native of Java. Flowers white.

*Var. β*; leaves narrow, oblong-lanceolate.

*Spiked Dicalyx.* Tree.

9 *D. CILIATUS* (Blum. bijdr. 1119.) leaves oblong-lanceolate, acuminate at both ends, nearly entire, and are, as well as the branches, glabrous; spikes branched, axillary, downy; bracteas and calyxes ciliated; fruit oval, smooth; calycine segments ovate, acute. *h. S.* Native of Java, on Mount Tjerimai.

*Ciliated Dicalyx.* Tree.

10 *D. ACUMINATUS* (Blum. bijdr. 1119.) leaves oblong-lanceolate, acuminate at both ends, finely serrulated at the apex, and are glabrous as well as the branches; panicles axillary or almost terminal, smooth. *h. S.* Native of Java, on Mount Salak. This species comes very near *D. sylvaticus* of Lour, but the leaves are acuminate, and the serratures hardly conspicuous.

*Acuminate-leaved Dicalyx.* Tree.

11 *D. SYLVATICUS* (Lour. coch. p. 663.) leaves lanceolate, serrate, glabrous; racemes simple, almost terminal. *h. S.* Native of Cochin-china. Rumph. amb. 5. t. 104. Flowers white.

*Wood Dicalyx.* Tree 30 feet.

*Cult.* A mixture of loam, peat, and sand will suit the species of this genus, and ripened cuttings will probably root if planted in sand, with a hand-glass placed over them.

**XIII. PYRENARIA** (from *pyren*, a cherry-stone; in reference to the bony seeds). Blum. bijdr. 1119.

**LIN. SYST.** *Polyándria, Pentagýnia*. Calyx inferior, of 5 sepals, bibracteate, imbricate. Petals 5, imbricately-conniving at the base. Stamens numerous, free, hypogynous, and somewhat adnate to the base of the petals. Anthers bursting outwardly. Ovary 5-celled; cells biovulate. Styles 5, approximate, emarginate. Pome globose, depressed, fleshy, 5-celled; cells covered with a papery membrane, containing each two bony seeds. Seeds exalbuminous. Embryo erect, with leafy contortuplicate cotyledons. This genus has the habit of *Pomáceæ*, but from the structure of the calyx and insertion of the stamens it comes nearer to *Ternstræmiaceæ*.

1 *P. SERRATA* (Blum. bijdr. 1120.) *h. S.* A tree, with alternate, stalked, oblong, serrated, coriaceous, exstipulate leaves; axillary solitary 1-flowered peduncles, and white flowers. *h. S.* Native of Java, on the higher mountains.

*Serrated-leaved Pyrenaria.* Tree.

*Cult.* For culture and propagation see *Dicalyx*.

**ORDER LXXXVI. CALYCANTHÆ** (plants agreeing with *Calycánthus* in important characters). Lindl. bot. reg. no. 404. D. C. prod. 3. p. 1.—*Calycanthinæ*, Link, enum. 2. p. 66.—*Calycánthus*, Lin. gen. no. 639. Lam. ill. t. 445. dict. 1. p. 565. Willd. hort. berol. no. 80.—*Rosàccis* affines, Juss. gen. Vent. Nees.—*Monimieis* affines, Juss. ann. mus. 14. p. 119.—*Magnoliis* affines, Batsch. t. 116.

Calyx coloured, with a fleshy urceolate tube, girdling the ovaries (f. 85. *b.*) and a many-parted limb; segments unequal, disposed in many series (f. 85. *d. a.*), imbricate. Petals wanting. Stamens numerous, inserted in several series in a fleshy disk in

the throat of the calyx; the inner ones sterile. Anthers adnate, bursting longitudinally outwardly by 2 cells. Carpels numerous (f. 85. b.), inserted on the inside of the tube of the calyx, as in *Rosa*, 1-celled, biovulate, only one of the ovula coming to maturity, and therefore 1-seeded from abortion. Styles terminal, distinct, exerted from the tube of the calyx; stigmas simple. Carpels of akenia inclosed in the fleshy tube of the calyx, 1-seeded; the pericarp rather corneous. Seed conformed to the cavity of the akenia, ascending, having the hylum nearly opposite the cicatrice of the pericarp. Embryo exalbuminous, straight, with convolute cotyledons, and an inferior radicle.—This order is composed of beautiful hardy early-flowering shrubs, with simple, exstipulate, scabrous, feather-nerved leaves. Flowers yellowish, sweet-scented, or lurid purple, hermaphrodite, solitary, pedicellate, terminal, or in the axils of the leaves of the present or preceding year. The wood, leaves, and flowers of *Calycanthus floridus* have a scent resembling the quince, hence it is called *American allspice*. *Calycanthæ* agrees with *Rosaceæ* in the carpels or akenia being inserted in the inner sides of the calyx as in *Rosa*, and with *Granatæ* in the opposite leaves, and in the convolute cotyledons of the embryo; in this last respect it also agrees with *Combretæ*. *Calycanthæ* differs from *Rosaceæ* and *Pomaceæ* in the form of the embryo, and from *Granatæ* in the form and imbricate aestivation of the calyx. It differs from both the last-mentioned orders in the absence of petals, in the numerous lobes of the calyx, and in the anthers bursting outwardly.

#### *Synopsis of the genera.*

1 *CALYCAN'THUS*. Lobes of calyx disposed in many series, lanceolate, coriaceous, coloured. Stamens deciduous, 12 outer ones fertile.

2 *CHIMONA'NTHUS*. Lobes of calyx oval, obtuse, outer ones form of bracteas. Stamens permanent, 5 outer ones fertile.

I. *CALYCA'NTHUS* (from *καλὺς*, *calyx*, a calyx; and *ανθος*, *anthos*, a flower; in reference to the calyx being coloured, and appearing like a corolla). Lindl. bot. reg. no. 404. Nees. nov. act. bonn. 11. p. 107.—Buttneria, Duham. arbr. 1. p. 114. but not of Lin.—Beurreria, Ehret, pict. t. 13.—Bastaria, Adans. fam. 2. p. 294.—Pompadoûra, Buchoz.—*Calycanthus* species, Lin. Lam. Willd.

LIN. SYST. *Icosandria, Polygynia*. Lobes of calyx disposed in many series (f. 88. a. d.), imbricate, lanceolate, all somewhat coriaceous and coloured. Stamens unequal, deciduous, 12 outer ones fertile. Akenia numerous (f. 85. b.).—Shrubs, natives of North America, with brachiate branches; and terminal and axillary flowers, rising after leaves, of a lurid purple colour; they are sweet-scented as well as the bark and leaves.

1 *C. FLORIDUS* (Lin. spec. 718.) leaves ovate, downy beneath as well as the branchlets. h. H. Native of Carolina, on the shady banks of rivulets. Curt. bot. mag. t. 503. Duham. arbr. 1. t. 45. Lam. ill. t. 445. f. 1. Guimp. abb. holz. t. 4. C. stérilis, Walt. car. 151. Mill. fig. t. 60. Branches spreading. Wood and roots smelling strong of camphor. Flowers usually sterile, with a sweet apple scent. Fruit turbinate.

Var. *a, oblongus*; leaves oblong. Ait. hort. kew. ed. 2. vol. 3. p. 282.

Var. *β, ovatus*; leaves roundish-ovate. Ait. l. c. *Florid* or Common American Allspice. Fl. May, Aug. Clt. 1726. Shrub 4 to 6 feet.

2 *C. FERTILIS* (Walt. car. p. 151.) leaves ovate-lanceolate, acuminate, glaucous and pubescent beneath. h. H. Native of Carolina, on the mountains. Lindl. bot. reg. t. 404. Guimp. abb. holz. t. 5. C. glaucus, Willd. enum. p. 559. D. C. prod. 3. p. 2. Andr. bot. rep. 539. Flowers fertile, of a lurid purple colour, but with very little scent (f. 85.).

Var. *β, oblongifolius* (Nutt. gen. amer. 1. p. 312.) leaves ovate-lanceolate, elongated. h. H. Native on the mountains of North Carolina.

*Fertile-flowered American Allspice*. Fl. May, Aug. Clt. 1726. Shrub 4 to 6 feet.

3 *C. LEVIGATUS* (Willd. enum. p. 559. hort. berol. t. 80.) leaves oblong or ovate, gradually acuminate, rather wrinkled, and rough to the touch on the upper surface, but glabrous and green beneath. h. H. Native of Pennsylvania, Virginia, and Carolina, on the mountains. Pursh, fl. sept. amer. 1. p. 358. Nutt. gen. amer. 1. p. 312. Guimp. abb. holz. t. 6. Lindl. bot. reg. 481. C. ferox, Michx. fl. bor. amer. 1. p. 305. Branches strictly erect. Flowers lurid purple, hardly sweet-scented? C. Pennsylvanicus, Lodd. cat. ex Lond. hort. brit. p. 214.

*Smooth American Allspice*. Fl. May, July. Clt. 1806. Sh. 3 to 6 feet.

Cult. These shrubs are well worth growing for the exquisite scent of their blossoms, resembling that of ripe apples or quinces; they all grow best in peat borders, although they will grow in any kind of soil, but not so freely as in peat. They are usually increased by layers, put down in the summer.

II. *CHIMONA'NTHUS* (from *χειμων*, *cheimon*, winter, and *ανθος*, *anthos*, a flower; in reference to the time of flowering, which is from December to February). Lindl. bot. reg. no. 404. and 451. D. C. prod. 3. p. 2.—Meratia, Nees. in nov. act. bonn. 11. p. 107.—*Calycanthus* species of Lin.

LIN. SYST. *Icosandria, Polygynia*. Lobes of calyx imbricate, oval, obtuse; outer ones in the form of bracteas; inner ones larger and appearing like a corolla. Stamens nearly equal, permanent, the 5 outer ones fertile, connate at the base, at maturity.—Shrubs, with the flowers rising before the leaves, in the axils of the leaves of the preceding year. Flowers very sweet-scented, yellowish, but purplish inside. Bark and leaves without scent.

1 *C. FRAGRANS* (Lindl. bot. reg. 404.). h. H. Native of Japan. *Calycanthus praecox*, Lin. spec. 718. Ait. hort. kew. ed. 1. vol. 2. p. 220. t. 10. Curt. bot. mag. t. 466. Lam. ill. t. 445. f. 2. Meratia fragrans, Nees. l. c.

Var. *β, grandiflora* (Lindl. bot. reg. t. 451.) flowers larger and more spreading. Perhaps a proper species, for the fruit of *C. fragrans* is lageniform, thicker above the base, and tapering at the apex into a long neck, but in the present plant, according to the figure, the fruit is oblong and tapering to the base.

Var. *γ, luteus*; flowers yellow, both inside and outside.

*Fragrant Winter-flower*. Fl. Dec. Feb. 1766. Sh. 6 feet.

Cult. The delightful fragrance of the blossoms, makes the *C. fragrans* and its varieties desirable objects in all collections.

FIG. 85.

They thrive in almost any kind of soil, and are usually increased by layers, but young cuttings will also strike root, if planted in a pot of sand, with a bell-glass placed over them, in a little bottom heat. The plants endure our winters in the open air, in a sheltered situation, with very little protection in severe weather. But as they flower during the winter months, the plants are liable to be injured by the frost, if planted in an exposed situation, they are therefore seen to most advantage under shelter, as in a greenhouse, pit, or conservatory.

**ORDER LXXXVII. GRANA'TEÆ** (this order only contains the species of *Pomegranate* and their varieties). D. Don, in edinb. phil. journ. july 1826. p. 134. D. C. prod. 3. p. 3. A genus of *Myrtaceæ*, Juss. and all other authors.

Calyx with a turbinate tube (f. 86. *a.*) and a 5-7-cleft coriaceous, tubular limb (f. 86. *c.*); segments valvate in æstivation. Petals 5-7 (f. 86. *b.*). Stamens numerous; filaments free; anthers 2-celled, bursting in front, by 2 chinks. Style filiform. Stigma capitate, papulose. Fruit large, spherical (f. 86. *c.*), crowned by the limb of the calyx (f. 86. *d.*), indehiscent; the fruit is the tube of the calyx, divided horizontally into two chambers or parts (f. 86. *f.*), the upper division 5-9-celled, and the lower division 3-celled; the dissepiments membranous, separating the cells; the placentas of the upper division of the fruit fleshy, reaching from the parietes to the centre; those of the lower division progressing irregularly from the bottom of the fruit. Seeds innumerable, exalbuminous, covered with pellucid bacate pulp. Embryo oblong, with a short, straight radicle, and foliaceous, spirally convolute cotyledons. This order is composed of trees or shrubs, with tetragonal subspinose branches, opposite, deciduous leaves, rarely verticillate or alternate; they are oblong-lanceolate and dotless, usually disposed in fascicles in the axils. Flowers 2-5, scarlet, almost sessile, rising near the tops of the branches.—This order only consists of one genus, the well-known *pomegranate*. It differs from *Myrtaceæ*, in the leaves being destitute of dots, and in being without the marginal nerve, also in the economy of the fruit, the pulpy seeds, and in the convolute cotyledons; from *Calycanthææ* in the valvate calyx, and in the anthers bursting inwardly; from *Memecyleæ* in the indefinite stamens; from *Combretææ* in the many-celled ovary, and in the situation of the seeds; from *Vochysiææ* in the indefinite stamens and regular flowers; and from all in the structure of the fruit.

**I. PUNICA** (*Punicus*, Carthaginian, because it is a native of the countries from the north of Africa to Rome; or from *punicus*, scarlet, from the colour of the flowers). Tourn. inst. t. 401. Lin. gen. no. 618. Gartn. fr. 1. t. 38. D. C. prod. 3. p. 3.

**LIN. SYST.** *Icosándria*, *Monogýnia*. Character the same as the order.

1 **P. GRANA'TUM** (Lin. spec. 676.) leaves lanceolate; stem arboreous. *h.* H. Native of Barbary, from whence it has migrated into the south of Europe, and now as it were become indigenous.

*Var. a, rubrum*; flowers scarlet, single; pulp surrounding the seed, reddish. *h.* H. Wild in the places stated above. Trew, ehret. t. 71. f. 1. Poit. et Turp. arb. fr. 22. Schkuhr,

handb. t. 131. *b.* Sims. bot. mag. 1832.

\* *flöre-plëno*; flowers double, scarlet. More impatient of cold than the single variety. Trew. ehret. t. 71. f. 2.

*Var. β, albescens*; corolla white; calyx yellowish; pulp surrounding the seeds pale. *h.* H. Less impatient of cold than the preceding variety. Andr. bot. rep. 96.

\* *flöre-plëno*; flowers double, white, having the calyx yellowish. *h.* H. This variety is very impatient of cold.

*Var. γ, flavum*; flowers yellow. This variety is very rare.

The rind of the fruit and the flowers of the pomegranate are the parts directed for medicinal use. They are both powerful astringents, and have long been successfully employed as such both externally and internally as gargles, in diarrhoeas, &c. The dose in substance is from half a drachm to a drachm. In infusion or decoction to half an ounce. The pulp is subacid, allaying heat, quenching thirst, and gently laxative.

Common *Pomegranate*. Fl. June, Sept. Clt. 1548. Tree 15 to 30 feet.

2 **P. NA'NA** (Lin. spec. 676.) leaves linear; stem shrubby. *h.* G. Native of the West India Islands, and South America; about Demerara, &c. Sims. bot. mag. 634. Trew. ehret. t. 71. f. 3. Flowers red. Perhaps only a variety of the preceding. The flowers are much smaller than those of the common *pomegranate*, and the fruit is about the size of a nutmeg. In the West Indies, where it is a native, it is planted for hedges, and continues flowering all the year.

*Dwarf Pomegranate*. Fl. Jul. Sept. Clt. 1723. Sh. 5 to 6 ft.

*Cult.* There is no tree more showy than the *Pomegranate*, when in flower. It is best planted against a wall with a south aspect. All the varieties strike root freely from cuttings or layers; the rarer varieties are sometimes increased by grafting on the commoner kinds. Those varieties most impatient of cold had better be grown in pots, that they may the more easily be protected by placing under shelter in the winter.

**ORDER LXXXVIII. MEMECYLEÆ** (plants agreeing with *Memecylon* in important characters). D. C. prod. 2. p. 5.

Calyx with an ovate or subglobose tube and a 4-5-lobed or 4-5-toothed limb. Petals 4-5, inserted in the calyx and alternating with its lobes. Stamens 8-10, or double the number of the petals; filaments free; anthers incurved, 2-celled. Style filiform. Berry crowned by the limb of the calyx, 2-4-celled. Seeds few, exalbuminous. Cotyledons foliaceous, convolute. Radicle straight.—Intrastropical shrubs, with simple, quite entire, dotless, opposite leaves, which are nearly always feather-nerved; and axillary pedicellate flowers. This is a very doubtful order, but is, on account of its convolute cotyledons, allied to *Calycanthææ*, *Granatææ*, and *Combretææ*, but from the form of the anthers and the number of the parts of the flower, it is nearer related to *Melastomæææ*, nor is it far removed from *Myrtæææ* in the habit, flowers, and opposite leaves.

*Synopsis of the genera.*

1 **MEME'CYLON**. Calyx with a globose tube and a bluntly 4-

FIG. 86.

toothed limb. Petals 4. Stamens 8. Berry dry, globose, 2-4-celled.

2 *SCUTULA*. Calyx with a truncate, spreading, fleshy, saucer-formed limb. Petals 4-5. Stamens 8-10. Berry 8-celled; cells 1-seeded.

3 *MOUR'RIA*. Calyx furnished with 2 scales at the base; limb urceolate, 5-toothed. Petals 5. Stamens 10. Berry 1-4-celled, 1-4-seeded.

1. *MEMECYLON* (from *μεμκylon* of Dioscorides, the Greek name of the fruit of the *Artubus*). Lin. gen. no. 481. Lam. dict. 4. p. 88, ill. t. 284. Pet. Th. obs. p. 57. and p. 58. but not of Mitch. D. C. prod. 3. p. 5.—Valikâha, Adans. fam. 2. p. 84.

LIN. SYST. *Octândria, Monogýnia*. Calyx with a hemispherical or subglobose tube, and a small limb striated at the bottom, and with a bluntly 4-toothed, repand, or entire border. Petals 4, oval. Stamens 8, longer than the petals; filaments free; anthers incurved, fixed by the middle, acutely beaked at one end, and blunt at the other, and bearing 2 polliniferous cells each. Style 1, filiform, bearing a simple stigma. Berry nearly dry, globose, crowned by the limb of the calyx; when young 2-4-celled, cells 2-seeded; but when mature 1-celled, and 1-seeded. Nut brittle, easily separated from the calyx. Seed pendulous, exalbuminous. Cotyledons foliaceous, convolute. Radicle superior, acute.—Shrubs having the branches nodose, at the origin of the leaves. Leaves glabrous, rarely 3-nerved, usually feather-nerved. Flowers axillary, in fascicles, or in racemose heads, of a bluish-violet colour. Bracteoles small, opposite, sometimes connate under the flowers and at the bifurcations of the pedicels.

\* *Branches tetragonal.*

1 *M. TRINE'RVLE* (D. C. prod. 3. p. 5.) branches acutely tetragonal; leaves almost sessile; flowers in fascicles, nearly sessile, at the knots of the branches. *h. S.* Native of the East Indies. Leaves bluntish, with revolute margins, 2 inches long and 1 broad.

*Three-nerved-leaved Memecylon.* Shrub 3 to 4 feet.

2 *M. ANGULOSUM* (Reichb. in Sieb. pl. exsic. maur. 2. no. 116.) branches acutely tetragonal; leaves on very short petioles, oval, rather attenuated at both ends, bluntish, 1-nerved; flowers pedicellate, in fascicles at the knots of the branches. *h. S.* Native of the Mauritius. *Melaleuca ovalifolia*, Poir. suppl. 3. p. 624. Petioles 1-2 lines long. Leaves 2 inches long and 10-12 lines broad. Pedicels usually bifid and 2-flowered.

*Angular-branched Memecylon.* Shrub 3 to 4 feet.

3 *M. OLO'PTERUM* (D. C. prod. 2. p. 5.) branches 4-winged; the wings curled; leaves sessile, ovate-roundish, somewhat emarginate at the apex, shining on both surfaces, scarcely 1-nerved. *h. S.* Native of Madagascar. Leaves 5-6 lines long and 4 lines broad. Flowers solitary, pedicellate in the specimen examined but it is badly preserved.

*All-winged-stemmed Memecylon.* Shrub 2 feet.

4 *M. SUBQUADRANGULARE* (D. C. prod. 2. p. 6.) branches tetragonal at the apex; leaves sessile, ovate, bluntish, 1-nerved; flowers pedicellate, in fascicled umbels at the knots of the branches. *h. S.* Native of the East Indies. Leaves 2 inches long and an inch broad. Pedicels 2-3 lines long. Border of calyx entire. Flower-bud tetragonal, acute.

*Subquadrangular-branched Memecylon.* Shrub 3 to 4 feet.

\*\* *Branches terete.*

5 *M. CAPITULATUM* (Lin. spec. 497.) branches nearly terete;

leaves oval, on short petioles, bluntish, 1-nerved; peduncles axillary, 3-times longer than the petiole, bearing a head of flowers. *h. S.* Native of Ceylon. *Burm. zeyl. t. 30.* Lam. ill. t. 284. f. 1. *Blum. bijdr. p. 1094.* Fruit globose, rather ventricose at the base, crowned by the bluntly 4-toothed calyx.

*Small-headed-flowered Memecylon.* Fl. July. Clt. 1796. Shrub 3 to 5 feet.

6 *M. SPIÆROCARPUM* (D. C. prod. 2. p. 6.) branches nearly terete; leaves on short petioles, oval, obtuse, sub-attenuated at the base, 7-nerved; peduncles axillary, many-flowered, hardly longer than the petioles. *h. S.* Native of the Mauritius. *M. tinctorium*, Sieb. pl. exsic. maur. 2. p. 115. and perhaps of Willd. Leaves yellowish when dried, with rather revolute margins, 2 inches long and 1 broad. Fruit exactly globose, smaller than those of the preceding, with the limb of the calyx caducous. Flower-bud conical, acute. Border of calyx nearly entire.

*Round-fruited Memecylon.* Shrub 3 to 4 feet.

7 *M. LAXIFLORUM* (D. C. prod. 2. p. 6.) branches nearly terete; leaves on short petioles, ovate, acutish, 1-nerved; peduncles axillary, twice the length of the petiole; flowers umbellate. *h. S.* Native of the Mauritius. *Rheed. mal. 5. t. 19.?* *M. tinctorium*, Willd. spec. 2. p. 347. *Blum. bijdr. p. 1094.?* Fruit ovate. Leaves 12-15 lines long and 6-7 lines broad. Border of calyx repandly toothed.

*Loose-flowered Memecylon.* Shrub 3 to 5 feet.

8 *M. RAMIFLORUM* (Lam. dict. 4. p. 88.) branches nearly terete; leaves on short petioles, elliptic, bluntish, 1-nerved; flowers in umbellate fascicles, borne in the axils and beneath the leaves; style twice the length of the stamens. *h. S.* Native of the Mauritius and Ceylon. *M. umbellatum*, *Blum. bijdr. p. 1094.?* *Melaleuca bicolor*, Poir. suppl. 3. p. 624. The figure in *Burm. zeyl. t. 31.* agrees well with this species, but the flowers are there represented as tetrandrous, not octandrous.

*Branch-flowered Memecylon.* Shrub 4 to 5 feet.

9 *M. EXCELSUM* (*Blum. bijdr. p. 1094.*) branches?; leaves on short petioles, elliptic-oblong, bluntly acuminate, glabrous, and rather veiny, pale beneath; fascicles of flowers corymbose, axillary; fruit oval. *h. S.* Native of Java, on Mount Salak.

*Tall Memecylon.* Tree 30 feet.

10 *M. OVATUM* (Smith, in Rees' cycl. vol. 23. no. 3.) branches nearly terete? leaves on long petioles, ovate, bluntly acuminate; peduncles rising on the naked parts of the branches, aggregate, umbelliferous; base of calyx 8-nerved. *h. S.* Native of the East Indies. Petioles half an inch long. Leaves 3 inches long.

*Ovate-leaved Memecylon.* Shrub 4 to 6 feet.

11 *M. EDULE* (Roxb. cor. 1. t. 82.) branches terete; leaves on short petioles, broadly ovate, obtuse, 1-nerved; peduncles tetragonal, usually rising from the knots beneath the leaves, umbellately racemose, many-flowered; style about equal in length to the stamens. *h. S.* Native of Coromandel, in every jungle. Fruit juicy, crowned by the 4-toothed limb of the calyx; when ripe they are eaten by the natives; they have much pulp of a bluish-black colour, and of an astringent quality.

*Edible Memecylon.* Clt. 1820. Tree 10 to 12 feet.

12 *M. ACUMINATUM* (Smith, in Rees' cycl. no. 4.) branches terete? leaves on short petioles, elliptic, acute; peduncles axillary, very short, umbelliferous; style about equal in length to the petals. *h. S.* Native country unknown.

*Acuminate-leaved Memecylon.* Tree.

13 *M. GRANDE* (Retz, obs. 4. p. 26.) arboreous; leaves ovate, acuminate, 1-nerved, on short petioles; peduncles axillary, 4-5-cleft, many-flowered. *h. S.* Native of the East Indies. *Blum. bijdr. p. 1095.* *Nedum-Schatti*, *Rheed. mal. 2.*

t. 15. Flowers purple. Fruit globose, ex Blum. Perhaps many species are confused under this name.

*Great Memecylon.* Tree 10 to 12 feet.

14 *M. CORDATUM* (Lam. dict. 4. p. 89. ill. t. 284. f. 2.) branches nearly terete; leaves sessile, cordate at the base, stem-clasping, ovate; peduncles axillary, branched; fruit crowned by the largish, bluntly 4-toothed limb of the calyx.  $\frac{1}{2}$ . S. Native of the East Indies and the Mauritius.

*Var. a, pedunculòsum* (D. C. prod. 2. p. 7.) peduncles nearly equal in length to the leaves; leaves smaller.  $\frac{1}{2}$ . S. Native of the East Indies.

*Var. β, brevipes* (D. C. l. c.) peduncles much shorter than the leaves; leaves larger.  $\frac{1}{2}$ . S. Native of the Mauritius.

*Cordate-leaved Memecylon.* Shrub 4 to 5 feet.

15 *M. FERREUM* (Blum. hijdr. p. 1095.) branches terete? leaves petiolate, oval, very blunt, sometimes retuse, attenuated at the base, coriaceous, veinless; umbels corymbose, axillary; fruit globose.  $\frac{1}{2}$ . S. Native of Java, on the mountains.

*Iron Memecylon.* Shrub 4 to 5 feet.

16 *M. CINNAMOMIODES*; leaves elliptic, obtusely acuminate, 3-nerved, glabrous, attenuated at the base; peduncles axillary, aggregate, longer than the petioles, umbellate, few-flowered.  $\frac{1}{2}$ . S. Native of Sierra Leone. (v. s. herb. Lamb.)

*Cinnamon-like Memecylon.* Shrub 5 to 6 feet.

17 *M. AFZÉLI*; leaves elliptic, attenuated at both ends, coriaceous, 1-nerved, ending in a long acumen at the apex; peduncles twin or tern, axillary; flowers umbellate.  $\frac{1}{2}$ . S. Native of Sierra Leone. (v. s. herb. Lamb.)

*Afzelius's-leaved Memecylon.* Shrub 5 to 6 feet.

18 *M. BLACKIODES*; leaves large, sessile, very broad, coriaceous, strongly 3-nerved, the lateral veins running into a marginal nerve; corymbs compound, pedunculate, axillary.  $\frac{1}{2}$ . S. Native of Sierra Leone, in the woods in the low lands.

*Blackia-like Memecylon.* Shrub 6 to 10 feet.

*Cult.* A mixture of sand, loam, and peat suits the species of *Memecylon*. Young cuttings, planted in a pot of sand, with a hand-glass placed over them in heat root freely.

II. *SCUTULA* (from *scutula*, a little saucer; form of the limb of the calyx). Lour. coch. p. 235. D. C. prod. 3. p. 7.

*LIN. SYST.* *Octo-Decandria*, *Monogynia*. Calyx with the tube adhering to the ovary, and with a truncate, spreading, fleshy, saucer-formed limb. Petals 4-5, connivent, seated on the border of the calyx. Stamens 8-10, with inflexed filaments and curved oblong anthers. Style filiform, simple at the apex. Berry 8-celled; cells 1-seeded. Seed compressed.—Small smooth trees, with opposite, lanceolate, quite entire leaves; and axillary and terminal peduncles, bearing blue or violaceous flowers. This genus is probably not distinct from *Memecylon*.

1 *S. SCUTELLA'TA* (Lour. l. c.) peduncles axillary, many-flowered; berries compressed.  $\frac{1}{2}$ . G. Native of Cochinchina. Flowers and fruit violaceous.

*Saucer-calyxed Scutula.* Shrub 8 feet.

2 *S. UMBELLATA* (Lour. l. c.) umbels terminal; berries roundish.  $\frac{1}{2}$ . G. Native of Cochinchina. Flowers white and partly-coloured.

*Umbellate-flowered Scutula.* Shrub 4 feet.

*Cult.* See *Memecylon* for culture and propagation.

III. *MOURIRIA* (*Mouririchira* is the Guiana name of *M. Guianensis*). Juss. gen. 320. Lam. ill. t. 360. D. C. prod. 2. p. 7.—*Mouriri*, Aubl. guian. 1. p. 452. t. 180.—*Petaloma*, Swartz, prod. p. 73. fl. ind. occ. 2. p. 831. t. 14.

*LIN. SYST.* *Decandria*, *Monogynia*. Calyx furnished with 2 scales at the base; tube adhering to the ovary; limb urceolate, 5-cleft. Petals 5, broad at the base, inserted near the

apex of the calyx, and alternating with its teeth, twisted in æstivation. Stamens 10, rather unequal. Anthers oblong, opening by 2 pores at the apex. Ovary nearly globose. Style filiform. Stigma capitate. Berry globose, crowned by the coarctate toothed tube of the calyx, 1-4-celled, 1-4-seeded.—Glabrous shrubs with nodose branches, opposite, feather-nerved, acute, quite entire, coriaceous leaves, and axillary peduncles. This genus is allied to *Melastomaceæ*, according to Richard, but according to R. Brown and E. Meyer it is intermediate between *Myrtaceæ* and *Melastomaceæ*; with the first it agrees in the elevated dots and feather nerves of the leaves, and with the last in the structure of the anthers.

1 *M. MYRTILLOIDES* (Poir. dict. sc. nat. 33. p. 163.) leaves almost sessile, ovate, attenuated, oblique at the base; pedicels solitary, 1-flowered.  $\frac{1}{2}$ . S. Native of Hispaniola and Jamaica, in woods in the lowlands. *Petaloma myrtilloides*, Swartz, fl. ind. occ. 2. p. 833. t. 14.—Sloane, hist. 2. p. 78. t. 87. f. 3. Flowers white. Berry ovate, black, 1, rarely 2-seeded, and 1-celled, ex Swartz. The bark is smooth and grey, with some very white spots, whence its name of *silver-wood*. The wood is hard, tough, heavy, and good for looms, handles, staves for oars, &c.

*Myrtle-like Silver-wood.* Clt. 1823. Shrub 2 to 3 feet.

2 *M. GUIANE'NSIS* (Aubl. guian. 1. p. 453. t. 180.) leaves on short petioles, ovate, acuminate, feather-nerved; peduncles crowded in the axils of the leaves, 1 or few-flowered; style filiform.  $\frac{1}{2}$ . S. Native of Guiana, in woods at the river Sinimari, where it is called *Mourichira*. Lam. ill. t. 360. *Petaloma Mouriri*, Swartz, fl. ind. occid. 835. Flowers yellow. Berry globose, yellow, dotted with red, 1-celled, 4-seeded. ex Aubl. Wood hard and whitish.

*Guiana Silver-wood.* Clt. 1817. Shrub 3 to 4 feet.

3 *M. CAULIFLORA* (D. C. prod. 2. p. 7.) leaves nearly sessile, ovate, much acuminate, somewhat cordate at the base; peduncles rising in umbellate fascicles from the old trunk.  $\frac{1}{2}$ . S. Native of Brazil, in woods. *Petaloma cauliflora*, Mart. mss. Trunk straight; branches horizontal. Petals white. Filaments of a rose white colour. ex Mart. Young fruit 5-celled, or only 2-4-celled from abortion.

*Stem-flowered Silver-wood.* Tree 10 to 12 feet.

4 *M. GRANDIFLORA* (D. C. prod. 2. p. 8.) leaves on short petioles, ovate, acuminate, feather-nerved; peduncles short, few-flowered, crowded at the axils along the branches; style compressed.  $\frac{1}{2}$ . S. Native of Para, in Brazil. Petals oval, attenuated at the base, thick, rather coriaceous. Anthers large.

*Great-flowered Mouriria.* Shrub 3 to 4 feet.

† *Species not sufficiently known.*

5 *M. MEXICANA* (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 8.).  $\frac{1}{2}$ . S. Native of Mexico. Like *M. Guianensis*, but the petals are rose-coloured; anthers hardly acute at the base, and the berries are red and 4-celled.

*Mexican Silver-wood.* Shrub.

*Cult.* See *Memecylon* for culture and propagation.

ORDER LXXXIX. COMBRETACEÆ (plants agreeing with *Combretum* in important characters). R. Br. nov. holl. 1. p. 351. in a note, Rich. in dict. class. 4. p. 353. D. C. diss. ined. in soc. hist. nat. gen. prod. 3. p. 9.—*Myrobalanæ*, Juss. dict. sci. nat. 31. p. 458.

Flowers hermaphrodite, rarely polygamous from abortion. Calyx with the tube adhering to the ovary (f. 88. a.); and with a 4-5-lobed (f. 88. e. c. f. 89. a.), limb, which falls off as the flower decays. Petals sometimes wanting (f. 88. e.), but usually

4-5 (f. 89. b.), inserted near the top of the tube of the calyx, and alternating with its lobes (f. 89. b.). Stamens inserted in the tube of the calyx (f. 88. a. c. f. 89. a.), usually double the number of the lobes of the calyx (f. 89. c.), rarely equal or triple that number; filaments exserted, free, filiform or subulate; anthers 2-celled, bursting lengthwise. Ovary 1-celled, 2 (f. 88. a.)-5 (f. 89. c.)-ovulate; ovula pendulous from the apex of the ovary. Style 1, slender (f. 88. d. f. 89. d.). Stigma simple. Fruit drupaceous, baccate or nucamentaceous, 1-celled, indehiscent, 1-seeded from abortion, and usually furnished with longitudinal wings. Seed pendulous, filling the cavity of the pericarp, exalbuminous. Embryo straight, having the radicle directed to the hylum, with an inconspicuous plumule, and foliaceous cotyledons, which are sometimes flattish and reflexed by a middle plait, but usually convolute, that is, spirally folded round the axis, continuous with the radicle.—Trees or shrubs, for the most part natives within the tropics, with alternate or opposite, exstipulate, feather-nerved, entire leaves, and axillary or terminal spikes or racemes of flowers.

*Combretaceæ* agrees with *Myrtaceæ*, in the structure of the embryo; in this respect it also accords with *Rhizophoraceæ*; and with *Alangiæ*, and *Onagrariæ*, in the general structure of the flower. With *Elcagnæ* and *Santalaceæ*, the apetalous genera agree in many important particulars. The properties are mostly astringent.

*Combretum* and *Quisqualis* are among the most splendid of the climbing plants of the tropics, adorning the trees from which they hang with garlands of white, crimson, and yellow flowers. The bark of *Bucida Bùceras* is used with success in Guiana for tanning leather. The juice of *Terminalia vèrnix* is employed by the Chinese as a varnish; it is, however, caustic, and its exhalation dangerous; benzoin is the produce of *Terminalia Benzoin*. The kernel of several species is eaten as a nut, and the expressed oil has the remarkable quality of not becoming rancid.

#### *Synopsis of the genera.*

##### TRIBE I.

TERMINALIEÆ. Flowers apetalous.

1 BUCIDA. Flowers hermaphrodite, apetalous. Calyx with an urceolate 5-toothed limb. Stamens 10. Drupe baccate, containing an angular putamen.

2 AGATHISANTHES. Flowers dioecious, apetalous. Calyx 5-parted. Stamens 10. Drupe baccate, umbilicate, containing a compressed 1-seeded nut.

3 TERMINALIA. Flowers usually polygamous from abortion, apetalous. Calyx campanulate, 5-cleft (f. 88. a.) Stamens 10 (f. 88. c.). Drupe crowned by the calyx, usually dry and 1-seeded (f. 87. a. b.).

4 PENTAPTERA. All as in *Terminalia*, but differs in the fruit being furnished with 5-7 vertical exserted wings.

5 GETONIA. Flowers hermaphrodite, apetalous. Calyx campanulate, 5-parted. Stamens 10. Fruit ovate, oblong, crowned by the calyx, pentagonal.

6 CHUNCOA. Flowers apetalous, some hermaphrodite, and some male. Calyx 5-cleft. Stamens 10. Fruit drupaceous,

5-angled; angles winged, two of the wings larger than the rest.

7 RAMATUELLA. Flowers unknown. Fruit 5-angled; angles winged at the apex.

8 CONOCARPUS. Flowers hermaphrodite, apetalous. Calyx 5-cleft. Stamens 5-10. Fruit corky, scale-formed, closely imbricated into a head resembling a cone.

##### TRIBE II.

COMBRETÆÆ. Flowers with 4 to 5 petals.

9 LAGUNCULARIA. Flowers hermaphrodite. Calyx 5-cleft, permanent. Petals 5, minute. Stamens 10, inclosed. Fruit marginate, coriaceous, crowned by the calyx.

10 GUILERA. Flowers hermaphrodite. Calyx tubular, 5-toothed. Petals 5, small. Stamens 10. Capsule narrow, pentagonal.

11 COMBRETUM. Flowers hermaphrodite. Calyx cylindrical (f. 89. a.) or campanulate, 4-5-toothed. Petals 4-5 (f. 89. b.). Stamens 8-10. Fruit narrow, oval, furnished with 4-5 vertical wings (f. 89. c.).

12 CACOUCIA. Flowers hermaphrodite. Calyx campanulate, 5-toothed. Petals 5. Stamens 10-14. Fruit ovate, 5-angled, pulpy inside.

13 LUMNITZERA. Flowers hermaphrodite, with 2 bractees under each. Calyx tubular, 5-toothed. Petals 5. Stamens 10. Fruit dry.

14 QUISQUALIS. Flowers hermaphrodite. Calyx tubular, 5-cleft. Petals 5. Stamens 10. Fruit dry, 5-angled.

† *Genera not sufficiently known.*

15 CERATOSTACHYS. Flowers hermaphrodite. Calyx with an entire limb. Petals 8, small. Stamens 8-16, unequal. Drupe baccate, crowned by the limb of the calyx.

16 BRUGIERA. Flowers hermaphrodite. Tube of calyx furnished with 2 scales in the middle. Petals 5. Stamens 10. Ovary adnate to the calyx, containing 4 pendulous ovula. Fruit unknown.

17 BOBUA. Flowers hermaphrodite. Calyx 5-cleft. Petals 5. Stamens 20-30. Fruit ovate, few-seeded.

##### Tribe I.

TERMINALIEÆ (plants agreeing with *Terminalia* in having apetalous flowers). D. C. prod. 3. p. 9.—Myrobalanæ, Juss. in ann. mus. 5. p. 222.—Terminaliæ, Jaum. exp. fam. 1. p. 178. t. 29.—Elcagnorum, gen. Juss. gen. p. 75. Flowers apetalous, usually dioecious or polygamous.

I. BUCIDA (from βους, *bous*, an ox; Dr. Browne had named this tree *buceras*, from βους and κερας, from the shape of the process terminating the spike of flowers resembling a bull's horn). Lin. gen. 541. Lam. ill. t. 356. Gærtn. fruct. 3. p. 208. t. 217.—Bùceras, P. Browne, jam. t. 23. f. 1.—Hudsonia, Robins, in Lun. hort. jam. 2. p. 310. but not of Lin.

LIN. SYST. *Dicandria, Monogynia*. Flowers hermaphrodite. Limb of calyx urceolately-campanulate, 5-toothed, deciduous. Petals wanting. Stamens 10, inserted by 2 series, 5 at the base of the limb, and the 5 longest inserted between the incisures of the calyx. Anthers didymous. Style subulate, acute. Drupe baccate, containing an angular putamen. Ovula 3. Seed 1,

cylindrically oblong.—West India trees, with scattered leaves, crowded at the tops of the branches. Peduncles axillary. Flowers disposed in spikes or heads.

1 *B. BUCERAS* (Lin. spec. 556.) leaves ovate-cuneiform, obtuse, glabrous; flowers disposed in cylindrical spikes, densely clothed with adpressed silky pubescence.  $\frac{1}{2}$  S. Native of the West Indies, in low swampy clayey lands near the coast. Flowers small, yellowish. Sloane, hist. 2. t. 189. f. 3. Browne, jam. t. 23. f. 1. Lam. ill. t. 356. The ends of the branches sometimes shoot out into a monstrous spongy excrescence, like an ox's horn, probably formed by insects; hence the specific name. Browne says this tree is remarkable for its slender crooked branches, and the tufted disposition of the leaves, that it grows to a considerable size, is reckoned an excellent timber tree, and that the bark is greatly esteemed by tanners. In Jamaica it is called *Black olive*, in Antigua *French oak*, and in the French Islands *Grignon*.

*Ox-horn Olive-bark-tree*. Fl. Aug. Sept. Clt. 1793. Tr. 20 to 30 feet.

2 *B. ANGUSTIFOLIA* (D. C. prod. 2. p. 10.) leaves cuneiform, obtuse, glabrous; flowers disposed in cylindrical spikes, clothed with rufous velvety down.  $\frac{1}{2}$  S. Native of Guiana. This species comes very near to *Bucida buceras*, but the leaves are not half so broad, and on shorter petioles, and the spikes are more numerous from the same knot, and the stamens are more exerted.

*Narrow-leaved Olive-bark-tree*. Tree 20 feet.

3 *B. CAPITATA* (Vahl. ecl. 1. p. 50. t. 8.) leaves cuneiform, bluntish, with villously ciliated margins; flowers disposed in subglobose capitate spikes.  $\frac{1}{2}$  S. Native of Mont Serrat, Porto Rico, St. Domingo, and Jamaica. Hudsonia, Robins in Lun. hort. jam. 2. p. 310. and Sloan. hist. 2. p. 176. t. 258. f. 3. Flowers yellowish. Bracteas villous. Calyxes glabrous.

*Capitate-flowered Olive-bark-tree*. Tree 20 to 30 feet.

4 *B. MEGAPOTAMICA* (Spreng. syst. append. p. 177.) racemes subcorymbose; bracteas silky; calyxes woolly; leaves oblong-lanceolate, obtuse, rather mucronate.  $\frac{1}{2}$  S. Native of Brazil, at the Rio Grande.

*Rio Grande Olive-bark-tree*. Tree.

*Cult.* The species of *Bucida* grow best in a mixture of loam and peat, and cuttings of well-ripened wood strike freely, if planted in a pot of sand, with a hand-glass placed over them, in heat.

II. AGATHISANTHES (from *αγαθῆ*, *agathis*, a round head, and *ανθος*, *anthos*, a flower; in reference to the flowers being disposed in pedunculate heads). Blum. bijdr. p. 615. D. C. prod. 3. p. 10.

LIN. SYST. *Diœcia*, *Decândria*. Flowers dioecious, apetalous. Calyx of the male flowers 5-parted, with the lobes conniving imbricately. Stamens usually 10; filaments very short, inserted in a flat disk; anthers didymous. Calyx of the female flowers with a short 5-toothed limb. Style short, bifid, perforating the flat disk. Ovary 1-ovulate. Drupe baccate, umbilicate, containing a 1-seeded compressed nut. Embryo exalbuminous, inverted.—A tree 120 feet high, with crowded, oblong, quite entire, coriaceous leaves; and axillary and lateral, solitary or twin stalked heads of flowers. This genus is intermediate between *Bucida* and *Ceratostachys*.

1 *A. JAVA'NICA* (Blum. l. c.).  $\frac{1}{2}$  S. Native of Java, in woods on the higher mountains on the west side of the island, where it is called by the natives *Hirung*.

*Java Agathisanthes*. Tree 120 feet.

*Cult.* See *Bucida* for culture and propagation.

III. TERMINALIA (from *terminus*, end; so named from the leaves being in bunches at the ends of the branches, in-

VOL. II.

termixed with spikes of flowers). Lin. mant. 21. Jacq. coll. 1. p. 130. D. C. prod. 2. p. 10.—Catappa, Myrobalanus, and Badamia, Gærtn.—Terminalia, Pamia, Tanibouca, and Fatræa, Juss.

LIN. SYST. *Polygamia*, *Monœcia*. Flowers usually polygamous from abortion. Limb of calyx campanulate (f. 88. c. e.), deciduous, 5-cleft; lobes acute. Petals wanting. Stamens 10, inserted by 2 series, longer than the calyx. Ovary biovulate (f. 88. a.). Style filiform, acutish (f. 88. d.). Drupe not crowned by the calyx, usually dry, indehiscent, 1-seeded. Seed amygdalaceous. Cotyledons spirally convolute (f. 88. b.).—Tropical trees and shrubs, with alternate leaves, usually crowded at the tops of the branches. Flowers disposed in spikes; spikes racinose or paniced; the flowers in the lower part of the spikes hermaphrodite, in the upper part male. This genus is divisible by the fruit, but that in most of the species being unknown, the greater part of them remain in uncertain divisions. Those species with a 4-cleft calyx and 8 stamens ought probably to be excluded from the genus.

SECT. I. CATA'PPA (the Molucca name of *T. Catappa*). Gærtn. fruct. 2. p. 206. t. 127. and 3. p. 207. t. 217.—Terminalia, Lam. ill. t. 848. Drupe compressed, winged at the margins (f. 87. a.), or much attenuated, containing a woody putamen.

1 *T. TANIBOU'CA* (Smith in Rees' cycl. vol. 35. no. 11.) leaves elliptic, acuminate at both ends, quite entire, when young rather pubescent, when adult smooth; petioles glandless.  $\frac{1}{2}$  S. Native of French Guiana. Lam. ill. 818. f. 3. R. Br. prod. nov. holl. 1. p. 351. Tanibouca Guianensis, Aubl. guian. 1. t. 178. Catappa Guianensis, Gærtn. fruct. 3. p. 207. t. 217. *Tanibouca* is the Guiana name of the tree.

*Tanibouca Terminalia*. Tree 25 feet.

2 *T. ANGUSTIFOLIA* (Jacq. hort. vind. 3. t. 100.) leaves linear-lanceolate, rather repand, attenuated at both ends, pubescent beneath and on the petioles, or pilose; petiole furnished with 2 glands at the apex.  $\frac{1}{2}$  S. Native of the East Indies. Crôton Benzôe, Lin. mant. 297. T. Benzôin, Lin. fil. suppl. Lam. dict. 1. p. 349.

Catappa Benzôin, Gærtn. fr. 2. p. 206. t. 127. T. Benzôe, Pers. Branches in whorles. This tree produces one kind of benzoin; it is procured by wounding the tree; it is composed of large white and light brown pieces, breaking very easily between the hands. When gently dried it forms a white powder, formerly in great request as a cosmetic. Its scent is one of the most agreeable. But the most striking ingredient of this resin is the benzoic acid.

*Narrow-leaved Terminalia*. Clt. 1692. Tree 30 to 40 feet.

3 *T. VERNIX* (Lam. dict. 1. p. 350.) leaves linear-lanceolate, tapering to both ends, glabrous as well as the branches and petioles.  $\frac{1}{2}$  S. Native of the Moluccas. Arbor vernicis, Rumph. amb. 2. p. 259. t. 86. Perhaps the petiole is furnished with 2 glands. The juice of the tree is employed in the countries of its natural growth as a varnish.

*Varnish Terminalia*. Tree 15 feet.

4 *T. MAURITIANA* (Lam. dict. 1. p. 349. ill. t. 848. f. 2.) leaves oblong-lanceolate, attenuated at both ends, rather repand, glabrous; petiole furnished with 2 glands at the top.  $\frac{1}{2}$  S. Native of the Mauritius and Bourbon, where a resin is collected

4 P

FIG. 87.

from the tree similar to Benzoin. *T. angustifolia*, Pet. Th. obs. pl. afr. austr. 19. *Catappa Mauritiāna*, Gært. fil. 3. p. 207. exclusive of the synonyme of Aublet.

*Mauritian Terminalia*. Tree 40 to 50 feet.

5 *T. CATAPPA* (Lin. mant. 519.) leaves obovate, tapering to the base, pubescent beneath; glands small, situated at the base of the leaves on the under surface at the sides of the middle nerve. *h. S.* Native of the East Indies, and now cultivated in many of the West India islands. Jacq. icon. rar. 1. t. 197. Lam. ill. t. 848. f. 1. Adamārum, Rheed. mal. 4. t. 3. and 4. Fruit ovate-roundish, compressed. Leaves obtuse, and somewhat acuminate. Drupe about 3 inches long, egg-shaped, containing an oblong kernel, which has the taste of an almond, and may be used for the same purposes, but it does not contain so much oil. Within the tropics the trees are commonly planted near houses in avenues, and seats are placed under them, for the enjoyment of the close extensive shade they afford. The timber is light and lasting, and is useful for many purposes. The bark and leaves yield a black pigment, with which the Indians dye their teeth, and Indian ink is made. Blume describes his *T. Catappa* (bijdr. p. 610.) as having the leaves cordate at the base, obsolete crenulated, glabrous, and rather pubescent on the mid-rib beneath.

*Var. β, subcordata* (Willd. spec. 4. p. 968.) leaves obovate, rather cordate at the base, obtuse, pubescent beneath, or glabrous in the adult state; glands small, situated at the base of leaves beneath, at the sides of the middle nerve. *h. S.* Native of the West Indies, but only perhaps cultivated there. H. B. et Kunth, nov. gen. amer. 6. p. 113. *T. intermedia*, Bert. ex Spreng. syst. 2. p. 359. Hardly distinct from the species.

*Catappa Terminalia*. Clt. 1778. Tree 20 to 40 feet.

6 *T. MOLLEANA* (Lam. dict. 1. p. 349.) leaves obovate, obtuse at the base, and biglandular, quite entire, glabrous on both surfaces in the adult state, standing on short petioles. *h. S.* Native of the Moluccas and East Indies. *Catappa*, Rumph. amb. 1. p. 174. t. 68. This species differs from *T. Catappa* in the flowers being usually double the size, in the disk being large and villous, and in the drupe being larger and hardly crested.

*Molucca Terminalia*. Clt. 1804. Tree 30 to 40 feet.

7 *T. GLABRATA* (Forst. prod. p. 389. pl. escul. p. 52.) leaves obovate, cuneate at the base, quite entire, glabrous on both surfaces; petioles longish, pubescent. *h. S.* Native of the Friendly and Society Islands. Spreng. antiq. bot. t. 2. According to Forster, this species differs from *T. Catappa* in the leaves being glabrous beneath, and not above half the size, and in the nut being very much smaller, oval, less furrowed, never margined, but acute, compressed, and membranous, and as if it was appendiculated at the apex. In the South Sea islands this tree is cultivated near the huts and in the burial-places. In the language of Otaheite it is named *Aurira* or *e-Tara-iri* and *e-Tara-heimi*, and is accounted sacred to their idols. The wood is used in building boats, and in making drums, benches, &c. The kernels are eaten and have the flavour of almonds.

*Smooth Terminalia*. Tree 30 to 50 feet.

8 *T. JANUARENSIS* (D. C. prod. 3. p. 11.) leaves oblong-lanceolate, quite entire, or crenately repand; peduncles lateral, few-flowered; drupe compressed, quadrangular, winged. *h. S.* Native of Brazil, on Mount Cercovado, near Rio Janeiro. *Catappa Braziliensis*, Raddi, quar. plant. add. p. 26. f. 6. in act. soc. ital. 1820. vol. 18. p. 414. but not *T. Braziliensis* of Spreng. Perhaps a species of *Combrētum*.

*Rio Janeiro Terminalia*. Tree 6 to 10 feet.

9 *T. FAGIFOLIA* (Mart. fl. bras. 1. p. 42. t. 29.) leaves in fascicles, ovate, or oval-oblong, acutish, mucronate, glandless, clothed with silky villi on both surfaces; spikes naked at the base, axillary, crowded with flowers, shorter than the leaves;

drupe large, furnished with 2 wings. *h. S.* Native of Brazil, in the province of Minas Geraes, where it is called *Caxapora de Gentio*. Nectary fleshy, plicately 5-lobed at the base of the style.

*Beach-leaved Terminalia*. Tree 10 to 30 feet.

10 *T. LANCEOLATA* (Mart. l. c.) leaves in fascicles, ovate-lanceolate, acutish, mucronate, clothed with silky pubescence. *h. S.* Native of Brazil, in the province of Bahia. Said to be like the preceding, but the branches are slenderer, epidermis thinner, and the leaves are lanceolate, green, and tapering more to the base.

*Lanceolate-leaved Terminalia*. Shrub 3 to 10 feet.

11 *T. ARGENTEA* (Mart. fl. bras. 1. p. 43.) leaves opposite, ovate, acuminate, pubescent above, and shining and silky beneath. *h. S.* Native of Brazil, in the province of Bahia, at Villa do Rio da Contas. A yellow resinous juice flows from this tree, which is used instead of gamboge by the inhabitants.

*Silvery Terminalia*. Tree.

12 *T. SERICEA* (St. Hil. fl. bras. 2. p. 243.) leaves oblong, acuminate, quite entire, glandless, clothed with silky silvery down; flowers disposed in dense heads. *h. S.* Native of Brazil, in the provinces of Minas Geraes and Goyaz. Drupe winged.

*Silky Terminalia*. Tr. 20 ft.

13 *T. AUSTRALIS* (St. Hil. fl. bras. 2. p. 240. t. 128.) leaves lanceolate, tapering into the petiole at the base, acute, quite entire, glandless, smoothish; flowers corymbose, on long peduncles. *h. S.* Native of Brazil, in the province of Minas Geraes. Flowers yellowish. Drupe winged on each side. (f. 88.)

*Southern Terminalia*. Tree. 8 to 10 feet.

SECT. II. MYROBALANUS (*μυροβάλανος*, a name under which Dioscorides speaks of an Egyptian tree, whose fruit yields a perfumed liquor, from *μυρον*, *myron*, perfume, and *βάλανος*, *balanos*, a nut). D. C. prod. 3. p. 12.—Myrobálanus and Bādāmia, Gært. fruct. 2. p. 90. t. 97.—Myrobálanus, Lam. ill. t. 849. Drupe ovate or a little compressed, dry or baccate, containing a roundish, angularly-furrowed putamen.

14 *T. OBOVATA* (St. Hil. fl. bras. 2. p. 241.) leaves obovate-oblong, narrowed into the petiole at the base, mucronulate, quite entire, glandless, smoothish; flowers corymbose, on long peduncles. *h. S.* Native of Brazil, in the province of Minas Geraes, on the mountains called Serra Negra, where it is called *Carascos*. Drupe ovoid, attenuated at both ends.

*Obovate-leaved Terminalia*. Tree 20 feet.

15 *T. ADAMANTUM* (St. Hil. fl. bras. 2. p. 241.) leaves oblong, narrowed at the base, rounded at the apex, and mucronulate, quite entire, glandless, pubescent; spikes naked at the base, but dense-flowered above the middle. *h. S.* Native of Brazil, in the province of Minas Geraes, in the Distrito Diamantes.

*Adamant Terminalia*. Tree.

16 *T. LATIFOLIA* (Swartz, fl. ind. occ. 2. p. 747.) leaves alternate, obovate, tapering to the base, obtuse, and almost entire, glabrous on both surfaces, glandless. *h. S.* Native of Jamaica, in all the great inland woods. Racemes length of leaves. Drupe ovate, acuminate, boat-shaped, fleshy, coriaceous. Nerves of young leaves as well as the petioles covered with very short velvety down. Calyxes pubescent.

*Var. β, dichotoma* (Meyer, esseq. 177.) flowers woolly. *h. S.*

Native of Guiana, in the island of Arowabisch, in woods. Probably a distinct species.

*Broad-leaved Terminalia*. Clt. 1800. Tree 30 to 40 feet.

17 *T. BENGALÉNSIS* (Roxb. hort. beng. p. 33.) leaves alternate, obovate, obtuse, quite entire, glabrous on both surfaces, glandless as well as the petioles. *h. S.* Native of Bengal. *T. rotata*, Roxb. in herb. Lamb. Perhaps *T. myrobálana*, Roth. is referrible to this species.

*Bengal Terminalia*. Tree 100 feet.

18 *T. BELLE'RIC* (Roxb. cor. 2. p. 51. t. 198.) leaves alternate, elliptic, quite entire, acutish at both ends, glabrous, on long petioles; petiole furnished with 2 small, opposite, or subalternate glands at the apex. *h. S.* Native of the East Indies, on the mountains. *Myrobálanus Bellérica*, Breyn. icon. 18. t. 4. Gaertn. fruct. 2. p. 90. t. 97. *Tàni*, Rheed. mal. 4. t. 10. Drupe ovate, bluntly pentagonal, fleshy. Flowers fetid. A quantity of insipid gum like gum-arabic issues from this tree when wounded. The kernel of the nut is reported to intoxicate if eaten in any great quantity.

*Belleric Terminalia*. Clt. 1818. Tree 100 feet.

19 *T. CHE'BULA* (Retz. obs. 5. p. 31. Roxb. cor. 2. p. 52. t. 197.) leaves nearly opposite, ovate, acutish, petiolate, glabrous above in the adult state, but when young they are clothed with silky villi on both surfaces; glands 2 at the top of the petiole, and many on the margin of the limb. *h. S.* Native of the East Indies, on the mountains. *Myrobálanus Chébula*, Gaertn. fruct. 2. p. 90. t. 97. Drupe ovate, bluntly angular, the alternate angles the largest; flesh hard and brittle. Nut pentagonal. The outer coat of the fruit mixed with salt of steel makes a very durable ink. The galls, called cadacay by the Tamuls, are found on the leaves of this tree, and are probably produced by the punctures of insects on the tender leaves. With them and alum the best and most durable yellow is dyed, and in conjunction with ferruginous mud a black is procured from them.

*Chebula Terminalia*. Clt. 1796. Tree 40 to 50 feet.

20 *T. CÍTRINA* (Roxb. hort. beng. p. 33.) leaves alternate, ovate, acuminate, quite entire, glabrous, petiolate; petioles furnished with 2 thick glands at the apex. *h. S.* Native of the East Indies. *Myrobálanus cítrina*, Gaertn. fruct. 2. p. 90. t. 97. Drupe ovate-oblong, tapering downwards, yellowish.

*Citron-fruited Terminalia*. Clt. 1823. Tree 40 to 50 feet.

21 *T. ARU'RA* (Hamilt. mss. in herb. Lamb.) leaves alternate, elliptic, puberulous as well as the petioles, which are furnished with 2 or 3 opposite glands at the apex; fruit obovate. *h. S.* Native of the East Indies.

*Aruta Terminalia*. Tree.

22 *T. NÍTIDA* (Roxb. in herb. Lamb.) leaves alternate, elliptic, tapering to both ends, acuminate at the apex, glabrous; spikes axillary; calyx very woolly inside. *h. S.* Native of the East Indies.

*Nitid-leaved Terminalia*. Tree.

23 *T. PRO'CERA* (Roxb. cor. 3. t. 224.) leaves alternate, obovate, quite entire, obtuse, with an acumen, on short petioles, glabrous, but bearing hairs in the axils of the lateral nerves, and bearing 2 glands on the under surface at the base at the sides of the middle nerve. *h. S.* Native of Coromandel. Branches horizontal, whorled. Limb of calyx rotate. Drupe oblong, obscurely 5-angled.

*Tall Terminalia*. Clt. 1816. Tree 50 to 100 feet.

24 *T. FATRÆA* (D. C. prod. 3. p. 12.) leaves alternate, hardly petiolate, oval, quite entire, obtuse, or mucronate, glabrous on both surfaces. *h. S.* Native of Madagascar. *Fatræa*, Juss. dict. sci. nat. 16. p. 206. Pet. Th. obs. pl. afr. aust. p. 19. *Myrobálanus Fatræa*, Poir. suppl. 3. p. 708. *T. Madagascariensis*, Spreng. syst. 2. p. 358. Drupe ovate, olive-formed, obsoletely angular.

*Fatræa Terminalia*. Clt. 1826. Tree 20 to 40 feet.

25 *T. RHOMBOÍDEA* (Spreng. syst. 2. p. 358.) leaves alternate, oblong-lanceolate, acutish at both ends, quite entire, glabrous, on short petioles. *h. S.* Native of Madagascar. *Myrobálanus*, Lam. ill. t. 849. f. 1. *Myrobálanus rhomboídea*, Poir. suppl. 3. p. 708. Drupe dry, oval, rather rhomboid, acutish at both ends, with 6-7 acute deep angles.

*Rhomb-fruited Terminalia*. Shrub 6 to 10 feet.

26 *T. BADA'MIA* (D. C. prod. 3. p. 12.) leaves obovate; drupe dry, elliptic, smooth; flesh spongy; putamen with 6 wings. *h. S.* Native of Madagascar. *Badamia Commersónii*, Gaertn. fruct. 2. p. 90. t. 97. *Myrobálanus*, Lam. ill. t. 849. f. 2. *Myrobálanus Terminalia*, Poir. suppl. 3. p. 707. Flowers unknown. *Badamier* is the name of the tree in the Isle of France.

*Badamia Terminalia*. Tree 30 feet.

27 *T. PA'MEA* (D. C. prod. 3. p. 13.) leaves alternate, oblong, attenuated at the base, acutish at the apex, petiolate, glabrous; drupes oblong, bluntly trigonal, rather baccate. *h. S.* Native of French Guiana, in woods. *Pamea Guianensis*, Aubl. guian. 2. p. 946. t. 359. Leaves crowded at the tops of the branches. Flowers unknown. *Pame* is the Guiana name of the tree.

*Pame Terminalia*. Tree 40 feet.

† Fruit of the following species unknown, or very doubtful.

\* Flower 4-cleft, octandrous.

28? *T. ERYTHROPHILLA* (Burch. cat. no. 1749. trav. 1. p. 400.) leaves alternate and opposite, quite entire, elliptic, acuminate, glabrous, rather ciliated, glandless; petioles very short, pubescent as well as the branches. *h. G.* Native of the Cape of Good Hope. Peduncles axillary, shorter than the leaves. Spikes ovate, capitate. Flowers hermaphrodite. Perhaps a species of *Combretum*.

*Red-leaved Terminalia*. Tree 40 feet.

29 *T. ? VILLOSA* (Spreng. neue. entd. 2. p. 111.) leaves alternate, oblong, attenuated at both ends, denticulated, petiolate, glabrous above, villous beneath; panicles axillary, clothed with rusty villi. *h. S.* Native of Brazil. Calyx corolline, villous inside. Stamens 8, exserted. Perhaps a species of *Combretum*.

*Villous Terminalia*. Shrub.

30 *T. ? DISCOLOR* (Spreng. l. c.) leaves obovate-oblong, quite entire, glabrous, rufous beneath; panicle terminal; branches angularly-compressed, glabrous. *h. S.* Native of Brazil. Calyx 5-lobed. Stamens said to be 8.

*Discoloured-leaved Terminalia*. Tree.

\*\* Flowers 5-cleft, decandrous.

31 *T. ARBUSCULA* (Swartz, fl. ind. occ. 750.) leaves scattered, ovate-lanceolate, entire, on short petioles, pubescent when young, at length glabrous; spikes length of the leaves. *h. S.* Native of the north of Jamaica. Limb of calyx urceolate, 5-toothed, villous inside. Stamens 10, exserted. Fruit unknown.

*Shrubby Terminalia*. Clt. 1822. Shrub 6 to 10 feet.

32 *T. SERÍCEA* (Burch. cat. geogr. afr. austr. no. 2399.) leaves alternate, crowded at the tops of the branches, oblong, mucronate, sessile, quite entire, clothed with silky adpressed villi on both surfaces; spikes shorter than the leaves, pedunculate, ovate, clothed with silky villi. *h. S.* Native of the Cape of Good Hope. Limb of calyx 5-cleft. Stamens inclosed in the specimen examined, but they were probably not mature.

*Silky Terminalia*. Shrub 6 to 8 feet.

33 *T. ? MONA'PTERA* (Roth. nov. spec. 382.) leaves alternate, oblong-ovate, acutish, obtuse at the base, wrinkled above and pubescent, but tomentose beneath, and biglandular at the base; drupe ovate, tomentose, furnished with 1 or 3 wings. *h. S.*

Native of the East Indies. Perhaps a species of *Pentaptera* or *Combretum*.

*One-winged-fruited Terminalia*. Tree.

34 *T. PANICULATA* (Roth. nov. spec. p. 383.) leaves petiolate, oblong-oval, obtuse at both ends, rather pilose, quite entire, biglandular beneath at the base; spikes densely paniced, tomentose. *h. S.* Native of the East Indies. Fruit unknown.

*Paniced Terminalia*. Tree.

\*\*\* *Species whose fruit and stamens remain undescribed.*

35 *T. CILIATA* (Spreng. syst. 2. p. 359.) leaves obovate-oblong, obtuse, attenuated at the base, ciliated, quite glabrous on both surfaces, glandless at the base; peduncles racemose, elongated, biglandular at the base. *h. S.* Native of the East Indies.

*Ciliated-leaved Terminalia*. Tree.

36 *T. ? RETICULATA* (Roth. nov. spec. 381.) leaves opposite, oval, obtuse at both ends, quite entire, clothed with silky pile, dotted above, and reticulated with black beneath. *h. S.* Native of the East Indies. Petioles 3 lines long, clothed with rufous velvety down. Spikes compound. Stamens exerted. Fruit unknown. Perhaps a species of *Pentaptera*.

*Reticulated-leaved Terminalia*. Shrub or tree.

37 *T. PUNCTATA* (Roth. nov. spec. p. 381.) leaves alternate, elliptic, attenuated at both ends, glandless, quite entire, obtuse at the apex, pubescent, dotted above, on long petioles. *h. S.* Native of the East Indies. Spikes simple, a little longer than the petioles. Stamens longer than the style. Fruit unknown.

*Dotted-leaved Terminalia*. Shrub or tree.

38 *T. ELLIPTICA* (Willd. spec. 4. p. 969.) leaves oblong-elliptic, obtuse, quite entire, glabrous above, and rather pilose beneath, biglandular at the base. *h. S.* Native of the East Indies. Glands of leaves cup-shaped, somewhat pedicellate. Spikes paniced, terminal. Stamens and fruit unknown.

*Elliptic-leaved Terminalia*. Shrub or tree.

39 *T. TRIFOLIATA* (Spreng. syst. 2. p. 358.) leaves ternate, lanceolate, bluntish, glabrous, of a different colour beneath; racemes paniced, smooth. *h. S.* Native of Brazil. The rest unknown.

*Trifoliolate Terminalia*. Shrub or tree.

40 *T. MACROSTEMON* (Spreng. syst. 2. p. 14.) leaves oblong-lanceolate, acuminate, coriaceous, veiny, quite glabrous on both surfaces; branches of panicle verticillate, pubescent; stamens elongated. *h. S.* Native of Brazil. The rest unknown.

*Long-stamened Terminalia*. Shrub or tree.

41 *T. LUCIDA* (Hoffmannsegg. ex Mart. fl. bras. 1. p. 43.) leaves opposite, ovate-oblong, acute, coriaceous, glabrous on both surfaces, and glandless at the base; spikes numerous, aggregate, pubescent. *h. S.* Native of Brazil in moist woods, in the province of Para. Fruit unknown.

*Shining-leaved Terminalia*. Shrub or tree.

42 *T. FIRMA* (Mart. ex Spreng. syst. 2. p. 358.) leaves in bundles, obovate, mucronate, coriaceous, with revolute margins, glabrous on both surfaces and reticulated; spikes terminal, aggregate, villous. *h. S.* Native of Brazil on high mountains, in the province of the Rio-Negro. The rest unknown.

*Firm Terminalia*. Tree.

43 *T. BRASILIENSIS* (Spreng. syst. 2. p. 358.) leaves oblong, membranous, glandularly crenated, veiny, smoothish; flowers in fascicled racemes. *h. S.* Native of Brazil. The rest unknown.

*Brazil Terminalia*. Shrub or tree.

*Cult.* See *Bucida* for culture and propagation. p. 657.

IV. PENTAPTERA (from *πεντε*, *pente*, five, and *πτερον*, *pteron*, a wing; in reference to the fruit being furnished with 5 wings). Roxb. hort. beng. p. 34. D. C. prod. 2. p. 14.

*LIN. SYST. Polygamia, Monœcia.* All as in *Terminalia*, except the drupe, which is coriaceous and ovate, furnished with 5-6 regular vertical wings.—East Indian trees, with opposite or sub-opposite petiolate leaves, which are biglandular at the base. Spikes of flowers axillary and terminal, usually so close together as to form a brachiate panicle. Flowers 5-cleft, decandrous. Perhaps only a section of *Terminalia*, or perhaps numbers of the Indian species of *Terminalia*, whose fruit are unknown, are referrible to this genus.

1 *P. TOMENTOSA* (Roxb. l. c. D. C. diss. t. 1.) leaves nearly opposite, on short petioles, ovate, repandly crenulated, obtuse at both ends, mucronate at the apex, somewhat dotted beneath, and velvety on the nerves, and bearing 2 thick cup-shaped glands at the base. *h. S.* Native of the East Indies, where it is called *Usun* or *Usuna*. *Terminalia alata*, Roth. nov. spec. 378. Leaves 7-9 inches long, and 3 broad. Spikes disposed in a brachiate panicle. Flowers hairy. Fruit glabrous, with the wings coriaceous and much extended.

*Tomentose Pentaptera*. Tree 40 ft.

2 *P. PANICULATA* (Roxb. l. c.) leaves nearly opposite, petiolate, oval-oblong, acutish, obtuse at the base, quite entire, glabrous on both surfaces, coriaceous, bearing 2 thick cyathiform glands at the base beneath. *h. S.* Native of Coronandel, where it is called *Nimceeri* and *Lokarakai*. Leaves 5-6 inches long, and 2 inches broad. Spikes clothed with adpressed velvety down, forming a brachiate panicle. Flowers hairy.

*Paniced Pentaptera*. Tree 40 ft.

3 *P. ARJUNA* (Roxb. l. c. D. C. diss. t. 2.) leaves nearly opposite, petiolate, oblong, acute, bluntish at the base, quite glabrous on both surfaces, entire, bearing 2 small glands at the origin of the pagina. *h. S.* Native of the East Indies, where it is called *Urjoon*, whence the trivial name. Leaves glaucous, 3-5 inches long, and an inch broad. Spikes usually tern, paniced. Drupe furnished with 6-7 thick coriaceous wings.

*Urjoon Pentaptera*. Tree 50 ft.

4 *P. OBOVATA* (D. C. prod. 3. p. 14.) leaves opposite, on short petioles, obovate, very blunt at the apex or emarginate, and rather narrowed at the base, quite entire, glabrous on both surfaces, bearing 2 marginal concave glands at the origin of the limb. *h. S.* Native of the East Indies, where it is called *Mardemarum*. *Terminalia alata*, Leschen. herb. Leaves 3 inches long, and 1 broad, sometimes glandless. Spikes usually tern, paniced. Flowers in fascicles along the rachis.

*Obovate-leaved Pentaptera*. Tree 40 feet.

5 *P. CUNEATA* (D. C. prod. 3. p. 14.) leaves opposite, petiolate, oblong, cuneate-elliptic, acutish, quite entire, glabrous above, and clothed with rufous pubescence beneath, bearing 2 small glands at the base. *h. S.* Native of the East Indies. *Terminalia cuneata*, Roth. nov. spec. p. 379. Spikes constituting a terminal panicle. Flowers in fascicles along the rachis. Drupe ovate, 5-angled, 5-furrowed; angles winged. Leaves sometimes glandless.

*Cuneate-leaved Pentaptera*. Tree 50 ft.

6 *P. CRENULATA* (D. C. prod. 3. p. 15.) leaves nearly opposite, on short petioles, oblong-oval, acutish, but somewhat cordate at the base, crenulated, dotted above, rufous beneath, and furnished with 2 glands at the base. *h. S.* Native of the East Indies. *Terminalia crenulata*, Roth. nov. spec. p. 380. Perhaps the same as *P. crenulata*, Roxb. hort. beng. p. 34. Spikes opposite, superior ones tern. Flowers pubescent, in fascicles. Fruit unknown.

*Crenulated-leaved Pentaptera*. Tree 40 ft.

7 *P. MARADU*; leaves nearly opposite, long, oblong, glabrous above; fruit large, 5-winged. *h. S.* Native of the East Indies. *Terminalia Maradu*, Hamilt. miss. in herb. Lamb.

*Maradu Pentaptera*. Tree 50 ft.

8 *P. GLA'BRA* (Roxb. hort. beng. p. 34.) leaves nearly opposite, oblong or obovate-oblong, obtuse, glabrous, furnished with 2 glands at the base on the middle nerve, discoloured beneath; panicle terminal, composed of spikes. *h. S.* Native of the East Indies, where it is called *Dilla-maduo*.

*Glabrous Pentaptera.* Tree 50 ft.

9 *P. ALA'TA* (Banks, herb.) leaves elliptic-obovate, obtuse, and mucronate, glabrous, furnished with 2 glands at the base of the limb; branches, rachis, and calyxes drooping; spikes on long peduncles, axillary or terminal, simple. *h. S.* Native of Tranquebar.

*Winged-fruited Pentaptera.* Tree 40 ft.

† *Species only known by name from Roxb. hort. beng. p. 34.*

10 *P. CORIA'CEA* (Roxb.) Native of Coromandel, where it is called *anemutti*. Perhaps the same as *Terminàlia coriacea* of Rottl.

*Coriaceous-leaved Pentaptera.* Tree 40 ft.

11 *P. BIALA'TA* (Roxb.) Native of the East Indies.

*Two-winged-fruited Pentaptera.* Tree 40 ft.

*Cult.* See *Bàcida* for culture and propagation, p. 657.

V. *GETONIA* (the author does not say from whence this name is derived). Roxb. cor. 1. t. 87. Gartn. fruct. 3. p. 210. t. 217. D. C. prod. 2. p. 15.—*Calycópteris*, Lam. ill. t. 357. Poir. suppl. 2. p. 41.

*LIN. SYST.* *Decándria, Monogýnia.* Limb of calyx permanent, campanulate, cleft almost to the base into 5 parts; lobes lanceolate, 3-nerved. Petals wanting. Stamens 10, exserted, disposed in 2 series, shorter than the calycine lobes, 5 inserted at the recesses of the lobes, and the other 5 inserted in the bottom of the calyx. Anthers orbicular, didymous. Style filiform, obtuse, pubescent. Nut roundish, pentagonal, crowned by the calyx, 1-celled, 1-seeded.—Climbing shrubs, with opposite ovate acuminate leaves, on short petioles, full of small resinous dots beneath. Racemes axillary, or constituting a terminal panicle.

1 *G. FLORIB'NDA* (Roxb. cor. 1. t. 87.) leaves ovate, acute, pubescent above, and clothed with rusty tomentum beneath; panicle terminal. *h. S.* Native of Malabar. Roth. nov. spec. 216. Perhaps the same as *Calycópteris floribunda*, Lam. ill. t. 357. a native of Madagascar, which, according to Poir. suppl. 2. p. 41. has glabrous leaves.

*Bundle-flowered Getonia.* Clt. 1815. Shrub cl.

2 *G. NUTANS* (Roxb. hort. beng. p. 33.) leaves ovate, ending in a long abrupt acumen, glabrous above except the nerve, pubescent beneath; racemes for the most part axillary, longer than the leaves. *h. S.* Native of the East Indies. *G. nitida*, Roth. nov. spec. 217. Flowers nearly twice the size of those of the preceding species.

*Var. β, brachystachya* (D. C. prod. 3. p. 15.) leaves ovate, acute, glabrous above except the nerve, pubescent beneath; racemes axillary, shorter than the leaves. *h. S.* Native country unknown. Perhaps a variety of *G. floribunda*, or perhaps a species.

*Nodding-racemed Getonia.* Clt. 1816. Shrub cl.

*Cult.* See *Combretum* for culture and propagation, p. 670.

VI. *CHUNCOA* (*Arbol del Chunchu* is the name of the first species in Peru). Pav. in Juss. gen. p. 76. (1789.) Poir. suppl. 2. p. 258. Gimbernàtia, Ruiz et Pav. fl. per. prod. p. 138. t. 36. (1794).

*LIN. SYST.* *Decándria, Monogýnia.* Flowers some of them hermaphrodite, and others male. Limb of calyx 5-toothed, deciduous. Petals wanting. Stamens 10, filiform, length of the calyx; anthers roundish. Style filiform. Fruit drupaceous, oblong, coriaceous, 5-angled; angles winged, the 2 opposite ones the largest. Seed one, pendulous.—Peruvian trees, with

alternate scattered leaves, and axillary spikes or racemes of flowers; those flowers at the base of the spikes hermaphrodite, and those at the apex male. The internal structure of the seeds is scarcely known. Ventenat doubts if the cotyledons are truly convolute. The genus is probably distinct from *Terminàlia*.

1 *C. OBOV'ATA* (Poir. l. c.) leaves obovate, acuminate; spikes pendulous; fruit 5-winged. *h. S.* Native of Peru, at Cuchera and Macora, where it is called *Arbol del Chunchu*. Gimbernàtia obovata, Ruiz et Pav. prod. 138. syst. 174. and Spreng. syst. exclusive of the synonyme of Aublet.

*Obovate-leaved Chuncoa.* Tree 40 feet.

2 *C. OBLONGA* (Poir. l. c.) leaves oblong; spikes crowded; fruit furnished with 2 wings. *h. S.* Native of Peru, in woods at Pozuzo. Gimbernàtia oblònga, Ruiz et Pav. l. c.

*Oblong-leaved Chuncoa.* Tree.

3 *C. BRASILI'ENSIS* (St. Hil. fl. bras. 2. p. 244.) leaves obovate-oblong, quite entire, biglandular at the base; spikes nearly sessile, many-flowered; fruit pubescent. *h. S.* Native of Brazil, in the provinces of Minas Geraes and Goyaz.

*Brazilian Chuncoa.* Tree 20 ft.

*Cult.* See *Bàcida* for culture and propagation, p. 657.

VII. *RAMATUELLA* (*Ramatuelle* is the vernacular name of the tree). D. C. prod. 3. p. 16.—*Ramatuèla*, H. B. et Kunth, nov. gen. amer. 7. p. 253. f. 656.

*LIN. SYST.* and flower unknown. Fruit coriaceous and woody, indehiscent, 1-seeded, 5-angled; angles winged above, and ending in a tapering beak at the apex. Seed ovate-subconical, marked by the raphe on one side. Cotyledons convolute.—A shrub, having the leaves crowded by threes or fours at the tops of the branches, quite entire, coriaceous. Peduncles terminal, but at length lateral. Fruit sessile, crowded into heads.

1 *R. ARG'NTEA* (H. B. et Kunth, l. c.) *h. S.* Native of South America, on the banks of the river Atabapo. Leaves obovate-cuneate, glabrous above, and silky beneath.

*Silvery Ramatuella.* Shrub 5 to 6 feet.

*Cult.* See *Bàcida* for culture and propagation, p. 657.

VIII. *CONOCARPUS* (from *κορυς*, *konos*, a cone, and *καρπος*, *karpus*, a fruit; in reference to the scale-formed fruit being so closely imbricated in a head as to resemble a small fir-cone). Gartn. fruct. 2. p. 470. t. 177. H. B. et Kunth, nov. gen. amer. 6. p. 113. but not of Adans.—*Conocárpus* spec. Jacq. and Lin.—*Rudbèchia*, Adans. fam. p. 80. but not of Lin.

*LIN. SYST.* *Penta-Decándria, Monogýnia.* Tube of calyx 5-cleft, deciduous. Petals wanting. Stamens 5-10, exserted; anthers cordate. Ovarium compressed, biovulate. Style 1. Fruit corky, scale-formed, closely imbricated, indehiscent, 1-seeded. Seed pendulous. Cotyledons involute.—Shrubs, with alternate quite entire leaves, rarely nearly opposite ones. Heads of flowers pedunculate; flowers crowded.

SECT. I. *ECCONOCARPUS* (from *eu*, *eu*, well or good, *κορυς*, *konos*, a cone, and *καρπος*, *karpus*, a fruit; this section contains those species whose fruit is so densely imbricated as to appear like a fir-cone). D. C. prod. 3. p. 16. Fruit somewhat boat-shaped, hardly winged on the margins, awnless at the apex, imbricated backwards. Tube of calyx not drawn out beyond the ovary, with a sessile limb seated obliquely on the ovary.

1 *C. ERECTA* (Jacq. amer. 78. t. 52. f. 1. H. B. et Kunth, nov. gen. amer. 6. p. 118.) leaves oblong-lanceolate, tapering to both ends, thickish, glabrous, or when young rather downy, usually biglandular at the base; heads of flowers panicled. *h. S.* Native of South America, West Indies, Tropical Africa, and Asia, in sandy places near the sea or on banks of rivers, as far up as the tide reaches, and usually growing along with mangroves.—Sloane, hist. 2. p. 161. f. 2.—Cat. car. c. 33.

*Erect Conocarpus.* Clt. 1752. Shrub 6 to 8 feet.

2 *C. PROCUMBENS* (Jacq. amer. 79. t. 51. f. 2.) stems much branched, procumbent; leaves obovate, glabrous; heads panicled. *h. S.* Growing along with the last, and lying flat on the ground. *C. erecta* var. *β*, *procumbens*, D. C. prod. 3. p. 16.

*Procumbent Conocarpus.* Clt. 1730. Pl. prostrate.

3 *C. ACUTIFOLIA* (Willd. in Rcem. acut. Schultes. syst. 5. p. 574.) stems erect; leaves lanceolate, acute at both ends; heads of flowers solitary and axillary, or aggregate at the tops of the branches; branches pubescent. *h. S.* Growing along with the two preceding species.

*Acute-leaved Conocarpus.* Clt. 1820. Shrub 5 to 8 feet.

4 *C. SERICEA* (Forst. in herb. Lher.) leaves oblong, acuminate at both ends, clothed with silky villi on both surfaces even in the adult state; heads panicled. *h. S.* Native of South America? *C. erecta* var. *γ sericea*, D. C. prod. 3. p. 16.

*Silky Conocarpus.* Shrub.

SECT. II. *LEIOCARPUS* (from *λειος*, *leios*, smooth, and *καρπος*, *karpos*, a fruit). Fruit *h. S.* imbricated backwards, amply winged on the margins, and ending in a short acumen at the apex. Tube of calyx stretched a little beyond the ovary. —African species.

5 *C. LEIOCARPA* (D. C. prod. 2. p. 16.) leaves oval, glandless, glabrous, hardly pubescent on the nerve beneath; heads axillary, pedunculate, solitary; fruit quite glabrous. *h. S.* Native of Senegal and Gambia.

*Smooth-fruited Conocarpus.* Shrub 5 to 6 feet.

SECT. III. *ANOGEISSUS* (from *ανα*, *ana*, upwards, and *γεισσος*, *geisson*, a tile; in reference to the scale-like fruit being imbricated upwards in the heads). D. C. prod. 3. p. 16. Fruit imbricated upwards, drawn out into a long acumen at the apex. Tube of calyx drawn out beyond the ovary, and so slender as to give the limb the appearance of being pedicellate. —Indian species.

6 *C. ACUMINATA* (Roxb. hort. beng. p. 34.) leaves glandless; heads axillary, pedunculate, solitary; fruit clothed with adpressed villi. *h. S.* Native of the East Indies, where it is called *panch-maun*. *Andersonia acuminata*, Roxb. herb. Leaves elliptic, acute, glabrous above, and clothed with adpressed down beneath. Heads globose, shorter than the leaves.

*Acuminated Conocarpus.* Shrub.

† *A species not sufficiently known.*

7 *C. LATIFOLIA* (Roxb. hort. beng. p. 34.) *h. S.* Native of the East Indies. Leaves glandless, quite glabrous, elliptic, apiculated by a mucrone. Heads solitary, globose, on short velvety peduncles. Perhaps the same as *C. latifolia*, Roxb.

*Broad-leaved Conocarpus.* Shrub.

*Cult.* See *Bucida* for culture and propagation, p. 657.

#### Tribe II.

COMBRETÆE (plants agreeing with *Combretum* in the flowers being furnished with petals). Flowers hermaphrodite, with 4-5 petals and 8-10 stamens.

IX. LAGUNCULARIA (meaning not explained). Gaertn. fruct. 3. p. 209. t. 217. D. C. prod. 3. p. 17. —*Spenocarpus*, Rich. anal. fr. p. 92. —*Conocarpus* species of Lin.

LIN. SYST. *Decandria, Monogynia*. Limb of calyx permanent, somewhat campanulate, 5-toothed; teeth obtuse. Petals 5, minute, spreading, caducous. Stamens 10, disposed in two series, inclosed. Style subulate. Stigma capitate. Fruit with 5 unequal ribs, coriaceous, crowned by the calyx, valveless, 1-seeded. Cotyledons convolute. Radicle very long. —A tree or shrub, with opposite leaves and opposite spikes of bractless flowers. Seed germinating within the nut.

1 *L. RACEMOSA* (Gaertn. l. c.) leaves elliptic, obtuse, glabrous; flowers racemose; calyxes clothed with white tomentum. *h. S.* Native of Guiana, Brazil, and the West Indies, in marshes by the sea side. *Conocarpus racemosa*, Lin. spec. 251. Jacq. amer. 80. t. 53. Swartz, obs. 79. Schousboda commutata, Spreng. syst. 2. p. 332. —Sloane, hist. t. 187. f. 1.

*Racemose-flowered Laguncularia.* Clt. 1822. Sh. or tree.

*Cult.* See *Bucida* for culture and propagation, p. 657.

X. GUIERA (*Guier* is the name of the tree in Senegal). Juss. gen. 320. Lam. ill. t. 360. D. C. prod. 3. p. 17.

LIN. SYST. *Decandria, Monogynia*. Tube of calyx oblong, slender, somewhat cylindrical, with a tubular campanulate 5-toothed limb. Petals 5, oblong-linear, small. Stamens 10, exserted; anthers globose. Ovary oblong. Style 1, filiform. Capsule narrow, pentagonal, 1-celled, 1-5-seeded. Seeds hanging by a thread, oblong. Cotyledons convolute? —A shrub, with opposite ovate entire leaves. Flowers crowded into spicate heads, sessile along the rachis, with large foliaceous bractes at the base of the head of flowers, and other small ones at the base of the flowers.

1 *G. SENEGALENSIS* (Lam. ill. t. 360. Poir. suppl. 2. p. 861.) *h. S.* Native of Senegal. Leaves dotted beneath. Heads of flowers girded by a 4-leaved involucre. Calycine tube or fruit bearded.

*Senegal Guiera.* Shrub 5 to 6 feet.

*Cult.* See *Bucida* for culture and propagation, p. 657.

XI. COMBRETUM (a name given by Pliny to a climbing plant, but to what plant is not at present known). Lcefl. itin. p. 308. Lin. gen. no. 457. Gaertn. fruct. 1. p. 176. t. 36. G. Don, in Lin. trans. 15. p. 413. D. C. prod. 2. p. 18. *Ætia*, Adans. fam. 2. p. 84. —*Poivreca*, Comm. — *Cristaria*, Sonn. voy. ind. 2. t. 140. but not of Cav.

LIN. SYST. *Octo-Decandria, Monogynia*. Calyx with a 4-5-toothed (f. 89. a.) deciduous limb. Petals 4-5 (f. 89. b.), inserted at the top of the calyx. Stamens 8-10, exserted. Ovary 2-5- (f. 89. c.) -ovulate. Style filiform (f. 89. d.). Fruit 4-5-winged. Seed 1, pendulous. —Climbing or erect shrubs, rarely herbs, with entire, opposite or tern, rarely alternate leaves. Spikes solitary or twin, axillary, and terminal, opposite, or 3 or 4 in a whorl, usually disposed in a terminal panicle. Flowers bracteate, almost sessile, rarely pedicellate. Petals scarlet, red, white, rarely orange.

SECT. I. *EUCOMBRETUM* (from *eu*, well or good, and *combretum*; this section contains what are considered the genuine species of the genus). Calyx 4-toothed. Corolla 4-petalled. Stamens 8. Fruit 4-winged. Cotyledons reflexed by a plait in the middle?

§ 1. *Calyx campanulate. Spikes axillary and terminal. Flowers secund.*

1 *C. SECUNDUM* (Jacq. amer. 103. t. 176. f. 30. ed. pict. p. 53. t. 260. f. 26. G. Don, in Lin. trans. 15. p. 419.) climbing, glabrous; branches sub-quadrangular; leaves ovate-lanceolate; calyxes and ovaries covered with resinous dots; petals scale-formed, elliptic, mucronate, cucullate. *h. S.* Native of Guiana and the Island of Trinidad. Lam. ill. t. 282. f. 1. C. elegans, H. B. et Kunth, nov. gen. amer. 6. p. 109. C. laxum, Aubl. guian. 1. p. 251. t. 137. Flowers large, secund. Petals yellow, a little shorter than the calycine teeth. Calyx covered with rusty dots outside. Stamens scarlet, disposed in one series, nearly an inch long.

*Secund-flowered Combretum.* Clt. 1818. Sh. cl.

2 *C. OXYPTALUM* (G. Don, in Lin. trans. 15. p. 420.) climbing, glabrous; branchlets somewhat quadrangular; leaves ob-

long, membranous, attenuated at both ends, covered with resinous rusty dots beneath, as well as the calyxes; petals scale-formed, obovate-lanceolate, acuminate; stamens very long. *h. c. S.* Native of Guayaquil. Very like the preceding, but differs in the membranous leaves tapering to both ends, and in the shape of the petals.

*Sharp-petalled Combretum.* Shrub cl.

3 *C. FORMOSUM* (G. Don, in Lin. trans. 15. p. 420.) climbing; leaves oblong-elliptic, acuminate, beset with resinous rusty dots beneath, but when in a young state clothed with rusty down, as well as the calyxes; flowers crowded; petals scale-formed, cuneate-lanceolate, acuminate. *h. c. S.* Native of Brazil, near Rio Janeiro. Very like the two preceding species, but differs in the young leaves and calyx being clothed with rusty down.

*Beautiful Combretum.* Shrub cl.

4 *C. MICROPTALUM* (D. C. prod. 3. p. 19. St. Hil. fl. bras. 2. p. 249.) leaves elliptic-oblong, acuminate, smoothish above, and lepidotted beneath; spikes simple, dense-flowered, on short peduncles, about equal in length to the leaves; calyx rubiginose, with a tetragonal tube; petals obovate-lanceolate; stamens very long. *h. c. S.* Native of Brazil, in the provinces of Minas Geraes and Minas Novas. Petals yellow.

*Small-petalled Combretum.* Shrub cl.

5 *C. ROTUNDFOLIUM* (Rich. act. soc. hist. nat. par. I. 791. p. 108.) climbing; leaves ovate-roundish, mucronate, glabrous; spikes opposite, bractless; flowers secund? calyx glabrous on the inside. *h. c. S.* Native of Cayenne. Leaves of the branches oval, of the branchlets roundish. Calyx lepidotted on the outside. Stamens very long, purple? Fruit with ample membranous wings.

*Round-leaved Combretum.* Shrub cl.

6 *C. MACROCARPUM* (Beauv. fl. d'ow. 2. p. 90. t. 118. f. 2.) fruit large, 4-winged; wings deeply cordate at the apex. *h. c. S.* Native of the west coast of Africa, at Benin.

*Large-fruited Combretum.* Shrub cl.

§ 2. *Calyx tubular.* Flowers disposed in terminal fascicles or umbels.

7 *C. LEUCOPHYLLUM* (G. Don, in edinb. phil. journ. 1824. p. 344. and in Lin. trans. 15. p. 421.) erect, clothed with fulvous villi; leaves oblong, mucronate; racemes corymbose or umbellate; floral leaves white, and constituting an involucre to the head of flowers, and with a linear white bractea to each flower; petals lanceolate, obtuse, 4 times longer than the calyx. *h. S.* Native of Sierra Leone, not far from Free-town, and of Senegal at St. Louis. *C. trigonoides*, Perr. in litt. ex D. C. prod. 3. p. 20. Flowers pedicellate, scarlet. Stamens scarlet, much longer than the petals, bearing black anthers.

*White-leaved Combretum.* Sh. 4 to 6 feet.

8 *C. LANUGINOSUM* (G. Don, in Lin. trans. 15. p. 422.) erect; leaves orbicular, emarginate; flowers in fascicles; petals oval, crenulate, a little longer than the calyx. *h. S.* Native of Abyssinia. Shrub branched, woolly. Stamens long.

*Woolly Combretum.* Sh. 4 to 6 feet.

9 *C. PUNCTATUM* (Blum. bijdr. p. 640.) climbing; leaves elliptic-oblong, acuminate, dotted on both surfaces; spikes capitate, paniced, axillary, and terminal; calyx villous inside. *h. c. S.* Native of Java, on the mountains.

*Dotted-leaved Combretum.* Shrub cl.

§ 3. *Calyx tubular.* Spikes axillary, never terminal.

10 *C. EXTENSUM* (Roxb. hort. beng. p. 28. G. Don, in Lin. trans. 15. p. 422.) climbing, glabrous; leaves oblong or obovate, coriaceous; spikes slender, short, solitary, dense-flowered; petals ovate, acute, shorter than the calyx. *h. c. S.* Native of

the Moluccas. Flowers small, white. Stamens white, disposed in one series, much exserted. Stigma subcapitate.

*Extended Combretum.* Shrub cl.

11 *C. HERBACEUM* (G. Don, in edinb. phil. journ. 1824. p. 344. and Lin. trans. 15. p. 423.) herbaceous, humble; stems simple, pubescent; leaves alternate, lanceolate, mucronate, clothed with silky villi beneath, but glabrous above in the adult state; peduncles twin, few-flowered; petals ovate, acute, a little longer than the calyx. *h. S.* Native of Sierra Leone, common in the low lands. Root woody. Flowers small, white. Stamens not much exserted.

*Herbaceous Combretum.* Fl. Feb. Pl. 1 foot.

12 *C. DUARTEANUM* (St. Hil. fl. bras. 2. p. 248.) leaves elliptic, acuminate, lepidotted on both surfaces; spikes shorter than the leaves; tube of calyx tetragonal; branches glabrous; petals lanceolate, very narrow at the base. *h. c. S.* Native of Brazil. Limb of calyx funnel-shaped.

*Duarte's Combretum.* Shrub cl.

§ 4. *Calyx turbinate-campanulate.* Racemes axillary and terminal, paniced. Flowers pedicellate.

13 *C. PANICULATUM* (Vent. p. 58.) leaves oblong, obtuse; panicle terminal, bracteoid, hairy; calyxes pubescent; bracteas very short; flower pedicellate. *h. c. S.* Native of Senegal and Sierra Leone. Flowers scarlet.

*Paniced-flowered Combretum.* Shrub cl.

14 *C. SPINOSUM* (G. Don, in edinb. phil. journ. 1824. p. 345.) erect, glabrous; branches spinose; leaves on long petioles, oval, membranous; flowers pedicellate; calycine teeth nearly obsolete; petals oval, obtuse; stamens not much exserted. *h. S.* Native of Sierra Leone, in the low lands. Flower small, scarlet, collected into fascicles. Anthers black.

*Spinose Combretum.* Shrub 6 to 8 feet.

15 *C. SMEATHMANNI* (G. Don, in Lin. trans. 15. p. 425.) climbing, hairy; leaves elliptic, acuminate, floral ones yellow; bracteas very large; racemes elongated; flowers pedicellate. *h. c. S.* Native of Sierra Leone. Flowers solitary, in the axils of large bracteas. Stamens exserted.

*Smeathmann's Combretum.* Shrub cl.

§ 5. *Calyx turbinate-campanulate.* Spikes axillary and terminal, usually disposed in the manner of a panicle.

16 *C. ELEGANS* (St. Hil. fl. bras. 2. p. 277. t. 129.) climbing, leaves elliptic, acute, acuminate, puberulous above, and clothed with yellowish tomentum beneath; spikes simple, on short peduncles; petals lanceolate, acute, hairy; calycine tube cylindrical. *h. c. S.* Native of Brazil, in the province of Minas Geraes. Branches covered with yellowish tomentum. Petals yellow.

*Elegant Combretum.* Shrub cl.

17 *C. FARINOSUM* (H. B. et Kunth, nov. gen. amer. 6. p. 110. G. Don, in Lin. trans. 15. p. 425.) climbing, glabrous; leaves elliptic-oblong, obtuse, rather coriaceous, rounded at the base, mealy beneath; spikes usually twin, many-flowered; petals scale-formed; stamens very long. *h. c. S.* Native of Mexico, between Acapulco and Venta del Exido. Flowers subsecund, orange-coloured.

*Mealy Combretum.* Fl. April, July. Clt. 1825. Shrub cl.

18 *C. FRANGULÆFOLIUM* (H. B. et Kunth, nov. gen. amer. 6. p. 109. t. 538.) climbing, glabrous; leaves elliptic, lepidotted on both surfaces; spikes solitary, rarely twin; bracteas oblong, acute, villous; petals crenate, rather fan-shaped. *h. c. S.* Native on the banks of the Orinoco, near Angustura, and Carichana. Stamens long.

*Frangula-leaved Combretum.* Shrub cl.

19 *C. LAXUM* (Jacq. amer. p. 104. and pict. p. 53.) climbing, glabrous; leaves ovate; spikes erect, loose-flowered; calyx pubescent; petals roundish, shorter than the calyx. *h. c. S.*

Native of the West India Islands. Lam. ill. t. 282. f. 1.—Loefl. itin. p. 308. Flowers small, white. Stamens long, inserted in the bottom of the calyx.

*Loose-flowered Combretum.* Shrub cl.

20 *C. MEXICANUM* (Humb. et Bonpl. pl. æquin. 2. p. 156. t. 132.) humble, glabrous; young branches compressed; leaves elliptic, membranous, rather cordate at the base; spikes disposed in the manner of a panicle, clothed with rusty tomentum, short, many-flowered; petals somewhat reniform, shorter than the calyx. *h. S.* Native of Mexico, near Acapulco, by the sea-side. Flowers sub-secund, with the petals and stamens white and the anthers yellow. Stamens 3-times the length of the calyx.

*Mexican Combretum.* Shrub 6 feet.

21 *C. OBTUSIFOLIUM* (Rich. act. soc. hist. nat. par. 1791. p. 108.) leaves obovate, obtuse, quite glabrous; peduncles terminal and axillary, of many spikes; branches clothed with rufous pubescence; calyx pubescent; stamens hardly exserted. *h. S.* Native of Cayenne. Leaves almost elliptic. Very like *C. Mexicanum*.

*Obtuse-leaved Combretum.* Shrub.

22 *C. PULCHELLUM* (Mart. Michx. G. Don, in Lin. trans. 15. p. 428.) climbing, puberulous; leaves elliptic, oblong, brownish beneath; spikes disposed in the manner of a panicle; calyxes and peduncles clothed with fuscous villi; petals rather reniform, reflexed. *h. S.* Native of Brazil, at the Rio Negro. Flowers small, scarlet. Petals a little longer than the calyx, reflexed. Stamens 3-times the length of the calyx.

*Neat Combretum.* Shrub cl.

23 *C. BUGI* (St. Hil. fl. bras. 2. p. 247. t. 130.) climbing; leaves elliptic, bluntly acuminate, glabrous; calycine tube cylindrical; spikes disposed in the manner of a panicle, on short peduncles; petals roundish. *h. S.* Native of Brazil, on the banks of the Rio St. Francisco, in the western part of the province of Minas Geraes, in the Certao or great desert, where it is called *Bugi*. Flowers polygamous; calyx downy; petals yellow.

*Bugi Combretum.* Shrub cl.

24 *C. RACEMOSUM* (Beauv. fl. d'ow. 2. p. 90. t. 118. f. 1.) climbing, glabrous; leaves ovate-oblong, acute, shining; panicle of many spikes; spikes elongated, tufted at the apex; petals lanceolate, obtuse. *h. S.* Native of Benin, on the west coast of Africa. Flowers middle-sized, white, on short pedicels. Petals much longer than the calyx. Stamens very long.

*Racemose-flowered Combretum.* Fl. Feb. Jul. Clt. 1826. Sh. cl.

25 *C. ALBIDUM* (G. Don, in Lin. trans. 15. p. 429.) climbing, glabrous; leaves on long petioles, oblong, obtuse, or somewhat orbicular, dotted and green above, and white beneath; panicle of many spikes; spikes crowded with flowers; calyxes pubescent; petals small. *h. S.* Native of the East Indies. *C. laxum*, Roxb. hort. beng. p. 88. Stamens very long.

*White-leaved Combretum.* Shrub cl.

26 *C. NANUM* (Hamilt. mss. in D. Don, prod. fl. nep. p. 219.) humble, erect; leaves oblong or ovate, obtuse, glabrous; spikes simple and sometimes branched at the base; calyxes pubescent; petals ovate, obtuse. *h. S.* Native of Nipaul. Flowers small, white. Stamens very long.

*Dwarf Combretum.* Clt. 1825. Shrub  $\frac{1}{2}$  to 1 foot.

27 *C. ROXBURGHII* (G. Don, in Lin. trans. 15. p. 429.) climbing, glabrous; leaves ovate, obtuse; panicle composed of many loose-flowered spikes; rachis and calyxes pubescent. *h. S.* Native of the East Indies. Leaves pubescent when young.

*Roxburgh's Combretum.* Shrub cl.

28 *C. ODORATUM* (Pav. mss. in herb. Lamb. G. Don, in Lin. trans. 15. p. 430.) climbing; branchlets puberulous; leaves oblong or obovate-oblong, rounded, and somewhat emarginate

at the apex, coriaceous, glabrous; panicle composed of many spikes; spikes crowded with flowers; petals reniform. *h. S.* Native of Guayaquil. Flowers red or scarlet. Stamens 3-times the length of the calyx.

*Sweet-scented Combretum.* Shrub cl.

29 *C. GLUTINOSUM* (Perr. in litt. D. C. prod. 3. p. 21.) unarmed, erect, arborescent, glabrous; leaves somewhat verticillate, ovate, petiolate, coriaceous, mucronate; racemes branched at the base or twin, elongated, bractless. *h. S.* Native of Senegal. Flowers yellow, on different branches from the leaf-bearing ones. Branches as well as the young leaves clammy.

*Clammy Combretum.* Shrub.

30 *C. PYRAMIDATUM* (Desv. in Hamilt. prod. fl. ind. occ. p. 35.) branches complanate, rather greyish; leaves obovate, somewhat emarginate, mucronulate; capsule pyramidal, with acute angles, not winged. *h. S.* Native of Guiana. The rest unknown.

*Pyramidal-capsuled Combretum.* Shrub.

31 *C. PUBERUM* (Rich. in act. soc. hist. nat. par. 1791. p. 108.) climbing, glabrous; leaves oblong, coriaceous, rather cordate at the base, shining above; panicle terminal, composed of many spikes; branches, rachis, and calyxes clothed with rusty down; stamens short; bractes setaceous. *h. S.* Native of Cayenne. Flowers small.

*Downy Combretum.* Shrub cl.

32 *C. GLABRUM* (D. C. prod. 3. p. 19.) climbing, glabrous; leaves elliptic, acuminate; spikes disposed in a terminal panicle; bractes setaceous. *h. S.* Native of French Guiana.

*Glabrous Combretum.* Shrub cl.

§ 6. *Calyx turbinate campanulate. Spikes axillary, never terminal.*

33 *C. TOMENTOSUM* (G. Don, in edinb. phil. journ. 1824. p. 346. and in Lin. trans. 15. p. 430.) climbing, clothed with fuscous tomentum; leaves oval, mucronate, smoothish above in the adult state; spikes loose-flowered; petals oval, obtuse, a little shorter than the calyx; stamens short. *h. S.* Native of Sierra Leone. Flowers small, white.

*Tomentose Combretum.* Shrub cl.

34 *C. MICRANTHUM* (G. Don, in edinb. phil. journ. 1824. p. 347.) erect; branches pubescent; leaves oblong, bluntly mucronate, glabrous in the adult state; spikes slender; petals linear-cuneate, 4-times the length of the calycine teeth; stamens not much exserted. *h. S.* Native of Sierra Leone. *C. parviflorum*, Rehb. in Sieb. pl. exsic. seneg. no. 35. hort. bot. t. 62. Flowers small, red or scarlet, on short pedicels. Stamens very little longer than the petals.

*Small-flowered Combretum.* Shrub 5 to 6 feet.

35 *C. MOLLE* (R. Br. in append. to Salt. trav. G. Don, in Lin. trans. 15. p. 431.) climbing, villous; leaves oblong-lanceolate, acuminate, cordate at the base; spikes elongated; calycine teeth very short; petals small; stamens twice the length of the calyx. *h. S.* Native of Abyssinia.

*Soft Combretum.* Shrub cl.

36 *C. LATIFOLIUM* (G. Don, in Lin. trans. 15. p. 432.) climbing, glabrous; leaves ample, coriaceous, oblong, acuminate, sometimes rounded; spikes short, crowded with flowers; calyxes pubescent; petals obovate, obtuse; stamens twice the length of the calyx. *h. S.* Native of the East Indies. *C. macrophyllum*, Roxb. hort. beng. p. 88. ? Flowers small, red.

*Broad-leaved Combretum.* Shrub cl.

37 *C. CHINENSE* (Roxb. hort. beng. p. 28. G. Don, in Lin. trans. 15. p. 432.) climbing, and covered with rusty scales or dots; leaves elliptic, acute at both ends, green above; spikes loose-flowered; petals small; stamens but little exserted. *h. S.* Native of China. Flowers middle-sized, scarlet?

*Chinese Combretum.* Shrub cl.

38 *C. VELUTINUM* (D. C. prod. 3. p. 20.) leaves ovate, acuminate, clothed with soft villi on both surfaces as well as the branches and peduncles; spikes axillary, solitary, simple; pedicels very short.  $\frac{1}{2}$ . S. Native of Brazil. *Terminalia argentea*, Mart. bras. 1. p. 43. ? Fruit large, 4-winged, pubescent; wings glabrous. Petioles hardly 2 lines long.

*Velvety Combretum.* Shrub cl. ?

39 *C. PEDICELLARE* (D. C. prod. 3. p. 20.) leaves oval-oblong, velvety, but especially beneath, as well as the branches, petioles, and peduncles; racemes axillary, solitary, simple; pedicels about one half the length of the fruit.  $\frac{1}{2}$ . S. Native of Brazil. Very like the preceding species, but the petioles and pedicels are half an inch long. Fruit ovate, acuminate, 4-winged, clothed with short, rufescent, lepidotted down.

*Pedicelled Combretum.* Shrub cl. ?

40 *C. ALTUM* (Perr. in litt. D. C. prod. 3. p. 20) quite glabrous; leaves elliptic, attenuated at both ends, smooth, quite entire, on short petioles; racemes at the base of the branches; fruit solitary, 4-winged, pruinose, or brownish purple between the wings, and lepidotted.  $\frac{1}{2}$ . S. Native of Senegal, at the lake called Du Panier, 28 miles from St. Louis.

*Tall Combretum.* Shrub cl.

41 *C. MUCRONATUM* (Thonn. in herb. Vahl. ex herb. Puer. D. C. prod. 3. p. 20.) climbing? branchlets pubescent; leaves on short petioles, elliptic, somewhat obovate, obtuse at the base, and acuminately mucronate at the apex, glabrous, but with the petiole and nerve rather pubescent; racemes pedunculate, elongated, bractless.  $\frac{1}{2}$ . S. Native of Guinea. Calyxes and racemes velvety. Fruit glabrous, with membranous wings. Not known whether it belongs to the present division of the genus or not.

*Mucronate-leaved Combretum.* Shrub cl.

42 *C. WALLICHII* (D. C. prod. 3. p. 21.) erect, glabrous; leaves opposite, petiolate, mucronately acuminate; spikes pedunculate, axillary, simple, shorter than the leaves, bractless.  $\frac{1}{2}$ . S. Native of Nipaul. Flowers small, glabrous on the outside and villous inside.

*Wallich's Combretum.* Shrub.

SECT. II. *POIVREA* (in honour of N. Poivre, intendent of the Mauritius in 1766, a patron of botany). *Poivrea*. Comm. ined. Pet. Th. obs. pl. afr. aust. p. 28. D. C. prod. 3. p. 17. *Cristaria*, Sonn. voy. ind. 2. t. 140. but not of Cav.—*Gonocarpus*, Hamilt. prod. but not of Thumb. Calyx 5-toothed. Petals 5. Stamens 10, exserted. Ovary 2-5, ovulate. Fruit with 5 wings. Cotyledons truly convolute.

§ 1. *Calyx tubular. Spikes axillary and terminal, usually disposed in the manner of a panicle.*

43 *C. COMOSUM* (G. Don, in edinb. phil. journ. 1824. p. 344. and in Lin. trans. 15. p. 433.) climbing; branches pubescent; leaves elliptic, acute, somewhat cordate at the base, pubescent when young, but glabrous in the adult state; panicle of many spikes; spikes bearing a tuft of flowers at the apex; bractes lanceolate, acute; petals spatulate, obtuse; stamens long.  $\frac{1}{2}$ . S. Native of Sierra Leone; very common. Lindl. bot. reg. 1105. Flowers crimson or red.

*Tufted-flowered Combretum.* Fl. Feb. Ju. Clt. 1822. Sh. cl.

44 *C. INTERMEDIUM* (G. Don, l. c.) climbing; branches pubescent; leaves elliptic-obovate, mucronate, pubescent when young, but glabrous in the adult state; bractes ovate, mucronate; petals spatulate, obtuse.  $\frac{1}{2}$ . S. Native of Sierra Leone. Very like *C. comosum*, but the flowers are larger and denser.

*Intermediate Combretum.* Clt. 1822. Shrub cl.

45 *C. PILOSUM* (Roxb. hort. beng. p. 28. G. Don, in Lin. trans. 15. p. 434.) climbing, pilose; leaves oblong-lanceolate, acuminate, auricled at the base; panicle of many spikes; spikes short; calyxes and peduncles beset with fuscous pili; petals obovate, oblong, ciliated.  $\frac{1}{2}$ . S. Native of the East Indies. Flowers crowded, white, about the size of those of *C. comosum*. Stamens twice the length of the petals.

*Pilose Combretum.* Shrub cl.

46 *C. BARBATUM* (Newman, mss. G. Don, in Loud. hort. brit. p. 157.) hairy in every part; leaves ovate-oblong; panicle of many spikes; spikes long; petals obovate, bearded at the apex.  $\frac{1}{2}$ . S. Native of Maranham. Flowers white, rather large.

*Bearded-petalled Combretum.* Clt. 1820. Shrub cl.

47 *C. OVALE* (R. Br. in append. to Salt. trav. in abyssin. G. Don, in Lin. trans. 15. p. 435.) erect; leaves oval-oblong, obtuse, white beneath, when young pubescent, but glabrous in the adult state; branches and calyxes pubescent; spikes axillary and terminal, short, loose-flowered; petals obovate-oblong, obtuse; stamens exserted.  $\frac{1}{2}$ . S. Native of Abyssinia. Flowers probably white.

*Oral-leaved Combretum.* Shrub erect ?

48 *C. ALTERNIFOLIUM* (Jacq. amer. p. 101.) climbing, glabrous; branches spinescent; spines recurved; leaves alternate, oblong, glabrous, shining above; panicle of many spikes; spikes short; flowers crowded; petals lanceolate, obtuse, twice the length of the calyx; stamens exserted.  $\frac{1}{2}$ . S. Native of South America. *C. decandrum*, Jacq. amer. ed. pict. p. 53. t. 260. f. 27. *C. spinosum*, Humb. et Bonpl. pl. equin. 2. p. 161. *Poivrea alternifolia*, D. C. prod. 3. p. 17. Flowers small, white, on short pedicels. The juice is very clammy, and is used as a substitute for glue.

*Alternate-leaved Combretum.* Shrub cl.

49 *C. PAVONII* (G. Don, in Lin. trans. 15. p. 436.) climbing; branches pilose; leaves oblong or ovate, acuminate, mucronate, somewhat cordate at the base, clothed with rusty villi beneath; panicle of many spikes, elongated; petals lanceolate; stamens a little longer than the petals.  $\frac{1}{2}$ . S. Native of Guayaquil. *C. decandrum*, Ruiz, et Pav. mss. in herb. Lamb. Flowers scattered, middle-sized, probably scarlet.

*Pavon's Combretum.* Shrub cl.

50 *C. LRIOPETALUM*; shrub bushy; leaves oval, quite glabrous, attenuated at both ends; spikes opposite, slender, rather velvety; flowers distant, bractless; calyxes glabrous; petals oblong, hairy.  $\frac{1}{2}$ . S. Native of St. Domingo and Cuba, about the Havannah. *Poivrea eriopetala*, D. C. prod. 3. p. 18.

*Woolly-petalled Combretum.* Shrub.

§ 2. *Calyx tubular. Panicle of several spikes. Flowers secund.*

51 *C. PURPUREUM* (Vahl. symb. 3. p. 51.) climbing, glabrous; leaves oblong-lanceolate, acute, dark green, shining; panicle of many spikes; flowers loose; petals elliptic-oblong, obtuse; stamens long.  $\frac{1}{2}$ . S. Native of Madagascar. Ker. bot. reg. 429. Sims, bot. mag. 212. *C. coccineum*, Lam. dict. 1. p. 731. ill. 282. f. 2. *Cristaria coccinea*, Sonn. itin. 2. p. 247. t. 140. *Poivrea coccinea*, D. C. prod. 3. p. 18. Flowers scarlet, secund.

*Purple Combretum.* Fl. June, Dec. Clt. 1818. Shrub cl.

52 *C. GRANDIFLORUM* (G. Don,

FIG. 89.

in edinb. phil. journ. 1824. p. 340. and Lin. trans. 15. p. 421.) climbing, hairy; leaves oblong; spikes short, axillary, and terminal; calyx pubescent; petals obovate, obtuse; stamens long. *h. J. S.* Native of Sierra Leone, in the low lands. Hook. bot. mag. t. 2944. *C. Afzelianum*, G. Don, in Lin. trans. 15. p. 437. Flowers large, scarlet, secund. Anthers yellow. (f. 89.)

*Great-flowered Combretum.* Fl. May, Jul. Clt. 1824. Sh. cl.

§ 3. *Calyx turbinate-campanulate. Spikes numerous, terminal, disposed in the manner of a panicle.*

53 *C. DECA'NDRUM* (Roxb. cor. 1. p. 43. t. 59.) climbing, clothed with fuscous down; leaves oblong, acuminate, floral ones yellowish; panicle composed of numerous close-flowered spikes; petals ovate, mucronate; stamens short. *h. J. S.* Native of the East Indies. *C. Roxburghii*, Spreng. syst. 2. p. 331. *Poirrea* Roxburghii, D. C. prod. 3. p. 18. Flowers small, white, shorter than the bracteas.

*Decandrous Combretum.* Fl. Feb. Jul. Clt. 1826. Sh. cl.

54 *C. SQAMOSUM* (Roxb. hort. beng. p. 88. G. Don, in Lin. trans. 15. p. 438.) climbing, spotted; leaves ovate, acuminate, coriaceous, rusty beneath, and on the calyxes; panicle of many spikes; spikes loose-flowered; petals small; stamens short. *h. J. S.* Native of the East Indies. Flowers small, inconspicuous.

*Scaly Combretum.* Shrub cl.

55 *C. ACULEATUM* (Vent. choix. n. 58. in a note) erect, bushy, spinose; spines a little hooked, solitary, under the leaves; leaves almost opposite, ovate, pubescent, on short petioles, and are as well as the calyxes and branches pubescent; racemes short; flowers pedicellate; bracteas oblong-linear. *h. S.* Native of Senegal. *Guiera nudiflora*, Richb. in Sieb. pl. exsic. seneg. no. 35. *C. secundum*, Mirb. elem. t. 44. f. 5. ? but not of Jacq. *Poirrea aculeata*, D. C. prod. 3. p. 18. Flowers white. Petals hairy.

*Prickly Combretum.* Shrub 4 to 6 feet.

§ 4. *Calyx turbinate-campanulate. Spikes axillary, never terminal.*

56 *C. SERICEUM* (G. Don, in edinb. phil. journ. 1824. p. 317. and in Lin. trans. 15. p. 21.) suffruticose, erect; leaves nearly opposite, lanceolate, bluish, clothed with silky villi beneath; spikes dense-flowered; rachis, ovaries, and calyxes clothed with villous tomentum; petals about equal in length to the calyx; stamens short. *h. S.* Native of Sierra Leone. Flowers white, on short pedicels.

*Silky Combretum.* Shrub 2 to 3 feet.

+ *Species not sufficiently known.*

57 *C. FERRUGINEUM* (G. Don, in Lin. trans. 15. p. 440.) leaves on short petioles, lanceolate, acuminate, glabrous, attenuated at the base, rusty beneath; spikes axillary and terminal. *h. S.* Native of South America.

*Rusty Combretum.* Shrub.

58 *C. CORDATUM* (G. Don, in Lin. trans. p. 440.) leaves on short petioles, large, roundish-cordate, pubescent when young; panicle terminal, composed of spikes. *h. S.* Native of Hispaniola. Flowers small.

*Cordate-leaved Combretum.* Shrub.

+ *Species only known by name from Roxburgh's Hortus Bengalensis.*

1 *C. ovalifolium* (Roxb. l. c. p. 28.). *h. J. S.* Native of Coromandel.

2 *C. acuminatum* (Roxb. l. c.). *h. J. S.* Native of Bengal.

3 *C. costatum* (Roxb. l. c.). *h. J. S.* Native of the East Indies.

4 *C. rotundifolium* (Roxb. l. c. p. 88.). *h. J. S.* Native of Bengal.

*Cult.* As few plants surpass the *Combretum* in the elegance and brilliancy of their blossoms, so their species have become great favourites with collectors. A few, as the *C. purpureum*, *C. comosum*, and *C. grandiflorum*, are the greatest ornaments of our stoves; but some of the species, not yet introduced to our gardens, outvie them in beauty. All of them thrive well in a mixture of loam and peat, and young cuttings root readily if planted in a pot of sand; placed in a moist heat, with a hand-glass over them. The climbing species are well fitted for training up the rafters, or covering trellis-work in a stove.

XII. CHRYSOSTACHYS (*χρυσος*, *chrysos*, gold, and *στάχυς*, *stachys*, a spike; in reference to the dense spikes of golden yellow flowers). Pohl. pl. bras. 2. p. 65.

LIN. SYST. *Decandria, Monogynia*. Calyx campanulate, obsoletely 5-toothed; teeth short, bluntish. Petals 5, alternating with the teeth of the calyx, roundish and bluntly emarginate, unguiculate at the base. Stamens 10, very long, rather flexuous, inserted in the base of the calyx. Ovary ovate.—A climbing shrub, with opposite, coriaceous, entire leaves. Spikes dense, terminal, and axillary, panicle, opposite, bracteate. Flowers small, golden yellow.

1 *C. OVATIFOLIA* (Pohl. pl. bras. 2. p. 66. t. 143.) leaves ovate-elliptic, glabrous; ovaries and rachis of the spike clothed with yellow down. *h. J. S.* Native of Brazil, in the northern part of the province of Goyaz.

*Ovate-leaved Chrysostachys.* Shrub cl.

*Cult.* This is a fine stove climber. Its culture and propagation are the same as that for *Combretum*, which see.

XIII. CACOUCIA (Guiana name of *C. coccinea*). Aubl. guian. 1. p. 450. t. 179. Juss. gen. 320. Lam. ill. t. 359. D. C. prod. 3. p. 22.—Schousboë'a, Willd. spec. p. 578.—Hambérgia, Scop. int.—Hambérgia, Neck. elem.

LIN. SYST. *Decandria* and *Dodecandria, Monogynia*. Limb of calyx tubularly campanulate, acutely 5-toothed, deciduous. Petals 5, alternating with the calycine teeth, and larger than them. Stamens 10-14, inserted in the base of the limb of the calyx, filiform, long. Ovary, according to Kunth, containing 3 pendulous ovula. Style filiform, acute. Berry or drupe ovate, quadrangular, acute at both ends, not crowned by the calyx, pulpy inside, 1-2-seeded. Cotyledons thick and fleshy.—Climbing shrubs, with alternate and opposite leaves, sometimes the lower ones are verticillate; they are ovate, acuminate, standing on short petioles. Flowers scarlet, alternate, bracteate at the base, disposed in long terminal spikes.

1 *C. COCCINEA* (Aubl. l. c.) fruit ovoid, acute at both ends, somewhat pentagonal. *h. J. S.* Native of Guiana, on the banks of the river Sinemari. Schousboë'a *coccinea*, Willd. l. c. Flowers scarlet.

*Scarlet-flowered Cacoucia.* Shrub cl.

2 *C. CHINENSIS* (Adr. Juss. ined. ex D. C. prod. 3. p. 22.) fruit acutely pentagonal. *h. J. S.* Native of China, where it is called *Koinze*. Pet. gazoph. t. 37. f. 8. ex Juss. Fruit one half smaller than those of the first species, bearing 2 seeds near the apex. Spermatoderm blackish, membranous. Cotyledons large, fleshy.

*China Cacoucia.* Shrub cl.

3 *C. ? TRIFOLIATA* (D. C. prod. 3. p. 22.) fruit oblong, 5-winged; wings stiff. *h. J. S.* Native of Java. *Combretum trifoliatum*, Vent. choix. t. 58. *Cacoucia lucidum*, Blum. bijdr. p. 641. Leaves opposite or 3 in a whorl, oval-oblong, glabrous. Panicle of many spikes. Flowers greenish, decandrous. Bracteas linear. Fruit sometimes 6-winged, according to Blum.

*Trifoliolate Caeoucia.* Shrub cl.

*Cult.* See *Combrètum* for culture and propagation, p. 666.

XIV. LUMNITZERA (in honour of Stephen Lumnitzer, author of *Flora Poseniensis*, 1 vol. 8vo. Leipzig, 1791). Willd. nov. act. nat. cur. berl. 1. (1803) p. 186. but not of Jacq. (1817). D. C. prod. 3. p. 22.

LIN. SYST. *Decándria, Monogýnia*. Bracteoles 2, very short, under each flower. Limb of calyx tubular, 5-toothed; teeth obtuse. Petals 5, inserted in the calyx and longer than it, reflexed. Stamens 10, 5 of which are shorter than the petals, and the longest 5 about the length of the petals. Ovary oblong, compressed. Style subulate. Drupe dry, 1-seeded.—A shrub, with alternate leaves, and intra-foliate racemes of flowers. The structure of the seed is hardly known, and therefore the genus may not be distinct from *Caeoucia*.

1. L. RACEMOSA (Willd. l. c.).  $\frac{1}{2}$ . S. Native of the East Indies. Jussieu's *racemosa*, Rottl. herb. Branches cinereous, glabrous. Leaves obovate, quite entire, rather fleshy, glabrous, tapering into the petiole. Racemes naked.

*Racemose-flowered Lumnitzeria.* Shrub cl.

*Cult.* See *Combrètum* for culture and propagation, p. 666.

XV. QUISQUALIS (from *quis*, who, and *qualis*, what kind; when the name was given to this genus it was uncertain to what class or order it belonged). Rumph. amb. 5. p. 71. Lin. gen. no. 539. Lam. ill. t. 357. Blum. bijdr. p. 638. D. C. prod. 3. p. 22.

LIN. SYST. *Decándria, Monogýnia*. Tube of calyx slender, lengthened out much above the ovary, deciduous, with a 5-cleft border. Petals 5, oval-oblong, obtuse, longer than the calycine teeth. Stamens 10, exserted, inserted in the throat of the calyx, alternate ones shorter than the others. Ovary ovate-globose, containing 4 ovula. Style filiform, obtuse, exserted. Drupe dry, 5-angled, 1-seeded. Cotyledons fleshy, large, plano-convex, ex Blume.—Climbing shrubs, with opposite, rarely alternate, ovate, quite entire leaves; and axillary and terminal spikes of changeable-coloured flowers, usually varying from white to red.

1. Q. INDICA (Lin. spec. 556.) pubescent; bracteas ovate-rhomboid, aristately acuminate, one under each flower; leaves ovate, acuminate; petals oval, oblong, clothed with adpressed pubescence.  $\frac{1}{2}$ . S. Native of Java. Amboyna, Lam. ill. t. 257. Sims, bot. mag. 2033. Ker. bot. reg. 492. Flowers beautiful, changeable in colour from orange to red, sweet-scented.

*Indian Quisqualis.* Fl. May, Aug. Clt. 1815. Shrub cl.

2. Q. PUBESCENS (Beauv. fl. d'ow. 1. p. 67.) pubescent; leaves cordate or oblong, acuminate, with a rounded base; bracteas ovate, acuminate.  $\frac{1}{2}$ . S. Native of Guinea. Flowers like those of *Q. Indica*.

*Pubescent Quisqualis.* Clt. 1815. Shrub cl.

3. Q. EBRACATA (Beauv. fl. d'ow. 1. p. 57. t. 34.) smoothish; flowers bractless; petals oblong, glabrous.  $\frac{1}{2}$ . S. Native of Guinea, in the kingdom of Warce. Leaves oval-oblong, lower ones smaller and roundish. Flowers white.

*Bractless-flowered Quisqualis.* Shrub cl.

4. Q. GLABRA (Burm. fl. ind. 104. t. 28. f. 2.) leaves ovate, acute, and are as well as the minute bracteas quite glabrous.  $\frac{1}{2}$ . S. Native of Java. Flowers in spikes; spikes all opposite.

*Smooth Quisqualis.* Clt. 1815. Shrub cl.

5. Q. LOUREIRI; leaves ovate, acute, glabrous; corymbs terminal.  $\frac{1}{2}$ . G. Native of Cochinchina. *Q. Indica*, Lour. coch. p. 274. Racemes corymbose. Flowers from white to red. The seeds are astringent and anthelmintic.

*Loureiro's Quisqualis.* Shrub cl.

6. Q. VILLOSA (Roxb. hort. beng. p. 90.) leaves oblong, somewhat cordate, villous as well as the linear-lanceolate bracteas; flowers pubescent.  $\frac{1}{2}$ . S. Native of the East Indies.

*Villous Quisqualis.* Shrub cl.

*Cult.* Some of the species of *Quisqualis* are equal in elegance to the species of *Combrètum* when in flower: their culture and propagation are the same, see p. 666.

† Genera belonging to *Combretaceæ*, but are not sufficiently known.

XVI. CERATOSTACHYS (from *κερας*, *keras*, a horn, and *σταχυς*, *stachys*, a spike; in reference to the heads of flowers being intermixed with spongy processes). Blum. bijdr. p. 641. D. C. prod. 3. p. 23.

LIN. SYST. *Octo-Decándria, Monogýnia*. Limb of calyx entire. Petals usually 8, small. Stamens 8-16, unequal. Ovary biovulate. Style short, crowned by a stigma. Drupe baccate, crowned by the limb of the calyx, containing a 1-seeded compressed nut. Embryo exalbuminous? inverted.—A tall tree, with scattered, oblong, entire leaves; and axillary spikes of flowers. Flowers disposed in dense heads, intermixed with spongy, filiform processes. The place which this genus should occupy in the order is uncertain, from the embryo being unknown.

1. C. ARBorea (Blume l. c.).  $\frac{1}{2}$ . S. Native of Java, on Mount Salak.

*Tree Ceratostachys.* Tree 40 feet.

*Cult.* See *Bacida* for culture and propagation, p. 657.

XVII. BRUGUIERA (in honour of Bruguiere, the well-known French botanist). Pet. Th. dict. sc. nat. 5. p. 375. gen. nov. mad. no. 70. p. 21. but not of Lam. D. C. prod. 3. p. 23.

LIN. SYST. *Decándria, Monogýnia*. Tube of calyx furnished with 2 scales in the middle; limb 5-lobed, obtuse. Petals 5, oblong-lanceolate, spreading. Stamens 10, equal in length to the petals. Style acute. Ovary adnate to the calyx, containing 4 pendulous ovula. Fruit unknown.—A small tree, with alternate, oval, smooth, succulent leaves, tapering into the petiole. Racemes axillary. Flowers small, white. The genus, according to Petit Thours, is nearly allied to *Combrètum*.

1. B. MADAGASCARIENSIS (D. C. prod. 3. p. 23.).  $\frac{1}{2}$ . S. Native of Madagascar, in places inundated with salt water.—Kada-kandel, Rheed. mal. 6. t. 37.

*Madagascar Bruguiera.* Tree.

*Cult.* See *Combrètum* for culture and propagation, p. 666.

XVIII. BOBUA (*Bobu* or *Bombu* is the name of the tree in Ceylon). D. C. prod. 3. p. 23.—Böbu, Adans. fam. pl. 2. p. 11.—Eugenioides, Lin. fl. zeyl. p. 192.

LIN. SYST. *Icosándria, Monogýnia*. Tube of calyx ovate, adnate to the ovary; limb 5-cleft, with very short blunt lobes. Petals 5, alternate with the lobes of the calyx, and longer than them. Stamens 20-30, free, longer than the petals. Style filiform. Stigma subcapitate. Fruit (berry?) ovate, indehiscent, few-seeded. Seed unknown.—A tree, with alternate, obovate-oblong, acute, glabrous, destitute, usually serrated leaves; and axillary, simple peduncles, bearing subspicate distant flowers; pedicels very short, each propped by 2 or 3 bracteas just under the calyx. This is a very doubtful genus.

1. B. LAURINA (D. C. prod. 2. p. 24.) spikes simple and panicled, shorter than the leaves; leaves serrated.  $\frac{1}{2}$ . S. Native of Ceylon. Laurus, Burm. zeyl. p. 139. t. 62.—Eugenioides, Lin. fl. zeyl. 192. no. 499. Böbu, Herm. zeyl. 9. Burm. zeyl. 26. Bömbu, Petiv. mus. p. 39. ex Lin. Myrtus

laúrina, Retz. obs. 4. p. 27. *Myrtus serrata*, Kœnig. *Eugenia laúrina*, Willd. spec. no. 30. Flowers 4 or 5-cleft.

*Laurel-like* Bobu. Tree.

*Cult.* See *Bacida* for culture and propagation, p. 657.

**XC. VOCHYSIÆ** (plants agreeing with *Vochysia* in important characters). St. Hil. mem. mus. 6. p. 265. E. Meyer in nov. act. bonn. 2. p. 812. D. C. prod. 3. p. 25.—*Vochysiænæ*, Juss. herb.—*Vochysiaceæ*, Mart. nov. gen. 1. p. 123, 124.

Calyx of 4-5 sepals (f. 90. d. f. 91. a.). Sepals connected at the base, imbricate in æstivation (f. 91. a.), unequal; the upper one drawn out into a spur (f. 90. d. f. 91. b.). Petals 1- (f. 90. b. a.) 2-3 (f. 91. d. c.) or 5, alternating with the calycine lobes, and inserted at their base. Stamens 1 (f. 90. c.) -5, usually opposite the petals, only alternating with them, and inserted in the bottom of the calyx, the most of them usually sterile and small, only one fertile and bearing an ovate (4-celled, ex Martins) anther. Ovarium free, or adhering to the calyx, 3-celled (f. 91. h.); ovula 1-2, or few in each cell, attached to the base of the axis. Style 1 (f. 90. g. f. 91. i.). Stigma 1. Capsule trigonal (f. 91. h.), 3-celled, 3-valved; valves opening along their middle. Seeds exalbuminous. Embryo straight, inverted. Cotyledons large, foliaceous, plicate, complute. Radicle short, superior. South American trees, with opposite tetragonal branches. Leaves opposite or verticillate, but sometimes alternate at the tops of the branches, quite entire, feather-nerved, bistipulate at the base. Flowers racemose, paniced or thyrsoïd, usually terminal; pedicels bracteate.

This order agrees with *Guttiferae* and *Marcgraviaceæ* in the habit and flowers, but is distinguished from them in the stamens being inserted in the calyx. It agrees with *Combretaceæ* in the cotyledons being convolute, and in the inverted seeds; and with some of the genera of *Onagraceæ*, especially with *Lopizia*, in the stamens being solitary from abortion. Perhaps this order comes nearer to *Violariæ* than to any other, an affinity which is pointed out by the irregular flowers, trilocular ovary, and stipulas; in fact, in every plant of that order the stamens are also perigynous.

#### *Synopsis of the genera.*

##### SECT. I. *Ovarium free. Calyx 5-parted.*

1 **CALLISTHENE**. Upper sepal drawn out into a large spur at the base (f. 90. d.). Petal 1, obcordate (f. 90. b.). Stamen 1 (f. 90. c.), without any rudiments of sterile ones. Valves of capsule without a dissepiment; cells 1-2-seeded (f. 89. c.).

2 **AMPHILOCHIA**. Upper sepal drawn out into a short spur at the base. Petal 1, obcordate. Fertile stamen 1, usually without any rudiments of sterile ones. Valves of capsule bent in so much as to form dissepiments; cells 1-2-seeded.

3 **VOCHYSIA**. Upper sepal drawn out into a long spur at the base (f. 91. b.). Petals 3 (f. 91. d.), middle one the largest (f. 91. c. i. k.). Stamens 3, lateral ones sterile. Valves of capsule opening in the middle. Seed solitary in the cells, winged.

4 **SALVERTIA**. Upper lobe of calyx furnished with a spur at the base. Petals 5, upper 2 very narrow. Stamens 3, lateral

ones sterile. Valves of capsule opening in the middle; cells 2-seeded.

5 **QUALEA**. Upper sepal furnished with a spur at the base. Petals 1, rarely 2. Stamens 1, rarely 2. Valves of capsule opening in the middle. Seeds winged.

##### SECT. II. *Ovary adnate to the calyx. Calyx 4-parted.*

6 **ERISMA**. One of the lobes of the calyx furnished with a spur at the base. Petal 1. Fertile stamen 1, sterile 4.

† *Genera doubtful whether they belong to the present order.*

7 **LOZANIA**. Calyx with a ventricose tube, and a 5-parted permanent limb. Petals wanting. Disk quadrangular, filling the bottom of the calyx. Stamen 1, small, inserted under the ovary. Capsule trigonal, 3-celled, 3-valved. Seeds 6. Stigmas 3, small, capitate.

8 **AGARDHIA**. Calyx of 3 sepals. Petals 5, convolute. Stamen 1, bearing a large 2-celled anther. Style 1. Drupe oval, 3-celled, 3-valved.

9 **SCHWEIGGERIA**. Calyx of 3 sepals. Petals 3, one of which is spurred. Stamen 1. Pistil none. Fruit unknown.

##### § 1. *Ovarium free from the calyx. Calyx 5-parted.*

1. **CALLISTHENE** (to the memory of Callisthenes, an ancient philosopher). Mart. bras. 1. p. 123. D. C. prod. 2. p. 25.

LIN. SYST. *Monandria, Monogynia*. Calyx of 5 unequal parts (f. 90. d.), upper one large, and drawn out into a spur (f. 90. d.). Petal one (f. 90. a. b.), obcordate. Stamen 1 (f. 90. c.), alternating with the petal, without any rudiments of sterile stamens. Anther 4-celled; cells separating by pairs. Ovary free, 3-celled; cells containing few ovula. Capsule 3-celled (f. 90. e.), 3-valved; valves without a dissepiment; cells 1-2-seeded. Seeds adnate to the angles of the central, thick, trigonal placenta.—Resinous trees; with minute axillary buds, covered with white grains. Leaves and branches opposite and distich, coetaneous, stipulate, deciduous. Flowers axillary and lateral. Petals yellowish.

1 **C. MAJOR** (Mart. l. c. t. 75.) glabrous; leaves elliptic or ovate-oblong, obtuse or acute; flowers solitary in the axils of the leaves, and therefore opposite. h. S. Native of Brazil, in hot sandy places. Petals yellow, lined with scarlet. (f. 90.)

*Larger Callisthene.* Tree 10 to 12 feet.

2 **C. MINOR** (Mart. l. c. t. 76.) pubescent; leaves linear-oblong, obtuse, ending in a glandular mucrone; flowers solitary in the axils, and therefore opposite. h. S. Native of Brazil, in the high plains called Chépada de Parana. Petals cream-coloured.

*Smaller Callisthene.* Tree 15 to 26 feet.

3 **C. FASCICULATA** (Mart. l. c. p. 126.) leaves ovate-oblong, obtuse, rather emarginate, glabrous above, and villous beneath; flowers axillary, in fascicles. h. S. Native of Brazil, in the desert between Serra de St. Antonio, and the river St. Francisco, in the province of Minas Geraes. Petals cream-coloured.

*Fascicled-flowered Callisthene.* Tree.

*Cult.* See *Vochysia* for culture and propagation, p. 670.

II. AMPHILOCHIA (to the memory of Amphilocho, an Athenian philosopher, and writer on agriculture). Mart. bras. 1. p. 127. D. C. prod. 3. p. 26.

LIN. SYST. *Monandria, Monogynia*. Calyx of 5 unequal coriaceous parts; upper part large, and drawn out into a short horn. Petal one, deeply obcordate. Fertile stamen one, alternate with the petal, usually without any rudiments of sterile ones. Anther 4-celled; cells in distinct pairs. Ovary free, with the cells containing few ovula. Capsule having the epicarp separable, corticate, 3-celled, 3-valved, opening at the dissepiments; the valves are bent inwards so much as to form the dissepiments to the capsule. Seeds 1-2 in each cell.—Trees, with opposite petiolate coriaceous, reticulately-veined leaves. Leaf-buds covered with white grains, which remain afterwards permanent at the base of the branches. Flowers terminal, disposed in somewhat interrupted spikes. Petal pubescent.

1 A. DICHOTOMA (Mart. l. c. t. 77.) leaves roundish and somewhat cordate at the base, narrow-oblong, and bluntish, pubescent beneath. h. S. Native of Brazil, in the province of Minas Geraes. Petal sulphur-coloured, marked with a blue spot at the base.

*Dichotomous Amphilochia*. Tree.

2 A. CORDATA (Mart. l. c. p. 129.) leaves deeply cordate at the base, rather ovate-lanceolate, acutish, glabrous and glaucescent on both surfaces. h. S. Native of the south of Brazil. *Qualea cordata*, Spreng. syst. 2. p. 17. Flowers like the last.

*Cordate-leaved Amphilochia*. Tree.

Cult. See *Vochysia* for culture and propagation, p. 670.

III. VOCHYSIA (*Vochy* is the Guiana name of one of the species). Juss. gen. p. 426. St. Hil. mem. mus. 6. p. 166. Mart. bras. 2. p. 139. D. C. prod. 3. p. 26.—*Vochy*, Aubl. guian. 1. p. 18. t. 6.—*Vochya*, Vand. fl. bras. in Rœm. scrip. t. 6.—*Salmonia*, Neck. elem. no. 808.—*Cucullaria*, Schreb. gen. no. 11.

LIN. SYST. *Monandria, Monogynia*. Calyx coloured, 5-parted (f. 91. a.), with 4 of the 1 bes small (f. 91. a.), and the fifth or superior one large, and drawn out into a spur at the base (f. 91. b.). Petals 3 (f. 91. c. d.), unequal, inserted in the calyx, the 2 lateral ones not half the size of the middle one (f. 91. d. c.). Stamens 3, opposite the petals, 2 lateral ones sterile and small; and the middle one larger and fertile, bearing a continuous immovable anther, which is cucullate at the apex. Stigma terminal, obtuse. Capsule trigonal (f. 91. h.), 3-celled; the valves opening in the middle. Seeds furnished with a wing, exalbuminous, solitary in the cells. Cotyledons large. Radicle superior.—South American trees, with opposite or verticillate, ovate, entire, feather-nerved, bistipulate leaves, standing on short footstalks. Flowers of all yellow, disposed in terminal racemes; pedicels 1-2-4-flowered, bibracteolate at the base.

1 V. GUIANENSIS (Lam. ill. no. 97. t. 11.) leaves opposite, obovate-oblong, ending in a short acumen each, glabrous on both surfaces; racemes simple, erect, terminal, dense-flowered; spur of flower spreading. h. S. Native of Guiana and Maranhão, in woods. *Vochy Guianensis*, Aubl. guian. 1. p. 18. t. 6. *Cucullaria excelsa*, Willd. spec. 1. p. 17. but not of Vahl.

*Guiana Vochysia*. Tree 20 to 40 feet.

2 V. TOMENTOSA (D. C. prod. 3. p. 26.) leaves opposite, oblong-oval, ending each in a long taper-point, attenuated at the base, glabrous above, but clothed with rusty tomentum beneath; racemes terminal, loose, nodding. h. S. Native of Guiana, in woods. *Cucullaria excelsa*, Vahl. enum. 1. p. 4. exclusive of the synonymes. *Cucullaria tomentosa*, Meyer, esseq. p. 12.

*Tomentose Vochysia*. Tree 20 to 30 feet.

3 V. CITRIFOLIA (Poir. suppl. 5. p. 491.) leaves opposite,

ovate, bluntly acuminate, glabrous; racemes terminal, panicle. h. S. Native of Brazil. *Cucullaria citrifolia*, Rœm. et Schultes, mant. 1. p. 52.

*Citron-leaved Vochysia*. Tree 20 to 30 feet.

4 V. EMARGINATA (Poir. dict. 8. p. 682.) leaves 4 in a whorl, petiolate, oblong, bluntly emarginate, attenuated at the base, rather coriaceous, glabrous on both surfaces; racemes numerous, ascending, elongated, terminal, erect; peduncles usually 3-flowered. h. S. Native of Brazil, about Rio Janeiro. *Vochya*, Vand. fl. bras. in Rœm. script. 69. t. 6. f. 1. *Cucullaria emarginata*, Vahl. enum. 1. p. 5.

*Emarginate-leaved Vochysia*. Tree 20 feet.

5 V. TETRAPHYLLA (D. C. prod. 3. p. 27.) leaves 4 in a whorl, linear-oblong, acuminate, coriaceous, glabrous on both surfaces; racemes axillary, very simple. h. S. Native of Guiana, in humid woods. *Cucullaria tetraphylla*, Meyer, esseq. p. 12. There is a variety of this species mentioned by Meyer in nov. act. bonn. 12. p. 813. with 3 leaves in a whorl.

*Four-leaved Vochysia*. Tree 20 feet.

6 V. ROTUNDIFOLIA (Mart. bras. 2. p. 140. t. 83.) quite glabrous; leaves 3 or 4 in a whorl, almost sessile, cordate at the base, orbicular and emarginate, glaucescent, coriaceous, firm; racemes terminal, solitary; peduncles usually 2-flowered; ovaries glabrous. h. S. Native of Brazil, in the province of Minas Geraes, on mountains.

*Round-leaved Vochysia*. Tree 10 feet.

7 V. HERBACEA (Pohl. pl. bras. 2. p. 27. t. 118.) leaves obovate, mucronate, pilose, on short petioles, 5-6 in a whorl; racemes elongated; peduncles clothed with villous tomentum, usually 5-flowered. h. S. Native of Brazil, in the province of Goyaz.

*Herbaceous Vochysia*. Shrub 2 feet.

8 V. SERICEA (Pohl. pl. bras. 2. p. 28. t. 119.) leaves crowded, in cumulated whorles, usually 6 in each whorl, petiolate, obversely-oblong, emarginate at the apex; racemes clothed with silky tomentum; peduncles usually 3-flowered. h. S. Native of Brazil, in the province of Goyaz.

*Silky Vochysia*. Shrub 6 to 8 feet.

9 V. CINNAMOMEA (Pohl. pl. bras. 2. p. 29. t. 120.) leaves cumulated in whorles, 6 or 8 in each whorl, nearly sessile, oblong, obtuse, emarginate, clothed with brown tomentum beneath; racemes very long, whorled; peduncles tomentose. h. S. Native of Brazil, in the province of Goyaz.

*Cinnamon-like Vochysia*. Shrub 6 to 8 feet.

10 V. ELLIPTICA (Mart. bras. 1. p. 141. t. 84.) leaves opposite, or 3 or 4 in a whorl, almost sessile, rounded and emarginate at both ends, glabrous, coriaceous, finely veined, glaucescent; racemes terminal, solitary; peduncles 2-flowered, and are, as well as the calyxes, pubescent; ovaries villous. h. S. Native of Brazil, in the province of Minas Geraes, in the diamond district. (f. 91.)

*Elliptic-leaved Vochysia*. Tree 10 to 12 feet.

11 V. TUCANDRUM (Mart. bras. 2. p. 142. t. 85.) leaves 3 to 8 in a whorl, lanceolate-oblong, or obovate-oblong, attenuated at the base, obtuse or rounded at the apex, and emarginate, glabrous on both surfaces; veins of leaves rather remote, combined a considerable way from the margin; racemes terminal, solitary; ovaries glabrous. h. S. Native of the south of Brazil.

*Var. α, fastigiata* (D. C. prod. 3. p. 27.) leaves 3 or 4 in a whorl, approximate, lanceolate; racemes short, fastigate, very simple, few-flowered; spur of flower bent downwards, and adpressed to the calyx.

*Var. β, macrostachya* (D. C. l. c.) leaves 4 in a whorl, oblong or obovate-oblong; racemes terminal, solitary, compound, tapering much to the apex; spur of flowers bent.

*Var. λ, hexaphylla* (D. C. prod. l. c.) leaves 4-6 in a whorl, linear-oblong, tapering much to the base; racemes terminal, very long, straight; spur straightish, spreading downwards.

*Var. δ, vulgaris* (D. C. l. c.) leaves 3-6 in a whorl, oblong-lanceolate, tapering to both ends, emarginate; racemes terminal, middle-sized, cylindrical, loose-flowered; spur of flower straightish, spreading downwards.

*Toucan's Vochysia.* Tree 15 to 20 feet.

12 *V. RU'FA* (Mart. bras. 1. p. 144. t. 86.) branches thickened, tomentose; leaves 4-8 in a whorl, petiolate, oblong, obtuse, clothed with rusty tomentum beneath, especially when young, reticulated with veins, coriaceous; racemes terminal, solitary, very long, loose-flowered; peduncles and calyxes tomentose; ovaries very hairy. *h. S.* Native of Brazil, in the province of Minas Geraes.

*Rufous Vochysia.* Tree 20 feet.

13 *V. DIVERGENS* (Pohl. pl. bras. 2. p. 19. t. 111.) leaves 3 in a whorl, diverging, petiolate, oblong-elliptic, hardly emarginate at the apex; racemes very long; peduncles 3-flowered, rather pilose. *h. S.* Native of Brazil, in the province of Goyaz.

*Diverging-leaved Vochysia.* Tree.

14 *V. MICRANTHA* (Pohl. pl. bras. 2. p. 20. t. 112.) leaves 3 in a whorl, petiolate, oblong, blunt at the apex and a little emarginate, rather attenuated at the base; racemes elongated; pedicels simple. *h. S.* Native of Brazil, in the province of Goyaz.

*Small-flowered Vochysia.* Tree 12 feet.

15 *V. PU'MILA* (Pohl. pl. bras. 2. p. 21. t. 113.) leaves 3-4 in a whorl, on short petioles, oblong, narrow at the base, obtuse at the apex and mucronate, glaucous beneath; racemes very long; peduncles 2-flowered, rather pilose. *h. S.* Native of Brazil, in the province of Minas Geraes.

*Dwarf Vochysia.* Shrub 2 feet.

16 *V. THYRSOIDEA* (Pohl. pl. bras. 2. p. 24. t. 115.) leaves 4 in a whorl, on short petioles, oblong-elliptic, retuse, hardly attenuated at the base; racemes pyramidal; peduncles usually 4-flowered. *h. S.* Native of Brazil, in the province of Minas Geraes.

*Thyrse-like-flowered Vochysia.* Tree 20 to 30 feet.

17 *V. ALPESTRIS* (Mart. bras. 1. p. 145. t. 87.) leaves opposite, on short petioles, elliptic or oblong-elliptic, rounded, glabrous on both surfaces, finely veined; racemes terminal, solitary, long, cylindrical; ovaries glabrous. *h. S.* Native of Brazil, in the province of Minas Geraes, on the mountains.

*Alp Vochysia.* Tree 15 to 25 feet.

18 *V. GRANDIS* (Mart. bras. 1. p. 146. t. 88.) leaves 4 in a whorl, petiolate, ovate-oblong, rounded, or somewhat truncate, and rather emarginate at the apex, glabrous on both surfaces and finely veined, membranous; racemes terminal, long, cylindrical, aggregate; ovaries glabrous. *h. S.* Native of Brazil, in the province of Rio Negro, in woods.

*Great Vochysia.* Tree 80 to 100 feet.

19 *V. HÆNKE'ANA* (Mart. bras. 1. p. 147. t. 89.) leaves 4 in a whorl, on long footstalks, oblong-lanceolate, rather cuspidate, bluntish and emarginate at the apex, glabrous on both surfaces and finely veined; racemes terminal, compound, aggregately paniced; ovaries tomentose. *h. S.* Native of Peru.

*Hænke's Vochysia.* Tree 20 feet.

20 *V. PYRAMIDALIS* (Mart. bras. 1. p. 148. t. 90.) leaves opposite or 4 in a whorl, subcordate or rounded at the base, oblong-lanceolate, acuminate, costately veined beneath, and clothed with fine cinereous tomentum, as well as the branches, petioles, and peduncles; racemes terminal, solitary, pyramidal; ovaries glabrous. *h. S.* Native of Brazil, in the province of Minas Geraes.

*Pyramidal Vochysia.* Tree 20 to 30 feet.

21 *V. FLORIBUNDA* (Mart. l. c. p. 149. t. 91.) leaves opposite or 3-4 in a whorl, oblong, cuspidate, costately veined beneath, and strigose and roughish at the veins; racemes terminal, aggregate; spur of calyx short, straight, and conical; ovary glabrous. *h. S.* Native of Brazil at Ega, in the province of Rio Negro. Allied to *V. Guianensis*.

*Bundle-flowered Vochysia.* Tr. 30 to 40 feet.

22 *V. PRUINOSA* (Pohl. pl. bras. 2. p. 22. t. 114.) leaves 4 in a whorl, cumulated, nearly sessile, oval-elliptic, rather cordate at the base, emarginate at the apex, pruinose; racemes elongated, tomentose; peduncles usually 3-flowered, tomentose. *h. S.* Native of Brazil, in the province of Goyaz.

*Frosted Vochysia.* Shrub 6 to 12 feet.

23 *V. CUNEATA* (Pohl. pl. bras. 2. p. 26. t. 117.) leaves usually 5 in a whorl, on short petioles, rather cuneate or obversely oblong-ovate, obcordate at the apex; racemes pyramidal; peduncles usually 4-flowered. *h. S.* Native of Brazil, in the province of Minas Geraes.

*Cuneate-leaved Vochysia.* Tree 24 feet.

24 *V. ELONGATA* (Pohl. pl. bras. 2. p. 25. t. 116.) leaves 3 or 4 in a whorl, on short petioles, oblong or oblong-elliptic, rounded and emarginate at the apex, attenuated at the base, reticulated; racemes elongated, straight; peduncles 2-5-6-flowered. *h. S.* Native of Brazil, in the province of Minas Geraes.

*Var. α, nitida* (Pohl. l. c.) leaves 4 in a whorl, elliptic, attenuated at the base; peduncles 5-6-flowered.

*Var. β, opaca* (Pohl. l. c.) leaves 4 in a whorl, oblong, attenuated at the base; peduncles 2-flowered.

*Var. γ, ternata* (Pohl. l. c.) leaves 3 in a whorl.

*Elongated Vochysia.* Tree 24 feet.

25 *V. FERRUGINEA* (Mart. bras. 1. p. 151. t. 92.) leaves opposite, ovate-oblong or oblong, acuminate, glabrous above, and costately veined beneath; the middle nerve and veins clothed with white tomentum, as well as the branches; racemes terminal, erect, straight; peduncles usually 4-flowered; spur of calyx hooked; ovaries glabrous. *h. S.* Native of Brazil, in the province of Rio Negro, in woods.

*Rusty Vochysia.* Tree 20 to 30 feet.

† *A doubtful species.*

26 *V. ? RACEMOSA* (Poir. dict. 8. p. 682.) leaves opposite, ovate-lanceolate, acute, glabrous, membranous; racemes axillary. *h. S.* Native of Cayenne. *Cucullaria racemosa*, Roem. et Schultes, syst. 1. p. 36. Capsule glabrous, size of a pea, 1-valved, 3-celled; cells 2 from abortion. Flowers unknown.

*Racemose-flowered Vochysia.* Tree.

*Cult.* A mixture of peat and loam will suit the species of this genus, and ripened cuttings will strike root if planted in a pot of sand, with a hand-glass placed over them.

IV. *SALVERTIA* (Auguste St. Hilaire, does not say to whom he has dedicated this name, but it is evidently dedicated to some person of the name of Salvert or Salvetti). *St. Hil. mem. mus. 6. p. 266. and 9. p. 340. Mart. bras. 1. p. 152. D. C. prod. 3. p. 28.*

*LIN. SYST. Monandria, Monogynia.* Calyx of 5 nearly equal

FIG. 91.

obtuse elliptic lobes, the upper one furnished with a spur at the base. Petals 5, the 2 superior ones very narrow. Stamens 3, inserted in the calyx, opposite the 3 lower petals, the lateral 2 sterile, the middle one only antheriferous. Style clavate. Stigma saucer-shaped, obtuse, lateral, situated beneath the apex of the style. Capsule 3-celled, 3-valved, trigonal; cells 1-seeded; valves opening in the middle. Seeds exalbuminous, drawn out at one side into a woolly wing. Embryo with convolute cotyledons, and a superior radicle.—Trees, with oval, obtuse, exstipulate, feather-nerved leaves, which are crowded in whorles of 6 or 8. Flowers thyrsoïd, sweet-scented, white, but at length becoming orange-coloured.

1 *S. CONVALLARIODORA* (St. Hil. l. c.) leaves in whorles, oval, obtuse; flowers thyrsoïd. *h. S.* Native of Brazil, in fields, in the province of Minas Geraes.

*Lily of the valley-scented Salvertia.* Tree 30 feet.

2 *S. THYRSIFLORA* (Pohl. pl. bras. 2. p. 16. t. 110.) leaves in whorles, obversely oblong-oval or oblong, obtuse, mucronate; thyrses large, paniced; flowers small. *h. S.* Native of Brazil, in the province of Goyaz. Petals white, spotted with red.

*Thyrse-flowered Salvertia.* Tree 20 feet.

*Cult.* See *Vochysia* for culture and propagation, p. 670.

V. *QUALEA* (a name given to one of the species by the Indians of Guiana). Aubl. guian. 1. p. 7. t. 1-2. Juss. gen. 424. Lam. ill. t. 4. St. Hil. mem. mus. 6. p. 265. and 269. Mart. bras. 1. p. 130. D. C. prod. 3. p. 28.

LIN. SYST. *Monándria, Monogýnia*. Calyx 5-parted; lobes very unequal, rounded, the largest one petaloid, and furnished with a spur at the base. Petal 1, rarely 2, inserted in the bottom of the calyx, or perhaps inserted in the torus. Stamen 1, rarely 2, alternating with the petal; filament linear; anther oblong. Ovary free. Capsule woody, 3-celled, 3-valved; the valves opening in the middle. Seeds exalbuminous, furnished with a wing. Embryo with large convolute cotyledons, and a superior radicle.—South American trees, with opposite branches, opposite coriaceous glabrous entire ovate feather-nerved leaves. Stipulas deciduous. Cymes of flowers terminal, trichotomous, paniced, furnished with 2 bracteas at each ramification. Flowers sweet-scented, rose-coloured or blue. The lateral veins of the leaves are the same as in *Calophýllum*, parallel, and approximate, running into a marginal nerve.

1 *Q. ROSEA* (Aubl. guian. 1. p. 5. t. 1.) leaves elliptic, acuminate, glabrous on both surfaces; lateral veins approximate; petal entire; spur shorter than the calyx. *h. S.* Native of Guiana, in woods. Petal, as well as the large segment of the calyx, white on the outside, and rose-coloured on the inside.

*Rose-coloured-flowered Qualea.* Tree 60 feet.

2 *Q. CÆRULEA* (Aubl. guian. 1. p. 7. t. 2.) leaves oval, ending in a short taper-point each, glabrous on both surfaces; lateral veins approximate; petal emarginate; spur length of the calyx. *h. S.* Native of Guiana, in woods. Petal cinereous on the outside, and rather bluish on the inside.

*Blue-petalled Qualea.* Tree 60 to 80 feet.

3 *Q. GESTASIANA* (St. Hil. mem. mus. 6. p. 254.) leaves lanceolate, acuminate, glabrous; petioles and peduncles pubescent; calyx ciliated, the superior lobe emarginate; petal cordate. *h. S.* Native of Brazil, in the mountains near Rio Janeiro. Petal sulphur-coloured, with the veins purplish at the base.

*Gestas's Qualea.* Tree 100 feet.

4 *Q. ECALCARATA* (Mart. bras. 1. p. 130. t. 78.) leaves oblong, acuminate, glabrous above, but costately veined and clothed with fulvous pubescence beneath; racemes lateral, subcorymbose, few-flowered; calyx without a spur. *h. S.* Native of Brazil, on mountains, in the province of Minas Geraes.

Stamen 1 in the flowers, with 2 petals, and 2 in the flowers, with 1 petal. Petal cream-coloured, veined.

*Spurless Qualea.* Tree 20 feet.

5 *Q. GRANDIFLORA* (Mart. bras. 1. c. p. 133. t. 79.) leaves oblong, rather acuminate, glabrous above, tomentose and costately-veined beneath, but with the nerves and veins glabrous; flowers axillary or terminal, solitary or racemose; calyx clothed with silky pubescence on the outside, furnished with an elongated acutish spur. *h. S.* Native of Brazil, in the provinces of St. Paul and Minas Geraes. Petal 1, large, white, yellow at the base, orbicular, emarginate. Stamen 1.

*Great-flowered Qualea.* Tree 10 to 20 feet.

6 *Q. MULTIFLORA* (Mart. l. c. p. 134. t. 80.) leaves opposite or 3 in a whorl, ovate or broad-lanceolate, or oblong, acuminate, glabrous on both surfaces, costately veined beneath; peduncles pilose; racemes axillary or terminal; whorles of flowers distant; upper lobe of calyx truncate and emarginate; spur and ovaries very hairy. *h. S.* Native of Brazil, in the provinces of Minas Geraes and St. Paul. Petal 1, obcordate, cream-coloured. Stamen 1.

*Var. β, pubescens* (Mart. l. c.) leaves pubescent beneath. *h. S.* Growing along with the *γ* *l.*

*Many-flowered Qualea.* Tree 10 to 20 feet.

7 *Q. PARVIFLORA* (Mart. l. c. p. 135. t. 81.) plant clothed with powdery hoary tomentum; leaves opposite or alternate, oblong, bluntish, costately-veined beneath; racemes axillary or terminal; calyx canescent, with the spur spreading and obtuse. *h. S.* Native of the south of Brazil, in the Certao or Great Desert. Petal 1, obcordate, unguiculate, white, having the scent of violets.

*Var. α, tomentosa* (D. C. prod. 3. p. 29.) leaves clothed with hoary tomentum on both surfaces, but in the adult state they are glabrous.

*Var. γ, glabrata* (D. C. l. c.) leaves smoothish on both surfaces.

*Var. β, discolora* (D. C. l. c.) leaves glabrous above and canescent beneath.

*Small-flowered Qualea.* Tree 12 to 20 feet.

† *Species not sufficiently known.*

8 *Q. PERRINI* (Spreng. syst. 1. p. 17.) leaves oblong, subcordate, veiny; racemes hairy; petal entire; spur equal in length to the calyx. *h. S.* Native of Guiana.

*Perrin's Qualea.* Tree.

9 *Q. VERTICILLATA* (Spreng. l. c.) leaves oblong, emarginate, attenuated at the base; corolla somewhat dipetalous, unequal. *h. S.* Native of Brazil.

*Whorled Qualea.* Tree.

*Cult.* For culture and propagation see *Vochysia*, p. 670.

§ 2. *Ovary adnate to the calyx. Calyx 4-parted.*

VI. *ERISMA* (from *ερισμα*, *erisma*, strife; so named from the anomalous form of the genus, which is at so much variance with others). Rudge, pl. guian. 1. p. 7. t. 1. D. C. prod. 3. p. 29.—Debrue's, Roem. et Schult. syst. 1. p. 4.—Ditmària, Spreng. syst. 1. p. 4.

LIN. SYST. *Monándria, Monogýnia*. Tube of calyx adnate to the ovary; limb 4-5-parted; the lobes unequal, the longest one parabolic, drawn out into a spur at the base, expanded into a large petaloid limb at the apex, which is bearded on the inside; it is convolute in æstivation, and incloses the genitals. Petal 1, opposite the petaloid limb of the calyx, inserted behind the filament. Stamens, 1 fertile and 4 sterile; these last are very short. Anther oblong, narrow, sagittate, 3-celled, ex Martius. Ovary 1-celled, oblong, biovulate. Style filiform. Fruit unknown.—Trees, with opposite, oval, acuminate, coriaceous, glabrous, quite entire, feather-nerved leaves; lateral nerves confluent be-

fore the margin. Stipulas 2, small, at the base of each leaf. Panicle terminal, with opposite branches and branchlets, furnished with 2 unequal membranous deciduous bracteas to each ramification.

1 *E. FLORIBUNDUM* (Rudge, l. c.) leaves ovate, acutish, with 16-18 lateral nerves on each side, having the upper surfaces hardly shining; branches of panicle clothed with rusty velvety down. *h. S.* Native of French Guiana. *Tratt. obs. bot.* 3. p. 71. t. 105. *Debraea floribunda*, Roem. et Schultes, syst. 1. p. 34. *Ditmæria floribunda*, Spreng. syst. 1. p. 16. Petal violaceous.

*Bundle-flowered* *Erisma*. Tree 40 feet.

2 *E. VIOLA'CEUM* (Mart. bras. 1. p. 137. t. 82.) leaves oblong, cuspidate, with 10-12 lateral distant nerves on each side; branches of corymbose panicle smoothish. *h. S.* Native of Brazil, in moist woods in Para. *Qualea calcarata*, Link. jahrb. gew. 1. 3. p. 24. Schultes, mant. 1. p. 53. Petal violaceous.

*Violaceous-petal* *Erisma*. Tree 30 to 40 feet.

3 *E. NITIDUM* (D. C. prod. 3. p. 30.) leaves oval, acute, with 7-9 lateral nerves on each side; shining on the upper surface; branches of panicle striated and glabrous. *h. S.* Native of Cayenne, on the mountains of Roura near Kaw. *Qualea lutea*, Martin in Desf. *h. S.* Petal yellow.

*Shining-leaved* *Erisma*. Tree 30 to 40 feet.

*Cult.* See *Vochysia* for culture and propagation, p. 670.

† The following genera are hardly known, and very doubtful whether they belong to the present order.

VII. LOZANIA (evidently a proper name, and perhaps the name of some botanist known to Mutis). Seb. Mut. in sem. nov. granad. 1810. p. 20. D. C. prod. 3. p. 30.

*LIN. SYST. Monándria, Monogýnia.* Calyx with a somewhat ventricose tube, and a 4-parted limb; lobes ovate, acute, spreading, permanent. Petals wanting. Disk quadrangular, filling the bottom of the calyx. Stamen 1, small, inserted obliquely under the ovary, and tapering to the apex; anther ovate, didymous. Ovary ovate. Stigmas 3, small, subcapitate. Capsule ovate, trigonal, acuminate, 3-celled, 3-valved. Seeds 6, with usually 3 of them abortive, angular, inserted in the bottom of the capsule.—A tree, with alternate oblong serrated leaves, and spikes of flowers; peduncles axillary, crowded; pedicels furnished each with a linear bracteole at the base.

1 *L. NEMORALIS* (Seb. Mut. l. c.) *h. S.* Native of New Granada, in temperate parts.

*Grove* *Lozania*. Tree.

*Cult.* See *Vochysia* for culture and propagation, p. 670.

VIII. AGARDHIA (in honour of Charles Agardh, a Swedish professor and writer upon Algæ; author of *Synopsis Algarum Scandanavice*, Lund. 1817. 8vo. and other works on the same subject). Spreng. syst. 1. p. 4. D. C. prod. 3. p. 30.

*LIN. SYST. Monándria, Monogýnia.* Calyx of 3 sepals. Petals 5, convolute. Stamen 1, bearing a large, 2-celled anther. Drupe oval, 3-celled, 3-valved. The rest unknown. Perhaps more nearly allied to *Terebinthaceæ*. It is a very doubtful genus.

1 *A. CRYPTANTHA* (Spreng. syst. 1. p. 17.) leaves ovate, acute, glabrous on both surfaces; raceme terminal. *h. S.* Native of Brazil.

*Hidden-flowered* *Agardhia*. Tree.

2 *A. GRANDIFLORA* (Spreng. l. c.) leaves cordate, oblong, coriaceous, with parallel veins, discoloured beneath and villously tomentose; racemes verticillate; flowers villous, as well as the petioles and peduncles, which are glandular at the base. *h. S.* Native of Brazil.

*Great-flowered* *Agardhia*. Tree.

*Cult.* See *Vochysia* for culture and propagation, p. 670.

IX. ? SCHWEIGGERIA (in honour of A. F. Schweigger, author of *Flora Erlangensis*). Spreng. syst. 1. p. 167. D. C. prod. 3. p. 30.

*LIN. SYST. Monándria, Monogýnia.* Calyx of 3 corolline sepals. Petals 3, one of which is furnished with a spur, the other two erect and cartilaginous. Glands 5, ovate, surrounding the base of the stamen, which is columnar and triquetrous, and bearing an anther at the apex. Pistil none. Fruit unknown.—A little shrub, with the habit of *Bétula fruticosa*, with scattered, sub-fascicled, obovate, crenulated, glabrous leaves; and axillary bibracteate pedicels. Flowers small, like those of a violet. This genus is hardly known.

1 *S. FRUTICOSA* (Spreng. l. c.) *h. S.* Native of Brazil.

*Shrubby* *Schweiggeria*. Shrub.

*Cult.* See *Vochysia* for culture and propagation, p. 670.

ORDER XCI. RHIZOPHOREÆ (plants agreeing with *Rhizophora* or *Mangrove* in particular characters). R. Brown, gen. rem. p. 17. Cong. p. 18. D. C. prod. 3. p. 31.—Paletüviers, Savig. in Lam. dict. 4. p. 696.

Tube of calyx adhering to the ovary (f. 92. a. f.), except in the genus *Cassipourea*, which is free; limb 4-13-lobed (f. 92. e.); lobes valvate in æstivation (but in *Olisbea* calyptriform). Petals inserted in the calyx (f. 92. c.), and alternating with its lobes, therefore equal to them in number. Stamens inserted with the petals (f. 92. d.), equal to them in number, or double or triple that number; filaments free, subulate, erect; anthers ovate, inserted by the base, erect, but somewhat incurved in the genus *Olisbea*. Ovary adnate to the calyx (f. 92. a.), 2-celled; cells 2 or many-ovulate; ovula pendulous. Fruit indehiscent (f. 92. f.), 1-celled, 1-seeded, crowned by the calyx (f. 92. c.). Seed pendulous, exalbuminous. Embryo with a very long radicle and 2 flat cotyledons.—Tropical trees or shrubs, with opposite, simple, entire, or toothed leaves, having the lateral nerves feathered when present. Stipulas interpetiolar. Peduncles axillary.

From a consideration of the structure of *Cardalia* and *Légnotes*, Mr. Brown has been led to conclude, that we have a series of structures, connecting *Rhizophoreæ* on the one hand with certain genera of *Salicariæ*, particularly with *Antheridium*, though that genus wants its intermediate stipulas, and on the other with *Cunoniaceæ*, especially with the simple-leaved species of *Ceratopetalum*. In the opposite leaves, interpetiolar stipulas, adnate ovary, and polypetalous flowers, this order agrees with *Vochysiæ* and *Cunoniaceæ*; in the valvate calyx with *Lythariæ* and *Cunoniaceæ*; and in the pendulous ovulas with *Combretaceæ*. The genus *Olisbea* seems to come nearest to *Mecycylea*. The species of *Rhizophora* or *Mangrove* are remarkable in tropical countries for growing upon the shores of the sea and rivers, even as far as low water. The seeds have the singular property of germinating while inclosed within the capsule, and adhering to their parent, and pushing forth a long fusiform radicle, which lengthens till it reaches and fixes itself in the mud in which the parent grows, and forms a new individual. These young plants never separate from the parent until they are fairly fixed and rooted, as otherwise they would be washed away by the tide. Where mangroves grow in abundance, the situation is always considered unhealthy, from their collecting a vast quantity of filth about their

roots, from the flowing and ebbing of the tide. The bark of *Rhizophora*, which is very astringent, is used in India for dyeing black.

*Synopsis of the genera.*

§ 1. *A genus having its calyx in the form of a calyptra.*

1 OLISBEA. Calyx undivided before the expansion of the flower, but afterwards separating transversely, in one piece. Petals 5. Stamens 10.

§ 2. *Rhizophorææ veræ. Tube of calyx adhering to the ovarium (f. 92. a.).*

2 RHIZOPHORA. Limb of calyx 4-13-lobed. Petals equal in number to the lobes of the calyx. Stamens double the number of the petals.

3 CARALLIA. Limb of calyx 6-7-lobed (f. 92. c.). Petals 6-7 (f. 92. c.). Stamens twice the number of the petals (f. 92. d.).

§ 3. *A genus with the calyx free from the ovarium.*

4 CASSIPOUREA. Calyx campanulate, 5-cleft. Petals 3, fringed. Stamens 20-40.

§ 1. *An intermediate genus between the orders Memecyleæ and Rhizophorææ, having a calyptriform calyx.*

1. OLISBEA (from ολισβος, *olishos*, penis coriaceous; in reference to the consistence of the anthers). D. C. prod. 3. p. 31.

LIN. SYST. *Decándria, Monogýnia*. Calyx closed, ovate, acute, undivided before the expansion of the flower, but afterwards bursting transversely, and falling off in one piece. Petals 5. Stamens 10; anthers rather incurved, opening by a longitudinal chink. Style filiform. Fruit and seeds unknown.—Shrub quite glabrous. Leaves oval, opposite, entire, acuminate, opaque, coriaceous, furnished with a longitudinal nerve, but without any lateral veins. Stipulas supra-axillary, connate at the base, and sheathing. Peduncles axillary, opposite, 1-flowered, articulated in the middle. This is a very doubtful but very singular genus, in the stipulas and habit being that of *Rhizophora*, the form of the anthers that of *Mouriria*, and the calyx that of *Calyptranthis* or *Conostégia*, but from all very different.

1 O. RHIZOPHOREÏDIA (D. C. l. c.). h. S. Native of the West Indies, particularly in St. Vincent, where it is probably cultivated only in the botanic garden.

*Rhizophora-leaved Olisbea. Tree.*

*Cult.* See *Carallia* for culture and propagation, p. 674.

§ 2. *Rhizophorææ veræ. Tube of calyx adhering to the ovary.*

II. RHIZOPHORA (ρίζα, *rhiza*, a root, and φέρω, *phoreo*, to bear; the species of this genus throw out roots from the branches in great abundance, which lengthen out until they fix themselves in the mud, and consequently one tree may, by these supports, spread over a large space, as every branch is supported by its own roots). Lin. gen. no. 592. Gært. fruct. 1. p. 212. t. 45. D. C. prod. 3. p. 31.—*Rhizophora* and *Bruguiera*, Lam. dict. et ill. t. 396. and 397.

LIN. SYST. *Tetra-Icosándria, Monogýnia*. Tube of calyx obovate, adhering to the ovarium; limb with 4-13, oblong-linear, permanent lobes. Petals equal in number to the lobes of the calyx, oblong, furnished with 2 awns at the apex, convolute, and when young clasping the stamens, of which two are situated in the front of each nectary; the stamens are therefore double the

number of the petals. Anthers erect, ovate, inserted by the base. Ovarium 2-celled, when young containing many pendulous ovula. Style 1, bifid at the apex. Fruit indehiscent, 1-seeded, crowned by the calyx. Seed small. Embryo inverted, germinating in the seed, with the radicle gradually lengthening out until it fixes itself in the mud.—Glabrous shrubs, growing in great abundance on the shores of the sea and rivers within the tropics, throwing out numerous roots from every branch. Leaves opposite, coriaceous, quite entire. Peduncles axillary.

\* *Flowers 4-petalled. Mangles, Plum. gen. t. 15.*

1 R. MANGLE (Lin. spec. 634.) leaves obovate-oblong, obtuse; peduncles 2-3-flowered, longer than the petioles; fruit subulately clavate. h. S. Native of Louisiana, Mexico, West Indies, Guiana, Brazil, and west coast of Africa, on the shores of the sea and rivers. Jacq. amer. p. 141. t. 89. ed. pict. t. 132. Catesb. car. 2. t. 63.—Plench. icon. t. 359. Flowers octandrous, pale yellow. P. Browne says the fruit terminates within the cup, and grows from the top downwards until it acquires a due degree of weight and perfection, when it falls off; and as the root is always the thickest, and hangs lowest, it drops in that direction, and is thus received in its natural position in the mud below, the leaves are immediately unfolded, and in a few minutes a perfect plant is seen, sometimes of 2 or 3 feet long, which soon begins to shoot its root, and push its growth like the parent plant. The lower branches frequently become the supporters of some species of oyster, which has given rise to the fabulous account of this shell-fish on trees as a fruit. The bark is most excellent for tanning leather. The decoction of it is a most powerful astringent. The wood is tough and durable.

*Mangle or Common Mangrove. Clt. 1820. Tr. 12 to 15 ft.*

2 R. CANDELA'RIA (D. C. prod. 3. p. 32.) leaves oval, acute; peduncles 1-3-flowered, very short and thickish; fruit subulately clavate. h. S. Native of Malabar and the Moluccas, on the shores of the sea and rivers. Pee-kandel, Rheed. mal. 6. t. 34. *Mángium Candalarium*, Rumph. amb. 3. t. 71. and t. 72. The flowers are at first white, but at length changing to reddish, according to Rheede. Stamens 9-12. Perhaps this species is not different from *R. Mangle*.

*Chandelez or Malabar Mangrove. Tree 12 to 15 feet.*

3 R. RACEMOSA (Meyer, prin. esseq. 185.) leaves obovate-oblong or obovate; racemes axillary, dichotomously panicled. h. S. Native on the shores of Guiana, near the Essequibo. Petals copper-coloured, pilose.

*Racemose-flowered Mangrove. Tree 12 to 15 feet.*

4 R. MUCRONATA (Lam. dict. 6. p. 169. ill. t. 396. f. 2.) leaves oval, abruptly acuminate; racemes nodding, dichotomous. h. S. Native of the Mauritius. Petals oblong, obtuse? Stamens 8. Ovary 4-sided, ex Poir.

*Mucronate-leaved Mangrove. Tree 12 to 15 feet.*

\*\* *Flowers of 5 petals. Kandelia (from Tsjerou-Candel, the Malabar name of R. Candel).*

5 R. CANDEL (Lin. spec. 634.) leaves obovate-oblong, obtuse, on short petioles; peduncles twice bifid, much longer than the petioles. h. S. Native of Malabar, in muddy places on the sea-shore. Tsjerou-Candel, Rheed. mal. 6. t. 35. Flowers whitish. Sepals spreading, somewhat reflexed. Stamens 10-15, exserted. Fruit cylindrical, long, acute.

*Candel Mangrove. Tree 10 to 15 feet.*

6 R. TIMORIE'NSIS (D. C. prod. 3. p. 32.) leaves oval, obtuse, on long petioles; peduncles length of petioles, bearing 10-15 flowers in a head. h. S. Native of Timor. Leaves 2 to 2½ inches long. Petioles 1-1½ inches long. Flowers crowded. Lobes of calyx 5, oblong, stiff. Petals 5, biaristate at the apex, when young convolute and clasping 4 stamens each.

*Timor Mangrove.* Tree 15 to 20 feet.

\* *Flowers of 8 petals.*—*Kanilia*, (from *Kanil-Kandel*, the Malabar name of *R. cylindrica*).

7 *R. CYLINDRICA* (Lin. spec. 634.) leaves oval, acuminate at both ends; peduncles axillary, 1-2-flowered; lobes of calyx at length reflexed. *h. S.* Native of Malabar, in muddy places by the sea-side. *Kanil-Kandel*, Rheed. mal. 6. t. 33. Flowers white. Anthers red. Fruit cylindrical, from reddish to blue, 2-3 inches long, ex Rheed.

*Cylindrical-fruited Mangrove.* Tree 12 to 15 feet.

8 *R. CARYOPHYLLOIDES* (Jack, mal. misc. 1. no. 2. p. 34.) leaves ovate-lanceolate, acute at both ends; peduncles axillary, 3-flowered, rarely dichotomously 5-flowered; lobes of calyx at length spreading. *h. S.* Native of the Moluccas, Singapore, Pulo-penang. Radicle rather cylindrical, acutish.—Rumph. amb. 3. t. 78.

*Clove-like Mangrove.* Tree 12 to 15 feet.

• • • *Flowers of 12-13 petals.*—*Paluviëra*, Pet. Th.—*Bruguiera*, Lam. ill. t. 397. t. 4. p. 696. but not of Pet. Th.

9 *R. SEXANGULA* (Lour. Arch. 297.) leaves ovate-lanceolate; pedicels 1-flowered, sub-ternate; fruit prismatic, hexagonal, obtuse. *h. G.* Native of Cochin-China, on the banks of rivers. *Bruguiera sexangula*, Steud. *Bruguiera sexangularis*, Spreng. Flowers red, of 10 petals. Petals cleft.

*Hexagonal-fruited Mangrove.* Tree 10 to 15 feet.

10 *R. GYMNORHIZA* (Lin. spec. 634.) leaves ovate-oblong, acuminate at both ends, shining; pedicels 1-flowered, deflexed, about the length of the petioles; fruit 4-angled, acute. *h. S.* Native of the Moluccas, East Indies, and Cochin-China.—Rheed. mal. 6. t. 31. 32.—Rumph. amb. 3. t. 63. 70, 71. *Bruguiera gymnorrhiza*, Lam. ill. t. 397. Flowers reddish-yellow, of 10-13 petals. Roots naked above the earth. The bark is very astringent, and is used in India for dyeing rufous or chesnut colour, which is easily changed into a fine permanent black.

*Naked-rooted Mangrove.* Tree 12 to 15 feet.

† *Species not sufficiently known.*

11 *R. CONJUGATA* (Lin. spec. 634.) leaves ovate-oblong, bluntish; flowers sessile; fruit cylindrically subulate. *h. S.* Native of Ceylon.

*Conjugate Mangrove.* Tree.

12 *R. PALUN* (D. C. prod. 3. p. 33.) leaves oval-oblong, acuminate at both ends, alternate; calyx 5-lobed; fruit cylindrical, striated. *h. S.* Native of the Moluccas, in marshes.—Rumph. amb. 3. t. 69.

*Palun Mangrove.* Tree.

13 *R. DECAEDRA* (Roxb. hort. beng. p. 36.) Native of the East Indies, where it is called *Guran*. Not described.

*Decandrous Mangrove.* Tree.

14 *R. CERATOPHYLLOIDES* (Ravuch. nom.). Not described.

*Buckhorn-leaved-like Mangrove.* Shrub.

*Cult.* The species of *mangrove* are difficult, if not impossible, to cultivate in this country. They may be tried in a mixture of loam and sand, and kept moist with salted water.

III. *CARALLIA* (*Carallie* is the name of *C. lucida*, in the language of the Telingas). Roxb. hort. beng. p. 87. and cor. 3. t. 211. D. C. prod. 3. p. 33.

LIN. SYST. *Dodecandria, Monogynia*. Tube of calyx subglobose (f. 92. a.); limb 6-7-lobed (f. 92. c.); lobes triangular. Petals 6-7 (f. 92. c.), orbicular. Stamens 12-14 (f. 92. d.), equal in length with the petals. Ovary globose (f. 92. a.), adnate to the calyx. Style length of stamens, crowned by a sub-urceolate, 3-lobed stigma (f. 92. b.). Berry globose (f. 92. f.), 1-celled, crowned by the calyx (f. 92. e.). Seed 1, reniform, rarely 2.—Ever-

green, glabrous, Indian trees, with opposite, serrated, stiffish leaves, which are shining on the upper surface. Peduncles axillary, trifid, many-flowered. The genus *Baralddia* of Pet. Th. sec vol. 1. p. 808. now inserted in *Rutaceæ*, is allied to this genus, according to R. Br. congo. p. 18.

1 *C. LANCEFOLIA* (Roxb. hort. beng. p. 87.) leaves oblong-lanceolate, acute, serrated, 3-times longer than broad. *h. S.* Native of Sumatra.

*Lanceolate-leaved Carallia.* Tree 20 feet.

2 *C. LUCIDA* (Roxb. cor. 3. t. 211.) leaves oval, acuminate, serrated, twice the length of the breadth. *h. S.* Native of the East Indies, on the lower Circars. Petals yellow, rather undulated. Fruit the size of a large pea.

*Lucid Carallia.* Clt. 1820. Tree 20 feet.

3 *C. INTEGRA* (D. C. prod. 3. p. 33.) leaves oval, acuminate, quite entire, twice the length of the breadth. *h. S.* Native of the East Indies. Perhaps only a variety of *C. lucida*.

*Quite-entire-leaved Carallia.* Tree 20 feet.

*Cult.* See *Cassipourea* for culture and propagation, p. 675.

§ 3. *A genus with a free calyx, intermediate between Rhizophoreæ and Lythrariceæ.*

IV. *CASSIPOUREA* (Guiana name of *C. Guianensis*). Aubl. guian. 1. p. 529. t. 211. (1775.)—Tita, Scop. intr. p. 219. (1777.)—Legnôtis, Swartz, prod. p. 84. (1788.) fl. ind. occ. p. 968. t. 17.—Richæia, Pet. Th. gen. nov. mad. no. 84. (1810.) but not of Lam. nor Browne.

LIN. SYST. *Icosandria, Monogynia*. Calyx campanulate, 5-lobed; lobes valvate in æstivation. Petals 3, inserted in the bottom of the calyx, attenuated at the base, fringed on the margins at the apex. Stamens 20-40, inserted in the bottom of the calyx and shorter than it, disposed in a single series. Ovary hemispherical. Style permanent, longer than the stamens. Stigma obtuse. Fruit 3-celled, 3-valved, girded by the calyx; cells 2-ovulate, but only 1-seeded from abortion. Seed hanging from the top of the cell, half arillate at the base. Albumen fleshy. Embryo inverted, with flat cotyledons and an oblong radicle.—Trees or shrubs, with opposite, oval, acute, feather-nerved, short-stalked, entire, or toothed leaves. Stipulas lanceolate, between the leaves. Flowers axillary, crowded; pedicels 1-flowered, bracteate at the base.—This genus agrees with *Rhizophoreæ* in the stipulas, and especially with the genus *Carallia*. It agrees with *Lythrariceæ* in the free calyx; but from both orders it differs in the albuminous seeds. Perhaps a proper order.

1 *C. MACROPHYLLA* (D. C. prod. 3. p. 34.) leaves ovate, obtuse at the base, on short petioles, acuminate at the apex, and with the margins bluntly repand; flowers sessile; petals pinnatifidly jagged. *h. S.* Native of Brazil, in the province of Para. Legnôtis *macrophylla*, Mart. herb. Leaves 6 inches long and 3 broad. Flowers larger than those of the following species, white.

*Long-leaved Cassipourea.* Tree or shrub.

2 *C. GUIANENSIS* (Aubl. guian. 1. p. 529. t. 211.) leaves ovate or oval, on short petioles, quite entire, acuminate at the apex; flowers almost sessile; petals pinnatifidly fringed. *h. S.* Native of French Guiana, in marshes, and of Brazil, in the

province of Para. Legnôtis Cassipourea, Swartz, fl. ind. 970. Petals white.

*Guiana Cassipourea*. Shrub 6 to 7 feet.

3 *C. ELLIPTICA* (Poir. suppl. 2. p. 131.) leaves elliptic, acuminate at both ends, quite entire, on short petioles; flowers distinctly pedicellate; petals rather palmately fringed. *h. S.* Native of Jamaica, on the higher mountains. Legnôtis elliptica, Swartz, prod. 84. fl. ind. p. 969. t. 17. Petals white.

*Elliptic-leaved Cassipourea*. Tree 10 to 30 feet.

4 *C. MADAGASCARIENSIS* (D. C. prod. 3. p. 34.) leaves on short petioles, toothed; flowers pedicellate; pedicels rising from an urceolate bractea each; petals fringed at the apex. *h. S.* Native of Madagascar. Richæia, Pet. Th. nov. gen. mad. p. 25. no. 84.

*Madagascar Cassipourea*. Shrub 6 to 10 feet.

† *A species not sufficiently known.*

5 *C. CONGOENSIS* (R. Br. congo, p. 58.). *h. S.* Native of the west coast of Africa, on the banks of the Congo. Petals less divided than the rest of the species.

*Congo Cassipourea*. Tree or shrub.

*Cult.* Loam and peat is a good soil for the species of *Cassipourea*, and cuttings root readily in sand, under a hand-glass, in heat.

ORDER XCII. ONAGRARIÆ (plants agreeing with *Onagros* or *Onager*, now *Enothëra*, in important characters). Juss. ann. mus. 3. p. 315. exclusive of *Haloragiceæ*. D. C. prod. 3. p. 35.—*Onagraceæ*, Juss. gen. 317. exclusive of numerous genera.—*Epilobiaceæ*, Vent. tabl. 3. p. 307.—*Calecanthemarum* gen. Lin.

Tube of calyx adnate to the ovarium the whole length (f. 93. a.), or only adhering to it at the base (f. 94. a.), and drawn out beyond the ovarium at the apex (f. 94. a.); limb 2-4-lobed, but usually 4-lobed (f. 93. a. f. 94. a. f. 96. a. f. 98. a.); lobes valvate in æstivation. Petals equal in number to the lobes of the calyx (f. 95. b. f. 96. b. f. 97. b. f. 98. d.), and alternating with them, for the most part regular, twisted in æstivation, inserted in the top of the tube of the calyx (f. 95. b. f. 96. b. f. 97. b. f. 98. d.), rarely wanting. Stamens sometimes equal in number to the petals (f. 93. d. f. 99. c.), but usually twice that number (f. 95. b.); filaments free, filiform; anthers oblong or ovate. Ovary many-celled, usually crowned by a cup-shaped gland. Style filiform. Stigma capitate (f. 95. c.) or lobed (f. 96. c. f. 97. a.). Fruit capsular (f. 96. d. f. 99. f.), baccate or drupaceous, 2 or 4-celled. Seeds many in each cell, rarely solitary, fixed to the central placenta. Albumen wanting, but the endopleura is sometimes tumid, and appearing like albumen. Embryo straight, with a long terete radicle and 2 short cotyledons.—Herbs or shrubs. Leaves simple, alternate or opposite, entire, toothed, or pinnatifid, feather-nerved. Flowers axillary, and disposed in terminal spikes or racemes.

This order is distinguished from *Lythraridæ* in the calyx being adnate to the ovarium, and from *Haloragiceæ* in the style being filiform, in the seeds being exalbuminous, and never pendulous in the cells. It is also distinguished from *Myrtaceæ* in the leaves being destitute of pellucid dots, in the stamens being definite in number, not indefinite; and from *Loasceæ* in the seeds being fixed to the central column, not parietal, as in that order. The order is generally known by its pollen cohering by a kind

of filamentose substance, an inferior polyspermous ovarium, a tetrasepalous tetrapetalous flower, with a definite number of stamens, and a single style; from this form, however, there are some anomalous variations, such as *Circæa* and *Lopèzia*, which are however easily reconciled to the usual structure of the order. Most of the genera are pre-eminently beautiful, as *Epilobium*, *Enothëra*, and *Fuchsia*, which are old favourites among gardeners.

The properties of *Onagraridæ* are but little known. The leaves of *Jussiaea Peruviana* are used as an emollient poultice, and the root of *Enothëra biennis* as a sort of salad. The valves and dry capsule of *Enothëra tetralptra* contract when the atmosphere is dry, but when moist they expand.

#### Synopsis of the genera.

##### TRIBE I.

MONTINIEÆ. Fruit capsular. Seeds imbricate, erect, furnished with a membranous wing. Trees or shrubs, with alternate leaves.

1 MONTINIA. Flower dioecious from abortion. Tube of calyx adhering to the ovarium (f. 93. a.), with a very short 4-toothed limb (f. 93. b.). Petals 4 (f. 93. d.). Stamens 4. Style bifid (f. 93. c.). Capsule 2-valved.

2 HAUYA. Calyx adhering to the ovary at the base, and drawn out into a long tube at the apex, which is 4-lobed. Petals 4. Stamens 8. Capsule 4-valved.

##### TRIBE II.

FUCHSIEÆ. Fruit baccate. Tube of calyx drawn out beyond the ovarium (f. 94. a.). Trees or shrubs, with opposite leaves.

3 GONGYLOCARPUS. Calyx adhering to the ovarium at the base, and drawn out into a long tube at the apex, which is 4-parted. Petals 4. Stamens 8. Fruit baccate, 2-celled, 2-seeded, indehiscent.

4 FUCHSIA. Calyx 4-lobed (f. 94. a.). Petals 4. Stamens 8. Ovary 4-valved, 4-celled.

##### TRIBE III.

ONAGREÆ. Fruit capsular, many-seeded (f. 95. d. f. 96. d.). Seeds not winged. Tube of calyx drawn out beyond the ovarium (f. 96. a.). Stamens twice the number of the petals (f. 94. d. f. 95. b.).

5 EPILOBUM. Limb of calyx 4-parted. Petals 4. Capsule tetragonal, 4-celled. Seeds pappous.

6 GAURA. Limb of calyx 3-4-parted. Petals 3-4. Ovary 3-4-sided, 1-celled. Seeds naked.

7 ENOTHEA. Limb of calyx 4-parted (f. 96. a.). Petals 4 (f. 96. b.). Capsule oblong-linear (f. 96. d.), bluntly tetragonal or clavate, 4-celled. Seeds naked.

8 GAYOPHYTUM. Limb of calyx 4-parted. Petals 4. The 4 stamens opposite the petals barren. Capsule 2-celled. Seeds naked.

9 CLARKIA. Limb of calyx 4-parted. Petals 4, tripartite (f. 97. b.). Capsule 4-celled. Seeds not pappous.

## TRIBE IV.

**JUSSIEÆ.** Fruit capsular (f. 99. f.); cells many-seeded. Tube of calyx permanent, not drawn out beyond the ovary, but dividing immediately (f. 98. a. f. 99. e. b.).

10 **JUSSIEÆ.** Limb of calyx 4-6-parted (f. 98. a.). Petals 4-6 (f. 98. d.). Stamens 8-12. Capsule 4-6-celled (f. 98. b.). Seeds naked.

11 **PRIEURÆ.** Limb of calyx 3-parted. Petals 3. Stamens 3.

12 **LUDWIGIA.** Limb of calyx 4-parted. Petals 4. Stamens 4. Capsule turbinate or elongated, 4-celled. Style pyramidal from the apex.

13 **ISNARDIA.** Limb of calyx 4-parted (f. 99. a. e.). Petals 4 (f. 99. b.). Stamens 4 (f. 99. e.). Style filiform from the base. Capsule obovate or almost cylindrical, tetragonal, 4-celled (f. 99. f.).

## TRIBE V.

**CIRCEÆ.** Tube of calyx not drawn out beyond the ovary, but immediately parted and deciduous. Fruit capsular, ovate-globose. Stamens 2, one of which is sometimes converted into a petal.

14 **LOPEZIA.** Limb of calyx 4-parted (f. 100. a.). Petals 4 (f. 100. h. b.), irregular. Stamens 2 (f. 100. c.), one of which is only fertile. Capsule subglobose (f. 100. e.), 4-celled.

15 **CIRCEÆ.** Limb of calyx 2-parted. Petals 2, obcordate. Stamens 2. Capsule hispid, 2-celled, 2-valved, 2-seeded.

† Genera not well known.

16 **PLEUROSTEMON.** Tube of calyx drawn out beyond the ovary, bifid at the apex. Petals 4. Stamens 8. Stigma 4-lobed. Capsule oval, 4-celled.

17 **ONOSCORIS.** Tube of calyx adhering to the ovary; limb 2-parted, with the lobes reflexed. Petals 4. Stigmas 4. Capsule 4-celled, 4-valved.

## Tribe I.

**MONTINIEÆ** (plants agreeing with *Montinia* in important characters). D. C. prod. 3. p. 35. Fruit capsular (f. 93. a.). Seeds imbricate, erect, furnished with a membranous wing.—Trees or shrubs, with alternate leaves. This tribe is formed from two genera that are not very well known.

I. **MONTINIA** (in honour of Laurence Montin, an acute Swedish botanist). Lin. gen. 1432. Gærtn. fruct. 1. p. 170. t. 33. Lam. ill. t. 808. D. C. prod. 3. p. 35.

LIN. SYST. *Dicæcia*, *Tetrândria*. Flowers dioecious from abortion. Tube of calyx adhering to the ovary (f. 93. a.); limb very short, 4-toothed (f. 93. a.). Petals 4 (f. 93. d.), roundish. Stamens 4 (f. 93. d.), alternating with the petals; in the female flowers barren. Anthers oblong, oscillatory. Ovary ovate; in the male flowers abortive. Style bifid (f. 93. b.). Capsule (f. 93. a.), 2-valved, 2-celled, crowned by the teeth of the calyx. Seeds 6-8 in each cell, fixed to the central placenta, which is somewhat tetragonal. Seeds girded by a wing. Albumen fleshy.—A smooth Cape shrub, with alternate leaves, and small white flowers. This genus differs from all the other genera in *Onagrarieæ* in the seeds being albuminous.

1 **M. A'CRIS** (Lin. fl. suppl. 427.) h. G. Native of the Cape of Good Hope, on sandy hills.—Pluck. alm. t. 333.—Burm. afr. t. 90. f. 1-2. *M. cario-phyllæa*, Thunb. nov. gen. 1. p. 28. Smith, spicil. t. 15. *M. frutescens*, Gærtn. fr. l. c. Leaves ovate-lanceolate, acute, glaucous, rather fleshy. Flowers terminal. Fruit with an acrid flavour. (f. 93.)

*Acrid-fruited Montinia.* Fl. July. Clt. 1774. Sh. 1 to 1½ ft.

*Cult.* *Montinia* thrives well in a mixture of loam and peat, and cuttings root readily if planted under a hand-glass.

FIG. 93.

II. **HAUYA** (perhaps a name of Mexican origin). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 3. p. 36.

LIN. SYST. *Octândria*, *Monogynia*. Calyx adhering to the ovary at the base, drawn out into a long cylindrical tube, which is cleft to the middle into 4 oblong-linear, acute, dependent lobes, which are coloured on the inside. Petals 4, oval, inserted in the top of the calycine tube. Stamens 8, exserted; anthers oblong, oscillatory. Style 1, filiform, exserted. Stigma thick, capitate. Capsule 4-valved, 4-celled. Seeds numerous, expanded into an oblong wing at the apex.—A shrub, with alternate petiolate ovate leaves. Flowers large, from white to rose-coloured, sessile in the axils of the upper leaves.

1 **H. ELEGANS** (Moc. et Sesse, fl. mex. icon. ined.) h. S. Native of Mexico. Branchlets, young leaves, and calyxes clothed with down. Tube of calyx an inch and a half long.

*Elegant Hauya.* Shrub.

*Cult.* See *Montinia* for culture and propagation.

## Tribe II.

**FUCHSIEÆ** (plants agreeing with *Fuchsia* in important characters). D. C. prod. 3. p. 36. Fruit baccate. Tube of calyx drawn out beyond the ovary (f. 94. a.).—Elegant South American shrubs, with opposite leaves.

III. **GONGYLOCARPUS** (from γονγυλος, *gongulos*, round, and καρπος, *karpos*; in reference to the shape of the fruit). Schlecht. et Cham. in Linnaea. 5. p. 557.

LIN. SYST. *Octândria*, *Monogynia*. Calyx adhering to the ovary at the base, with the tube drawn out a long way beyond the ovary; limb 4-parted; throat crowned by a ring of glands below the stamens. Petals 4, entire. Stigma capitate. Fruit baccate, 2-celled, 2-seeded; putamen woody.—An annual herb, with alternate, glabrous, ovate-lanceolate, acuminate leaves. Petals obovate-cuneate, caducous, shorter than the calycine segments. Fruit turbinate, about the size of a grain of pepper.

1 **G. RUBRICAU'LIS** (Schlecht. et Cham. l. c.) C. H. Native of Mexico, about Jalapa. Stems red, furnished with short axillary branches.

*Red-stemmed Gongylocarpus.* Pl. 1½ foot.

*Cult.* The seeds of this plant will require to be sown in a hot-bed in spring, and when the plants are about 2 or 3 inches high they may be planted out into the open border in a warm sheltered situation.

IV. **FUCHSIA** (in honour of Leonard Fuchs, a celebrated German botanist, author of *Historia Stirpium* in 1542.) Plum. gen. 14. Lin. gen. 126. Lam. ill. t. 282. D. C. prod. 3. p. 36.

**LIN. SYST.** *Octándria, Monogýnia*. Tube of calyx adhering to the ovarium at the base, and drawn out at the apex into a cylindrical 4-cleft tube (f. 94. a.), whose lobes soon fall off. Petals 4, alternating with the lobes of the calyx, and inserted in the upper part of the tube, very rarely wanting. Stamens 8. Ovarium crowned by an urceolate gland. Style filiform, crowned by a capitate stigma (f. 94. b.). Berry oblong or ovate-globose, 4-valved, 4-celled, many-seeded.—Shrubs, usually with opposite leaves, and axillary 1-flowered pedicels, which are sometimes disposed in racemes at the tops of the branches. Flowers usually drooping, red, rarely white, sometimes 5-cleft and decandrous.

**SECT. I. QUELUSIA** (an insignificant name given by Vandelii. *Quelus* is the name of a country-house of the queen of Portugal, situated about 2 leagues from Lisbon). Vand. in Rœm. script. p. 101. t. 7. f. 10a.—Dorvália, Comm. mss.—Nahúsia, Schnev. with a figure. Tube of calyx cylindrical or obconical, attenuated or constricted above the ovarium. Ovula numerous, 2 series in each cell. Leaves opposite or verticillate, rarely subalternate.—South American shrubs.

§ 1. *Breviflora* (from *brevis*, short, and *flos*, a flower; flowers short). D. C. prod. 3. p. 36. The free part of the tube of the calyx shorter than its lobes, or about equal in length to them. Stamens inclosed.

1 F. MICROPHYLLA (H. B. et Kunth, nov. gen. amer. 6. p. 103. t. 534.) branches pubescent; leaves opposite, small, elliptic-oblong, acutish, toothed, glabrous, but a little ciliated; pedicels axillary, shorter than the flowers; calyx funnel-shaped, with ovate acuminate lobes; petals retuse, toothed. h. G. Native of Mexico, on the burning mount Jorullo. Lindl. bot. reg. t. 1269. Sweet, fl. gard. new ser. t. 16. Calyx scarlet. Petals deep red. Stigma 4-lobed. (f. 94.)

*Small-leaved Fuchsia*. Fl. Ju. Sept. Clt. 1828. Sh. 4 to 6 ft.

2 F. THYMIFOLIA (H. B. et Kunth, nov. gen. amer. 6. p. 104. t. 535.) branches puberulous; leaves about opposite, small, ovate or roundish-ovate, obtuse, nearly quite entire, hairy above and glabrous beneath; pedicels axillary, shorter than the flowers; calyx funnel-shaped, with oblong acute lobes; petals obovate-oblong, undulated. h. G. Native of Mexico, in temperate places near Pazeuaro. Lindl. bot. reg. 1284. *Lopèzia thymifolia*, Bonpl. herb. Willd. ex Link, in Schultes, mant. 50. F. alternans, Moc. et Sesse, fl. mex. ined. Flowers red. Stigma undivided.

*Thyme-leaved Fuchsia*. Fl. May, Oct. Clt. 1827. Shrub 4 to 6 feet.

3 F. ROSEA (Ruiz et Pav. fl. per. 3. p. 88. t. 322.) stem beset with prominent pulvinate tubercles; branches glabrous; leaves opposite, petiolate, oval, quite entire; pedicels axillary, sub-aggregate, shorter than the flowers; calyx funnel-shaped, with oblong, acute, reflexed lobes, twice the length of the petals, which are obcordate. h. G. Native of Chili. T. lycioides, Andr. bot. rep. t. 120. Sims, bot. mag. 1024. Calyx red. Petals purple. Stigma 4-lobed.

*Rose-coloured-flowered Fuchsia*. Fl. April, Oct. Clt. 1796. Shrub 3 to 6 to 12 feet.

4 F. PARVIFLORA (Lindl. bot. reg. 1048.) branches smoothish; leaves scattered and opposite, petiolate, ovate-cordate or oval,

quite entire, glaucous, glabrous; pedicels sub-aggregate; lobes of calyx reflexed; stigma thick, 4-lobed. h. G. Native of Mexico. F. ovata, Moc. et Sesse, fl. mex. icon. ined. but not of Ruiz et Pav. fl. per. The pedicels, according to the figure in the fl. mex., are pubescent, but according to that in bot. reg. glabrous. Calyx red. Petals purple. Very like F. rosea

*Small-flowered Fuchsia*. Fl. May, Oct. Clt. 1824. Shrub 3 to 6 feet.

§ 2. *Macrostemonea* (from *μακρος*, *makros*, long, and *στημον*, *stemon*, a stamen; in reference to the stamens which are exserted). D. C. prod. 3. p. 37. The free part of the tube of the calyx shorter than the lobes, or equal in length to them. Stamens exserted.

5 F. ARBORESCENS (Sims, bot. mag. 2620.) branches glabrous; leaves 3 in a whorl, oval-oblong, acuminate at both ends, petiolate, quite entire; panicle terminal, trichotomous, nearly naked; calyx funnel-shaped, with the lobes ovate, acute, and spreadingly reflexed; also the petals. h. G. Native of Mexico. Lindl. bot. reg. 943. F. amœna, Rich. Flowers small, red, 5-6 lines long, disposed in terminal panicles. Stamens but little exserted. F. hamelioides, Moc. et Sesse, fl. mex. icon. ined. F. racemosa, Moc. et Sesse. Leaves broad.

*Arborescent Fuchsia*. Fl. Oct. Clt. 1824. Sh. 6 to 15 feet.

6 F. OVALIS (Ruiz et Pav. fl. per. 3. p. 87. t. 324. f. a.) branches pubescent; leaves opposite or 3 in a whorl, petiolate, oval, a little denticulated, acute, pubescent on both surfaces; pedicels axillary, sub-aggregate on the branchlets, erect, much shorter than the flowers; lobes of calyx villous, oblong, acute, twice the length of the petals, which are ovate and acute. h. G. Native of Peru, in groves about Muna. Calyx and corolla scarlet. Stamens hardly exserted.

*Oval-leaved Fuchsia*. Shrub 4 to 6 feet.

7 F. DECUSSATA (Ruiz et Pav. fl. per. 3. p. 88. t. 323. f. b.) branches pubescent; leaves opposite or 3 in a whorl, petiolate, lanceolate, pubescent on both surfaces; pedicels axillary, pendulous, longer than the calyx; lobes of calyx oblong, acute, longer than the petals, which are also oblong and acute. h. G. Native of Peru, in subhumid groves about Muna. Calyx rose-coloured. Petals scarlet. Stamens not much exserted.

*Decussate-leaved Fuchsia*. Shrub 2 to 3 feet.

8 F. GRACILIS (Lindl. in bot. reg. t. 847.) branches finely pubescent; leaves opposite, glabrous, on long petioles, remotely denticulated; pedicels axillary, nodding, puberulous, length of the calyx; lobes of calyx oblong, acute, exceeding the petals, which are convolute and retuse; stigma undivided. h. G. Native of Mexico. F. decussata, Graham in edinb. phil. journ. 11. p. 401. Sims, bot. mag. 2507. but not of Ruiz et Pav. Calyx scarlet. Petals purple. Stigma fusiform.

Var. β, *multiflora* (Lindl. bot. reg. 1052.) leaves smaller, glaucous, on short petioles; stigma conical.

*Slender Fuchsia*. Fl. May, Oct. Clt. 1823. Sh. 6 to 10 ft.

9 F. MACROSTEMMA (Ruiz et Pav. fl. per. 3. p. 88. t. 324. f. 6.) branches glabrous; leaves 3 in a whorl, ovate, acute, denticulated, on short petioles; pedicels axillary, nodding, longer than the flowers; lobes of calyx oblong, acute, exceeding the petals, which are obovate and spreading; stigma 4-lobed. h. G. Native of Chili, in marshes. Lodd. bot. cab. 1062. Thilco, Feuille, obs. 3. p. 64. t. 47. This species differs from F. coccinea in the petals being blue and spreading, not convolute, in the stigma being 4-lobed, not undivided. Calyx scarlet.

Var. β, *tenella* (D. C. prod. 3. p. 38.) flowers smaller; leaves opposite. h. G. F. gracilis var. *tenella*, Lindl. bot. reg. 1052.

*Long-crowned Fuchsia*. Fl. July, Oct. Clt. 1823. Shrub 6 to 12 feet.

10 F. COCCINEA (Lindl. bot. reg. 1062.) leaves 3 or 4 in a

FIG. 94.

whorl, ovate, flat, denticulated, glabrous; petioles pubescent; flowers pendulous, solitary; petals about equal in length to the calyx; tube of corolla conical. *h. G.* Native of Chili. Calyx scarlet. Corolla purple. Stigma ovate.

*Conical-calyxed Fuchsia.* Fl. June, Oct. Clt. 1824. Shrub 3 to 6 feet.

11 *F. COCCI'NEA* (Ait. hort. kew. 2. p. 8.) branches glabrous; leaves opposite or 3 in a whorl, ovate, acute, denticulated, on short petioles; pedicels axillary, drooping, longer than the flowers; lobes of calyx oblong, acute, exceeding the petals, which are obovate and convolute. *h. G.* Native of Chili, in marshes, and as far south as the Straits of Magellan. Curt. bot. mag. 97. Duham. arbr. ed. nov. 1. t. 13. *F. pendula*, Salisb. st. rar. t. 7. *F. Magellánica*, Lam. dict. Náhüsia coccinea, Schnevoigt, icon. no. 21. Skinnëra coccinea, Moench. Quelú-sia, Vand. l. c. Calyx scarlet. Petals violaceous.

*Scarlet Fuchsia.* Fl. May, Oct. Clt. 1788. Sh. 3 to 6 feet.

12 *F. MONTANA* (St. Hil. fl. bras. 2. p. 275. t. 135.) branches sulcate and puberulous at the apex; leaves 3 in a whorl, oblong, acute, obsolete denticulated, glabrous, but when young puberulous; calycine tube funnel-shaped, about equal in length to the lobes, which are lanceolate and acute; petals obovate, convolute; stigma 4-toothed; fruit oblong. *h. S.* Native of Brazil, in the province of Minas Geraes, on the mountain called Serra da Caraca. Calyx scarlet. Corolla violaceous.

*Mountain Fuchsia.* Shrub 1 to 2 feet.

13 *F. PUBESCENS* (St. Hil. fl. bras. 2. p. 275. t. 134.) branches sulcate, puberulous; leaves 3-4 in a whorl, ovate-oblong, acute, denticulated, puberulous; tube of calyx funnel-shaped, about equal in length to the lobes, which are lanceolate and acute; petals obovate, convolute; fruit ovate-roundish. *h. G.* Native of Brazil, in the province of Minas Geraes, on the high mountain called Serra da Piedade, and in that part of the province of St. Paul called Campos Geraes. Calyx scarlet. Corolla violaceous.

*Pubescent Fuchsia.* Shrub 5 feet.

§ 3. *Longiflora* (from *longus*, long, and *flos*, a flower; in reference to the flowers, which are long). *D. C. prod.* 3. p. 38. *Free part of the tube of the calyx twice or thrice the length of its lobes. Stamens exerted.*

14 *F. PETIOLARIS* (H. B. et Kunth, nov. gen. amer. 8. p. 104.) branches glabrous; leaves 3 in a whorl, or the upper ones are opposite, on long petioles, lanceolate-oblong, acute, remotely denticulated, glabrous; pedicels axillary, shorter than the flowers; lobes of calyx ovate-oblong, acuminate, longer than the petals, which are nearly of the same shape. *h. G.* Native of South America, at Santa Fe de Bogota. Calyx downy, an inch and a half long.

*Petiole Fuchsia.* Shrub 4 to 6 feet.

15 *F. QUINDIENSIS* (H. B. et Kunth, nov. gen. amer. l. c.) branches clothed with adpressed pili; leaves 3 in a whorl, small, approximate, oblong, acute, remotely denticulated, rather pilose above, and glabrous beneath; pedicels axillary, shorter than the flowers; lobes of calyx ovate, acuminate mucronate, a little longer than the petals, which are lanceolate and acute. *h. G.* Native of the Andes of Quindiu. Shrub probably procumbent. Pedicels and calyxes puberulous.

*Quindiu Fuchsia.* Shrub proc. ?

16 *F. VENUSTA* (H. B. et Kunth, l. c.) branches downy; leaves opposite and 3 in a whorl, elliptic, acute, entire, glabrous, and rather shining; pedicels axillary, a little shorter than the flowers, the upper ones disposed in a raceme; lobes of calyx ovate-lanceolate, acuminate, about equal in length to the petals, which are oblong-lanceolate, acute, with undulated margins.

*h. G.* Native of New Granada, near Guayavalito. Calyx purple, glabrous. Petals scarlet. Perhaps the same as *F. multiflora*, Lin. which is scarcely known.

*Beautiful Fuchsia.* Shrub 4 to 6 feet.

17 *F. LOXE'NSIS* (H. B. et Kunth, nov. gen. amer. l. c. t. 536.) branches hairy; leaves 3 in a whorl, oblong-elliptic or lanceolate-oblong, acute, obsolete and remotely denticulated, glabrous, but hairy on the veins beneath; pedicels axillary, a little shorter than the flowers; lobes of calyx ovate-oblong, acute, a little shorter than the petals, which are ovate-roundish. *h. G.* Native of New Granada, near Loxa. Calyx purplish, glabrous. Petals scarlet.

*Loxa Fuchsia.* Shrub 4 to 6 feet.

18 *F. AYAVACE'NSIS* (H. B. et Kunth, l. c.) branches hairy; leaves 3 in a whorl, oblong, acuminate, remotely denticulated, hairy on both surfaces; pedicels axillary, longer than the flowers; lobes of calyx ovate-lanceolate, ending in a narrow taper-point each, exceeding the petals, which are roundish-ovate. *h. G.* Native of Peru, near Ayavaca. Calyx smoothish and purplish.

*Ayavaca Fuchsia.* Shrub 3 to 6 feet.

19 *F. HIRTE'LLA* (H. B. et Kunth, l. c.) branches hairy; leaves 3-4 in a whorl, on short petioles, oblong-lanceolate, obsolete and remotely denticulated, hairy on both surfaces; flowers sub-racemose; lobes of calyx lanceolate, acuminate, a little longer than the petals, which are lanceolate-oblong and acutish. *h. G.* Native of New Granada. Flowers nearly 2 inches long.

*Hairy Fuchsia.* Shrub 3 to 6 feet.

20 *F. TRIPHYLLA* (H. B. et Kunth, l. c.) branches downy; leaves 3 in a whorl, oblong, acute, quite entire, stiffish, smooth except the veins beneath, which are pubescent; pedicels axillary, shorter than the flowers, upper ones forming a raceme; lobes of calyx ovate-lanceolate, acuminate, a little longer than the lanceolate-oblong cuspidate petals. *h. G.* Native of New Granada. *F. triphylla*, Lin. spec. 159. ex Mutis, but exclusive of the synonyme.

*Three-leaved Fuchsia.* Shrub 3 to 6 feet.

21 *F. INTEGRIFOLIA* (St. Hil. fl. bras. 2. p. 273.) branches glabrous; leaves 3-4 in a whorl, oblong, acute, almost quite entire, glabrous; tube of calyx cylindrical, 3 times shorter than the lobes, which are lanceolate and acute; petals obovate, convolute; stigma 4-toothed; fruit elliptic. *h. G.* Native of Brazil, in the province of Minas Geraes, on the mountain called Serra da Caraca. This species differs from *F. macrosténia* in the leaves being entire, and in the tube of the calyx being short, compared with the lobes.

*Entire-leaved Fuchsia.* Shrub 3 to 4 feet.

22 *F. AFFINIS* (St. Hil. fl. bras. 2. p. 274.) branches glabrous; leaves 3 in a whorl, oblong or ovate-oblong, acute, nearly quite entire, glabrous; calycine tube funnel-shaped, twice the length of the lobes, which are lanceolate and acute; petals obovate, convolute; fruit ovate oblong; stigma 4-toothed. *h. G.* Native of Brazil, in the province of Rio Janeiro, on the mountains called Serra da Boa Vista and Serra da Estrada Nova, and in the southern part of the province of St. Paul in the Distrito de Curityba. Calyx scarlet. Corolla violaceous. Nearly allied to *F. integrifolia*, from which it differs in the calyx being more deeply cleft.

*Allied Fuchsia.* Shrub 6 feet.

23 *F. RACEMOSA* (Lam. dict. 2. p. 565. ill. t. 282. f. 1.) branches downy; leaves opposite or 3 in a whorl, on short petioles, oval, acute, denticulated, puberulous on both surfaces; pedicels axillary, about equal in length to the flowers, upper ones racemose; lobes of calyx lanceolate-oblong, acute; tube of calyx widened at the base. *h. S.* Native of St. Domingo.

Plum. ed. Burm. t. 133. f. 1. gen. p. 34. Flowers scarlet. Pedicels velvety. This species agrees with section second in the tube of the calyx being dilated at the base.

*Racemose-flowered Fuchsia.* Shrub 4 to 6 feet.

24 *F. FULGENS* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 3. p. 39.) branches glabrous; leaves opposite, petiolate, ovate-cordate, acute, denticulated, glabrous; pedicels axillary, shorter than the flowers, upper ones racemose; lobes of calyx ovate-lanceolate, acute, exceeding the petals, which are acutish. *h. G.* Native of Mexico. Branches and pedicels red. Flowers reddish scarlet, 2 inches long. Racemes drooping at the apex.

*Fulgent Fuchsia.* Sh. 4 to 6 feet.

25 *F. DENTICULATA* (Ruiz et Pav. fl. per. 3. p. 87. t. 325. f. b.) branches trigonal; leaves 3 in a whorl, petiolate, oblong-lanceolate, acuminate at both ends, denticulated, having the middle nerve villous behind; pedicels axillary, rather shorter than the flowers; lobes of calyx lanceolate, acuminate, nearly twice the length of the obovate petals. *h. G.* Native of Peru, among rocks about Huassa-huassi and Cheuchin, where it is called *molto-cantu*, which signifies a beautiful plant. Flowers purple, nodding.

*Denticulated-leaved Fuchsia.* Sh. 6 to 12 feet.

26 *F. CORYMBIFLORA* (Ruiz et Pav. fl. per. 3. p. 87. t. 325. f. a.) branches somewhat tetragonal; leaves opposite, petiolate, oblong-lanceolate, almost quite entire; pedicels 3, nearly terminal, nodding, shorter than the flowers; lobes of calyx lanceolate, acute, twice the length of the petals, which are oblong-lanceolate. *h. G.* Native of Peru, about Chincac and Muna, in shady groves. Flowers scarlet, nearly 2 inches long. Berry ovate-oblong, reddish-purple.

*Corymb-flowered Fuchsia.* Sh. 6 ft.

27 *F. SERRATIFOLIA* (Ruiz et Pav. fl. per. 3. p. 86. t. 323. f. a.) branches furrowed; leaves opposite or verticillate, petiolate, oblong, serrated, pubescent beneath; pedicels axillary, shorter than the flowers, drooping; lobes of calyx lanceolate, acuminate, exceeding the petals, which are ovate-oblong. *h. G.* Native of Peru, in humid, rather shaded places at Muna. Calyx red, rather villous, an inch and a half long, somewhat tumid at the base. Petals scarlet.

*Saw-leaved Fuchsia.* Sh. 6 to 8 ft.

28 *F. SIMPLICICAULIS* (Ruiz et Pav. fl. per. 3. p. 89. t. 322. f. a.) stem simple, quite smooth; leaves 4 in a whorl, lanceolate-linear, on short petioles; pedicels 4 together, very short, terminal, sub-corymbose; lobes of calyx lanceolate, exceeding the petals. *h. G.* Native of Peru, in woods at Muna. Suffrutescent. Whorles remote. Involucrum 4-leaved, rather downy. Flowers pendulous, with a rose-coloured calyx, and scarlet petals.

*Simple-stemmed Fuchsia.* Sh. 1 to 2 feet.

29 *F. APETALA* (Ruiz et Pav. fl. per. 3. p. 89. t. 322. f. b.) stem villous, climbing, rooting; branches warted; leaves alternate, petiolate, ovate, acuminate, quite entire; petioles, branches, pedicels, and young leaves rather villous; pedicels sub-corymbose, shorter than the flowers; lobes of calyx ovate; petals wanting. *h. G.* Native of Peru, about Huassa-huassi and Muna, in groves. Calyx red, but the lobes are pale yellow. Flowers drooping, an inch and a half long. Berry oblong.

*Apetalous Fuchsia.* Sh. 1 to 2 ft.

SECT. II. *SKINNÈRA* (named by Mr. Forster in honour of Mr. Skinner, an Oxfordshire gentleman, whom Forster terms an acute and clear-sighted botanist). Forst. gen. t. 29. D. C. prod. 3. p. 39. Tube of calyx strumose and ventricose at the base above the ovary. Ovula very minute, crowded on the central placenta, without prder. Leaves alternate.—A shrub from New Zealand.

30 *F. EXCORTICATA* (Lin. fil. suppl. 217.) branches smooth, at length excoriate; leaves alternate, petiolate, ovate-lanceolate, acuminate, denticulated, glabrous, whitish beneath; pedicels axillary, somewhat shorter than the flowers; lobes of calyx lanceolate, 3-nerved, longer than the tube and twice the length of the petals, which are ovate. *h. G.* Native of New Zealand. Lindl. bot. reg. 857. Link. et Otto. abb. t. 46. *Skinnèra excorticata*, Forst. prod. p. 163. Calyx green and purple. Petals violaceous.

*Excoriated Fuchsia.* Fl. June, Oct. Clt. 1824. Sh. 2 to 3 ft.

*Cult.* The elegance of the flowers and foliage of all the species of *Fuchsia* are well known to every lover of plants. They all thrive well in rich light soil, and young cuttings of them strike root readily in the same kind of soil, with a hand-glass over them; the glass to be taken off occasionally, to give the cuttings air, so as to keep them free from damp. Most of the species only require to be protected from frost, and many of them will survive the winter in the open air, with a very slight protection. Some of them, as *F. gracilis*, *F. microphylla*, *F. thymifolia*, *F. conica*, and *F. coccinea* have a fine effect all the summer, when planted in clumps on lawns, or in borders; in this situation the plants only require to be mulched at the root to preserve them through the winter, and in spring the ground is cleared, and the stems of the preceding year, which are generally dead, are cut off quite close to the ground, to allow the young shoots to spring from the root.

### Tribe III.

*ONAGRÆ* (plants agreeing in important characters with *Onagros* or *Onager*, now *Enothera*. D. C. prod. 3. p. 40. Fruit capsular (f. 95. d. f. 96. d.); cells many-seeded. Seeds not winged. Tube of calyx drawn out beyond the ovary (f. 96. a.). Stamens twice the number of the petals.—Herbs usually suffrutescent at the base.

V. *EPILOBIUM* (ἐπι, *epi*, upon, and λοβος, *lobos*, a pod; the flower is seated as if it were on the top of the pod). Lin. gen. 471. Gærtn. fr. 1. p. 157. t. 31. f. 6. D. C. prod. 3. p. 40.—*Chamænèrion*, Tourn. inst. p. 302. t. 157. f. A, B, C.

Lin. syst. *Octandria*, *Monogynia*. Calyx of 4 sepals; sepals connected into a long tetragonal tube; the limb falling off when the flower begins to decay. Petals 4. Stamens 8; pollen not clammy. Capsule linear, bluntly tetragonal, 4-celled, 4-valved, many-seeded, inseparable from the calyx. Seeds pendulous, pappous.—Herbs, with opposite or alternate leaves. Flowers axillary, solitary, or disposed in terminal spikes, each flower furnished with a bractea. Corolla purple, rose-coloured, flesh-coloured, very rarely yellow.

SECT. I. *CHAMÆNERION* (from χαμαί, *chamai*, on the ground; and νεριον, *nerion*, the Oleander; similar leaves but dwarfier habit). Tauch. hort. canal. fasc. 1. D. C. prod. 3. p. 40. Flowers irregular. Petals entire. Genitals declinate. Filaments dilated at the base. Leaves alternate.

1 *E. ANGUSTIFOLIUM* (Lin. spec. 493.) root creeping; stems erect, nearly simple; leaves nearly sessile, lanceolate, undulated, glabrous, with the veins pellucid; flowers disposed in spicate racemes, bracteate; style reflexed, pilose at the base, shorter than the stamens. *W. H.* Native of Europe and Siberia, in mountain woods and meadows. In Britain in moist shady places, particularly in the north of England and south of Scotland. Smith, engl. t. 1747. fl. dan. 289. E. Gesnèri, Vill. dauph. 3. p. 507. E. intermedium, Wormsk. ex herb. Puerari. *Chamænèrion spicatum*, Gray, brit. 2. p. 559. Flowers crimson, inodorous; pollen blue. A very ornamental plant, but hardly fit to be introduced to a garden, on account of its increasing so rapidly by the roots, which it is almost impossible

again to eradicate. The young shoots are said to be eatable, although a decoction of the plant stupifies. The pith, when dried, is boiled, and becoming sweet, is, by a proper process, made into ale, and this into vinegar, by the Kamtschatdales; it is also added to the cow-parsnet to enrich the spirit that is prepared from that plant.

*Var. β, album*; flowers white. 2. H.

*Var. γ, latum* (Ser. in D. C. prod. 3. p. 40.) leaves broader. 2. H. *E. angustifolium* β, Lin. spec. 494. *E. spicatum* β, D. C. fl. fr. 4. p. 420. *E. latifolium*, Schmidt. fl. bohem. no. 372. but not of Lin.

*Narrow-leaved Willow-herb* or *French Willow*. Fl. Jul. Aug. Britain. Pl. 3 to 6 feet.

2 *E. SPICATUM* (Lam. dict. 2. p. 378.) leaves lanceolate, entire, scattered, glabrous; flowers disposed in terminal spicate racemes; flowers unequal. 2. H. Native of North America, in meadows and moist places; United States, Canada, Newfoundland, north-west coast, &c. Root creeping. Flowers about half the size of those of *E. angustifolium*, but the habit is almost the same.

*Spicate Willow-herb*. Fl. July, Aug. Clt. ? Pl. 2 to 3 ft.

3 *E. OPAECUM* (Lehm. ex Hook. fl. bor. amer. p. 205.) stem erect, pubescent; leaves nearly sessile, narrow, lanceolate, almost quite entire, opaque, veiny; flowers axillary, solitary, pedunculate; style reflexed, glabrous, shorter than the stamens. 2. H. Native of North America, on the banks of the Columbia, particularly about Fort Vancouver. Flowers red; petals entire or crose. An intermediate plant between *E. angustifolium* and *E. latifolium*.

*Opaque Willow-herb*. Pl. 1 to 2 feet.

4 *E. ROSMARINIFOLIUM* (Hänke, in Jacq. coll. 2. p. 50. but not of Pursh) downy; stem erect, branched towards the middle; leaves linear, obsolete denticulated, cinereous, veinless; pedicels connected with the bracteas, crowded near the tops of the branches. 2. H. Native of Europe, in woods and on the banks of rivers. Rehb. icon. bot. 4. t. 341. — Moris. hist. sect. 3. t. 11. f. 2. Lob. icon. 343. f. 2. *E. angustissimum*, Curt. bot. mag. t. 76. *E. angustifolium*, Lam. dict. 2. p. 374. Stem woody at the base. An elegant plant with red flowers.

*Rosemary-leaved Willow-herb*. Fl. July, Aug. Clt. 1775. Pl. 2 feet.

5 *E. DODONÆI* (All. pedem. 1016. Vill. dauph. 3. p. 507.) stem almost glabrous, erect, branched at the apex; leaves linear, obsolete denticulated, glabrous; pedicels connected with the bracteas, crowded near the tops of the branches. 2. H. Native of Piedmont and Dauphiny. *E. Halleri*, Retz. *E. rosmarinifolium* β, D. C. fl. fr. 4. p. 421. *E. rosmarinifolium* β, alpinum, Ser. in D. C. prod. 3. p. 40. — Rehb. icon. bot. 4. t. 342. An elegant plant, much resembling the preceding, but smoother, smaller, and the flowers are large, and of a more deep rose colour.

*Dodoncus's Willow-herb*. Fl. July, Aug. Clt. 1700. Pl. 1 ft.

6 *E. CRASSIFOLIUM* (Lehm. in nov. act. bonn. 14.) stem suffruticose; branches twiggly; leaves alternate, thickish, linear, having the margin denticulated with blunt glands; genitals declinate. 2. H. Native of Siberia. Leaves deep green. Petals crenulated, rose-coloured. Stigma 4-cleft.

*Thick-leaved Willow-herb*. Pl. 1 foot.

7 *E. LATIFOLIUM* (Lin. spec. 494.) stems erectish, firm, branched; leaves ovate-lanceolate, acuminate, almost quite entire, stiff, veinless, glaucous; flowers axillary, pedicellate; style nearly erect, glabrous, shorter than the stamens; bracteas free from the pedicels. 2. H. Native of Greenland, Siberia; North America, on the banks of rivers on the Rocky Mountains, between lat. 52 and 56, to the shores and islands of the Arctic sea, Labrador, and Behring's Straits. Fl. dan. t. 565.

Salisb. par. lond. t. 58. *E. frigidum*, Retz, fl. scand. ed. 2. no. 459. *E. corymbosum*, Act. hafn. 10. p. 440. t. 8. f. 23. The North American plant differs from the Siberian one only in the less copious pubescence of its leaves. Flowers large, rose-coloured, or purple.

*Var. β, venustum* (Dougl. mss.) plant smaller in every part. 2. H. North America.

*Broad-leaved Willow-herb*. Fl. Jul. Aug. Clt. 1779. Pl. 2 ft. 8 *E. HUMILE* (Willd. herb. ex Stev. in litt. D. C. prod. 3. p. 40.) leaves lanceolate, quite entire, glabrous, veiny; branches opposite; corolla unequal. 2. H. Native of Siberia. Perhaps a variety of *E. latifolium*.

*Humble Willow-herb*. Fl. July, Aug. Pl. ½ foot.

SECT. II. *LYSIMACHION* (containing plants agreeing in habit with the genus *Lysimachia*). Tauch, hort. canal. fasc. 1. Ser. in D. C. prod. 3. p. 41. Flowers regular. Petals obcordate. Genitals ascending. Lower leaves opposite, upper ones alternate.

9 *E. ALPINUM* (Lin. spec. 495.) stems creeping at the base, bifariously pubescent, few-flowered; leaves nearly sessile, elliptic-lanceolate, obtuse, mostly entire, glabrous; stigma undivided; capsules sessile, glabrous. 2. H. Native of the alps of Europe and the Pyrenees. In Scotland, by the sides of alpine rivulets, on Ben Lomond, about two-thirds of the way up, and on all the highland mountains; of North America, in the alpine rivulets of the Rocky Mountains. Smith, engl. bot. 2001. Lightf. fl. scot. p. 199. t. 10. f. 1. Fl. dan. 322. *E. anagallidifolium*, Lam. dict. 2. p. 376. Plant small. Flowers very small, bright red.

*Var. β, pumilum* (Pers. ench. 2. p. 410.) stem rather pubescent at the base; leaves ovate-lanceolate, acutely serrated, wrinkled.

*Alpine Willow-herb*. Fl. June, July. Scotland. Pl. ½ foot.

10 *E. HORNEMANNI* (Rehb. icon. bot. p. 73. t. 180.) stems creeping at the base, angular, few-flowered, nodding at the apex; leaves oblong or lanceolate, denticulated; stigma clavate, undivided. 2. H. Native of Finland, in alpine rivulets; and north-west coast of America. *E. nutans*, Horn. fl. dan. 1387. but not of Schmidt. *E. alpinum* β, nutans Hook. fl. bor. amer. p. 205. Flowers bright red. Very like *E. alpinum*.

*Hornemann's Willow-herb*. Fl. June, Aug. Clt. ? Pl. ½ ft.

11 *E. ORIGANIFOLIUM* (Lam. dict. 2. p. 376. Rehb. icon. bot. 2. t. 180.) stems creeping at the base, smoothish, nodding at the apex, bluntly quadrangular; leaves ovate, acutely denticulated, glabrous, on short petioles; stigma undivided, clavate; capsule pedicellate, glabrous. 2. H. Native of the alps of Europe and the Pyrenees, in rivulets and fountains; on many of the highland mountains of Scotland, in alpine rivulets, common; in rivulets on the sides of the Cheviot hills, as mentioned by Ray; in North America, in alpine woods, sides of rivulets, and shady elevated spots on the Rocky Mountains, and of the island of Unalashka. *E. alsinifolium*, Vill. dauph. 3. p. 511. Smith, engl. bot. t. 2000. Flowers small, rose-coloured. A much more robust plant than *E. alpinum*.

*Marjoram-leaved Willow-herb*. Fl. June, Aug. Scotland. Pl. ¼ to ½ foot.

12 *E. GLANDULOSUM* (Lehm. pug. 2. p. 14. Hook. fl. bor. amer. p. 206.) stem simple, creeping at the base, angular, glabrous; leaves sessile, ovate-lanceolate, rather decurrent, acute, glandularly denticulated; flowers erect; stigma clavate; capsule sessile, with the angles slightly pubescent. 2. H. Native of North America, at Cumberland House Fort, on the Saskatchewan. Petals white. An intermediate plant between *E. origanifolium* and *E. tetragonum*.

*Glandular Willow-herb*. Pl. 1 foot.

13 *E. MINUTUM* (Lindl. mss. ex Hook. fl. bor. amer. p. 207.) root annual; stem erectish, terete, puberulous, branched; leaves alternate, elliptic-lanceolate, obtuse, usually entire, full of pellucid dots; flowers drooping, minute; stigma clavate; capsules on short pedicels, circinnately reflexed, smoothish. ☉. H. Native of the north-west coast of America, at Fort Vancouver, and near the Grand Rapids of the Columbia, and on moist rocks near springs on the high mountains. Flowers minute, pale red.

*Minute Willow-herb.* Fl. June, July. Clt. 1826. Pl.  $\frac{1}{2}$  ft.

14 *E. OLIGANTHUM* (Michx. fl. bor. amer. 1. p. 233.) plant small; stems very simple, bearing only 1 flower at the apex; leaves opposite, linear, quite entire. ♀. H. Native of Hudson's Bay, near Lake Mistissiny. Probably referrible to *E. alpinum*.

*Few-flowered Willow-herb.* Fl. July, Aug. Shrub  $\frac{1}{2}$  foot.

15 *E. ROSEUM* (Schreb. lips. 147.) stems erect, with 4 obsolete angles; leaves opposite, upper ones alternate, smooth, ovate, toothed, stalked; stigma clavate, undivided. ♀. H. Native of Europe, in waste boggy ground and watery places. In England, in Lambeth Marsh; at Moreton, near Ongar, Essex; and near Witham, Sussex. Smith, engl. bot. t. 693. *E. montanum*, Willd. spec. 2. p. 316. Flowers pale red.

*Red Willow-herb.* Fl. July. Britain. Pl. 1 foot.

16 *E. ALPESTRE* (Schmid. fl. bohem. cent. 4. p. 81.) leaves opposite, or 3 in a whorl, glabrous, ovate, acuminate, denticulately serrated, stem-clasping, with the nerves sometimes hairy; stems obsoletely tetragonal, 2-edged; flowers almost sessile; fruit pedicel nearly the length of the capsule; petals much longer than the calyx; stigma undivided. ♀. H. Native of Europe, on the Alps and the Pyrenees. *E. roseum*, D. C. fl. fr. 4. p. 442. but not of Schreb. nor Smith. Rehb. icon. bot. 2. t. 190. Flowers pale red. *E. trigonum*, Schrank, bav. no. 594. *E. alpestre*, Jacq. and Rehb. icon. bot. t. 200.

*Alp Willow-herb.* Fl. June, July. Clt. 1820. Pl. 1 foot.

17 *E. BILLARDIERIANUM* (Ser. mss. ex D. C. prod. 3. p. 41.) stem straight, terete, leafy, pubescent; leaves ovate, obtuse, regularly serrulated, short, sessile, stem-clasping; pedicels short. ♀. H. Native of New Holland.

*La Billardier's Willow-herb.* Pl. 1 foot.

18 *E. STRICTUM* (Muhl. ex Spreng. syst. 2. p. 233.) stem straight; leaves quite entire, veiny; flowers axillary; capsules slender, clothed with hoary villi.—Native of Pennsylvania.

*Straight Willow-herb.* Fl. July, Aug. Clt. 1817. Pl. 1 to 2 feet.

19 *E. MONTANUM* (Lin. spec. 494.) stem leafy, terete, glabrous; lower leaves opposite, upper ones alternate, ovate-lanceolate, irregularly toothed, all stalked; flowers on short pedicels, disposed in a terminal, leafy, corymbose cluster; stigma of 4 deep segments. ♀. H. Native of Europe, in groves. In Britain, in dry, shady, hilly, and stony places; on old walls or cottage roofs, frequent. Smith, engl. bot. 1177. Curt. lond. 3. t. 24. Fl. dan. 922. Rehb. icon. bot. 189. *E. lanceolatum*, Seb. et Maur. fl. rom. p. 138. t. 1. f. 2. *Chamanerion montanum*, Scop. carn. ed. 2. no. 453. *E. virgatum*, Lam. Flowers pale purple.

*Var. β, origanoides* (Ser. in D. C. prod. 3. p. 41.) leaves very minute, hardly denticulated, nearly all opposite; stem weak, dwarf.

*Mountain Willow-herb.* Fl. July. Brit. Pl. 1 to 2 feet.

20 *E. MEXICANUM* (Moc. et Sesse, fl. mex. icon. ined. t. 379. D. C. prod. 3. p. 41.) glabrous, herbaceous, erect; leaves oblong, sessile, somewhat denticulated, lower ones opposite, upper ones alternate. ♀. H. Native of Mexico. Habit of *E. montanum*.

*Mexican Willow-herb.* Pl. 1 foot.

VOL. II.

21 *E. BREVIFOLIUM* (D. Don, prod. fl. nep. p. 222.) leaves ovate, acute, serrated, pubescent on both surfaces, and lined on the upper surface; flowers axillary, on short pedicels; lobes of calyx linear-lanceolate, shorter than the corolla. ♀. H. Native of Upper Nipaul. Stem branched. Flowers small, lilac.

*Short-leaved Willow-herb.* Pl. 1 foot.

22 *E. NUTANS* (Schmidt, fl. bohem. no. 380. Schultes, cestr. fl. 1. p. 595.) stem terete, branched, many-flowered; leaves opposite, almost sessile, ovate-lanceolate, obtuse, quite entire; petals obcordate; stigma quadrifid. ♀. H. Native of Bohemia, in bogs at Isera. Rehb. icon. bot. 2. p. 87. t. 197. *E. hypericifolium*, Tauch, hort. canal. fasc. 1. no. 7. This plant comes very near to *E. montanum*, from which it differs in the leaves being remote and quite entire, in the flowers being smaller and changeable in colour, at first white but afterwards changing to a flesh colour.

*Nodding-flowered Willow-herb.* Pl. 1 foot.

23 *E. ALGIDUM* (Bieb. fl. taur. 1. p. 296.) leaves opposite and alternate, ovate, glandularly toothed; calyx obtuse-angled; stigma undivided. ♀. H. Native of Caucasus. This species differs from *E. montanum* in the undivided stigma, in the stem being angled, from the margins of the petioles being decurrent, in the leaves being firmer, and in the flowers being nearly twice the size. Perhaps only a variety of *E. origanifolium*.

*Var. β, humile* (Bieb. l. c.) leaves toothed all round.

*Algid Willow-herb.* Pl.  $\frac{1}{2}$  to 1 foot.

24 *E. COLORATUM* (Muhl. in Willd. enum. 411.) stems terete, pubescent; leaves lanceolate, serrulated, stalked, opposite, superior ones alternate, glabrous. ♀. H. Native of Pennsylvania. This plant differs from *E. roseum* in the stems being branched at the apex, in the leaves being nearly sessile and narrower, and in the flowers being smaller, ex Link. enum. 1. p. 379.

*Coloured Willow-herb.* Fl. Jul. Aug. Clt. 1805. Pl. 2 to 3 ft.

25 *E. DAURICUM* (Fisch. in Horn. hort. hafn. suppl. 44. and Link. enum. 1. p. 379.) stem erect, very simple; leaves usually toothed, pubescent, opposite and alternate, nearly sessile; petals obcordate; fruit pilose. ☉. H. Native of Dauria. Flowers very minute. Calyx reddish.

*Daurian Willow-herb.* Fl. Ju. Jul. Clt. 1822. Pl.  $\frac{1}{2}$  to 1 ft.

26 *E. GERMAESCENS* (Meyer, verz. pfl. p. 193.) smoothish; stem rather angular, branched; leaves stalked, opposite, or alternate, ovate-oblong, repandly denticulated, bearing bulbs in their axils; petals rather longer than the calyx; stigma clavate. ♀. H. Native of Caucasus, on the margins of rivulets, near Kaischaur, at the height of 2400 feet above the level of the sea. This is a singular species, from its bearing bulbs in the axils of the leaves.

*Budding Willow-herb.* Pl. 1 foot.

27 *E. DENSUM* (Rafin. prec. dec. 42. and in Desv. journ. bot. 1814. 2. p. 271.) plant pubescent; leaves scattered, approximate, sessile, linear-lanceolate, bluntish, nerved; flowers panicled, pedunculate; bracteas oblong.—Native of North America.

*Dense-flowered Willow-herb.* Pl. 1 foot?

28 *E. DENTICULATUM* (Ruiz, et Pav. fl. per. 3. p. 78. t. 314.) stems suffruticose; leaves somewhat lanceolate, denticulated; lower ones opposite; petals equal, bifid. ♀. G. Native of Peru and Chili. *E. junceum*, Forst. ex Spreng. syst. 2. p. 233. Petals rose-coloured.

*Denticulated-leaved Willow-herb.* Pl.  $\frac{1}{2}$  to 1 foot.

29 *E. LEPTOPHYLLUM* (Rafin. prec. dec. 41. and Desv. journ. bot. 1814. p. 271.) stem branched, rather scabrous; leaves alternate, nearly sessile, linear, narrow, entire, glabrous, 1-nerved, acute, tapering to the base; flowers axillary, solitary, pedunculate. ♀. H. Native of North America, especially in Pennsylvania and Maryland, in humid woods.

*Slender-leaved Willow-herb.* Pl. 1 foot.

30 *E. DIVARICATUM* (Rafin. prec. dec. p. 42. and in Desv. journ. bot. 1814. 2. p. 271.) stem branched, glabrous; branches spreading; leaves opposite, petiolate; petals lanceolate, acute, glabrous, unequally denticulated.  $\mathcal{U}$ . H. Native of North America.

*Divaricate-branched Willow-herb.* Pl. 1 to 2 feet?

31 *E. HIRSUTUM* (Lin. spec. 494.) roots creeping; stems branched, hairy; lower leaves opposite, upper ones alternate, ovate-lanceolate, hairy, toothed, half stem-clasping; stigma deeply 4-cleft; the segments deflexed.  $\mathcal{U}$ . H. Native of Europe and Siberia, in wet places. In Britain, in watery places, ditches, and margins of rivers, among reeds, coarse grasses, and willows. Smith, engl. bot. 838. Curt. lond. 2. t. 21. Fl. dan. t. 326. *E. ramosum*, Huds. p. 162. *E. amplexicaule*, Lam. dict. 2. p. 374. *E. grandiflorum*, All. pedem. no. 1018. Flowers in a leafy, corymbose cluster, large, of a delicate, pale pink, with cloven, regular petals. The whole herb is downy, soft, and clammy, exhaling a peculiar, acidulous scent, justly compared to the flavour of boiled codlings and cream. The plant varies with white flowers and variegated leaves.

*Var.  $\beta$ , intermedium* (Ser. in D. C. prod. 3. p. 42.) stem, branches, and leaves clothed with hoary villi; fruit covered with very long pili.  $\mathcal{U}$ . H. Native about Paris, and of Siberia. *E. intermedium*, Mer. fl. par. 147. but not of Wormsk. *E. hirsutum Sibiricum*, Deless. herb.

*Hairy Willow-herb or Codlings and Cream.* Fl. July. Brit. Pl. 3 to 5 feet.

32 *E. VILLOSUM* (Thunb. prod. 75.) leaves alternate, lanceolate, serrated, hairy.  $\mathcal{U}$ . G. Native of the Cape of Good Hope. This species hardly differs from *E. hirsutum*, unless in the lobes of the stigma being thicker and more convolute. Flowers red.

*Villous Willow-herb.* Pl. 2 to 3 feet.

33 *E. TOMENTOSUM* (Vent. hort. cels. t. 90.) plant clothed with hoary tomentum; stems much branched; leaves half stem-clasping, lanceolate, bluntish, serrulated; stigmas quadrifid, with the lobes horizontal.  $\mathcal{U}$ . H. Native of the Levant, between Julpha and Hispahan, on the borders of rivulets. Perhaps only a variety of *E. hirsutum*. Flowers red.

*Tomentose Willow-herb.* Fl. July, Aug. Clt. 1818. Pl. 3 to 4 feet.

34 *E. CYLINDRICUM* (D. Don, prod. fl. nep. p. 222.) leaves lanceolate-linear, serrulated, stalked, lower ones opposite, upper ones alternate; stems terete, pubescent.  $\mathcal{U}$ . H. Native of Nipaul. Flowers small, red. Habit of *E. palustre*.

*Cylindrical-stemmed Willow-herb.* Pl. 1½ foot.

35 *E. PALUSTRE* (Lin. spec. 495.) stems terete, branched, pubescent; leaves sessile, linear-lanceolate, slightly toothed, glabrous, lower ones opposite, upper ones alternate; stigma linear, obtuse, undivided.  $\mathcal{U}$ . H. Native of Europe, Siberia, and Labrador; in boggy turfy ground, near ditches and rivulets. Smith, engl. bot. t. 346. Fl. dan. 1574. Flowers pale purple, in leafy clusters. Herb extremely variable in luxuriance.

*Var.  $\beta$ , verticillatum* (Ram. ex D. C. fl. fr. 4. p. 422.) leaves 3 in a whorl.  $\mathcal{U}$ . H. Native of the Pyrenees.

*Var.  $\gamma$ , albiflorum* (Hook, fl. bor. amer. p. 207.) stem terete, simple, smoothish; leaves sessile, linear, somewhat denticulated; flowers drooping; capsules pedicellate, elongated, canescent; stigma undivided.  $\mathcal{U}$ . H. Native throughout Canada, and as far north as lat. 64°, and among the prairies of the Rocky Mountains. *E. palustre*, var. *albescens*, Wahl. fl. suec. 1. p. 234. Richards. in Frankl. journ. ed. 2. append. p. 12. *E. lineare*, Muhl. Flowers white. Perhaps the same as *E. Dahuricum* of Fischer.

*Marsh Willow-herb.* Fl. June, July. Brit. Pl. ½ to 1½ ft.

36 *R. RIVULARRE* (Wahl. fl. ups. p. 126.) puberulous; leaves sessile, long-lanceolate, denticulated, lower ones opposite, upper ones alternate; petals oval, emarginate; stigma 4-lobed.  $\mathcal{U}$ . H. Native of Sweden, on the banks of rivulets and fountains. Rehb. icon. bot. 2. p. 61. t. 170. Flowers red. Habit of *E. palustre*.

*Rivulet Willow-herb.* Fl. July. Pl. 1 foot.

37 *E. PARVIFLORUM* (Schreb. lips. 146.) stem nearly simple, woolly, terete; leaves sessile, lanceolate, minutely toothed, soft, and downy on both surfaces; flowers in leafy clusters; root fibrous; stigma 4-cleft, spreading.  $\mathcal{U}$ . H. Native of Britain; frequent in watery places and about the banks of rivers. Smith, engl. bot. t. 795. *E. pubescens*, Willd. spec. 2. p. 315. *E. hirsutum*, Huds. 161. Lin. spec. p. 494. var.  $\beta$ . *E. villosum*, Curt. fl. lond. 2. t. 22. — Fl. dan. 347. Flowers not a quarter the size of those of *E. hirsutum*.

*Small-flowered Willow-herb.* Fl. July. Brit. Pl. 2 to 3 ft.

38 *E. SIMPLEX* (Tratt. arch. 1. p. 37. with a figure.) stems simple, striated, pubescent; leaves decussate, linear-lanceolate, quite entire, sessile, pubescent; petals emarginate; stigma quadrifid;  $\mathcal{U}$ . H. Native on Mount Scheiblingstein. According to Trattineck, this plant differs from *E. parviflorum*, in the leaves being quite entire, sessile, and linear, and in the flowers being smaller.

*Simple-stemmed Willow-herb.* Fl. July. Pl. 2 feet.

39 *E. ROTUNDIFOLIUM* (Forst. prod. no. 161.) leaves opposite, roundish, denticulated.  $\mathcal{U}$ .? H. Native of New Zealand.

*Round-leaved Willow-herb.* Pl.?

40 *E. SQUAMMATUM* (Nutt. gen. amer. 1. p. 250.) pubescent; roots scaly, bulbous; stems cylindrical, branched; cauline leaves opposite, rameal ones alternate, all linear, and quite entire, with revolute margins; flowers pedicellate; petals bifid; stigma clavate, undivided.  $\mathcal{U}$ . H. Native of North America, about Philadelphia. *E. rosmarinifolium*, Pursh, fl. amer. sept. 1. p. 259. Petals white. *E. lineare*, Bigel. in litt. Perhaps the same as *E. palustre*, var. *albiflorum*. The scaly bulbous roots are by no means peculiar to this species.

*Scaly-rooted Willow-herb.* Fl. July. Clt. 1800. Pl. 1½ ft.

41 *E. TENELLUM* (Rafin. prec. dec. p. 41. and in Desv. journ. bot. 1814. p. 271.) stem filiform, simple, pubescent above; leaves opposite, sessile, linear, elongated, usually entire, full of pellucid lines, glabrous except the margins, which are finely ciliated; flowers erect; stigma undivided; capsule pedicellate, slender, canescent.  $\mathcal{U}$ . H. Native of North America.

*Slender Willow-herb.* Pl. 1 foot.

42 *E. TETRAGONUM* (Lin. spec. 494.) stem erect, usually quadrangular, sometimes rather downy; leaves lanceolate, sessile, minutely toothed, decurrent; flowers erect; stigma clavate, undivided; capsules puberulous, on short pedicels.  $\mathcal{U}$ . H. Native of Europe, Siberia, and North America, in ditches, and watery, marshy places; plentiful in Britain. Smith, engl. bot. 1948. Curt. lond. fasc. 2. t. 23. Fl. dan. 1029. Rehb. icon. bot. 2. p. 88. t. 198. Flowers small, purple, in leafy clusters. A very variable plant in luxuriance, sometimes rather pubescent and sometimes quite smooth.

*Var.  $\beta$ , obscurum* (Pers. ench. 2. p. 410.) leaves opposite and alternate, lanceolate, glabrous, and serrated, decurrent at the base; stigma clavate.  $\mathcal{U}$ . H. *Chamaenerion obscurum*, Schreb. *E. obscurum*, Schmidt, fl. bohem. cent. 4. p. 81. Rehb. icon. bot. 2. p. 89. t. 199.

*Var.  $\gamma$ , virgatum* (Wahl. fl. suec. 1. p. 233.) narrower and rather pubescent; leaves less decurrent.  $\mathcal{U}$ . H. Native of Sweden and Siberia.

*Tetragonal-stemmed Willow-herb.* Fl. July. Britain. Pl. 1 to 1½ foot.

43 *E. FLAECIDUM* (Brot. fl. lus. 2. p. 18.) stem weak, tetra-

gonal below, flaccid, creeping at the base; leaves lanceolate, denticulated, glabrous, almost sessile, lower ones opposite.  $\mathcal{U}$ . H. Native of Portugal, about Coimbra and elsewhere in Beira. Flowers red. This plant is usually taken for a variety of *E. tetragonum*, but is a perfectly distinct species.

*Flaccid-stemmed Willow-herb.* Fl. July. Pl. 1 foot.

44 *E. BONPLANDIANUM* (H. B. et Kunth, nov. gen. amer. 6. p. 95.) plant rather woody; stem simple or branched, usually erect; leaves opposite, lanceolate, sessile, a little toothed; flowers axillary, solitary, almost sessile; stigma capitate?  $\mathcal{U}$ . F. Native of South America, on the Andes, about Popayan, in humid places, at the height of 5000 feet above the level of the sea. Petals nearly orbicular, rose-coloured, twice the length of the calyx. Capsule 2 to 3 inches long.

*Bonpland's Willow-herb.* Pl.  $\frac{1}{2}$  to 1 foot.

45 *E. LUTEUM* (Pursh, fl. sept. amer. 1. p. 259.) stem tetragonal, rather pilose; leaves opposite, serrulated; peduncles axillary, alternate, elongated; lobes of calyx narrow, length of petals; style exserted; stigma thick, 4-lobed.  $\mathcal{U}$ . H. Native of the north-west coast of America, and in the grassy valleys of Unalashka. Flowers yellow, as large as those of the *French-willow*.

*Yellow-flowered Willow-herb.* Pl. 1 foot.

*Cult.* All the species of the *Willow-herb* are of the easiest culture and propagation; they will grow in any common garden soil, and are easily increased by dividing at the roots or by seeds. Those species belonging to the first section of the genus being the most shewy, are the most worthy of cultivation, as border flowers.

VI. GAURA (from γαῦρος, *gauros*, superb; in reference to the elegance of the flowers of some of the species). Lin. spec. 205. Gært. fruct. 2. p. 205. t. 127. f. 2. D. C. prod. 3. p. 44.

LIN. SYST. *Octandria, Monogynia*. Calyx of 3-4 sepals; sepals connected into a long tube; limb 3-4-parted, deciduous. Petals 3-4. Stamens 6-8. Stigma 3-4-lobed. Fruit 1-celled, closely adhering to the calyx, 3-4-sided, 1-4-seeded. Seeds naked. Flowers terminal, spiral, sessile, bracteate, white, red, rarely yellow, all becoming reddish as they fade.

1 *G. BIENNIS* (Lin. spec. 493.) stem herbaceous; leaves lanceolate-oblong, acute, denticulated; flowers irregular; petals obovate, ascending, spreading, naked; genitals deflexed; style longer than the stamens; fruit obovate, triquetrous, sessile, pilose, acute, bluntish, marked with thick depressed nerves, and with transverse wrinkles below.  $\mathcal{G}$ . H. Native of Virginia and Pennsylvania, and about Montreal. Curt. bot. mag. 389. Limb of calyx length of tube. Sepals purple at the apex. Petals at first white, then reddish. Floriferous branches subcapitate, at length becoming a somewhat whorled spike.

*Biennial Gaura.* Fl. Aug. Oct. Clt. 1763. Pl. 4 to 6 feet.

2 *G. ANGUSTIFOLIA* (Michx. fl. bor. amer. 1. p. 226.) leaves linear, crowded, repandly undulated; fruit ovate, triquetrous, acute at both ends, whitish, having the angles acute.  $\mathcal{G}$ . H. Native of Lower Carolina. *G. undulata*, Desf. cat. hort. par. p. 196. *G. fruticosa*, Jacq. coll. 1. p. 142. icon. rar. 3. p. 457. Flowers not half the size of those of *G. biennis*; petals secund; genitals not deflexed. Fruit disposed in long loose spikes, ovate, triquetrous, sessile; angles not winged.

*Narrow-leaved Gaura.* Pl. 2 to 3 feet.

3 *G. SINUATA* (Nutt. in litt. ex D. C. prod. 3. p. 44.) branches and leaves rather pilose; pili adpressed; leaves numerous, linear, sinuated; flowers disposed in long spikes; fruit distant, clavate, tetragonal at the apex, attenuated at the base, and terete, on short pedicels; the angles tumid.  $\mathcal{G}$ . H. Native of North America, in the territory of the Arkansa and Red rivers. A very distinct species.

*Sinuated-leaved Gaura.* Pl. 2 to 3 feet.

4 *G. EPILOBIODES* (H. B. et Kunth, nov. gen. amer. 6. p. 93.) herbaceous; branches and leaves pubescent, approximate; leaves linear, quite entire, or remotely toothed; petals ovate-roundish obtuse; stamens straight; fruit pubescent, oblong-linear, tetragonal, 4-ribbed; ribs thick, alternating with the angles.  $\mathcal{G}$ . H. Native of Mexico, near Actopan, at the height of 3120 feet above the level of the sea. This species hardly differs from *G. angustifolia*, unless in the stem being more branched, in the leaves being flat, not curled on the margins, and in the flowers being much larger. The habit approaches that of *Epilobium rosmarinifolium* in habit and colour of flowers.

*Willow-herb-like Gaura.* Pl. 2 to 3 feet.

5 *G. TRIPETALA* (Cav. icon. 4. p. 66. t. 396. f. 1. good) herbaceous; branches pilose; leaves lanceolate-linear, a little toothed, puberulous; flowers hexandrous; sepals 3, deflexed; petals 3, rose-coloured, obovate-oblong, unilateral, ascending; fruit ovate, triquetrous, acute, with transverse plicate stripes, and turgid angles.  $\odot$ . H. Native of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 94. *G. hexandra* Ortega. Flowers white, but at length becoming red.

*Three-petalled Gaura.* Fl. Aug. Clt. 1804. Pl.  $1\frac{1}{2}$  foot.

6 *G. ODORATA* (Sesse, ex Lagas. gen. et spec. p. 14.) leaves linear-lanceolate, repandly toothed; petals 4, ovate, ascending.  $\mathcal{G}$ . H. Native of New Spain.

*Sweet-scented Gaura.* Pl. 2 to 3 feet.

7 *G. BRACTEATA* (Ser. mss. in D. C. prod. 3. p. 45.) leaves linear-lanceolate, deep and irregularly serrated; bracteas linear, entire, acute; flowers pedicellate; petals obovate, spreading, length of the limb of the calyx.  $\mathcal{G}$ . F. Native of Mexico, in the garden of St. Angeli. *G. sinuata* and *G. spicata*, Moc. et Sesse, fl. mex. icon. ined. t. 373. Flower-bud obtuse. Style clavate at the apex. Stamens 8.

*Bracteate-flowered Gaura.* Pl. 2 to 3 feet.

8 *G. LINFOLIA* (Nutt. in James' exped. rock. mount. 2. p. 355.) stems much branched; leaves linear, acute, entire, glabrous; flowers racemose, dense, numerous; bracteas linear-subulate, puberulous; tube of calyx long, pilose; the lobes oblong-linear; petals 4, obovate-oblong; fruit very minute, ovate, triquetrous, pilose.  $\mathcal{G}$ . H. Native of North America, about the Arkansa. Flowers octandrous. Calyx of a brownish-purple colour. Petals white.

*Flax-leaved Gaura.* Pl. 1 to 2 feet.

9 *G. PARVIFLORA* (Doug. ex Lehm. pug. 2. p. 15. and Hook. fl. bor. amer. p. 208.) stems herbaceous, erect, pilose; leaves oblong, acuminate, remotely denticulated, and ciliated on the margins, rather velvety when young; spikes elongated; flowers minute, crowded; fruit distant, tetragonal, smoothish, tapering to both ends.  $\mathcal{G}$ . H. Native of the north-west coast of America, on the sandy banks of the Wallawallah river.

*Small-flowered Gaura.* Pl. 1 to  $1\frac{1}{2}$  foot.

10 *G. COCCINEA* (Fras. cat. 1813. Pursh, fl. amer. sept. 2. p. 733.) stems herbaceous, decumbent; leaves linear-lanceolate, repandly denticulated, but when young quite entire, canescent; spikes loose; flowers alternate; bracteas linear, permanent; fruit elliptic, terete at the base, but tetragonal at the apex, canescent.  $\mathcal{U}$ . F. Native of North America, at Fort Mandan, also on the plains of the Saskatchewan and Red rivers. Petals scarlet.

*Scarlet-flowered Gaura.* Fl. Aug. Oct. Clt. 1811. Pl. proc.

11 *G. MARGINATA* (Lehm. pug. 2. p. 16. Hook. fl. amer. bor. p. 208.) stems ascending, suffruticose at the base; leaves lanceolate, repandly toothed, rather revolute, white on both surfaces from adpressed down; flowers in terminal, verticillate spikes; bracteas linear, deciduous; fruit white.  $\mathcal{U}$ . H. Native of North America, on the plain of the Saskatchewan. Petals obovate, red. Ovary tetragonal.

*Marginate Gaura.* Pl. ascending.

12 *G. GLABRA* (Lehm. pug. 2. p. 16. Hook. fl. bor. amer. p. 209.) stems ascending, suffrutescent at the base, quite glabrous; leaves narrow-lanceolate, undulated, glabrous; spikes elongated; flowers alternate; ovaries linear, tetragonal, glabrous. *U. H.* Native of North America, about Carlton House, on the Saskatchewan. Petals spatulate, red.

*Glabrous Gaura.* Pl. ascending.

13 *G. ? MOLLIS* (H. B. et Kunth, nov. gen. amer. 6. p. 93.) plant suffrutescent? branches clothed with silky hairs; leaves lanceolate-oblong, remotely denticulated, pubescent; petals ovate, obtuse, cruciately opposite, pale yellow; stamens straight; fruit oblong, arcuately incurved, nearly as in *Cenothëra*. *U. H.* Native of Mexico. Perhaps a species of *Cenothëra*.

*Soft Gaura.* Pl. 1 foot?

14 *G. MUTABILIS* (Cav. icon. rar. 3. p. 30. t. 258.) leaves ovate, sessile, remotely toothed; petals broadly ovate, acute, cruciately disposed, spreading; styles and stamens straight; stem shrubby. *U. H.* Native of New Spain. (*Cenothëra anómala*, Curt. bot. mag. t. 388. Petals yellow, but becoming red as they fade.

*Changeable-flowered Gaura.* Fl. July, Aug. Clt. 1795. Pl. 2 feet.

15 *G. CENOTHERIFLORA* (Zuccagni, obs. bot. tent. 2. no. 65.) leaves ovate-lanceolate, running down the petiole at the base, remotely toothed, villous; flowers sessile. *♂. H.* Native country unknown. Habit of *Cenothëra longiflora*. Flowers at first yellow, but becoming red as they fade. Fruit elliptic, quadrangular. Perhaps a variety of *G. mutabilis*.

*Evening primrose-flowered Gaura.* Fl. Jul. Aug. Clt. 1816. Pl. 2 to 3 feet.

† *Species not sufficiently known.*

16 *G. CHINENSIS* (Lour. coch. p. 225.) leaves lanceolate, serrated, opposite, sessile; spikes terminal; stigma sessile. *U. ? F.* Native of China, about Canton.—Pluk. alm. t. 128. Flowers yellow. Stem tetragonal.

*China Gaura.* Pl. 1 foot.

17 *G. SUFFRUTESCENS* (Moc. et Sesse. fl. mex. icon. ined. t. 371.) stems shrubby at the base; leaves oblong-linear, undulated, glaucescent; young branches drooping; flowers loose, spreading; bractæ lanceolate, acute; limb of calyx deflexed; petals somewhat secund, spatulate, on long claws; stamens 8, and are as well as the style ascending; fruit unknown. *h. G.* Native of Mexico. Flowers large, red. Stigma capitate.

*Suffrutescent Gaura.* Shrub.

18 *G. ? EPILOBIA* (Moc. et Sesse. fl. mex. icon. ined. t. 375.) stem glabrous; leaves oval-oblong, denticulately sinuated; racemes few-flowered; flowers nearly sessile; petals almost orbicular, incumbent, hardly unguiculate; fruit unknown. *U. F.* Native of Mexico. Flowers red. Stamens shorter than the petals.

*Epilobium-like Gaura.* Pl. 1 to 2 feet.

*Cult.* The most part of the species of *Gaura* are little better than biennials, although some are marked perennial. A light soil suits them best, and they are only to be propagated by seeds, which should be sown early in spring in the open ground. Those species natives of Mexico will require a little protection in winter the first year from seed.

VII. CENOTHERA (from *οἶνος*, *oinos*, wine, and *θηρα*, *thera*, a catching; the roots of *C. biennis* were formerly eaten after meals, as incentives to wine-drinking, as olives are). Lin. gen. 469. D. C. prod. 3. p. 45.

LIN. SYST. *Ocláudia*, *Monogýnia*. Calyx of 4 sepals (f. 95. a. f. 96. a.); sepals connected into a long, tetragonal, or 8-ribbed tube; segments of the limb deciduous, as well as the free part

of the tube. Petals 4 (f. 95. b. f. 96. b.). Stamens 8, erect, or declinate; pollen triangular, clammy. Stigma 4-cleft or capitate. Capsule 4-celled, 4-valved, cylindrical or prismatic, clavate, or tetragonal, inseparable from the base of the calyx. Seeds fixed to the central placenta, naked. Flowers opening at sun-set and closing at sun-rise.

SECT. I. SPHÆROSTÍGMA (from *σφαῖρα*, *sphaira*, a sphere, and *στῆγμα*, *stigma*, a stigma; in reference to the form of the stigma, which is globose). Ser. in D. C. prod. 3. p. 46. Stigma globose (f. 95. c.). Fruit oblong, cylindrical or tetragonal; valves linear. Anthers short, retuse at the apex.

1 *C. DENTATA* (Cav. icon. 4. p. 67. t. 398.) leaves linear, denticulated, glabrous; capsule cylindrical, very narrow. *⊙. H.* Native of Peru and Chili. *C. dentata*, Ruiz. et Pav. fl. per. 3. p. 81. t. 317. Lindl. coll. 10. *C. Chamissonis*, Link. enum. 1. p. 378. Plant prostrate. Petals longer than the calyx, yellow. Stigma slightly 4-lobed.

*Toothed-leaved Evening Primrose.* Fl. Ju. Aug. Clt. 1818. Pl. prostrate.

2 *C. HIRTA* (Link. enum. 1. p. 378.) hairy; stem branched, erect; leaves lanceolate, denticulated; flowers sessile, minute; capsules curved, terete. *⊙. H.* Native of California. *C. micrantha*, Horn. ex Spreng. syst. 2. p. 228. Plant hairy. Flowers small, yellow. Petals not so long as the sepals. Stigma capitate, slightly 4-lobed.

*Hairy Evening Primrose.* Fl. June, Aug. Clt. 1823. Pl. †

3 *C. CHEIRANTHIFOLIA* (Horn. ex Spreng. syst. 2. p. 223.) stems branched; branches ascending, hairy; leaves sessile, spatulate, obtuse, quite entire, villous, canescent; flowers sessile; capsule subulate, curved, angular, acute, hairy. *h. F.* Native of Chili. Lindl. bot. reg. 1040. Flowers middle-sized, pale yellow. (f. 95.)

*Wall-flower-leaved Evening Primrose.* Fl. June, Aug. Clt. 1823. Sh. 1 foot.

4 *C. ALATA* (Rafin. fl. lud. p. 95.) branches winged; leaves sessile, oval-lanceolate, entire, glabrous; flowers sessile; petals unguiculate; stigma globose; capsule 4-winged.—Native of Louisiana.

*Winged-stemmed Evening Primrose.* Pl.

5 *C. QUADRIVULNERA* (Dougl. in bot. reg. 1119.) stem declinate, branched, weak, puberulous; leaves linear-lanceolate, somewhat denticulated, puberulous; petals with crenulated margins; capsule tetragonal, attenuated at the apex, villous. *⊙. H.* Native of the north-west coast of America, on the banks of streams, as well as in the open elevated country west of the Rocky Mountains. Petals lilac, each marked with a more intense spot. Stigma globular, entire.

*Four-spotted-flowered Evening Primrose.* Fl. July, Sep. Clt. 1826. Pl. 1 to 2 feet.

6 *C. BOOTHII* (Dougl. mss. ex Hook. fl. bor. amer. p. 213.) stem branched; leaves ovate, toothed, glabrous above, hairy beneath, lower ones stalked; flowers secund, in spikes; petals small, obovate, entire, equal in length to the stamens; style exserted; capsule cylindrical, furrowed, twisted, pubescent. *⊙. H.* Native of North America, on low exposed gravelly hills, near the branches of Lewis's and Clarke's rivers, in lat. 46°. N. Flowers white, sweet-scented. Stigma capitate.

FIG. 95.

*Booth's Evening Primrose.* Pl.  $\frac{1}{2}$  foot.

7 *CE. PYGMÆA* (Dougl. mss. ex Hook. fl. bor. amer. 213.) stem ascending, branched; lower leaves stalked, rhomboid, superior ones sessile, lanceolate, all toothed and pubescent; capsules somewhat secund, cylindrical, attenuated at the apex, torulose. ☉. ? H. Native of North-west America, in barren sands near the Utalla river. Habit of the preceding species.

*Pygmy Evening Primrose.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

8 *CE. SPIRALIS* (Hook. fl. bor. amer. p. 213.) stem nearly simple, decumbent, hoary; leaves lanceolate, obtuse, quite entire, hoary, and beset with strigose pili, attenuated at the base; spikes leafy; petals twice the length of the stamens; capsule acutely tetragonal, acuminate, hoary, somewhat spirally twisted. ☉. ? H. Native of the north-west coast of America. Allied to *CE. Boothii*, but larger in all parts, and very easily distinguished by its entire hoary leaves and capsules.

*Spiral-capsuled Evening Primrose.* Pl.  $\frac{1}{2}$  foot.

9 *CE. VARIDESCEUS* (Hook. fl. bor. amer. p. 214.) plant densely clothed with hoary tomentum; stem erect, simple; leaves ovate, acute, sessile, coarsely toothed; spikes leafy; petals deep green in the dried state, twice the length of the stamens; capsule acutely tetragonal, rather hairy, twisted. ☉. ? H. Native of the north-west coast of America.

*Greenish-petalled Evening Primrose.* Pl.  $\frac{1}{2}$  foot.

10 *CE. CONTORTA* (Dougl. mss. ex Hook. fl. bor. amer. p. 214.) stem weak, branched, glabrous; leaves linear, quite entire, glabrous; flowers small; capsule cylindrical, twisted, curved, elongated, torulose. ☉. ? H. Native of North America, in sandy barren soil on the interior banks of the Columbia river. Although the specimens examined by Dr. Hooker of this, as well as those of *CE. pygmæa*, are too imperfect to determine exactly the form of the stigmas, he thinks it not improbable from the habit of these plants that they should be ranged in the present section.

*Twisted-podded Evening Primrose.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

SECT. II. ONA'GRA (a name given by Tournefort to the genus *Enothera*). Ser. in D. C. prod. 3. p. 46.—Onagra species, Tourn. inst. p. 302. t. 156. Gartn. fruct. 1. p. 159. t. 32. f. 1. Stigma quadrifid. Anthers oblong-linear, usually emarginate at the base. Capsule cylindrical, prismatic, or obsoletely tetragonal, sometimes thickened at the base, but never at the apex.

*Flowers yellow.*

11 *CE. BIENNIS* (Lin. spec. 492.) stem erect, branched; radical leaves oblong-lanceolate, cauline ones ovate-lanceolate, toothed, pubescent; petals hardly obcordate, exceeding the stamens; lobes of stigma linear and thickish; capsule nearly cylindrical, thickest at the base; valves either entire or bifid, opening at the apex. ♂. II. Native of North America, in Virginia, Canada, and on the north-west coast, from whence it has migrated to Europe in the year 1614, and now found apparently wild in England; particularly between the first and second ranges of sand banks on the coast of Lancashire, a few miles north of Liverpool, in the greatest abundance. It covers several acres of ground near Woodbridge, Suffolk. This plant is common in gardens, and often escapes from thence into rich waste ground. But on the dreary sand of our Lancashire coast it is truly wild, being planted there by the hand of nature, though perhaps transported by natural means from the other side of the Atlantic. Fl. dan. 446. Smith, engl. bot. 1534. Flowers large, pale yellow, delicately fragrant. Roots eatable.

*Biennial or Common Evening Primrose.* Fl. July, Sep. Brit. Pl. 2 to 4 feet.

12 *CE. MURICATA* (Lin. syst. veg. 296. Murr. nov. comm. goett. 6. p. 24. t. 1.) stem erect, branched, purplish, mucronate with strigæ; leaves oblong-lanceolate, glabrous, remotely denticulated; petals obcordate, length of the stamens; capsule

nearly cylindrical, rather hairy. ♂. H. Native of Canada, and on the plains of the Saskatchewan, and of the Straits of Fuca. Fl. dan. t. 1752. Flowers yellow. Upper leaves downy. Sepals lanceolate, acuminate, hairy, longer than the petals. Strigæ red at the base.

*Mucronated-stemmed Evening Primrose.* Fl. July, Sep. Clt. 1789. Pl. 3 to 4 feet.

13 *CE. ELATA* (H. B. et Kunth, nov. gen. amer. 6. p. 90.) leaves lanceolate, acute, clothed with silky canescent pubescence, obsoletely and remotely denticulated; petals roundish-obovate, retuse, pale yellow; stamens declinate, about the length of the petals; capsules sessile, cylindrical, slightly angular, clothed with silky villi. ♂. H. Native of Mexico. Flowers pale yellow.

*Tall Evening Primrose.* Fl. July. Clt. 1826. Pl. 6 feet.

14 *CE. PUBESCENS* (Willd. herb. ex Spreng. syst. 2. p. 229.) stem simple, erect; leaves oblong-lanceolate, obsoletely toothed, pubescent; capsule curved, cylindrical, clothed with silky villi. ♂. H. Native of South America. Flowers yellow.

*Pubescent Evening Primrose.* Pl. 2 to 3 feet.

15 *CE. GRANDIFLORA* (Ait. hort. kew. ed. 1. vol. 2. p. 2. (1789.) ed. 2. vol. 2. p. 341. but not of Ruiz et Pav.) pubescent; stem simple; leaves lanceolate, remotely toothed; genitals deflexed; petals large, obcordate; capsule sessile, cylindrical, and slightly angular. ♂. H. Native of North America. Flowers large, pale yellow, solitary and sessile in the axils of the leaves.

*Var. α, pubescens* (Sims, bot. mag. t. 2068.) stems, leaves, and capsules pubescent; calyx villous. ♂. H.

*Var. β, glabra* (Sims, bot. mag. 2068.) stem, leaves, and capsules glabrous. ♂. H.

*Great-flowered Evening Primrose.* Fl. June, Aug. Clt. 1778. Pl. 2 feet.

16 *CE. SWAVEOLENS* (Desf. tabl. ed. 1804. p. 169. et Pers. ench. 1. p. 408.) stems, calyxes, and capsules pilose; leaves ovate-lanceolate, obsoletely toothed; petals large, emarginate; capsule elongated, about equal in thickness from base to apex. ♂. H. Native of North America. This plant is cultivated for the scent and size of the flowers, which are yellow.

*Sweet-scented Evening Primrose.* Fl. June, Aug. Pl. 2 ft.

17 *CE. SIMSIANA* (Ser. in D. C. prod. 3. p. 47.) stem straight, hispid, furrowed; leaves lanceolate, repandly toothed; tube of calyx 3 times the length of the ovary; sepals very narrow, length of the petals; petals obovate, rather truncate, denticulated at the apex; stamens arched, shorter than the corolla; lobes of stigma linear, thickish; capsule sessile, cylindrical, slightly angular, with the valves reflexed at the apex. ♂. H. Native of Mexico. (*CE. corymbosa*, Sims, bot. mag. t. 1974. but not of Lam. Flowers yellow.)

*Sims's Evening Primrose.* Fl. July, Aug. Clt. 1816. Pl. 3 ft.

18 *CE. LAMARKIANA* (Ser. in D. C. prod. 3. p. 47.) stem branched; leaves quite entire; petals large, entire; capsules glabrous, cylindrically tetragonal, short. ♂. H. Native of North America. *CE. grandiflora*, Lam. dict. 4. p. 554. but not of Ait. Flowers yellow.

*Lamark's Evening Primrose.* Pl. 2 to 3 feet.

19 *CE. SALICIFOLIA* (Desf. cat. 1815. p. 271.) stem tall, simple, angular; leaves oblong-lanceolate, acute, nearly entire, rather pilose, thickish; genitals about equal in length to the corolla; lobes of stigma oblong-linear, large, thickish; capsule oblong, tetragonal; valves linear, with red nerves. ♂. H. Native country unknown. Flowers yellow.

*Willow-leaved Evening Primrose.* Fl. July, Aug. Clt. 1824. Pl. 2 to 3 feet.

20 *CE. PARVIFLORA* (Lin. spec. 492.) stem even, reddish, rather villous; leaves ovate-lanceolate, denticulated; stamens erect, longer than the petals; capsule ovate-cylindrical. ♂. H.

Native of North America. Mill. fig. 189. f. 1. Flowers small, yellow. Capsule sessile, 8-cleft at the apex.

*Small-flowered Evening Primrose.* Fl. July, Sep. Clt. 1757. Pl. 3 to 5 feet.

21 *Œ. CRUCIATA* (Nutt. mss.) stem reddish, rather hairy; leaves lanceolate, acuminate, denticulated, glabrous, but the upper ones are rather downy; flowers sessile; petals linear, rather shorter than the anthers; calycine segments reflexed, linear, mucronate, longer than the petals, but about equal in length to the stamens; lobes of stigma thick, conniving, or spreading a little; capsule cylindrical, hairy. ♂. H. Native of North America. Flowers small, yellow.

*Cross-petalled Evening Primrose.* Fl. July, Aug. Clt. 1824. Pl. 2 to 4 feet.

22 *Œ. GAUROIDES* (Horn. hort. hafn. 1 p. 362.) stem erect, pubescent, red, branched at the apex; leaves ovate-lanceolate, toothed, nearly sessile, spotted with red at the apex; capsules elongated, length of the bracteas. ♂. H. Native of North America, near Baltimore. Flowers small, yellow.

*Gaura-like Evening Primrose.* Fl. July, Aug. Clt. 1810. Pl. 4 to 5 feet.

23 *Œ. MEDIA* (Link. enum. 1. p. 377.) stem erect, pubescent; leaves lanceolate-linear, acute, toothed, clothed with soft pubescence; tube of calyx long, pubescent; petals emarginate. ♂. H. Native of North America. Flowers yellow.

*Intermediate Evening Primrose.* Fl. July, Aug. Clt. 1823. Pl. 2 to 3 feet.

24 *Œ. CORYMBOSA* (Lam. dict. 4. p. 50. but not of Sims.) stems twisted, furrowed; leaves numerous, lanceolate, glabrous, a little toothed, green; flowers sub-corymbose, terminal, pedunculate?; tube of calyx short, length of the ovary, with the segments ovate and concave, unguiculate on the back; capsule ovate-oblong, villous. ♂. H. Native of North America. Cultivated in gardens. *Œ. spectabilis*, Horn. ex Spreng. syst. 2. p. 227.

*Corymbose-flowered Evening Primrose.* Fl. Ju. Aug. Clt. 1820. Pl. 2 to 3 feet.

25 *Œ. ALBICANS* (Lam. dict. 4. p. 552. ill. t. 270. f. 2.) plant clothed with glaucous pubescence; leaves lanceolate, toothed, white; petals obovate, toothed at the apex; filaments and anthers red; capsule pubescent, cylindrical, rather gibbous at the base, 8-lobed at the apex. ♀. G. Native of Peru. Flowers yellow?

*Whitened Evening Primrose.* Pl. 1 foot.

26 *Œ. NOCTURNA* (Jacq. coll. 3. p. 205. icon. rar. 3. t. 455.) stems branched, terete, pubescent; leaves lanceolate, remotely toothed, flat, glabrous? petals obovate, obtuse; fruit ovate-oblong, somewhat revolute at the apex. ♂. H. Native of the Cape of Good Hope. Leaves almost like those of *Chenopodium ambrosioides*. Petals at first yellow, but at length changing to red.

*Night-smelling Evening Primrose.* Fl. Apr. Aug. Clt. 1790. Pl. 1 to 2 feet.

27 *Œ. LONGIFLORA* (Jacq. hort. t. 172. Willd. spec. 2. p. 307.) stems simple, pilose; leaves lanceolate, denticulated, hairy; petals obcordate; tube of calyx very long; segments of the stigma very long and linear; genitals shorter than the petals; capsules long, thickened at the base, and narrow at the apex, somewhat tetragonal, hairy. ♂. H. Native of Buenos Ayres and Brazil. Curt. bot. mag. 365. Flowers large, pale yellow. Leaves like those of *Picris echioides*.

*Long-flowered Evening Primrose.* Fl. July, Sep. Clt. 1776. Pl. 1 to 1½ feet.

28 *Œ. VILLOSA* (Thunb. prod. p. 75.) stems rather angular, very villous; leaves lanceolate, toothed, undulated, very villous; capsules nearly terete. ♂. H. Native of the Cape of Good Hope. According to Sprengel this species is allied to *Œ. mollissima* and *Œ. odorata*. Flowers yellow.

*Villous Evening Primrose.* Fl. July. Clt. 1791. Pl. 1 to 2 ft.

29 *Œ. MOLLISSIMA* (Lin. spec. 492.) stem branched; leaves lanceolate, a little undulated, repandly toothed, clothed with soft down; petals obovate, entire, shorter than the calyx; genitals hardly the length of the petals; lobes of stigma filiform; capsule cylindrical, striated, very long, downy, somewhat tetragonal, a little thickened at the apex. ♂. H. Native of Buenos Ayres, Monte Video, and Chili, in fields. Schkuhr, handb. 1. t. 105. *Œ. nocturna*, Willd. herb. ex Spreng.—Dill. hort. elth. 286. Flowers at first yellow, but afterwards changing to a reddish colour as they fade.

*Very-soft Evening Primrose.* Fl. July, Oct. Clt. 1732. Pl. 1 to 2 feet.

30 *Œ. AFFINIS* (St. Hil. fl. bras. 2. p. 269.) stem branched, suffruticose at the base, tomentose; leaves lanceolate, acute, sinuately denticulated, tomentose; petals quite entire, longer than the calyx; genitals shorter than the petals; lobes of stigma linear; capsule cylindrical, somewhat tetragonal, a little thickened above the middle, tomentose. ♀. G. Native of Brazil, in the province of Rio Grande de St. Pedro do Sul, on the margins of woods near the town of Rio Pardo. Flowers yellow. Nearly allied to *Œ. mollissima*.

*Allied Evening Primrose.* Pl. 1 to 1½ foot.

31 *Œ. CATHARINENSIS* (St. Hil. fl. bras. 2. p. 270.) stems trailing or ascending, simple or branched, puberulous; leaves lanceolate, acute, sinuately denticulated, puberulous; petals exceeding the calyx, emarginate at the apex; genitals shorter than the petals; lobes of the calyx linear; capsule cylindrical, somewhat tetragonal, a little thickened above the middle, pubescent. ♀. G. Native of Brazil, in the island of St. Catharine, at the entrance to Rio Janeiro. Flowers yellow. Very nearly allied to *Œ. mollissima*, from which it may be distinguished by the greater size of the flowers, by the petals being emarginate at the apex, by the stigmas being short in proportion to the length of the style, and by the leaves being less velvety.

*St. Catharine Evening Primrose.* Pl. ascending.

32 *Œ. ODORATA* (Jacq. coll. 3. p. 107.) pubescent; stems branched, suffruticose at the base; leaves lanceolate, a little toothed, undulately curled; genitals length of the corolla; sepals unguiculate on the back; petals deeply obcordate; stigmas downy; capsule elongated, cylindrical, villous. ♂. H. Native of Patagonia. Jacq. icon. rar. t. 456. *Œ. undulata*, Ait. hort. kew. ed. 2. vol. 2. p. 342. *Onagra undulata*, Moench. Leaves stiffish. Flowers at first yellow, but afterwards becoming reddish as they fade, about the size of those of *Œ. longiflora*. Plant rather clammy.

*Var. α, glaucescens* (Ser. mss. in D. C. prod. 3. p. 48.) leaves glaucous; peduncles and calyxes purplish; genitals erect.—Jacq. icon. rar. 3. t. 456.

*Var. β, virescens* (Ser. mss. in D. C. prod. 3. p. 48.) leaves green; nerves of leaves, calyx, and germs usually red; genitals inclinate. Ker. bot. reg. t. 147. Sims, bot. mag. 2403. Hook. exot. fl. t. 183.

*Sweet-scented Evening Primrose.* Fl. April, May. Clt. 1790. Pl. 1 to 2 feet.

33 *Œ. STRIATA* (Ledeb. in Link. enum. 1. p. 377.) stem mucronated, greenish; lower leaves linear, very long, denticulated, cauline ones lanceolate. ♂. H. Native country unknown. Flowers yellow. Capsule cylindrical, but at length becoming clavate, having the nerves thick and coloured. Seeds irregularly oval-oblong, bay-coloured, striated longitudinally.

*Striated-calycex Evening Primrose.* Fl. July, Aug. Clt. 1822. Pl. 2 feet.

34 *Œ. SINUATA* (Michx. fl. bor. amer. 1. p. 224.) plant decumbent, clothed with soft pubescence; leaves lanceolate, sinuately toothed or cut; flowers small; sepals unguiculate towards the apex; capsules cylindrically tetragonal, somewhat incurved, pilose, length of the bracteas. ☉. H. Native of Virginia.

Murr. nov. comm. goett. 5. p. 44. t. 9. ex Willd. spec. 2. p. 309. Petals obcordate, about the length of the sepals.

*Sinuato-leaved Evening Primrose.* Fl. Jul. Aug. Clt. 1770. Pl. 1 foot.

35 (E. ERÖSA (Lehm. in sem. hort. hamb. 1821. and in nov. act. bonn. 14. p. 818.) stem terete, pilose, fistular; leaves lanceolate, pubescent, veiny, crosely toothed at the base, somewhat sinuated, toothed to about the middle, but quite entire at the apex; flowers small; capsule cylindrical, 4-furrowed, thickened a little in the middle. ♂. H. Native of the Cape of Good Hope. Petals obcordate, citron-coloured, finely crenulated. Lobes of stigma cylindrical, thick, obtuse.

*Rose-toothed-leaved Evening Primrose.* Fl. July, Aug. Clt. 1828. Pl. 2 to 3 feet.

36 (E. VISÖSA (Rafin. fl. lud. p. 96.) stem branched, decumbent, terete, villous, and clammy; leaves sessile, lanceolate, nerved, sinuately toothed; flowers axillary, sessile; petals obcordate; stigma 4-lobed; capsule cylindrical, channelled. ♂. ? H. Native of Louisiana. Flowers yellow.

*Clammy Evening Primrose.* Pl. dec.

37 (E. INDE'CORÄ (St. Hil. fl. bras. 2. p. 268.) stems many from the same root, nearly simple, pubescent; leaves lanceolate, acute, absoletely and sinuately denticulated, pubescent; petals shorter than the calyx, emarginate; genitals equal in length to the petals; lobes of stigma linear, papillose; capsule cylindrical, pubescent. ☉. H. Native of Brazil, not far from the town of Rio Grande de St. Pedro do Sul. Flowers small, yellow.

*Indecorous Evening Primrose.* Fl. May. Pl.  $\frac{1}{2}$  ft.

38 (E. PROSTRÄTA (Ruiz et Pav. fl. per. p. 79. t. 315.) leaves somewhat lanceolate, acute, sinuately toothed; sepals longer than the corolla; petals obcordate; capsule linear, bluntly tetragonal, crowned, curved. ☉. H. Native of Peru, in corn-fields.—Pluk. alm. t. 203. f. 3. Flowers at first yellow, but afterwards changing to purplish as they fade.

*Prostrate Evening Primrose.* Pl. prostrate.

39 (E. MINIMA (Pursh, fl. amer. sept. 1. p. 262. t. 15. f. 1.) stem simple, 1-flowered; leaves small, lanceolate, quite entire, pilose; flowers sessile, hairy; ovary prismatic. ☉. H. Native of Georgia and New Jersey. Flowers yellow. Perhaps E. sinuata minima of Nutt. gen. amer. 1. p. 245.

*Least Evening Primrose.* Fl. Ju. July. Clt. 1825. Pl.  $\frac{1}{4}$  ft.

40 (E. SERRULÄTA (Nutt. gen. amer. 1. p. 246. journ. acad. philad. 1821. p. 120.) stem branched, and is, as well as the under side of leaves and capsules, rather pubescent; leaves oblong-linear, irregularly serrulated, ending in a hard acute point; flowers remote, sessile; calyx angular; capsule prismatic; petals entire; stamens and style very short. ♀. H. Native of North America, on the mountains about the rivers Platte and Missouri. Lindl. in Hook. exot. fl. 140. Sweet, fl. gard. t. 133. Flowers small, deep yellow. Corolla salver-shaped. Stigma capitate, slightly 4-lobed.

*Serrulated-leaved Evening Primrose.* Fl. June, July. Clt. 1824. Pl. 1 foot.

41 (E. LEUCOCÄRPA (Comien, mss. in Hook. fl. bor. amer. p. 210.) stem branched; leaves stiff, serrulated, spatulate-lanceolate, upper ones lanceolate, when young rather silky; petals emarginate, crenulated at the apex; tube of calyx shorter than the petals and segments; segments of stigma linear-oblong; anthers adnate; capsule cylindrical, clothed with hoary silky down. ♀. H. Native of North America, on the dry banks of the Saskatchewan, and common upon limestone rocks on the Red and Assinaboyné rivers. Flowers yellow. Plant with the habit of a species of *Heliánthemum*.

*White-fruited Evening Primrose.* Pl.  $\frac{1}{2}$  ft.

• • Flowers white.

42 (E. CÆSPITÖSA (Sims, bot. mag. t. 1593.) plant almost

stemless; leaves lanceolate, deeply toothed; tube of calyx very long; petals deeply obcordate; genitals shorter than the corolla; segments of stigma thickish, elongated, spreading; capsules sessile, somewhat obconically-oblong, with the margins of the valves crestedly mucronated. ♀. H. Native of North America, on hills about the Missouri. Nutt. gen. 1. p. 346. E. scapigera, Pursh, fl. bor. amer. 1. p. 263. ex Link, enum. 1. p. 377. Flowers large, white, but afterwards changing to purplish as they fade.

*Tufted Evening Primrose.* Fl. Ju. July. Clt. 1811. Pl.  $\frac{1}{3}$  ft.

43 (E. ALBICÄULIS (Fras. cat. 1813. Nutt. gen. amer. 1. p. 245.) stem erect, branched at the apex, white, quite glabrous; leaves linear-lanceolate, almost quite entire, pubescent beneath; petals roundish, entire, about equal in length to the stamens; capsule cylindrically prismatic, truncate. ♀. H. Native of North America, on the banks of the Saskatchewan and Missouri. Flowers white, large.

*White-stemmed Evening Primrose.* Pl. 2 to 3 feet.

44 (E. PÄLLIDA (Lindl. bot. reg. 1142.) roots creeping; stems ascending, branched, glabrous; leaves linear-lanceolate, acuminate, quite entire or toothed, glabrous; petals retuse, crenulated, exceeding the stamens; capsules cylindrical, twisted.

♀. H. Native of North America, common over all the dry sandy soil to the west of the Rocky Mountains. Petals white, yellow at the base, becoming reddish as they fade.

*Pale-flowered Evening Primrose.* Fl. June, Sep. Clt. 1826. Pl.  $\frac{1}{2}$  foot.

\*\*\* Flowers ed or purple. Anthers innate.

45 (E. HUMIFÜSA (Nutt. gen. amer. 1. p. 245.) plant prostrate; stems branched, villous; leaves linear-lanceolate, somewhat denticulated, or entire and setaceous; tube of calyx rather longer than the ovary; petals obcordate; capsule prismatic. ☉. H. Native of Florida, on the sea shore. Flowers purple.

*Trailing Evening Primrose.* Fl. June, Aug. Clt. 1824. Pl. trailing.

46 (E. TENELLÄ (Cav. icon. 4. p. 68. t. 396. f. 2.) stem branched, erect; leaves linear-spatulate; petals obovate, rather retuse, violaceous; style longer than the stamens, which are erect, but much shorter than the petals; segments of stigma narrow, short; capsule sulcate, cylindrical, curved, tomentose, longer than the bracteas. ☉. H. Native of Chili, about Coquimbo and elsewhere. Ruiz et Pav. fl. per. 3. t. 316. Sims, bot. mag. t. 2424. Plant rather glaucous. Flowers purple; petals crenulated at the apex. Lobes of stigma as well as anthers dark purple.

*Delicate Evening Primrose.* Fl. June, Aug. Clt. 1823. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  ft.

47 (E. TENUIFÖLIA (Cav. icon. 4. p. 67. t. 397.) stem branched; branches ascending; leaves lanceolate; petals obovate, somewhat truncate, crenated at the apex; style longer than the stamens, which are erect, but shorter than the petals; lobes of stigma narrow, short; capsule cylindrical. ☉. H. Native of Chili, about Coquimbo, where it is commonly called *serena*. Sweet, fl. gard. new. ser. t. 19. Ruiz et Pav. fl. per. 81. t. 317. Flowers purple. Very like (E. *ténella*).

*Fine-leaved Evening Primrose.* Fl. June, July. Clt. 1828. Pl. 1 ft.

48 (E. AMÖNA (Lehm. in nov. act. bonn. 14. p. 811. t. 45. and in ind. sem. hort. hamb. 1821.) pubescent; stem terete; leaves lanceolate, bluntish, slightly toothed, glaucous; petals 3 times longer than the calyx, obovate, slightly emarginate, undulately crenated; capsule cylindrically tetragonal; lobes of stigma semi-cylindrical. ☉. H. Native of North America. E. roseo-älbä, Bernh. in sched. hort. clt. 1824. Sweet, fl. gard. 268. Petals whitish, but rose-coloured at the base, and below that marked by a triangular, purple, striated blotch.

*Pleasing Evening Primrose.* Fl. Ju. July. Clt. 1825. Pl. 1 ft.  
 49 *CE. VIMINEA* (Dougl. in bot. mag. t. 2873.) stem erect, branched, glaucous, glabrous; leaves lanceolate, nearly quite entire, glaucous, and glabrous; tube of calyx about equal in length to the segments; petals entire, denticulated, twice the length of the genitals; stigmas purple; capsule cylindrical, attenuated at the apex, furrowed, pubescent. ☉. H. Native of North California, near the river Aquilar, in dry prairies in lat. 43° north. Lindl. bot. reg. 1220. Flowers lilac.

*Twiggy Evening Primrose.* Fl. June, Sep. Clt. 1826. Pl. 2 to 3 ft.

50 *CE. LINDLEYI* (Dougl. in bot. mag. 2832.) stem ascending, diffuse, branched; leaves linear-lanceolate, quite entire, glabrous; tube of calyx 3 times shorter than the segments; petals entire, denticulated, twice the length of the genitals; stigmas yellow; capsule cylindrical, elongated, tapering to both ends, puberulous. ☉. H. Native of the north-west coast of America, about Fort Vancouver, and at the Mulnomak river. Petals lilac, each marked with a purple spot; claws yellow.

*Lindley's Evening Primrose.* Fl. June, Nov. Clt. 1826. Pl. 1 to 2 feet.

51 *CE. DECUMBENS* (Dougl. in bot. mag. 2889.) stem ascending; leaves glaucous, quite entire, pubescent, lower ones broadly ovate, upper ones ovate-lanceolate; petals emarginate, crenulated; stigmas purple, with reflexed segments; capsule bluntly tetragonal, tapering from the base, villous. ☉. H. Native of California, in dry mountain valleys. Lindl. bot. reg. 1221. Petals lilac, obcordate. From all its near allies this plant differs in the form of the stigmas.

*Decumbent Evening Primrose.* Fl. June, Nov. Clt. 1827. Pl. 1 to 2 ft. long, ascending.

52 *CE. PURPUREA* (Curt. bot. mag. 352.) plant glaucescent; leaves lanceolate, attenuated at both ends, bluntish; tube of calyx short; petals obovate, crenulated; genitals exerted, much shorter than the corolla; lobes of stigma thick, short, dark purple; anthers yellow; capsule ovate, triquetrous, sessile, angular, pilose; seeds irregularly angular, and covered with dots when examined by a lens. ☉. H. Native of the north-west coast of America. *CE. HUMILIS*, Donn, hort. cantab. p. 41. Flowers purple.

*Purple Evening Primrose.* Fl. May, Aug. Clt. 1794. Pl. 1 ft.

53 *CE. ROMANZOVII* (Ledeb. in Horn. hort. hafn. suppl. 133.) glaucous; stem erect; leaves lanceolate-oblong, mucronate, tapering into the petiole; tube of calyx very short; limb one-half shorter than the corolla; petals broad-obovate, crenulated; stamens much shorter than the corolla; anthers green; stigmas nearly sessile, inclosed, dark purple; capsule oblong-cylindrical, somewhat tetragonal, pilose; seeds hoary, and rather scaly when examined by a lens. ☉. H. Native of North America, on the western coast. D. Don in Ker. bot. reg. t. 662. Flowers violaceous.

*Romanzov's Evening Primrose.* Fl. July, Aug. Clt. 1817. Pl.  $\frac{3}{4}$  to 1 ft.

SECT. III. *CENOTHERIUM* (an alteration from the generic name). Ser. in D. C. prod. 3. p. 49. Stigma quadrifid (f. 96. c.). Tube of calyx cylindrical, dilated at the apex. Anthers oblong. Capsule oblong or obovate, tetragonal; the angles prominent; valves obovate.

\* *Flowers white.*

54 *CE. ACAULIS* (Cav. icon. 4. p. 68. t. 399.) leaves rosulate, pinnatifid; the terminal lobe large and denticulated; tube and flowers large; calycine segments free, reflexed; petals obovate, rather retuse, entire; anthers and stigmas narrow, shorter than the corolla; capsule obovate, tetragonal, a little winged, sessile.  $\mathcal{U}$ . F. Native of Chili. Ker. bot. reg. 763. Petals large, white, but becoming red as they fade.

*Stemless Evening Primrose.* Fl. May, Sep. Clt. 1821. Pl.  $\frac{1}{2}$  ft.

55 *CE. TARAXACIFOLIA* (Hort. and Sweet, fl. gard. t. 294.) stem branched, elongated, procumbent; leaves pubescent, alternate, interruptedly pinnatifid, sinuately toothed, but the apex entire; tube of flower very long; petals large, obovate, entire, 5-nerved; anthers and stigmas shorter than the corolla; capsules sessile, obovate, pubescent, tetragonal; angles winged.  $\mathcal{U}$ . H. Native of Chili, about Conception. *CE. GRANDIFLORA*, Ruiz. et Pav. fl. per. 3. t. 318. f. 6. *CE. ACAULIS*  $\beta$ , major, Ser. in D. C. prod. 3. p. 49. Flowers large, white, but becoming reddish as they fade.

*Dandelion-leaved Evening Primrose.* Fl. May, Aug. Clt. 1825. Pl.  $\frac{1}{2}$  foot.

56 *CE. ANISOLOBA* (Sweet, fl. gard. new. ser. 105.) stem suffrutescent, tall, straight, branched, downy; radical leaves elliptic, entire, or few-toothed; middle ones elliptic, sharply toothed, with the segments at the base variable, linear, acute, and divaricating; upper ones unequal, pinnatifid, with the segments divaricate, with the terminal lobes large; tube of flower very long; ovary tetragonal; petals large, imbricate, with crenulated margins.  $\mathcal{U}$ . H. Native of Chiloe. Flowers large, white, becoming red as they fade. Lindl. bot. reg. t. 1479. Leaves downy. Lobes of stigma linear.

*Unequal-lobed-leaved Evening Primrose.* Fl. May, Oct. Clt. 1828. Pl. 3 feet.

57 *CE. PURSHII*; pubescent; stem decumbent, white; radical leaves nearly entire; cauline ones pinnatifid, with linear acute divaricate segments; nerves of leaves white like the stem; flowers few, disposed in a kind of spike; petals obcordate, white, large, longer than the stamens; style filiform; ovaries sessile, prismatic, furrowed. ☉. H. Native of North America, on the plains of the Missouri. *CE. ALBICAULIS*, Pursh, fl. amer. sept. 2. p. 733. but not of Nutt. *CE. PINNATIFIDA*, Nutt. gen. amer. 1. p. 245. but not of Kunth. Flowers large, white.

*Pursh's Evening Primrose.* Fl. May, Aug. Clt. 1811. Pl. dec.

58 *CE. SPECIOSA* (Nutt. in mem. acad. soc. hist. nat. phil. 1821. p. 119.) plant puberulous; stem suffrutescent; leaves oblong-lanceolate, attenuated at both ends, serrated, and somewhat pinnatifid, nerved, pubescent beneath; flowers subracemose; raceme naked, at first drooping; petals obcordate, equal in length to the stamens; capsule obovate, angular.  $\mathcal{U}$ . H. Native of North America, on the banks of the Red river. Hook. exot. fl. t. 80. Sweet, fl. gard. 253. Flowers large, white, but becoming reddish as they fade.

*Shewy Evening Primrose.* Fl. Mar. Sept. Clt. 1821. Pl. 2 to 3 ft.

59 *CE. TETRAPTERA* (Cav. icon. 3. p. 40. t. 279.) stem branched, pilose; leaves lanceolate, pinnatifid, or toothed, somewhat ciliated, hardly petiolate; tube of calyx almost wanting; petals obcordate, entire; genitals shorter than the corolla; anthers and stigmas narrow and long; capsule obovate, 4-winged, ribbed, pilose, tapering into a pedicel at the base; seeds ovate, acute, smooth, pale. ☉. H. Native of New Spain. Sims, bot. mag. 468. Petals white, but becoming red as they fade.

*Four-winged-capsuled Evening Primrose.* Fl. June, Sept. Clt. 1796. Pl. 1 foot.

60 *CE. LATIFLORA* (Moc. et Sesse, fl. mex. icon. ined. t. 376.) root fusiform; stem terete, hairy, branched at the apex; leaves lanceolate-linear, acute, deeply toothed, alternate, opposite, or in whorles; flowers on short pedicels. ☉. H. Native of Mexico. Flowers large, white, but becoming reddish as they fade. Fruit unknown.

*Broad-flowered Evening Primrose.* Pl. 1 foot.

\* \* *Flowers red or purple.*

61 *CE. VIRGATA* (Ruiz, et Pav. fl. per. 29. t. 315.) stem prostrate or erect, branched; leaves lyrate and lanceolate, toothed;

flowers disposed in a kind of raceme; petals obovate, hardly longer than the limb of the calyx; capsule clavate, 10-angled, the alternate angles broadest. ☉. H. Native of Peru, in fields, and among rubbish. Flowers purple. There is a variety of this with nearly entire leaves.

*Twiggy Evening Primrose.* Fl. Ju. Jul. Clt. 1823. Pl. pr.

62 *C. SUBULATA* (Ruiz, et Pav. fl. per. p. 82. t. 316.) leaves subulate, long, villous; petals bifid; capsule clavate, tetragonal, winged above, mucronate; valves broad, somewhat 3-winged at the apex. ☉. H. Native of Chili, in dry fields. Flowers purplish-red.

*Subulate-leaved Evening Primrose.* Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

63 *C. ROSEA* (Ait. hort. kew. ed. 1. vol. 2. p. 3. ed. 2. vol. 2. p. 343.) shrubby; stem branched; branches twiggy; leaves elliptic, attenuated at both ends, toothed, lower ones lyrate; tube of calyx short; petals obovate-roundish; genitals shorter than the corolla; capsule clavate, 8-angled. ☉. F. Native of Mexico. Curt. bot. mag. 347. *C. purpurea*, Lam. dict. 4. p. 564. *C. rubra*, Cav. icon. 4. p. 68. t. 400. Flowers red, about the size of those of *Epilobium angustissimum*.

*Rose-coloured-flowered Evening Primrose.* Fl. May, Aug. Clt. 1783. Shrub 1 to 2 feet.

64 *C. TUBIFLORA* (Moc. et Sesse, fl. mex. icon. ined. t. 377.) root rather fusiform; stems depressed; leaves linear-oblong, acute, somewhat denticulated; tube of calyx very long; petals obcordate; stamens longer than the stigmas; fruit unknown. ☉. F. Native of Mexico. Flowers rose-coloured. This is a very distinct species, but from the fruit being unknown it is doubtful whether it belongs to the present section.

*Tube-flowered Evening Primrose.* Pl.  $\frac{1}{2}$  foot.

\* \* \* *Flowers yellow.*

65 *C. TRILOBA* (Nutt. in journ. acad. philad. 1821. p. 118.) stemless; leaves interruptedly pinnatifid, toothed, glabrous; petals obovate, slightly 3-lobed at the apex, the middle lobe mucronate; capsules almost 4-winged, large, sessile at the root. ☉. H. Native of North America, in arid fields on the banks of the Red River, and of Louisiana. Sims, bot. mag. 2566. *C. rhizocarpa*, Spreng. syst. 2. p. 230. Flowers radical, pale yellow, sweet-scented in the evening. Tube of calyx very long.

*Three-lobed-petalled Evening Primrose.* Fl. May, Sept. Clt. 1822. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

66 *C. PINNATIFIDA* (H. B. et Kunth, nov. gen. amer. 6. p. 91.) stem erect, branched at the base; leaves pinnatifid, pubescent; capsule 8-angled, somewhat 4-winged, on short pedicels. ☉. F. Native of Mexico, about Actopan. Flowers yellow, about the size of those of *Epilobium hirsutum*, axillary at the tops of the stem and branches.

*Pinnatifid-leaved Evening Primrose.* Pl. 1 foot.

67 *C. MACROCARPA* (Pursh, fl. amer. sept. 2. p. 734.) stem simple, prostrate, downy; leaves lanceolate, quite entire, or glandularly denticulated, with the margins and nerves covered with white silky down; petals broad, obcordate; stamens arched, shorter than the corolla; lobes of stigma cylindrical, blunt; capsule large, sessile, oblong, 4-winged. ☉. H. Native of North America, on the banks of the Mississippi, near St. Louis. Sweet, fl. gard. t. 5. Stem purplish. Corolla large, yellow. Calyx spotted with red; tube long.

*Large-fruited Evening Primrose.* Fl. June, Aug. Clt. 1811. Pl. prostrate.

68 *C. MISSOURIENSIS* (Sims, bot. mag. t. 1592.) stems simple, downy, decumbent; leaves lanceolate, tapering to both ends, marginate and slightly ciliated; petals broad, obcordate, with a notch in the recess; capsule 4-winged, slightly pedicellate. ☉. H. Native of North America. *C. alata*, Nutt. gen. amer.

1. p. 346. Corolla large, yellow. Calyx spotted as in *C. macrocarpa*. Leaves sometimes glandularly denticulated.

*Missouri Evening Primrose.* Fl. Ju. Sep. Clt. 1818. Pl.  $\frac{1}{2}$  ft.

69 *C. GLAUCA* (Michx. fl. bor. amer. 1. p. 224.) plant quite glabrous, decumbent, glaucous; leaves ovate, repandly denticulated; limb of calyx longer than the tube; petals large, obcordate, erose; genitals shorter than the corolla; capsules ovate, tetragonal, thick, short. ☉. H. Native of North America, in woods west of the Mississippi. Sims, bot. mag. 1606. Flowers pale yellow.

*Glaucous Evening Primrose.* Fl. June, Oct. Clt. 1812. Pl. 1 to 2 feet.

70 *C. HYBRIDA* (Michx. fl. bor. amer. 1. p. 225.) stem erect, villous; leaves pubescent on both surfaces, lanceolate, remotely toothed; flowers on short pedicels; bractees wanting or subulate; capsules ovate, tetragonal, disposed in something like spikes. ☉. H. Native of Upper Carolina. Flowers yellow. There is a variety of this plant with glabrous leaves.

*Hybrid Evening Primrose.* Fl. Ju. Oct. Clt. 1813. Pl. 1 ft.

71 *C. FRUTICOSA* (Lin. spec. 492.) stems erect, brownish, glabrous, or pilose; leaves ovate-lanceolate, denticulated, pilose, or glabrous; racemes spicate, leafy, nakedish at the base; petals broadly obcordate, erose, twice the length of the stamens; capsule clavate, pilose, 8-angled, 4 of the angles winged. ☉. H. Native of Virginia and Canada. Curt. bot. mag. t. 332. *C. Canadensis*, Goldie, in edin. phil. journ. 1821. p. 7. Flowers large, deep yellow. Stem branched at the apex.

*Shrubby Evening Primrose.* Fl. June, Sept. Clt. 1737. Pl. 2 to 3 feet.

72 *C. SEROTINA* (Hort. ex Sweet, fl. gard. 184.) stems ascending, branched, pubescent; leaves lanceolate, acute, denticulated, glabrous, attenuated at the base; petals wrinkled or plaited; capsule pedicellate, 4-winged, oblong, pubescent; segments of stigma blunt, spreading. ☉. H. Native of North America. Flowers yellow. Habit procumbent and branching.

*Late-flowering Evening Primrose.* Fl. Aug. Sept. Clt. 1820. Pl. procumbent.

73 *C. AMBIGUA* (Spreng. syst. 2. p. 229.) stem simple, pilose; leaves ovate-lanceolate, acute, denticulated, dotted; calycine segments short; capsule sessile, clavate, 4-winged. ☉. H. Native of Pennsylvania. *C. fruticosa*  $\beta$ , *ambigua*, Nutt. gen. amer. 1. p. 217. Flowers yellow.

*Ambiguous Evening Primrose.* Fl. June, Aug. Clt. 1818. Pl. 1 to  $1\frac{1}{2}$  foot.

74 *C. FRASERI* (Pursh, fl. amer. sept. 2. p. 734.) smoothish; stems simple at the base; leaves ovate, glandularly denticulated; tube of calyx longer than the ovary; petals obcordate, broad, erose, undulated; capsule obovate, thick, tetragonal. ☉. H. Native of South Carolina. Sims, bot. mag. 1674. Flowers yellow.

*Fraser's Evening Primrose.* Fl. Ju. Oct. Clt. 1811. Fl. 1 ft.

75 *C. TARQUENSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 91.) procumbent; leaves lanceolate-oblong, acute, narrowed at the base, nearly quite entire, puberulous; petals obovate-roundish, retuse? genitals shorter than the corolla; capsules very nearly sessile, 4-winged, bluntly truncate at the apex. ☉. F. Native of South America, near the town of Quito, in the valley of Tarquo, at the height of 4000 feet above the level of the sea. Flowers yellow. Like *C. pumila*, but differs in the leaves being broader and puberulous, and in the calyxes, capsules, and ovaries being clothed with silky down.

*Tarquo Evening Primrose.* Pl. procumbent.

76 *C. PUMILA* (Lin. spec. 493.) stems usually simplish, ascending, rather pilose; leaves lanceolate, quite entire, obtuse, a little ciliated; flowers subspicuous, on short pedicels; petals obcordate, rather longer than the genitals; capsule clavate, 8-

angled, 4 of the angles winged. America, in most parts. Curt. bot. mag. t. 335. Mill. ill. 188. Flowers yellow, about the size of those of *Potentilla verna*. Leaves small. (f. 97.)

*Dwarf Evening Primrose*. Fl. May, Sept. Clt. 1757. Pl.  $\frac{1}{2}$  ft.

77 Œ. *RIPARIA* (Nutt. gen. amer. 1. p. 247.) stem erect, nearly glabrous; leaves lanceolate, denticulated, glabrous; flowers subspicate, on short pedicels; petals emarginate, a little longer than the genitals; capsules 8-furrowed, the 4 alternate ribs more prominent than the rest.

♂. II. Native of North America, in North Carolina, near Wilmington; and on the plains of the Saskatchewan. Flowers small, yellow.

*River-bank Evening Primrose*. Pl. 1 to  $1\frac{1}{2}$  foot.

78 Œ. *CHRYSA'NTHA* (Michx. fl. bor. amer. 1. p. 225.) stems weak, minutely pubescent; leaves lanceolate, bluntish, entire; flowers small; tube of calyx not half so long as the segments; capsule sessile, clavate, 8-angled, the 4 alternate angles more prominent than the others. ♀. II. Native of North America, from Quebec to Hudson's Bay. Flowers yellow, the size of those of *Epilobium palustre*. Dr. Hooker considers this identical with Œ. *pumila*, see fl. bor. amer. p. 212.

*Golden-flowered Evening Primrose*. Fl. May, Sept. Pl.  $\frac{1}{2}$  to 1 foot.

79 Œ. *PUSILLA* (Michx. fl. bor. amer. 1. p. 225.) plant minutely pubescent; stems humble, simple; leaves lanceolate-oblong, bluntish, entire; capsule sessile, clavate, almost equally 8-angled. ♀. II. Native of North America, on rocks at Lake Mistassiny. Lam. dict. 4. p. 144. Flowers small, yellow. Œ. *pumila* β, *minima*, Hook. fl. bor. amer. p. 212.

*Small Evening Primrose*. Fl. May, Sept. Clt. 1817. Pl.  $\frac{1}{4}$  ft.

80 Œ. *MULTICAULIS* (Ruiz, et Pav. fl. per. 3. p. 80. t. 317. f. 6.) stems tufted, depressed; radical leaves lanceolate-oblong, denticulated, cauline ones ovate; flowers sessile, secund; petals hardly exceeding the calyx in length; capsules secund, clavate, 8-angled, the 4 alternate angles more prominent than the others; seeds obovate, angular, fuscous. ☉. ? II. Native of Peru, on the Andes, in the provinces of Tarma and Canta. Flowers yellow.

*Many-stemmed Evening Primrose*. Pl. depressed.

81 Œ. *LINFOLIA* (Nutt. in journ. acad. philad. 1821. p. 120.) stem straight; leaves linear, very narrow, obtuse, entire; flowers spicate; calyxes hispid, obovate-oblong; angles bluntish; petals obcordate, 1-nerved; nerve thick, coloured. ☉. H. Native of North America, on rocks along the Akanza river. Flowers 2 lines broad, yellow.

*Flax-leaved Evening Primrose*. Fl. June, Aug. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  ft.

82 Œ. *LINEARIS* (Michx. fl. bor. amer. 1. p. 225.) plant slender, pubescent; leaves linear, entire; capsules on longish stipes, roundish-tetragonal, villous. ☉. ? H. Native of Upper Carolina. This species is hardly known. Flowers yellow.

*Linear-leaved Evening Primrose*. Fl. June, July. Clt. 1822. Pl.  $\frac{1}{2}$  to 1 foot.

83 Œ. *EPILOBIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 92.) stem branched; leaves oblong or ovate-oblong, acute, narrowed at the base, remotely and obsoletely denticulated, puberulous; capsules pedicellate, clavate, 4-winged. ♀. h. F. Native of New Granada. Flowers orange-coloured.

*Willow-herb-leaved Evening Primrose*. Pl. 1 foot?

♀. II. Native of North America. FIG. 96.

84? Œ. *TETRAGONA* (Roth, cat. 2. ex Horn. hort. hafn. suppl. 44.) leaves ovate, obtuse, entire; flowers somewhat fastigiate; capsules pedicellate, truncate, 4-valved. ♀. H. Native of North America. Link. enum. 1. p. 377. Flowers yellow.

*Tetragonal-podded Evening Primrose*. Pl. 1 foot.

85? Œ. *ADSCENDENS* (Willd. herb. ex Spreng. syst. 2. p. 230.) stems weak, ascending, branched; leaves lanceolate, toothed, pubescent; capsule sessile, clavate, curved. ♀. ? H. Native of South America.

*Ascending Evening Primrose*. Pl. ascending.

† *Species not sufficiently known.*

86 Œ. *INCA'NA* (Nutt. gen. amer. 1. p. 247.) stem humble, slender, erect; leaves clothed with hoary tomentum, quite entire, elliptic-ovate, acute; racemes few-flowered, naked; capsules almost sessile, oblong, 4-angled. ♂. II. Native of Maryland. Flowers golden yellow.

*Hoary Evening Primrose*. Pl.  $\frac{1}{2}$  foot.

87 Œ. *AUSTRALIS* (Sal. prod. p. 278.) leaves linear-lanceolate, denticulated, undulated, minutely pubescent; capsule sessile, cylindrical, obsoletely 8-angled.—Native about Port Desire.

*Southern Evening Primrose*. Pl. 1 foot.

*Cult.* All the species of *Œnothëra* are handsome border flowers, and deserve to be cultivated. They will grow in any common garden soil. The perennial kinds are easily increased by seeds, by dividing the plants at the root, and some of them by cuttings. The seeds of annual and biennial kinds only require to be sown where the plants are intended to remain.

VIII. *GAYOPHYTUM* (a name peculiarly composed from M. Gay, the discoverer of the plant, and *phuton*, *phyton*, a plant; signifying Gay's plant). Adr. Juss. in ann. sc. nat. 25. p. 18.

LIN. SYST. *Octândria, Monogýnia*. Calyx 4-parted. Petals 4. Stamens 8, the 4 opposite the petals small and barren. Style short. Stigma capitate, obscurely 2-lobed from a transverse furrow. Ovarium oblong-elliptic, compressed, 2-celled. Capsule linear, 4-valved, 2-celled; lateral valves revolute; cells many-seeded. Seeds fixed to the longitudinal placenta, 1 row in each cell, ascending, naked.—A small, glabrous herb. Leaves linear-falcate, lower ones nearly opposite, upper ones alternate. Flowers solitary, axillary, shorter than the leaves, yellowish. Pollen trigonal.

1 G. *HUMILE* (Adr. Juss. l. c.). ☉. H. Native of Santiago, in Chili.

*Humble Gayophytum*. Pl. 1 to 3 inches.

*Cult.* The seeds of this plant only require to be sown in the open border, in a warm sheltered situation.

IX. *CLARKIA* (in honour of Capt. Clarke, the companion of Capt. Lewis, in his journey to the Rocky Mountains of North America). Pursh, fl. amer. sept. 1. p. 260. t. 11. D. C. prod. 3. p. 52. Hook, fl. bor. amer. p. 214.

LIN. SYST. *Octândria, Monogýnia*. Calyx tubular, 4-cleft, nearly as in *Œnothëra*. Petals 4, unguiculate, cruciate, 3-lobed (f. 97. b.), convolute in æstivation. Stamens 8, the 4 alternate ones sterile. Stigma 4-lobed (f. 97. a.); lobes petaloid. Capsule cylindrical, furrowed, 4-celled, 4-valved. Seeds ascending, naked.—Smooth, annual herbs, with alternate, lanceolate, or linear, entire leaves; and axillary, sessile, solitary, showy flowers.

1 C. *PULCHRELLA* (Pursh, l. c.) petals deeply 3-lobed; leaves linear. ☉. H. Native of North-west America, on the banks of the Kootskoosky and Clarke's rivers, and from the great falls of the Columbia to the Rocky Mountains. Hook. bot. mag.

2918. Lindl. bot. reg. 1100. Flowers large, of a beautiful rose-purplish colour, rarely white.

*Var. β*; petals less deeply lobed, but more denticulated. Hook. bot. mag. t. 2918.

*Neat Clarkia.* Fl. June, Aug. Clt. 1826. Pl. 1½ foot.

2 *C. RHOMBOIDEA* (Dougl. mss. ex Hook. fl. bor. amer. p. 214.) petals entire, rhomboid; leaves lanceolate. ☉. B. S. Native along with the preceding species. Flowers of a beautiful rose-purple colour.

*Rhomboid-petalled Clarkia.* Fl. June, Aug. Pl. 1 foot.

*Cult.* The *C. pulchella* is one of the most showy border annuals ever introduced to the gardens, and is on that account to be seen in every flower-garden and nursery, although but a few years since its first introduction. Both species will grow in any common garden soil, in which the seeds may be sown.

#### Tribe IV.

**JUSSIEÆ** (plants agreeing in character with the genus *Jussiaea*). D. C. prod. 3. p. 52. Fruit capsular; cells many-seeded. Tube of calyx permanent, not drawn out beyond the ovary, but dividing immediately into segments (f. 98. a.).—Usually herbs, rarely shrubs.

X. **JUSSIEÆA** (so named by Linnæus, in memory of Antoine de Jussieu, Demonstrator of Plants in the Royal Garden at Paris, uncle of the celebrated Antoine Laurent de Jussieu). Lin. gen. no. 538. Gärtn. fruct. 1. p. 154. t. 31. Lam. ill. t. 28. D. C. prod. 3. p. 52.—Jussieu, Pers. ench. no. 1069.

**LIN. SYST.** *Octo-Decandria, Monogynia.* Tube of calyx prismatic or cylindrical, adhering in its whole length to the ovary; limb 4 (f. 98. a.) -5-6-parted; the lobes acute and permanent, valvate in æstivation. Petals spreading, equal in number to the lobes of the calyx (f. 98. d.). Stamens double the number of the petals, deciduous like them. Ovary sometimes flattish at the apex, sometimes elevated into a furrowed cone (f. 98. b.). Style filiform, short, crowned by a capitate 4-6-furrowed stigma. Capsule 4-6-celled, oblong, usually ribbed and opening between the ribs, always crowned by the calyx. Seeds numerous, naked.—Herbs, rarely shrubs, natives of marshes. Leaves alternate, for the most part quite entire. Flowers axillary, solitary, sessile, or on very short petioles, usually bibracteate at the base, generally yellow, rarely white.

\* *Flowers with 5 petals and 10 anthers, very rarely with 6 petals and 12 anthers.*

1 *J. PERUVIANA* (Lin. spec. 555.) stem suffruticose, erect; leaves oblong, attenuated at both ends, pubescent beneath; pedicel bearing 2 foliaceous bracteoles at the apex, twice the length of the tube of the calyx, which is pentagonal and turbinate; calycine lobes 5, lanceolate, one half shorter than the petals, which are roundly obovate. ♀. B. S. Native of Peru, near rivulets about Lima. Feull. obs. 2. p. 716. t. 9. Flowers large, yellow. An emollient poultice is formed of the leaves of this plant in Peru.

*Peruvian Jussiaea.* Shrub 1 to 2 feet.

2 *J. VARIEBILIS* (Meyer. prim. esseq. 174.) stem shrubby, ascending, glabrous; leaves lanceolate, acuminate at both ends, crenate-serrated, glabrous; flowers on short pedicels, bibracteolate at the base; tube of calyx angular; calycine lobes 5-6, lanceolate, shorter than the petals, which are ovate. ♂. B. S.

FIG. 97.

Native of Guiana, about Essequibo, in marshes. Flowers yellow. This species is said to be nearly related to *J. Peruviana*, but the leaves are narrower and the flowers are on shorter pedicels.

*Variable Jussiaea.* Fl. Aug. Sept. Clt. 1826. Pl. 1 to 2 ft.

3 *J. DODECANDRA* (D. C. prod. 3. p. 53.) herbaceous, erect, glabrous; leaves oval, acute at both ends, on short petioles; flowers sessile; tube of calyx elongated, cylindrical; calycine lobes 5-6, linear-oblong, acuminate; petals ovate, emarginate, equal in length to the calycine lobes. ☉. B. S. Native about Demerara. Stem terete, below; branches compressed, angular. Flowers yellow.

*Dodecandrous Jussiaea.* Pl. 1 foot.

4 *J. LEPTOCARPA* (Nutt. gen. amer. 1. p. 279.) herbaceous, erect, smoothish; stem and calyx partly hairy; leaves lanceolate, smoothish, attenuated at both ends; flowers sessile, 5-6-petalled; tube of calyx very slender, cylindrical; petals hardly longer than the calycine lobes. ☉. B. H. Native of North America, on the banks of the Mississippi and Missouri; very plentiful. Stem usually simple, irregularly angled. Petals yellow.

*Slender-fruited Jussiaea.* Fl. Jul. Sept. Clt. 1817. Pl. 1 ft.

5 *J. PILOSA* (H. B. et Kunth, nov. gen. amer. 6. p. 101. t. 532. a and b.) herbaceous, erect, hispid; leaves oblong-lanceolate, narrowed at the base, hairy on both surfaces; flowers on very short pedicels, bractless; tube of calyx cylindrical, elongated; calycine lobes 5-6, rarely 4, oblong-lanceolate, acuminate; petals roundly ovate, shorter than the calycine lobes. ♀. B. S. Native of Caraccas, on the banks of the river Apures, near St. Fernando. Flowers yellow. Nearly allied to *J. villosa*.

*Pilose Jussiaea.* Pl. 1 foot.

6 *J. AFFINIS* (D. C. prod. 3. p. 53.) herbaceous, erect, pilose; leaves oblong-lanceolate, acuminate at both ends, smoothish, ciliated on the nerve and margins; flowers on very short pedicels, bractless; calyx pilose, with a cylindrical elongated tube, and 5 linear-lanceolate acuminate lobes; petals oblong-obovate, equal in length to the calycine lobes. ☉. B. S. Native of Guiana, about Demerara. Flowers yellow. Nearly allied to *J. pilosa*.

*Allied Jussiaea.* Pl. 1 foot.

7 *J. GRANDIFLORA* (Michx. fl. bor. amer. 1. p. 267.) plant floating; stems herbaceous, villous; leaves pubescent, oblong-lanceolate, lower ones rather spatulate, the rest tapering to both ends; pedicels bractless, and are as well as the calyxes villous; flowers drooping before expansion; calycine lobes 5, acute; petals obovate, emarginate, twice the length of the calycine segments. ♀. W. H. Native of Georgia and Lower Carolina, in ponds. Sims, bot. mag. 2122. Flowers large, yellow.

*Great-flowered Jussiaea.* Fl. Jul. Oct. Clt. 1812. Pl. fl.

8 *J. MONTEVIDEENSIS* (Spreng. syst. 2. p. 232.) stem ascending, smooth at the base, but hairy above; lower leaves spatulate, glabrous, upper ones lanceolate, acute, quite entire, and hairy; calyx with a narrow tube and 5 lanceolate acute lobes; petals 5, obovate, emarginate. ♀. W. S. Native of Brazil, in marshes and rivulets in the province of Cisplatina, near the town of Monte-Video. *J. grandiflora*, St. Hil. fl. bras. 2. p. 265. Pedicels bibracteolate. Flowers yellow.

*Var. β*; flowers 3-times smaller than those of the species; leaves smoothish above, but with a few scattered hairs beneath. St. Hil. l. c.

*Monte-Video Jussiaea.* Pl. floating.

9 *J. DIFFUSA* (Forsk. descr. p. 210.) stems creeping; leaves lanceolate; flowers sessile, 5-petalled, decandrous. ♀. W. S. Native of Egypt, in the Delta at the Nile, on the edges of fields. This plant is hardly known, but evidently distinct from *J. erecta*,

as may be seen from the short description of Forskael, and is admitted by Delile, in his fl. ægyp. ill. p. 14. without any description.

*Diffuse Jussiaea.* Fl. diffuse.

10 *J. PEPLIOIDES* (H. B. et Kunth, nov. gen. amer. 6. p. 97.) plant shrubby, creeping, glabrous; leaves oblong-spatulate, obtuse, thickish; flowers on short pedicels, bractless; tube of calyx slender, somewhat pentagonal; calycine lobes 5, lanceolate.  $\gamma$ . B. S. Native of New Granada, near Ibaguë, in humid valleys. Petals not known.

*Peplus-like Jussiaea.* Pl. creeping.

11 *J. PATIBILCENSIS* (H. B. et Kunth, l. c.) herbaceous, creeping, glabrous; leaves oblong, or obovate-oblong, acutish, cuneated at the base; flowers pedicellate, bibracteolate; tube of calyx slender and angular; calycine lobes 5, lanceolate, acuminate; petals roundish-ovate, twice the length of the calycine lobes.  $\gamma$ . B. S. Native on the shores of the Pacific, near Patibilca. Flowers yellow. Capsule linear.

*Patibilca Jussiaea.* Pl. creeping.

12 *J. POLYGONOIDES* (H. B. et Kunth, nov. gen. amer. 6. p. 97.) herbaceous, creeping, glabrous; leaves lanceolate-oblong, acute, cuneately narrowed at the base; flowers pedicellate, tube of calyx slender, furnished with 2 bracteoles in the middle; calycine lobes oblong-lanceolate, acute.  $\gamma$ . W. H. Native of New Granada, in marshes and bogs; and of Mexico, near Hacienda la Laguna, in running waters. Flowers yellow. Capsule linear.

*Polygonum-like Jussiaea.* Pl. creeping.

13 *J. FLUVIATILIS* (Blume, bijdr. p. 32.) stems herbaceous, terete, glabrous, floating; leaves obovate-oblong, rounded, sometimes retuse; pedicels bibracteolate; calycine lobes lanceolate, acuminate, pubescent; tube of calyx and capsule cylindrical.  $\gamma$ . W. S. Native of Java, in mountain rivulets. Allied to *J. repens*.

*River Jussiaea.* Pl. floating.

14 *J. REPENS* (Lin. mant. p. 381.) plant herbaceous, creeping, glabrous; leaves oblong-obovate, retuse, petiolate; flowers on longish pedicels, somewhat bicallous at the base; calyx villous, with a short terete tube, which is attenuated at the base, and 5 lanceolate acute lobes; petals obovate, twice the length of the calycine segments.  $\gamma$ . W. S. Native of the East Indies, floating in water; in Java, Malabar, Timor, &c. Lin. fl. zeyl. 169. Willd. spec. 2. p. 574. exclusive of Swartz's and Browne's synonymes.—Rheed. mal. 2. t. 51. Cubospérnum palustre, Lour. coch. p. 275. *J. adscendens*, Lin. mant. 69. does not differ from this unless in the pedicels being a little shorter, as will be seen by comparing the descriptions in Rees' cycl. by Smith. Capsule terete, an inch long. Flowers white, yellow at the base.

*Creeping Jussiaea.* Fl. Aug. Sep. Clt. 1817. Pl. fl. and cr.

15 *J. SWARTZIANA* (D. C. prod. 3. p. 54.) plant herbaceous, creeping, smooth in every part; leaves oblong, obtuse, petiolate; flowers pedicellate, furnished with 2 little scales at the base; tube of calyx terete, attenuated at the base; calycine lobes 5, lanceolate, acute, about equal in length to the petals, which are ovate.  $\gamma$ . B. S. Native of the West Indies and Brazil, in marshes, bogs, and water. *J. repens*, Swartz, obs. p. 172. Oldenlândia, P. Browne, jam. 208. no. 3. Petals yellow. Very like *J. repens*, but differs in the leaves being oblong, not obovate, in the calyx being glabrous, not villous, and in the petals being smaller.

*Swartz's Jussiaea.* Pl. fl. and cr.

16 *J. URUGUAYENSIS* (St. Hil. fl. bras. 2. p. 264.) suffruticose, hairy; leaves linear-lanceolate, acute, mucronulate, quite entire, hairy; the mucrone glandular at the apex; calyx hairy; tube of calyx linear; calycine lobes 5, lanceolate, acute; capsule cylindrical, 5-ribbed; seeds subtriangular.  $\gamma$ . B. S. Native

of Brazil, in the province of Cisplatine, in the mud cast out by the river Uruguay, in that part of the province called Salto-grande. Petals yellow, obovate, emarginate.

*Uruguay Jussiaea.* Pl.  $1\frac{1}{2}$  foot.

17 *J. RAMULOSA* (D. C. prod. 3. p. 54.) plant herbaceous, creeping; stem puberulous, much branched; branches pubescent, leafy; leaves linear-oblong, obtuse, glabrous; flowers on short pedicels, somewhat bicallous at the base; tube of calyx cylindrical, glabrous; calycine lobes 5, lanceolate, acute, about equal in length to the petals.  $\gamma$ . B. S. Native of Cuba. Flowers of a shining yellow. Capsules twice the length of the leaves, terete, tapering to the base.

*Branched Jussiaea.* Pl. cr.

18 *J. FLUTANS*; leaves roundish-spatulate; peduncles axillary, very long, solitary, 1-flowered; flowers decandrous?  $\gamma$ . W. S. Native of Maranhão, floating in rivulets. Flowers yellow.

*Floating Jussiaea.* Pl. fl.

\*\* *Flowers with a 4-cleft (f. 98. a.) calyx, 4 petals (f. 98. d.), and 8 stamens.*

19 *J. INCLINATA* (Lin. fil. suppl. p. 577.) erect, glabrous, rooting at the base; leaves petiolate, obovate, obtuse; peduncles 1-flowered, a little longer than the petioles; calycine lobes ovate, smaller than the petals.  $\odot$ . B. S. Native of Surinam, in marshes. *J. erecta*, Lin. amœn. 8. p. 256. but not of his spec. Lam. dict. 3. p. 330. Petals yellow. Perhaps only an octandrous variety of *J. repens* or *J. Swartziana*.

*Inclinate-stemmed Jussiaea.* Pl. 1 ft.

20 *J. NATANS* (Humb. et Bonpl. pl. equin. 1. p. 16. t. 3.  $\beta$ .) herbaceous, glabrous, floating, supported in the water by a bladder and large white spongy roots, which issue from the ramifications; leaves petiolate, nearly orbicular, quite entire or toothed; flowers pedunculate; lobes of calyx 4-5 acute, shorter than the petals, which are ovate.  $\gamma$ . W. S. Native of New Granada, near Mompo, in pools near the river Magdalena. H. B. et Kunth, nov. gen. amer. 6. p. 99. Flowers white, yellow at the base, octandrous, and decandrous. Capsule cuneated.

*Natant Jussiaea.* Pl. fl.

21 *J. SEDOIDES* (Humb. et Bonpl. pl. equin. 1. p. 13. t. 3.) herbaceous, floating, rooting; leaves on long petioles, disposed in stellate tufts, ovate-rhomboid, obtuse, dentately crenated, clothed with adpressed down beneath; flowers pedicellate, almost bractless; lobes of calyx ovate-oblong, acute; petals roundish-obovate, longer than the lobes of the calyx.  $\gamma$ . W. S. Native of New Granada, in stagnant water between Guadua and Ibaguë. H. B. et Kunth, nov. gen. amer. 6. p. 98. Flowers yellow. Capsule linear-clavate.

*Stonecrop-like Jussiaea.* Pl. floating.

22 *J. SUBACAU' LIS* (Pursh, fl. amer. sept. 1. p. 304.) herbaceous, creeping, glabrous; leaves linear-lanceolate, repandly toothed; flowers pedicellate; petals obovate; alternate filaments very short.  $\gamma$ . B. F. Native of North America, on the banks of the Missouri. Flowers small, yellow, octandrous, solitary in the axils of the leaves.

*Stemless Jussiaea.* Pl. creeping.

23 *J. ACUMINATA* (Swartz, fl. ind. occ. p. 745.) plants herbaceous, ascending, erectish, nearly simple, glabrous; leaves or short petioles, broad-lanceolate, acuminate at both ends; flowers on short pedicels, bractless; lobes of calyx ovate-lanceolate, petals acute, spreading.  $\odot$ . B. H. Native of the south of Jamaica, in low places, and in the island of Arowabisch, ex Meyer prim. esseq. 173. Flowers small, yellow, octandrous, solitary in the axils of the leaves. Capsule elongated, tetragonal.

*Acuminate-leaved Jussiaea.* Pl. ascending.

24 *J. LINIFOLIA* (Vahl. eclog. 2. p. 32.) herbaceous, erect

glabrous; branches spreading, compressed, angular; leaves almost sessile, linear-lanceolate, acuminate at both ends; flowers almost sessile; lobes of calyx lanceolate, attenuated. ☉. B. S. Native of South America. Flowers yellow. Specimens gathered about Demerara, in marshes, agree with the description of Vahl, except in the leaves being more lanceolate, in the capsule being 8-10 lines long, not an inch, and in the petals being obovate-oblong, length of the calyx. The specimens we have collected ourselves in Trinidad, Jamaica, Grand Cayman, and about the Havannah, as also in Brazil, agree perfectly with the plant described by Vahl.

*Fax-leaved Jussiaea.* Fl. July, Aug. Clt. 1824. Pl. 1 ft.

25 *J. ERÉCTA* (Lin. spec. 556. exclusive of syn. of Rumph. and fl. zeyl.) herbaceous, erect, glabrous, branched; stems nearly terete; branches rather angular; leaves on short petioles, lanceolate, acuminate at both ends; flowers sessile, bractless; lobes of calyx acuminate, about equal in length to the petals, which are obovate; capsule cylindrically tetragonal, constricted under the limb of the calyx. ♂. B. S. Native of South America, and all the West India islands, common. Gærtn. fruct. 159. t. 31. Smith in Rees' cycl. no. 8. exclusive of the synonyme of Rheede. Perhaps two plants are confused under the name of *J. erecta*. Perhaps *J. ramosa* of Jacq. in Rehb. hort. bot. 1. t. 75. is distinct from this.

*Var. α, Sebana* (D. C. prod. 3. p. 55.) leaves broad-lanceolate, much longer than the capsules.—Native about Demerara.—Seb. thes. 1. t. 26. f. 3.

*Var. β, Plumeriana* (D. C. 1. c.) leaves narrow-lanceolate, twice the length of the capsules. Native of the West Indies. *J. sessiliflora*, Moc. et Sesse, fl. mex. icon. ined. is probably referrible to this plant. *J. Onagra*, Mill. dict. no. 4. *J. erecta*, Swartz, obs. 173. Lam. ill. t. 280. f. 2.—Plum. ed. Burm. t. 175. f. 2.

*Erect Jussiaea.* Fl. July, Sept. Clt. 1739. Pl. 2 to 3 ft.

26 *J. BLUMEA'NA* (D. C. prod. 3. p. 55.) stem suffruticose, erect, striated, puberulous; leaves linear-lanceolate, rather puberulous; flowers almost sessile; calycine lobes oblong-lanceolate, ciliated; capsule cuneate-oblong, puberulous, about equal in length to the leaves. ♂. B. S. Native of Java. *J. angustifolia*, Blum. bijdr. p. 1132. but not of Lam. Flowers yellow. Said to be nearly allied to *J. erecta*. There is also a variety of this plant with narrow leaves, which are crowded at the tops of the branches.

*Blume's Jussiaea.* Pl. 1 to 2 ft.

27 *J. ALTISSIMA* (Perr. in litt. ex D. C. prod. 3. p. 55.) herbaceous, erect, glabrous, branched; stem angular under the branches; leaves sessile, linear-lanceolate, tapering to both ends; flowers almost sessile, bractless; lobes of calyx acuminate, 3-nerved, exceeding the petals. ♂. B. S. Native of Senegal. Capsule tetragonal, 7-9 lines long.

*Tallest Jussiaea.* Pl. 3 to 4 feet.

28 *J. TENUIFOLIA* (Nutt. in Sillim. journ. amer. 1822. p. 294.) leaves sessile, linear, glabrous, remote, few; flowers sessile, octandrous; capsule 4-angled. ☉. B. F. Native of Eastern Florida.

*Fine-leaved Jussiaea.* Pl. 1 ft.

29 *J. LINEARIS* (Willd. spec. 2. p. 575.) stem erect, branched, smoothish; leaves linear, sessile, and are, as well as the branchlets, rather hispid; flowers sessile; lobes of calyx linear, acutish; tube cylindrical, slender and elongated. ☉. B. S. Native of Guinea. Flowers small. Stem hard, woody, slender. Hairs on leaves short, scattered. Capsule puberulous when examined under a lens, 8-9 lines long, one-half shorter than the leaves.

*Linear-leaved Jussiaea.* Pl. 1 ft.

30 *J. HYSSOPIFOLIA*; herbaceous, erect; stems and branches angular, glabrous; leaves narrow-lanceolate, almost entire, mem-

branous, glabrous; flowers solitary, axillary, pedicellate; lobes of calyx acute, longer than the petals. ☉. B. S. Native of Guinea, in the Island of St. Thomas, in bogs and by the sides of rivers. Petals small, yellow. Sepals 4 or 5.

*Hyssop-leaved Jussiaea.* Pl. 1 ft.

31 *J. TETRAGONA* (Spreng. syst. 2. p. 231.) stem herbaceous, erect, simple, tetragonal; leaves alternate, almost sessile, linear-lanceolate, quite entire, glabrous; stigma quadrifid; capsule subcylindrical. ☉. W. S. Native of China and Cochinchina, in water. *Epilobium tetragonum*, Lour. coch. p. 225. exclusive of the synonymes. The seeds being naked, and the flowers yellow, indicate that it is not a species of *Epilobium*, and the stigma being quadrifid indicates its being a species of *Urotheca* according to Jussieu.

*Tetragonal-stemmed Jussiaea.* Pl. 2 feet.

32 *J. ALATA*; stem erect, branched, quadrangular; angles winged; leaves lanceolate; flowers pedicellate; lobes of calyx 4. ☉. B. S. Native of Maranhão, in boggy places. Flowers yellow.

*Winged-stemmed Jussiaea.* Pl. 1 ft.

33 *J. ANGUSTIFOLIA* (Lam. dict. 2. p. 331. ill. t. 280. f. 3.) herbaceous, erect, glabrous; leaves nearly sessile, linear-lanceolate, tapering to both ends; flowers on very short pedicels; lobes of calyx acuminate; tube cylindrical and elongated. ☉. B. S. Native of Java and the Moluccas.—Rumph. amb. 6. t. 21. f. 1. Petals yellow, obovate, hardly longer than the calyx. There is a species which we have gathered in bogs in Maranhão, and in the province of Bahia, which agrees in almost every particular with this plant, unless that the leaves are more linear, and the flowers perfectly sessile.

*Narrow-leaved Jussiaea.* Pl. 1 ft.

34 *J. SALICIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 99. t. 520.) herbaceous, erect, glabrous; leaves on short petioles, linear, elongated, acuminate, glabrous, puberulous on the nerve beneath; flowers on short pedicels; lobes of calyx ovate; tube elongated, cylindrical, rather angular. ♀. B. S. Native of New Spain, about Guadua. Flowers yellow, octandrous, and decandrous.

*Willow-leaved Jussiaea.* Pl. 1½ ft.

35 *J. FRUTESCENS* (Jacq. fil. sem. hort. vind. 1821.) erect, glabrous, suffrutescent at the base; branches and nerves of leaves clothed with adpressed pubescence; leaves almost sessile, lanceolate-linear, glandularly suberenated; flowers on short pedicels; lobes of calyx ovate, acute, pubescent on the outside; tube cylindrical, 8-furrowed. ♀. B. S. Native country unknown. At the base of the leaves there are sessile glands in place of stipulas. Flowers yellow.

*Shrubby Jussiaea.* Fl. April, Aug. Clt. 1824. Sh. 1½ ft.

36 *J. LONGIFOLIA* (D. C. rapp. pl. rar. 1822. in mem. soc. gen. 2. p. 2. p. 141. pl. rar. hort. gen. 1. p. 12. t. 4.) suffruticose, twiggly, glabrous; stems 3-4-angled; leaves nearly sessile, linear-lanceolate, very long and acute, smoothish, furnished with small glands at the margins beneath; flowers solitary, pedicellate, bibracteate at the base; calyx smoothish, with acute lobes, and a triangular tube; petals obovate, exceeding the lobes of the calyx; capsule clavate, 4-ribbed; seeds 1-celled. ♀. B. S. Native of Brazil, in the province of Rio Janeiro, on the banks of the river Parahyba; and in the province of St. Paul near Fauxina, in marshes. Rehb. ho t. bot. 1. t. 57. Flowers yellow.

*Long-leaved Jussiaea.* Fl. June, July. Sh. 3 to 4 ft.

37 *J. PALMIFOLIA* (St. Hil. fl. bras. 2. p. 261. t. 133.) shrubby; branches terete, glabrous; leaves lanceolate, acute, quite entire, glabrous above, but pubescent on the nerves beneath; flowers pedicellate; calyx puberulous, with acute lanceolate lobes, and a triangular tube; petals obovate, 3 times the length of the calyx; capsule clavate; seeds oblong, 1-celled.

h. B. S. Native of Brazil, in the province of Minas Novas, in humid valleys near Piedade, and in the province of Minas Geraes in meadows, near Palmita. Petals yellow.

*Palmita Jussiea*. Fl. June. Sh. 3 to 5 ft.

38 *J. MYRTIFOLIA* (St. Hil. fl. bras. 2. p. 260.) shrubby, much branched; branches hairy, angularly furrowed at the apex; leaves lanceolate, acute, quite entire, glabrous above, but puberulous beneath; flowers pedicellate; calyx hairy, with an obconical tube and lanceolate acute lobes; petals obovate, slightly emarginate. h. B. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, in sand on the banks of the river Jiquitinhonha. Petals yellow.

*Myrtle-leaved Jussiea*. Fl. May. Sh. 4 ft.

39 *J. LANCEOLATA* (St. Hil. fl. bras. 2. p. 259.) suffruticose; branches red, sulcately angular, puberulous above; leaves lanceolate, acute, quite entire, glabrous; flowers pedicellate; calyx pubescent, with an obconically quadrangular tube, and lanceolate acute lobes; petals obovate, exceeding the calyx; capsule obovate, 4-ribbed; seeds elliptic, 1-celled. h. B. S. Native of Brazil, near Salto Grande, not far from the town of St. Paul. Petals yellow.

*Lanceolate-leaved Jussiea*. Sh. 1 ft.

40 *J. CAPAROSA* (St. Hil. fl. bras. 2. p. 258.) shrubby; branches furrowed at the apex, beset with brownish pili; leaves oblong, ending in a short acumens, quite entire, hairy; flowers pedicellate; calyx hairy, with an obconical 4-ribbed tube, and lanceolate acute segments; petals obovate, slightly emarginate, exceeding the calyx; capsule obconical, obsoletely tetragonal; seeds elliptic, 1-celled. h. B. S. Native of the province of Minas Geraes, near the village of Sucuriu, where it is called *caparosa*. Petals yellow.

*Caparosa Jussiea*. Sh.

41 *J. ELEGANS* (St. Hil. fl. bras. 2. p. 257.) shrubby; branches pubescent and furrowed at the apex; leaves lanceolate, acuminate, obsoletely sinuated, hispid; flowers pedicellate; calyx pubescent, with an obconical 8-ribbed tube, and lanceolate acute lobes; petals obovate, exceeding the calyx. h. B. S. Native of Brazil, in the province of Rio Janeiro, at the river Parahyba, near the village of Uba. Flowers yellow.

*Elegant Jussiea*. Fl. Oct. Sh. 1 to 2 ft.

42 *J. LARUOTTEANA* (St. Hil. fl. bras. 2. p. 256.) shrubby; branches angular, reddish, smoothish; leaves oblong-lanceolate, acute or rounded at the apex and ending in a short point, tapering to the base, obsoletely toothed, smoothish; calyx pubescent, with an obconical quadrangular 4-ribbed tube, and lanceolate acute ciliated lobes; petals obovate, exceeding the calyx; capsule obconical, 8-ribbed; seeds elliptic, 1-celled. h. B. S. Native of Brazil, in the province of Minas Geraes, near Padre-Bento, where it was collected by one Laruotte.

*Laruotte's Jussiea*. Sh. 1 to 2 ft.

43 *J. DECURRENS* (D. C. prod. 3. p. 56.) herbaceous, erect, branched, glabrous; stems winged from the leaves running down them; leaves lanceolate; flowers rather pedicellate; pedicel furnished with 2 glands in the middle; lobes of calyx 3-5-nerved, acute; petals obovate, longer than the calyx; capsule turbinate, winged at the angles. W. F. Native of Georgia and Carolina, and probably of Virginia, in watery shady places. J.

FIG. 98.

erecta, Abbot. insect. georg. t. 40. ex Pursh, fl. amer. sept. 1. p. 304. but not of Lin. *Ludwigia Jussieoides*, Michx. fl. bor. amer. 1. p. 89. but not of Lam. *Ludwigia decurrens*, Walt. car. 89. Ell. sketch. 1. p. 217. Flowers yellow. There are varieties of this species with ovate and linear-lanceolate leaves, and sessile and pedicellate flowers.

*Decurrent-leaved Jussiea*. Pl. 1 ft.

44 *J. PALUSTRIS* (Meyer, prim. esseq. 173.) stem erect, suffruticose, winged; upper leaves lanceolate, lower ones rather spatulate, glabrous; pedicels short; lobes of calyx lanceolate, veined, about equal in length to the petals, which are oval; tube of calyx bluntly tetragonal. ♂. B. S. Native of marshes about Essequibo. Flowers yellow.

*Marsh Jussiea*. Pl. 1 ft.

45 *J. ANASTOMOSANS* (D. C. prod. 3. p. 56.) arboreous; branches deflexed, red, smoothish, angular towards the apex; leaves lanceolate, acute, quite entire, shining, smoothish; lateral nerves running into a parallel marginal one; flowers pedicellate; calyx smoothish, with an obconical quadrangular tube, and lanceolate acute lobes, furnished with 2 bracteas at the base; petals obovate, rounded, about equal in length to the calycine lobes. h. S. Native of Brazil, in the province of Minas Geraes, on the mountain called Serra de Nossa Senhora Mui dos Uomens. Stem as thick as a man's arm. St. Hil. fl. bras. 2. p. 255. Flowers yellow.

*Anastomosing-leaved Jussiea*. Sh. 10 to 12 ft.

46 *J. NERVOSA* (Poir. suppl. 3. p. 199.) branches angular, and are, as well as the nerves of the leaves, beset with short velvety down; leaves sessile, lanceolate, acute, glabrous, with the nerves rather prominent beneath; pedicels 1-flowered, longer than the ovary, furnished with 2 scales at the apex; lobes of calyx 5-nerved, acuminate, about equal in length to the tube, which is rather turbinate and angular. h. B. S. Native of Cayenne. Top of ovary protruding into an 8-furrowed truncate cone.

*Nerved-calyxed Jussiea*. Sh. 2 feet.

47 *J. LIGSTRIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 100.) herbaceous, erect, smoothish; leaves on short petioles, oblong, acute; pedicels 1-flowered, bibracteolate at the apex; lobes of calyx ovate, acute, 5-nerved; tube quadrangular, attenuated at the base; petals roundish, longer than the calyx. W. F. B. S. Native of Mexico. Plum. ed. Burm. t. 175. f. 1. ex Kunth. Flowers yellow.

*Privet-leaved Jussiea*. Pl. 1 to 2 ft.

48 *J. MAYPURENSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 100. t. 531.) stem shrubby, glabrous; leaves on short petioles, oblong-lanceolate, acute, stiffish, puberulous on the nerves and veins beneath; pedicels 1-flowered, bibracteolate at the apex; lobes of calyx ovate, acute, somewhat 5-nerved, about equal in length to the petals, which are ovate; tube tetragonal, obconical. h. B. S. Native in humid places, on the banks of the Orinoco near Maypures. Petals yellow. Anthers twisted. Bracteoles linear.

*Maypures Jussiea*. Pl. 1 to 2 ft.

49 *J. OVALIFOLIA* (Sims, bot. mag. t. 2530.) plant erect, branched, clothed with villous pubescence; branches tetragonal, a little winged; leaves nearly sessile, elliptic, acuminate, nerved; flowers sessile; lobes of calyx ovate, acuminate, 3-nerved, about equal in length to the petals, which are orbicular; tube elongated, tetragonal. ♂. B. S. Native of Madagascar. Flowers yellow. Genitals very short.

*Oval-leaved Jussiea*. Fl. Aug. Sep. Clt. 1810. Pl. 1 to 2 ft.

50 *J. BURMAENSI* (D. C. prod. 3. p. 57.) stem erect, nearly terete; when young rather villous, but at length glabrous; leaves lanceolate, acuminate at both ends; flowers on short pedicels, bibracteolate; lobes of calyx ovate, acute, 3-nerved; tube and

capsule cylindrical, pubescent, slender.—Native of the East Indies. *Ludwigia perennis*, Burm. fl. ind. 37. *J. suffruticosa*, Lin. spec. 553.? Blume, bijdr. p. 1133. Upper leaves alternate. Petals obovate, emarginate, flabellately pinnate, a little longer than the calyx. Filaments villous at the base. Allied to *J. villosa*.

*Burmah's Jussiaea*. Pl. 1 ft.

51 *J. VILLOSA* (Lam. dict. 3. p. 331.) stem suffruticose, villous; leaves almost sessile, lanceolate, rather villous on both surfaces; flowers sessile; calyx villous; lobes lanceolate; tube cylindrical.  $\frac{1}{2}$ . B. S. Native of the East Indies and the Island of Timor. *J. exaltata*, Roxb. hort. beng. 33. Hamilt. in Lin. trans. 14. p. 303. Andr. bot. rep. 621. — Rheed. mal. 2. t. 50. but the capsule is dilated at the apex in the figure of Rheede, not cylindrical. The nerves of the capsule are 8, filiform and permanent, as well as in the two following species.

*Villous Jussiaea*. Pl.  $1\frac{1}{2}$  ft.

52 *J. OCTONEURVA* (Lam. dict. 3. p. 332.) herbaceous, erect, glabrous; leaves narrow-lanceolate, acuminate; flowers sessile; lobes of calyx lanceolate, acute; tube cylindrical, 8-nerved, striated, shorter than the floral leaves; petals obovate, emarginate, exceeding the calycine lobes.  $\frac{1}{2}$ . B. S. Native of the West Indies, in humid or watery places. (*Eriothera octovalvis*, Jacq. amer. 102. t. 70. exclusive of the synonyme of Plum. Lam. ill. t. 280. f. 1. Flowers yellow.

*Eight-nerved-calyx Jussiaea*. Pl. 2 to 3 ft.

53 *J. OCTOFILA* (D. C. prod. 3. p. 57.) herbaceous, erect, downy; leaves lanceolate, acuminate; flowers on short pedicels, furnished with 2 bracteoles at the top of the pedicel, or on the tube; lobes of calyx ovate-lanceolate, 5-nerved; tube cylindrically obconical, 8-nerved, attenuated at the base.—Native of the West Indies and Mexico, in watery places. Plum. ed. Burm. t. 175. f. 1. *J. octovalvis*, Swartz, obs. 142. The 8 nerves of the capsule are permanent and filiform. This species differs from the preceding in being downy, not glabrous, in the capsule being attenuated at the base, not cylindrical, in the flowers being pedicellate, not sessile, and furnished with two bracteas, not naked. Petals obovate, longer than the calyx.

*Eight-threaded Jussiaea*. Pl.  $1\frac{1}{2}$  ft.

54 *J. SCABRA* (Willd. enum. 1. p. 449.) stem suffruticose at the base, hairy; branches angular at the apex; leaves oblong, acute, quite entire, hairy; flowers almost sessile; calyx hairy, with a linear tetragonal tube, and lanceolate acute lobes; petals obovate, 3 times the length of the calyx; capsule linear, 8-ribbed; seeds roundish, 2-celled.  $\frac{1}{2}$ . B. S. Native of Brazil, in the province of Rio Janeiro, at the river Parahyba near Uba. *J. hirta*, Lam. dict. 3. p. 331. but not of Vahl.—*J. Maragravi*, D. C. prod. 3. p. 58.—Camaranbaia, Maragr. bras. p. 30. with a figure.

*Scabrous Jussiaea*. Fl. Oct. Clt. 1816. Sh. 2 to 3 ft.

55 *J. HIRTA* (Vahl. eclog. 2. p. 31.) shrubby, erect, hairy; leaves on very short petioles, lanceolate, attenuated, hairy beneath; pedicels bractless, shorter than the ovary; lobes of calyx ovate, acute, 5-7-nerved at the base; tube obconical, 4-nerved; petals obovate, longer than the calyx.  $\frac{1}{2}$ . B. S. Native of South America. (*Eriothera hirta*, Lin. spec. 491.—Plum. ed. Burm. t. 174. f. 2. Flowers yellow.

*Hairy Jussiaea*. Fl. July, Aug. Clt. 1816. Sh. 1 to 2 ft.

56 *J. MACROCARPA* (H. B. et Kunth, nov. gen. amer. 6. p. 102. t. 533.) suffruticose, erect; stem and branches villous; leaves oblong, acuminate, narrowed at the base, clothed with adpressed hairs on both surfaces; pedicels length of the ovary, bibracteolate at the apex; lobes of calyx ovate, acute, 5-7-nerved; tube cylindrically oblong, attenuated at the base, obconical; petals obovate, longer than the calyx.  $\frac{1}{2}$ . B. S. Native of New Granada, in humid places near Guadua. This

species differs from the preceding in the pedicels being furnished with two caducous foliaceous linear bracteas, but perhaps only a variety.

*Long-fruited Jussiaea*. Shrub 1 to 2 feet.

57 *J. PARVIFLORA* (St. Hil. fl. bras. 2. p. 263.) suffruticose; branches downy, and rather angular at the apex; leaves linear-lanceolate, acute, quite entire, rather scabrous; flowers almost sessile; calyx puberulous, with a narrow tetragonal tube, and lanceolate acute lobes; petals obovate, equal in length to the lobes of the calyx, pale yellow; capsule linear, 8-ribbed; seeds roundish, bilocular.  $\frac{1}{2}$ . B. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, in sand on the banks of the river Jiquitinhonha, also in marshes. Petals pale yellow.

*Small-flowered Jussiaea*. Sh. 2 ft.

58 *J. SERICEA* (St. Hil. fl. bras. 2. p. 560.) suffruticose, branched; branches angular at the apex, and densely clothed with yellowish pili; leaves lanceolate, acute, quite entire, clothed with silky tomentum on both surfaces; flowers pedicellate; calyx clothed with silky pili, with an obconical 4-ribbed tube, and lanceolate acute lobes; petals obcordate.  $\frac{1}{2}$ . B. S. Native of Brazil, in the province of Minas Geraes. Petals yellow.

*Silky Jussiaea*. Sh. 1 to 2 ft.

59 *J. TOMENTOSA* (St. Hil. fl. bras. 2. p. 254.) shrubby, a little branched; branches angular at the apex, and densely clothed with brownish tomentum; leaves obovate or elliptic, mucronulate, dentately serrated, pilose above, but densely clothed with grey tomentum beneath; flowers pedicellate; calyx hairy, with an obconical obsoletely 5-furrowed tube, and lanceolate acute segments; petals obovate, slightly emarginate; capsule obconical; seeds elliptic, 1-celled.  $\frac{1}{2}$ . B. S. Native of Brazil, in the province of Minas Geraes, near the town of Paracatu. Flowers yellow, crowded at the tops of the branches. In the character the calyx is said to be 4-cleft, but in the description 5-cleft; the last is most probably correct, as the stamens are said to be 10; if such be the case the plant should have been ranged in the first section.

*Tomentose Jussiaea*. Sh. 3 ft.

60 *J. MOLLE* (H. B. et Kunth, nov. gen. amer. 6. p. 102.) herbaceous? erect; branches villous; leaves ovate, acute at the base and apex, hairy on both surfaces, soft beneath; pedicels villous; calyx villous; lobes ovate, acute; tube obovate.  $\frac{1}{2}$ . B. S. Native of Cumana, in humid places. Petals and stamens unknown.

*Soft Jussiaea*. Pl. 1 ft.

61 *J. VELUTINA*; herbaceous, erect, branched, downy; leaves elliptic-lanceolate, attenuated at both ends; flowers on short pedicels, almost sessile.  $\frac{1}{2}$ . B. S. Native of Guinea, in the Island of St. Thomas, in marshes and on rivers' banks. Flowers yellow, middle-sized.

*Velvety Jussiaea*. Pl.  $1\frac{1}{2}$  ft.

62 *J. FRUTICOSA* (D. C. prod. 3. p. 57.) stem shrubby, much branched; leaves lanceolate, quite entire, alternate, hairy; flowers pedicellate.  $\frac{1}{2}$ . B. S. Native of Cochinchina, in cultivated fields. (*Eriothera fruticosa*, Lour. coch. p. 226. Flowers yellow. Calyx columnar, crowned by the calyx. Seed naked. This plant is referred by Sprengel to *J. suffruticosa* of Lin. but that species is hardly known.

*Shrubby Jussiaea*. Sh. 6 feet.

63 *J. SUFFRUTICOSA* (Lin. spec. 555.) erect, villous; flowers pedicellate, octandrous.  $\frac{1}{2}$ . B. S. Native of the East Indies. The synonymes attached to this species by Linnaeus are perfectly erroneous.

*Suffruticose Jussiaea*. Fl. Aug. Sep. Clt. 1808. Pl.  $1\frac{1}{2}$  ft.

† *Species hardly known.*

64 *J. HIRSU'TA* (Mill. dict. no. 5.) stem erect, simple, hairy;

leaves lanceolate; flowers large, sessile, yellow, decandrous. † B. S. Native about Campeachy.

*Hairy Jussiaea.* Sh. 3 ft.

65 *J. PUBESCENS* (Lin. spec. 555.) erect, villous; flowers sessile, decandrous, pentapetalous.—Native of South America.

*Pubescent Jussiaea.* Pl. 2 ft.

66 *J. TENELLA* (Burm. fl. ind. p. 103. t. 35. f. 5.) glabrous; leaves opposite, linear-lanceolate; flowers pedicellate, decandrous, pentapetalous.—Native of Java.

*Weak Jussiaea.* Pl. 1 ft.

*Cult.* All the species of this genus are either water or bog plants, and therefore require to be kept moist. The species, natives of bogs, may be grown in pots, under which may be placed pans of water. The floating aquatic kinds should be grown in tubs, filled with water, with a layer of mould in the bottom, in which the plants may root. All the species, natives of warm climates, require a great degree of heat to bring them to flower. The *J. grandiflora* is the only hardy aquatic kind; it grows best when planted in a shallow pond or rivulet.

**XI. PRIEUREA** (this genus is dedicated to M. Le Prieur, the discoverer of the plant at Senegal). D. C. prod. 3. p. 58.

**LIN. SYST.** *Triandria, Monogynia*. Tube of calyx cylindrical, elongated, adhering to the ovary; limb 3-parted; segments lanceolate, acute, permanent. Petals 3, small. Stamens 3, alternating with the lobes of the calyx; filaments filiform, short. Style short. Seeds small. † Herb glabrous, dwarf, branched, of an obscure green colour. Leaves alternate, oblong-linear, acute, entire. Flowers axillary, solitary, on very short pedicels.

1 *P. SENEGALENSIS* (D. C. l. c.). Native of Senegal, in bogs. Habit almost of *Jussiaea ramulosa*.

*Senegal Prieurea.* Pl. dwarf.

*Cult.* For culture and propagation see *Jussiaea*.

**XII. LUDWIGIA** (so named by Linnaeus in honour of Christian Gottlieb Ludwig, once Professor of Medicine at Leipsic, author of *Definitiones Plantarum*, 1 vol. 8vo. Leipsic, 1737, and numerous other botanical works). Roxb. fl. ind. 1. p. 440. D. C. prod. 3. p. 58.—*Ludwigia* species of Lin. and others.

**LIN. SYST.** *Tetrandria, Monogynia*. Tube of calyx cylindrical, adhering to the ovary; limb 4-parted, the lobes almost permanent. Petals 4, alternating with the lobes of the calyx. Stamens 4, opposite the lobes of the calyx. Apex of ovary or base of style pyramidal, tetragonal, 4-furrowed, glabrous in the furrows, and villous on the angles; the stamens lying in the furrows. Style filiform, pyramidal from the apex. Stigma capitate, 4-furrowed, or 4-lobed. Capsule turbinate, or very much elongated, 4-celled, 4-valved, crowned by a cone-formed pyramid. Seeds numerous.—Branched Indian herbs. Leaves alternate, linear, on very short petioles, quite entire. Flowers axillary, almost sessile, yellow, furnished with two bracteoles at the base of the calyx. This genus is intermediate between *Jussiaea* and *Isnardia*; from the former, it is distinguished in the stamens being equal in number to the petals, not double that number; from the latter, in the capsule being elongated and ending in a cone-formed pyramid at the base of the style. The genus *Ludwigia* of Linnaeus is the same as *Isnardia*.

1 *L. JUSSIEOIDES* (Lam. dict. 3. p. 588. but not of Michx.) erect, glabrous; leaves lanceolate-linear, acuminate at both ends; flowers pedicellate, almost bractless; capsule elongated, nearly terete.—Native of the Mauritius and the East Indies. Stems terete, branched. Branches and leaves puberulous, when

examined under a lens. Flower-bud ovate, acuminate. Capsule an inch long, but hardly a line in breadth. Perhaps the same as *L. alternifolia* of Burm. exclusive of the synonymes.

*Jussiaea-like Ludwigia.* Pl. 1 foot.

2 *L. FRUTICOSA* (Blume, bijdr. p. 1133.) stem erect, glabrous, shrubby, pentagonal; leaves lanceolate, bluntly acuminate, with finely ciliated margins; flowers twin or crowded, axillary, sessile; capsule linear, tetragonal. † B. S. Native of Java, near rivers and rivulets. There is a variety with narrow leaves. Allied to *L. Jussiaeoides*.

*Shrubby Ludwigia.* Shrub 1 foot?

3 *L. LEUCORHIZA* (Blume, l. c.) stem erect, glabrous, herbaceous, pentagonal; leaves alternate, linear-lanceolate, bluntish, with the margins finely ciliated; flowers at first capitate, but at length axillary, solitary, and sessile; capsule elongated, clavate, tetragonal.—Native of Java, about Buitenzorg at the river Tjelimong. Root white, fusiform. Allied to *L. fruticosa*.

*White-rooted Ludwigia.* Pl.  $\frac{1}{2}$  foot.

4 *L. LYTHROIDES* (Blum. bijdr. 1134.) stems erect, glabrous, pentagonal; leaves linear, bluntish; flowers pedicellate, furnished with 2 bracteas at the top of the pedicels; capsule tetragonal, rather turbinate, short.—Native of the East Indies. Branches angular. Leaves oblong-linear, acute at the base. Bracteas one half shorter than the capsule. Pyramid of ovary depressed at the base of the style. Stigma large, 4-lobed.

*Lythrum-like Ludwigia.* Pl.  $\frac{1}{2}$  foot.

5 *L. ERIGATA* (Lin. mant. p. 40.) stem erect, smooth; leaves alternate, lanceolate; pedicels usually tern, 1-flowered; capsule subcubical, 4-angled; petals small. ☉. W. H. Native of the East Indies. *L. triflora*, Lam. dict. 3. p. 613. *L. alternifolia*, Burm. fl. ind. p. 36. exclusive of the synonymes. There are two plants in Burmann's herbarium under this name, one referable to *L. Jussiaeoides* and the other *L. erigata*.

*Erigated Ludwigia.* Pl. 1 foot.

6 *L. PARVIFLORA* (Roxb. fl. ind. 1. p. 440.) diffuse, glabrous; flowers sessile or on short pedicels, bibracteolate at the base; capsule linear, somewhat tetragonal. ☉. B. H. Native of Bengal. Plant small, branched. Petals oblong, length of the calycine lobes. Bracteoles small.

*Small-flowered Ludwigia.* Fl. July, Aug. Clt. 1825. Pl.  $\frac{1}{2}$  foot.

7 *L. DIFFUSA* (Hamilt. in Lin. trans. 14. p. 301.) diffuse, glabrous; leaves lanceolate; flowers almost sessile; capsule prismatic, tetragonal; angles blunt; peduncles one half shorter than the leaves. ☉. W. H. Native of the East Indies, in water. Rheed. mal. 2. t. 49. *Jussiaea caryophyllæa*, var. *a*. Lam. dict. 3. p. 331.

*Diffuse Ludwigia.* Pl. diffuse.

8 *L. PROSTRATA* (Roxb. fl. ind. 1. p. 440.) lower branches prostrate and rooting; flowers sessile, solitary, or numerous in the axils of the leaves; capsules filiform; seeds disposed in one series in each cell. ☉. H. Native of Pegu.

*Prostrate Ludwigia.* Fl. Jul. Aug. Clt. 1816. Pl. 1 to 2 ft.

† *Species hardly known.*

9 *L. PERENNIS* (Lin. spec. ed. 2. p. 173.) flowers pedicellate; capsule cylindrical; stems diffuse; leaves lanceolate. ☉. W. S. Native of the East Indies, and Ceylon. *Ludwigia*, Lin. fl. zeyl. no. 66. *Ludw. oppositifolia*, Lin. syst. veg. p. 135. This species is hardly known, as Linnaeus, in his spec. pl. says the leaves are opposite, and in his fl. zeyl. alternate, and cites the figure in Rheed. mal. 2. t. 49. for his plant, and at the same time excludes it from his mant.

*Perennial Ludwigia.* Pl. prostrate.

10 *L. TRIFLORA* (Burm. fl. ind. p. 37.) erect, herbaceous,

smooth; leaves opposite or tern, petiolate, ovate-lanceolate; flowers nearly terminal, pedicellate. ☉? H. Native of Java. *Isnardia trifolia*, Poir. suppl. 3. p. 188. There is no specimen of this plant in the herbarium of Burmann, and therefore the plant is truly doubtful.

*Three-flowered Ludwigia*. Pl. 1 foot.

*Cult.* None of the species of *Ludwigia* are worth cultivating, unless in botanic gardens. The perennial species should be grown in small pots, placed in pans of water. The seeds of annual species may be reared in a hot-bed, and afterwards planted out in the open border, in a moist situation.

XIII. ISNARDIA (so named by Linnæus in memory of M. Antoine Dante Isnard, member of the Academy of Sciences, and who published descriptions of some plants in their memoirs for 1716. &c.). D. C. prod. 3. p. 59.—*Isnardia* and *Ludwigia*, Lin. gen. no. 156. and 153. Juss. gen. p. 333. and p. 319. Lam. ill. t. 77.—*Ludwigia*, Ell. sketch. 1. p. 214. Spreng. syst. 1. p. 444. but not of Roxb.—*Dántia*, Du Pet. Th. gen. p. 49.

*LIN. SYST.* *Tetrándria*, *Monogýnia*. Tube of calyx ovate or subcylindrical (f. 99. a. d.), short, adhering to the ovary; limb 4-parted, permanent (f. 99. b.). Petals sometimes 4, alternating with the lobes of the calyx, sometimes only rudiments of petals, and sometimes wanting altogether. Stamens 4 (f. 99. c.) in front of the calycine lobes. Style filiform from the base, deciduous; stigma capitate. Capsule obovate or nearly cylindrical (f. 69. f.), tetragonal, 4-valved, 4-celled, many-seeded, opening at the cells.—Aquatic or marsh herbs. Leaves entire, alternate, or opposite. Flowers axillary, sessile.

SECT. I. LUDWIGIARIA (see *Ludwigia* for derivation). D. C. prod. 3. p. 60.—*Ludwigia*, Lin. Petals 4, sometimes larger than the calycine lobes, or equal in length to them, and sometimes smaller.

\* *Leaves alternate.*

1 I. ALTERNIFOLIA (D. C. prod. 3. p. 66.) stem erect, branched, smoothish; leaves alternate, lanceolate, rather scabrous on the margins, and hoary beneath; capsule obovate-globose, tetragonal, with the angles winged; calycine lobes large, coloured; petals a little longer than the calyx. 2. B. H. Native of Virginia and Carolina, in marshes. Pluk. alm. t. 203. f. 2. amalth. t. 412. f. 1. *Ludwigia alternifolia*, Lin. spec. 173. Lam. ill. t. 77. Gært. fr. 1. p. 31. f. 8. *Ludwigia macrocarpa*, Michx. fl. bor. amer. 1. p. 89. *Ludwigia ramosissima*, Walt. *Ludwigia microcarpa*, Link. enum. p. 141. Habit of *Jussiaea octandra*. Petals oval, yellow. Root emetic, and is called *Bonman's root*.

*Var. β, salicifolia* (D. C. l. c.) flowers on very short pedicels. 2. B. H. Native of Carolina. *Ludwigia salicifolia*, Poir. suppl. 3. p. 512. Lateral nerves of leaves confluent near the margins, giving the leaves the appearance of being 3-nerved.

*Var. γ, uniflora* (D. C. l. c.) stem simple; flower terminal.—Native of New Jersey. *Ludwigia uniflora*, Rafin. in Desv. journ. bot. 1. p. 224.

*Alternate-leaved Isnardia*. Fl. June, Jul. Clt. 1752. Pl. 2 ft.

2 I. LINEARIS (D. C. prod. 1. c.) stem erect, branched, glabrous, angular above; leaves alternate, linear, acute, glabrous; capsule oblong-turbinate, somewhat tetragonal, longer than the lobes of the calyx, which are linear-lanceolate; petals longer than the calyx. ☉. W. H. Native of Carolina, in ditches and marshes. *Ludwigia linearis*, Walt. car. p. 89. Pursh, fl. amer. sept. 1. p. 110. Ell. sketch. 1. p. 215. *Ludwigia angustifolia*, Michx. fl. bor. amer. 1. p. 88. *Ludwigia angustifolia β*, Poir.

VOL. II.

suppl. 3. p. 513. Flowers sessile, solitary, axillary. Petals obovate, yellow.

*Linear-leaved Isnardia*. Pl. 2 to 5 feet.

3 I. VIRGATA (D. C. l. c.) stem erect, twiggy, rather pubescent; leaves linear, obtuse, glabrous; flowers pedicellate, disposed in an elongated, spicate, nearly naked, raceme; capsule globose, tetragonal; petals length of calyx. 2. H. Native of Lower Carolina, in dry sandy woods. *Ludwigia virgata*, Michx. fl. bor. amer. 1. p. 89. *Ludwigia lutea*, Bosc. ined. *Ludwigia virgata*, Ell. sketch. 1. p. 216. is perhaps different. Petals yellow. Lobes of calyx, when in flower, longer than the tube.

*Twiggy Isnardia*. Pl. 1 foot.

4 I. HIRSUTA (Rœm. et Schultes, syst. 3. p. 477.) stem erect, branched, rather diffuse, hairy; leaves alternate, lanceolate, rather hairy on both surfaces; capsule globose, tetragonal; petals rather longer than the calyx. 2. B. H. Native from New Jersey to Carolina, in swamps. *Ludwigia pilosa*, Walt. car. 89. Ell. sketch. 1. p. 216. Lam. dict. 3. p. 587. Flowers axillary, pedicellate, yellow.

*Var. β, permollis* (D. C. prod. 3. p. 60.) leaves obtuse; flowers on short pedicels. 2. B. H. *Ludwigia permollis*, Bart. fl. p. 52.

*Hairy Isnardia*. Pl. 2 feet.

5 I. MOLLIS (Poir. suppl. 3. p. 188.) stem erect, much branched, villous; leaves lanceolate-oblong; flowers rather crowded; petals small, shorter than the calyx; capsule globose. 2. B. H. Native of Carolina; frequent in bogs. *Ludwigia mollis*, Michx. fl. bor. amer. 1. p. 90. Ell. sketch. 1. p. 214. *Ludwigia rudis*, Walt. car. p. 89. *Ludwigia hirtella*, Rafin. med. rap. 5. p. 356.

*Soft Isnardia*. Pl. 1 to 2 feet.

6 I. CAPITATA (D. C. prod. 3. p. 60.) stem erect, twiggy, glabrous, but the stolons are creeping and pubescent; leaves alternate, linear-lanceolate, glabrous, acute at the apex and rounded at the base; heads spicate, terminal; petals shorter than the calyx; capsule nearly globose; calycine lobes short. 2. B. H. Native of Lower Carolina, in swamps. *Ludwigia capitata*, Michx. fl. bor. amer. 1. p. 90. *Ludwigia suffruticosa*, Walt. car. p. 90. Petals yellow. Roots creeping.

*Capitate-flowered Isnardia*. Pl. ½ to 1 foot.

\* \* *Leaves opposite.*

7 I. PEDUNCULOSA (D. C. prod. 3. p. 60.) stems procumbent, rooting, pubescent; leaves opposite, lanceolate; pedicels axillary, very long; capsule oblong-clavate; petals exceeding the calycine lobes, which are lanceolate. 2. B. H. Native of Virginia and Lower Carolina, in swamps near the sea. *Ludwigia pedunculosa*, Michx. fl. bor. amer. 1. p. 88. Ell. sketch. 1. p. 215. *Ludwigia acuata*, Walt. fl. car. 86. Petals yellow.

*Stalked-flowered Isnardia*. Pl. procumbent.

8 I. REPENS (D. C. l. c.) stems creeping, glabrous; leaves opposite, obovate; pedicels axillary, shorter than the leaves; petals ovate, much smaller than the calyx; capsule oblong, tetragonal. 2. B. S. Native of Jamaica, among stones on the banks of rivers. Habit of *I. palustris*. *Ludwigia repens*, Swartz, fl. ind. occ. 1. p. 273. icon. t. 8.

*Creeping Isnardia*. Pl. creeping.

SECT. II. DÁNTIA (see genus for the derivation). D. C. prod. 3. p. 61.—*Dántia*, Pet. Th. gen. 49.—*Isnardia*, Lin. gen. 156. Petals wanting.

\* *Leaves opposite.*

9 I. PALUSTRIS (Lin. spec. 175.) stems procumbent, rooting, glabrous; leaves opposite, ovate, acute; flowers axillary, solitary.

tary, sessile, apetalous. ☉. W. H. Native of Europe, Siberia, and Persia, in marshes and slow running water; in England, in a pool at Buxstead, Sussex. Schkuhr, handb. 1. t. 25. Hook. in engl. bot. suppl. t. 2593. *Dántia palústris*, Pet. Th. l. c. (f. 99.)

*Var. β, Americana* (D. C. l. c.) leaves more acuminate at both ends. ☉. W. H. Native of North America, in marshes and water, from Canada to Georgia; and of Mexico. *Ludwigia apétala*, Walt. car. 89. *Ludwigia útida*, Michx. *L. palústris*, Torrey.

*Marsh Isnardia*. Fl. July. Britain. Pl. creeping.

• • *Leaves alternate.*

10 *I. ALATA* (D. C. prod. 3. p. 61.) stems diffuse, branched, glabrous, distinctly angular and winged; leaves lanceolate-cuneate, decurrent, glabrous; flowers sessile, axillary, apetalous; capsule cubical, a little winged. ☿. B. H. Native of North America, in Sullivan Island. *Ludwigia alata*, Ell. sketch. 1. p. 212.

*Winged-stemmed Isnardia*. Pl. diffuse.

11 *I. MICROCARPA* (Poir. suppl. 3. p. 188.) stems procumbent, a little winged, quite smooth; leaves alternate, obovate-spatulate, obscurely glandular-toothed on the margins; flowers axillary, sessile, apetalous; capsule small, rather square. ☉. B. H. Native of Lower Carolina, in swamps. *Ludwigia microcarpa*, Michx. fl. bor. amer. 1. p. 88. *Ludwigia glandulosa*, Pursh. fl. bor. amer. 1. p. 111. Habit almost of a species of *Ammannia*.

*Small-fruited Isnardia*. Pl. procumbent.

12 *I. SPHEROCARPA* (D. C. prod. 3. p. 61.) stem erect, branched, glabrous, hardly angular; leaves alternate, linear-lanceolate, acute at both ends, when young rather downy; flowers axillary, sessile, apetalous; capsule globose, small, pubescent. ☿. B. H. Native of South Carolina, about Orangeburgh. *Ludwigia sphaerocarpa*, Ell. sketch. 1. p. 213.

*Round-fruited Isnardia*. Pl.  $\frac{1}{2}$  foot.

13 *I. CYLINDRICA* (D. C. l. c.) stem erect, branched, glabrous, subangular; leaves alternate, lanceolate, hardly denticulated; flowers axillary, sessile; lobes of calyx subserrated; capsule cylindrical. ☿. B. H. Native of Georgia, and perhaps of South Carolina. *Ludwigia cylindrica*, Ell. sketch. 1. p. 13. *Jussieu's brachycarpa*, Lam. dict. 3. p. 331. *Ludwigia heterophylla*, Poir. suppl. 3. p. 512.?

*Cylindrical-fruited Isnardia*. Pl. 1 foot.

14 *I. LANCEOLATA* (D. C. prod. 3. p. 61.) stem erect, twiggy, angular, glabrous; leaves narrow-lanceolate, glabrous, rather decurrent; flowers sessile, axillary, apetalous; capsule cubical, winged. ☿. B. H. Native of Georgia and Carolina, in marshes. *Ludwigia lanceolata*, Ell. sketch. 1. p. 213.

*Lanceolate-leaved Isnardia*. Pl. 1 foot.

† *Species hardly known.*

15 *I. ? RAMOSA* (D. C. prod. 3. p. 61.) stems procumbent, rooting, branched, glabrous; leaves opposite, linear-lanceolate; flowers nearly sessile, axillary. ☿. B. H. Native country unknown. *Ludwigia ramosissima*, Roth. cat. 3. p. 24. ? but not of Walt. Petals white, ex Willd. one half shorter than the calyx, ex Roth. Capsule elliptic, ex Willd. tetragonal, ex Roth. Stipules joined to the leaves, ex Roth. Perhaps the plant of Willd. is the same as that of Roth.

*Branched Isnardia*. Pl. creeping.

FIG. 99.

16 *I. AURANTIACA* (D. C. l. c.) stem erect, branched; leaves sessile, ovate-lanceolate, alternate, acute, glabrous; flowers axillary; petals length of calyx.—Native of Newcastle, Delaware, Chester, and Pennsylvania, in North America. *Ludwigia aurantiaca*, Rafin. in Desv. journ. 1. p. 224. Flowers orange-coloured. The rest unknown.

*Orange-coloured-flowered Isnardia*. Pl. 1 to 2 feet.

*Cult.* None of the species are worth cultivating, except in botanical gardens. Their culture and propagation is the same as that for *Ludwigia*, see p. 697.

#### Tribe V.

**CIRCEÆÆ** (plants agreeing with *Circea* in important characters). D. C. prod. 3. p. 61. Tube of calyx not drawn out beyond the ovary, but dividing immediately (f. 100. a.), deciduous. Fruit capsular, ovate-globose (f. 100. c.). Stamens 2, one of which is usually converted into a petal (f. 100. b.).—Herbs or subshrubs. Leaves opposite, petiolate, cordate, or ovate. Flowers racemose.

**XIV. LOPEZIA** (in honour of Thomas Lopez, a Spanish botanist, who is said to have directed his attention to the natural history of the New World). Cav. icon. 1. p. 12. t. 18. Juss. gen. 3. p. 30. t. 30. f. 4. Schrank, pl. rar. hort. mon. t. 20. nov. act. bonn. 9. p. 90. D. C. prod. 3. p. 62.—Pisaura, Bonat. mon. 1793.

**LIN. SYST.** *Monandria, Monogynia*. Limb of calyx 4-parted (f. 100. g.), deciduous. Petals 4, irregular (f. 100. h.). Stamens 2, only 1 of which bears an anther (f. 100. c.), the other opposite, sterile, petal-formed (f. 100. b.), usually of a different colour from the true petals. Stigma capitate (f. 100. d.). Capsule naked, subglobose (f. 100. e.), 4-celled, divided into 4 valves at the apex of the cells; valves adnate to the central placenta by the disseminations. Seeds small, numerous.—Erect herbs or subshrubs. Leaves toothed, alternate, rarely opposite. Racemes terminating the stem and branches. Flowers small, pedicellate, purple, or red.

1 *L. RACEMOSA* (Cav. icon. 1. p. 12. t. 18.) herbaceous, nearly glabrous; leaves alternate, ovate-lanceolate, serrated, tapering to the base; racemes terminating the branches; bractees much shorter than the pedicels. ☉. H. Native of Mexico. Curt. bot. mag. 254. Bonpl. nav. t. 25. *L. Mexicana*, Jacq. icon. rar. t. 203. *Pisaura automorpha*, Bonato, mon. 1793. with a figure. Sterile stamen white. Petioles ciliated.

*Racemose-flowered Lopezia*. Fl. Aug. Oct. Clt. 1792. Pl. 1 to  $1\frac{1}{2}$  foot.

M'Phail says, "The names of the *peach* trees fit for forcing are the *Magdaleine*, *Double Montagne*, *Royal George*, and *Noblesse*. Nicol recommends the following:—1 *Red Magdalen.* 2 *White Magdalen.* 3 *Royal George.* 4 *Noblesse.* 5 *Double Montagne.* 6 *Early Admirable.* 7 *Late Admirable.* 8 *Late Purple.* 9 *Grosse Mignonne.* 10 *Smith's Newington.* 11 *Early purple, and orange.*

*Choice of plants.* "Before a house for forcing *peaches* and *nectarines* be built," M'Phail observes, "trees to plant in it had best be got in readiness, and if they be growing on the premises it will be an advantage. If it can be avoided, no tree should be planted in a forcing-house until the fruit of it has been seen and tasted. The trees should be well trained ones, 4 or 5 feet high; indeed, it is of no consequence what their age be, provided they are healthy, well rooted, and in a bearing state; and if they have been transplanted several times since they were budded, they will be the fitter for transplanting again; and if the work of taking them up and of planting them in the peach-house be carefully and methodically done, the trees, by their removal, will be but little retarded in their growth. When every thing in the forcing-house is got in readiness for the reception of the trees, loosen them from the wall to which they were fastened with nails and shreds, and dig a wide semi-circular trench, 4 feet distant from the stem of each tree, and a little deeper than their spreading roots, then, by little and little, with a pointed stick, work the earth out among their roots, taking care to break as few of them as possible. In this manner the roots of the plants are to be divested of earth in a careful manner, so as to undermine the stem, that the tree may be lifted out of its place without straining the roots of it. Having holes previously prepared, about 8 or 10 inches deep and 4 feet wide, set the trees into them one after another, training their roots out in a regular horizontal manner at full length, and after let the ends of the roots be cut, so as to take the ruggedness off; cover them not deeper than about 6 inches at their extremities, and at the stem of the tree about 4 inches. Clean healthy dwarfs, that have been one or two years trained, Nicol prefers to older plants, and riders three and even four years trained; because, being temporary, it is desirable to have them produce fruit as soon as possible, for if the dwarfs thrive, the former will have to be removed in three or at most in four years. In a house 35 feet long, 3 dwarfs should be planted, and in a house 35 or 40 feet, 4 dwarfs; in both cases with riders between them."—*Kal.* 323.

*Situation of the plants in the house.*—Permanent occupants, intended to be forced early, Abercrombie plants in a front border, training them on a trellis just under the roof. In late forcing-houses, he trains them to an upright trellis near the back wall. M'Phail plants so as to train under the glass, and Nicol's practice concurs with that recommended by Abercrombie.

For a late peach-house, dwarfs should be planted in front, to be trained about half-way up the roof; and dwarfs, with riders between them, against the back wall, to be trained to the top. In this case, the trees on the back trellis would not be shaded

by those in front, provided they are not trained to more than half way up the sloping-glass; and thus the greatest possible extent of unshaded surface, and the greatest quantity of unshaded fruit may be obtained. A house planted in this manner, about 40 or 45 feet in length, may have 4 dwarfs in front, and 4 dwarfs and 5 riders at back, and when in a full bearing state would produce a large quantity of nectarines and peaches. If only 30 or 34 feet in length, 3 dwarfs in front and 3 dwarfs and 4 riders at back, would be trees enough to fill it.—*Pract. gard.*

*Season of planting.*—Abercrombie recommends November and December as preferable, if not February and March; which practice is also agreeable to that of Nicol.

*Training.*—All seem agreed in recommending fan-training for *peaches* and *nectarines*, which being the simplest and most natural training, is always to be preferred.

*Pruning.*—This, according to Abercrombie, may be performed at the fall of the leaf, but should be completed before the blossom-buds are considerably advanced. M'Phail says the best season is in the spring, when the blossom-buds can be distinguished. In the case of a newly-planted house, Nicol heads down the maiden plants, or cuts the trained trees about the end of March or beginning of April. With respect to the dwarfs, the shoots on the lower branches should be cut back to 2 or 3 buds, that the trellis may be furnished from the bottom with young wood. The shoots on the upper or further extended branches may be shortened back to half or one-third of their lengths, according to their strength, provided they have been well ripened, and are free from canker; but if the tree be any-ways diseased, let them be cut so far back as to get rid of the cankered or mildewed part, but it would be advisable that no diseased tree should be planted, unless of a particular kind that cannot be easily obtained. The riders need not be headed so much in as the dwarfs, the object being rather to throw them into a bearing state than to cause them to push very strong shoots, which would not be fruitful. If they make moderately strong shoots, and if these be well ripened in autumn, a good crop may be expected on them next year. Let the young shoots be laid in, as they advance, at the distance of about 9 inches from each other, that is of the dwarfs; those of the riders may be laid in considerably closer, it not being intended they should grow so vigorously as those of the dwarfs. In a bearing-house the winter pruning is supposed to take place in November, and if the summer shoots have been regularly trained and laid in at the distances of 9 inches in the dwarfs, and rather less in the riders, they will not require much pruning at this time. A few of the shoots may be shortened about the lower and middle parts of the tree, for the purpose of providing a supply of young wood in these parts, and thinning out such shoots here and there as have been left too thick; for others should not be shortened, but should be laid in at full length, that is, such as are short, stout, nearly of an equal thickness, and have a bold wood-bud at the extremity, as from these may be expected the best fruit next season. In some parts of the tree, perhaps, or in some particular trees, it may be expedient to cut out such old branches as have but few young shoots on them, provided there be neighbouring branches better furnished, whose shoots may be spread out so as to fill, or nearly to fill, the vacancy occasioned by such lopping. In this case, the shoots borrowed as it were for this purpose, must be shortened more or less, according to the size of the vacancy to be filled up, and according to their strengths, in order that the plant may appear complete in all parts as soon as possible. In summer Nicol pinches off foreright shoots as they appear, and all such as are ill-placed, weakly, watery, deformed, or very luxuriant, leaving a leader to every shoot of last

year, and retaining a plentiful supply of good lateral shoots in all parts of the tree. If any blank is to be filled up, some conveniently-placed strong shoot is shortened in June to a few eyes, in order that it may throw out laterals. Sir Joseph Banks, in speaking of the culture of *peaches* at Montreuil, near Paris (Hort. trans. vol. 1. append.) says, "Much advantage is derived from the practice of rubbing off the leaf-buds from the fruit-bearing branches, leaving only as many as are wanted to produce wood for the succeeding year. The *taille d'été* does not only leave the remaining wood to grow stronger and to ripen sooner, but it naturally increases the size of the fruit. The fruit is thinned after the stoning season, as already described for thinning of wall fruit." In a peach-house, in a state of bearing, when the fruit is swelling off, in order that it may attain a greater degree of perfection, such leaves and summer shoots as overhang and shade the fruit are taken off or thinned. The leaves of *peach* trees "may be dressed off," when the wood is ripened, by the use of a withy or small cane, which is more necessary in a house than if the trees were growing in the open air, where the wind or frost may make them tumble down fast. In the newly-planted peach-house the dwarfs must be well cut in, in order to make them push shoots freely for furnishing the trellis next season. Those situated in the lower and middle parts of the tree should be cut back to half their lengths, or to a few buds, less or more according to their strength; and those of the extremities to one-third or to about half their lengths, also according to their strength, and how well they have been ripened. They should be thinned so at this time, as that the shoots which are to issue from them next season may be laid in at the medium distance of about 6 inches. The riders need not be pruned near so much as the dwarfs, as they are wished to produce a crop of fruit the following season, shortening no shoots that are fully ripened, except a few of those at the extremities of the tree, in order to make them throw out others for its full extension upwards next year.

*Stirring the soil.*—The borders are to be pointed and forked up after pruning, and a little well-rotted dung or compost added where deemed necessary. That part of the border on the outside may in addition be covered with dung, and after forcing is commenced, those in the inside may be occasionally watered with the drainings of the dung-hill.—*Kal.* 324 and 438.

*Time of beginning to force.*—From the rise of the sap, according to Abercrombie, it occupies, in some sorts, about 4 months to make mature fruit; in the later varieties 5 months; and when much of winter is included in the course of forcing, the time is proportionably lengthened. To ripen moderately early kinds by the end of May, begin to force on the 21st of December. Little is gained by commencing sooner. But you may put on the glasses a week before, and make gentle fires, admitting a constant stream of fresh air, to get the house ready. M'Phail says, "Those who wish to have *peaches* and nectarines ripe in May, should begin to force them about the beginning or middle of December." For a general crop, Nicol, Weeks, and most gardeners recommend forcing to begin in the month of February. He says it is much better to force too slow than too fast.

*Temperature.*—Abercrombie directs to begin at 42° min. and 45° max. from sun heat, and rise in a fortnight to 45° min. and 50° max. from sun heat; in the progress of the second fortnight augment the temperature from 3 to 8 degrees, so as to have it at the close up to 53° min. and 56° max. from sun heat, admitting air in some degree daily. When the trees are in blossom, let the heat be 55° min. and 60° max. Continue to aim at this till the fruit is set, then raise the minimum to 60° and the artificial maximum to 65°, in order to allow of giving air. When the sun shines do not let the maximum from col-

lected heat pass 70°, rather employ the opportunity to admit a free circulation of air. M'Phail, beginning in February, keeps the thermometer to about 55°, increasing it as the days lengthen; when the fruit is set and swelling, raise it to 60° with fire heat; when the sun shines, let it rise to 65° or 70° with air. A short time before the fruit begins to ripen, from 55° to 70° is not too much with fire heat, and when the sun shines let it rise a little above 75°. In a house, begun to force on the 1st of February, Nicol begins with 45° for the first fortnight, and then increases the heat to 50° or 52°. The times of regulation are supposed to be at 6 or 7 o'clock in the morning and 8 or 9 o'clock at night. At the end of the month the temperature is to be kept as steadily as possible to 55°. In two months keep it to about 65°, seldom allowing it to pass 70°, which if it does, will have the effect of drawing the shoots up weak, and may cause the setting fruit to drop. He recommends 60° by fire heat, mornings and evenings, as proper after the fruit are fairly stoned. T. A. Knight finds that neither *peaches* nor nectarines acquire perfection either in richness or flavour, unless they be exposed to the full influence of the air and sun during their last swelling, without the intervention of the glass. In consequence, he says, some gardeners take off the lights wholly before the fruit begins to ripen, but he recommends taking them off only in bright sunshine, and putting them on during rain, and at night to protect the fruit from dews, &c.

*Air.*—A constant stream of fresh air is to be admitted before beginning to force, and plenty of air, when the sun shines, during the whole progress of forcing. M'Phail says, "when the fruit is set and swelling, give the house air every day, whether the sun shine or not. Give plenty of air, and keep the house dry when the fruit begins to ripen." When the intention is to begin to force on the first of February, Nicol shuts up the house from the middle of January, admitting plenty of free air through the day. During the first month of forcing, he admits air freely "every day, even in frosty weather, by the sashes, till the flowers begin to expand, after which time by the ventilators, except in fresh weather, till the season become mild." Air should be admitted all this month to such an extent as to keep down the temperature in sunshine to within 5° of the fire heat medium, and this in order to strengthen the buds as they break, and that the young shoots may spring in a vigorous manner. Admit large portions of air every day when the fruit is swelling off, except in damp weather, from 7 or 8 o'clock in the morning to 5 or 6 o'clock in the evening, opening the sashes to their fullest extent, from 10 to 2 or 3 o'clock in the afternoon, giving and reducing gradually, &c.

*Watering and steaming.* "While the fruit is in blossom," Abercrombie observes, "steaming the flues must be substituted for watering over the leaves; at the same time you may water the roots now and then gently, avoiding such a copious supply as might risk the dropping of the fruit to be set. Let the water be warmed to the air of the house." M'Phail directs to keep the border moist by watering; and after the fruit are as big as nuts, sprinkle the flues now and then with water, to raise steam, and wash the trees about once a week with clean water, not too cold. It is better not to wash all over the top till the fruit are set. A sunshiny morning is to be preferred, and the water may be about 65°. Do not water after the fruit begins to ripen, but recommence when it is all gathered (Gard. rem. p. 148. and 191.) Newly planted *peach* trees should be freely supplied with water at the roots throughout the season, in order to promote their growth; and the engine must be applied with force to the branches for the suppression of the red spider, and refreshing the foliage, generally once in two or three days (Gard. kal. p. 358). In a fruit-bearing house, after the fruit is set, water should be given pretty freely to the plants at the

roots once in two or three days, increasing the quantity as the fruit begins to swell, and as the shoots advance in growth. Also continue the operation of the engine regularly, and do not be afraid to hurt the foliage if the red spider appear upon them, and more particularly towards the top of the house, as it is there the red spider is fostered by the extreme heat. Withhold water from the border, and cease to exercise the engine on the foliage when the fruit are swelling.—*Gard. kal. p. 401.*

*Insects and diseases.*—The red spider is the great enemy to *peach* and *nectarine* trees, but they are also attacked by blight, mildew, the aphid, thrips, and sometimes even the coccus. The blight, Abercrombie says, is caused by a small insect, very pernicious both to the trees and fruit in their growth; this is apparent by the leaves curling, and often by the ends of the shoots being bunched and clammy. In this case it is advisable to take off the distempered leaves, and cut off the diseased ends of the shoots. Further to check the mischief, if the weather be hot and dry, give the trees a smart watering all over the branches by a garden engine, and repeat it two or three times a week in the afternoon when the power of the sun is declining. These waterings will clear the leaves, branches, and fruit, refresh and revive the whole considerably, and conduce greatly to exterminate the vermin. When the plants have begun to expand their blossoms and leaves, the aphid or green-fly makes its appearance; in which case M'Phail directs to fill the house full of tobacco-smoke once a week or oftener. If there be any appearance of mildew, dust a little sulphur on the infected parts, and if the gum or canker be seen on the shoots, or on any parts of the trees, open the bark and cut out the dying wood. Inspect the trees in every part minutely, and if you perceive the bark dying or the gum oozing out of any part of the stem, cut off the bark as far as it is dead or decaying, and if the branches be strong, that you cannot well effect it with your knife, take a chisel with a semicircular edge and a mallet and cut out the wood as far as you see it is affected; you need not be afraid of hurting the tree, even if the branches or stem are cut half way. This method exposes the old wood to the sun and air, by which it is dried, and the tree is thereby assisted in casting off the unwholesome juices, or those kept in it too long for want of a more dry genial climate (*Gard. rem. 131.*). J. Michell, of Moncrieff House, Perthshire, hangs on his *peach* trees, when the fruit are ripe, large white glass phials, with a little jam or jelly in them, in order to entice large black flies, which he finds very destructive to peaches. Wasps he destroys by finding out their nests in the day time, and going in the evening with a candle, he introduces a burning stick smeared with wet gunpowder, which stupifies the wasps, and causes them to fall nearly dead, when he crushes them (*Caled. hort. mem. 1. p. 194.*). Nicol strongly recommends watering for keeping down insects, especially the red spider. If the green fly or thrips make their appearance, recourse must be had to fumigation. Shut the house close at night, and fill it as full of tobacco-smoke as possible. If this be repeated the next evening they will be completely destroyed. Calm cloudy weather is the most favorable for this operation (*Gard. kal. p. 340 and 350.*). The coccus and chermes, he says, are not so immediately hurtful, and unless very numerous need not be much minded at this season, but they must be more particularly attended to at the time of pruning in November. The males, which have wings and are active, will be dislodged by the operation of the engine, and the females, which are stationary and adhere to the shoots and branches, if very numerous, may readily be crushed by the finger, or by a small flattish stick. In November, the winter pruning being finished, the plants and trellis are to be anointed with the composition recommended for vines, see vol. 1. p. 708.

*Gathering of the fruit.* M'Phail advises laying moss or some soft material over the borders, to save those from being injured which drop of themselves. Sir Joseph Banks, quoting from a French author, states that peaches are never eaten in perfection if suffered to ripen on the tree; they should be gathered just before they are quite soft, and kept at least 24 hours in the fruit chamber. *Hort. trans. vol. 1. append.* John Williams of Pitmaston says, "should the season prove wet when the peaches are ripe, they should be gathered, and placed for about two days in a dry airy room before they are eaten." *Hort. trans. 2. p. 113.*

*Ripening of the wood.* Abercrombie says, "on account of the fruit of most sort of *peaches* ripening somewhat earlier than grapes, and the growth of the shoots stopping sooner than the runner-wood of vines, it is not so often necessary to assist the plant in September or October by artificial heat; but in some of the late kinds, if, by the time the external air is down to 60°, the shoots have not taken a greenish-brown tint as high as several eyes from the origin, and if the blossom-buds on these, when full swelled, are not distinguishable from the oblong wood-buds, apply a little fire heat, and continue it till the leaves fall." Nicol directs attention to be paid to the ripening of the wood of *peach* trees in September. "A little fire heat may be necessary fully to mature the shoots, especially of young trees. Fire heat should be continued till the growth of the smaller and middle-sized shoots stop, their bottom parts become greenish-brown, and the flower-buds upon them appear turgid, so as to be distinguishable from the wood-buds. The stronger, and more extreme shoots, of the dwarfs in particular, will continue to grow later than the above shoots, which as they are to be considerably shortened back in November for the production of wood to fill the trellis next season, is not very material, provided the bottom part be pretty well hardened."

*Resting of the wood.* The management of the peach-house when at rest, Abercrombie says, "should be nearly the same as for the grape-house, except when there is but one set of frames to serve both an early peach-house and a late grape-house; in which case, as soon as the young wood of the vine is perfectly ripened, the glasses should be brought back to the peach-house; for although the fruit of the grape is to be set and ripened in a higher heat, the *peach* tree as a plant is more tender than the vine, and independently of forcing comes into blossom about two months sooner." M'Phail keeps on the glasses from the time the fruit is gathered till he begins to force, in order to keep the wood dry; but gives them all the air he can. *Gard. rem. p. 367.* Nicol exposes the house fully day and night, only shutting up in the time of heavy rains. *Gard. kal. p. 420.*

*Forcing the peach tree in pots.* "All the varieties of *peaches* and *nectarines*," Abercrombie remarks, "are extremely well suited for forcing in large pots. Small plants intended to come in before or after these in the borders may be excited in the first stage in a distinct house, so as the temperature of that in which they are brought to finish fruiting be suited to their progress." The pots or tubs should be such as not to contain less than a cubic foot of earth, the soil should be lighter and richer than that recommended for the borders, and liquid manure should be plentifully supplied to make up in some degree for the confinement of the roots. They are best forced in a peach-house, but succeed in a vinery or succession stove; best of all, however, in a pit or Dutch frame, where the temperature can be regulated at pleasure, and where they are near the glass. Great care must be taken to supply them regularly with water, for which purpose some place saucers under the pots, others cover their surface with moss, or what is better, fresh cow or rotten horse dung. Casing the pots with ropes made of moss is also a very good method, as it not only preserves an uniform degree of moisture,

but also of temperature. Of course the moss must be kept watered. *Peach* trees in pots are sometimes trained to small fan-trellises attached to the pot, but in general they are pruned as dwarf standards, in which form they bear rather better than when trained. When the fruit is nearly ripe, the pots should be removed from the hot-house or vine-house to a cooler and more airy situation, or if in the pits the sashes may be taken off a part of every fine day. In other respects the treatment of *peach* trees in pots is similar to that of the trees in the borders. With respect to the quality of fruit from *peach* trees in pots, J. Williams observes, "by far the best flavoured peaches I have ever tasted were from trees planted in large pots, and kept in a vinery from February till the first week in June, when the trees were removed into the open air, and after being shaded a little from the sun for the first ten days, were placed in the most open part of the garden till the fruit became ripe. Treated in this way the peach is beautifully coloured on the outside, and of a most exquisite flavour." Occasionally in very warm seasons *peach* trees in pots, when forced very early in the season, and afterwards plunged in the open air, will produce a second crop late in the autumn, but this is more a matter of curiosity than utility. It frequently happens with forced cherries and strawberries. Hort. trans. 3. p. 367.

*Peach trees as standards.* The *peach* bears remarkably well in the standard form, planted in the middle of the house, and the flavour of the fruit is universally acknowledged to be preferable to that grown on the trellis, from the comparatively free circulation of the air. The glass tent or moveable house might be most advantageously applied in this way, and when the fruit begins to ripen, the sashes could be removed, and applied to ripening a late crop of grapes against a common wall, or to cover pits or houses which had not been forced.

*Forcing peaches by dung heat.* Sir Thomas Neave (Hort. trans. 5. p. 218.) forces *peaches* and *nectarines* principally by dung heat; about 3 feet and a half of the bottom of the front wall of his peach-house is open brick-work, with a flue on the inside, the top of which is covered with flat tiles. The inside of the house is filled with earth to within 2 feet of the bottom of the lights, and the trees planted as near as possible to the front wall, and trained under the lights or wires like vines; the back wall of the pine-pit is built of the same height as the front of the peach-house, and 3 feet distant from it; this of course forms a space 3 feet wide for the hot dung, and as soon as he wishes to begin forcing, this space is filled with hot dung. The roots being next the flue soon begin to feel the warmth of the dung. He finds great advantage from this method, and it is productive of no ill effects until the leaf buds begin to expand, and if the steam is not then perfectly sweet and moderate, the places left to admit it must be secured. The way in which this dung lining is placed is, that, while it is forcing the *peaches* and *nectarines*, it is assisting to work the pines in the pine-pit at the same time. By this means he has never failed in producing abundant crops of *peaches* and *nectarines*.

In medicine peach blossoms are recommended as an anthelmintic purgative. They are given in infusion; half an ounce of the fresh petals or a drachm of the dry for a dose. A syrup made from peach blossoms is officinal in Wirtemberg.

*Common Peach.* Fl. April, May. Clt. 1562. Tree 10 to 15 feet.

2 P. LÆVIS (D. C. fl. fr. 4. p. 487.) fruit smooth, glabrous. 2. II. Native of Persia. Amygdalus Persica, Lam. dict. 1. p. 100. no. 21-27. Amygdalus Persica nectarina, Ait. hort. kew. ed. 2. vol. 3. p. 194. Noisett. jard. fruct. p. 89-90. no. 17-22. t. 20. f. 23. t. 21. f. 3-4. The *nectarine* is distinguished from the peach by its smooth, and rather firmer, more plump fruit. In other respects the general history of the peach equally applies

to the *nectarine*, as well as its culture and uses. Forsyth says, "the fruit is called *nectarine* from *nectar*, the poetical drink of the gods." The varieties of the *nectarine* are as follow. •

*Var. a;* flesh separating from the stone. Called in French *brugnons*, and in English *free-stone nectarines*.

*A list of free-stone or melting nectarines.*

1 *Aromatic.* Leaves with reniform glands. Flowers small. Fruit pale yellow, red on the exposed side, middle-sized, ripening about the beginning of September. Resembles the *violette hâtive*.

2 *Balgone.* Leaves with reniform glands. Flowers small. Fruit large, pale greenish, but red on the sunny side, ripening in the beginning of September. A first-rate sort.

3 *Boston.* Leaves with globose glands. Flowers small. Fruit middle-sized, orange, but dark red on the sunny side, ripening about the beginning of September. A second-rate kind.

4 *Brinion, brugnion red at the stone, violet red at the stone.* Leaves with reniform glands. Flowers small. Fruit large, pale yellow, red on the sunny side, ripening about the beginning of September. A first-rate sort.

5 *Cérise pêche, cherry nectarine.* Leaves with reniform glands. Flowers small. Fruit small, whitish, but red on the sunny side, ripening about the end of August. More a subject of curiosity than use.

6 *Claremont.* Leaves with reniform glands. Flowers small.

7 *Desprèz, Deprès.* Leaves with reniform glands. Flowers large.

8 *Du Tellier's, due de Tello, du Tilly's.* Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening in the beginning of September. A first-rate sort.

9 *Dornton.* Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of August. A first-rate sort.

10 *Elruge, common elruge, Claremont, Outlands, Temple's* of some. Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green and red, ripening about the beginning of September. Flesh almost white to the stone, excellent. A good bearer, and forces very well.

11 *Elruge* of Miller. Leaves without glands. Flowers small.

12 *Fairchild's, Fairchild's early.* Forsyth. Leaves with reniform glands. Flowers small. Fruit small, green, but red on the sunny side, ripening in the beginning and middle of August. Esteemed chiefly for its earliness.

13 *Genoa, late Genoa, Genoese.* Leaves with reniform glands. Flowers small.

14 *Greenshield's late.* Leaves with reniform glands. Flowers small. Fruit middle-sized, greenish on one side, and red on the other, ripening about the end of September.

15 *Hoy's new seedling.* Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green and red, ripening about the beginning of September. A first-rate sort, resembling the *Elruge*.

16 *Jaune lisse, lisse jaune, jaune lisse tardive, Rousanne, mofrin.* Leaves with reniform glands. Flowers large. Fruit yellow, small, ripening in October. A second-rate sort.

17 *Murrey, Murry* (Forsyth), *black Murry.* Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green on one side, and dark red on the other, ripening in the end of August. A first-rate sort.

18 *Large melting.* Leaves with reniform glands. Flowers small.

19 *Ord's new.* Leaves with reniform glands. Flowers small.

20 *Peterborough, late green, vermash,* Forsyth. Leaves with reniform glands. Flowers small. Fruit middle-sized, green, ripening in the middle of October. A second-rate sort.

21 *Pitmaston orange*, *Williams's orange*, *Williams's seedling*. Leaves with globose glands. Flowers large. Fruit large, orange and dark red, ripening about the end of August. An excellent, hardy, and good bearer.

22 *Scarlet* of Forsyth. Leaves with reniform glands. Flowers small. Fruit small, fine scarlet and pale red, ripening about the end of August.

23 *Hunt's tawny*, *Hunt's early tawny*. Leaves without glands. Flowers small. Fruit middle-sized, orange and dark red, ripening from the middle to the end of August. A very distinct sort, worthy of cultivation for its earliness.

24 *Temple's* (Lang. t. 30.), *Temple*. Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green and red, ripening about the beginning of September. A first-rate sort.

25 *Vermash*, *true vermash*. Leaves with reniform glands. Flowers large. Fruit middle-sized, green on one side, and red on the other, ripening about the end of August. A first-rate, but rare sort.

26 *Violette grosse*, *grosse violette hâtive*, *violette de courson*, *le gros brugnion* in some parts of the continent. Leaves with reniform glands. Flowers small. Fruit large, pale greenish and red, ripening in the beginning of September. A first-rate sort, having the flesh very red at the stone.

27 *Violette hâtive* (Hooker, t. 15.), *violet*, *early violet*, *lord Selsey's eluge*, *Hampton Court*, *large scarlet*, *new scarlet*, *vermash* of some, *petite violette hâtive*. Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of August. A first-rate sort, forces well.

28 *Violette tardive*, *violette marbrée*, *violet panachée*. Leaves with reniform glands. Flowers small.

29 *New white*, *Neat's white*, *white*, *Flanders* (Hook. t. 30.), *Emmerton's new white*, *Cowdray white*, *large white*. Leaves with reniform glands. Flowers large. Fruit large, white, ripening about the beginning of September. In a favourable soil and warm exposure both the *new* and *old white* acquire an excellent flavour; under other circumstances only indifferent.

30 *Old white*. Leaves with reniform glands. Flowers large. Fruit large, white, ripening in the beginning of August. A first-rate sort.

*Var. β*; flesh adhering to the stone. Called in French *pêches-violettes*, and in English *cling-stone nectarines*.

#### *List of cling-stone nectarines.*

1 *Aiton's seedling*. Leaves with reniform glands. Flowers small. Fruit large, dark brown, red on the sunny side, ripening in the beginning and middle of September. A second-rate fruit.

2 *Brugnion*, *Italian*. (Lang. t. 29.) Leaves with reniform glands. Flowers small. Fruit large, greenish, but dark red on the sunny side, ripening in August. A second-rate fruit.

3 *Brugnion hâtif*, *early brugnion*. Leaves with reniform glands. Flowers small.

4 *Brugnion violet musqué*, *brugnion musqué* (Duham. 26.), *brugnion*, *red Roman*. Leaves with reniform glands. Flowers large. Fruit middle-sized, pale yellow, but red on the exposed side. A second-rate fruit. Ripens in September.

5 *Early pavié* (Forsyth, 57.). Leaves without glands. Flowers large.

6 *Golden* (Lang. t. 29.), *fine gold-fleshed*, *orange*. Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow, but red on the exposed side. Flesh orange-coloured. A second-rate fruit, ripening in the beginning or middle of September.

7 *Pince's golden*. Leaves with reniform glands. Flowers large. Fruit large, orange, but dark red on the exposed side,

ripening throughout September. As a cling-stone nectarine very good.

8 *Imperatrice*. Leaves with reniform glands. Flowers small. Fruit large, dark red. A first-rate fruit. Hangs and shrivels like a *Newington*.

9 *Newington*, *late Newington* (Lang. t. 29.), *scarlet Newington*, *old Newington*, *Smith's Newington*, *French Newington*, *brugnion de Newington de l'Angleterre*, *rough Roman*, *red Roman* of some, *Sion-hill*, *Anderdon's*, *Anderson's round*. Leaves without glands. Flowers large. Fruit large, dark, ripening in September. A good bearer, excellent when beginning to shrivel.

10 *Early Newington* (Forsyth, 27.), *early black Newington*, *black*, *early black*, *new early Newington*, *new dark Newington*, *Lucombe's seedling*, *Lucombe's black*. Leaves without glands. Flowers large. Fruit large, dark red, ripening in the end of August. A first-rate sort, larger than the *Newington*.

11 *Tawny Newington*. Leaves without glands. Flowers large. Fruit large, yellowish brown, red on the sunny side, ripening in the beginning and middle of August. A first-rate sort.

12 *West Dean Newington*. Leaves without glands. Flowers large.

13 *Roman*, *red Roman*, *old Roman*, *brugnion musqué* (Duham. no. 26.), *brugnion violet musqué* of some. Leaves with reniform glands. Flowers large. Fruit large, green brown and red, ripening in the beginning and middle of August. A first-rate sort.

14 *Royal Buckfast*. Leaves without glands. Flowers large. Has much resemblance to the *Newington*.

15 *Tawny*, *late tawny*, *Murrey* of some. Leaves with reniform glands. Flowers small. Fruit middle-sized, brown, and red, ripening in the middle of September. A second-rate sort.

#### † *Varieties of nectarines not well known.*

1 *Bright red alberge*.

2 *Argyle*. Leaves with reniform glands. Flowers small.

3 *Bowden*. Leaves with reniform glands. Flowers large.

4 *Brugnion tardif*.

5 *Ford's seedling*. Leaves with reniform glands.

6 *Fox's seedling*.

7 *Freeman's*.

8 *Late French*. Leaves with reniform glands. Flowers small.

9 *Lyndoch*. Leaves with reniform glands. Flowers small.

10 *Pholia*. Leaves with reniform glands. Flowers small.

11 *Please's seedling*. Leaves with reniform glands. Flowers large.

12 *Saunders's seedling*. Leaves without glands. Flowers large.

13 *Small orange*. Leaves with globose glands.

14 *Spring-grove*. Leaves with reniform glands. Flowers small.

15 *Vitch's*. Leaves without glands.

*Selection of sorts.* Forsyth recommends for a small garden; 1 *Fairchild's early*. 2 *Eluge*. 3 *Scarlet*. 4 *Newington*. 5 *Red Roman*. 6 *Temple*.—Those of the Dalkeith garden are as follow. Such as are marked with a † are planted against a hot wall. 1 *Roman* †. 2 *Du Tellier's* †. 3 *Eluge* †. 4 *Brugnion* †. 5 *Temple's* †. 6 *Murrey* †. 7 *Fairchild's*. 8 *Scarlet* †. 9 *Claremont* †. The surest way of having superior kinds is to select according to quality from the catalogue given.

*Insects.* "On account of the smoothness of the skin of the fruit," Forsyth says, "it suffers more from the wood-louse, earwigs, &c. than the peach; it will therefore be necessary to hang up a greater number of bundles of bean-stalks about these than about any other fruit trees. Wasps are also very destructive to nectarines, and the trees are very liable to be infested with the red spider."

**Culture, &c.** This is in all respects the same as for the peach. **Smooth-fruited Peach or Nectarine.** Fl. April, May. Tree 10 to 15 feet.

III. ARMENTACA (so called from the *apricot* being originally from Armenia). Tourn. inst. t. 399. Juss. gen. 341. D. C. fl. fr. 4. p. 485. prod. 2. p. 531.—*Prunus* species of Lin. and others.

**LIN. SYST.** *Icosándria, Monogýnia.* Drupe ovate-globose, fleshy, covered with a velvety skin, containing a nut or stone, which is acute at one end, and blunt at the other, with a furrow on both sides; the rest smooth, not wrinkled.—Small trees. Leaves when young convolute. Flowers rising before the leaves from scaly buds, solitary or few together, almost sessile.

1 *A. VULGARIS* (Lam. dict. 1. p. 2.) flowers sessile; leaves ovate or cordate, glabrous. *h.* H. Native of Armenia. *Prunus Armeniaca*, Lin. spec. 679. *Malus Armeniaca* of the ancients, *Abricot* of the French, *Abricosenbaum* of the Germans, and *Alhjococco* of the Italians. The *apricot* is a low tree, of rather crooked growth, with broad, roundish, cordate or ovate, glandularly-serrated leaves. The flowers are white, tinged with dusky red. The fruit round, yellow both within and without, firmer than plums and most peaches, inclosing a smooth compressed stone, like that of the plum. The flowers appear in April on the shoots of the preceding year, and on spurs of two or more years old, and the fruit ripens in September. It is supposed to have originated in Armenia, but Regnier and Sickler assign it a parallel between the Niger and the Atlas; and Pallas states it to be a native of the whole of the Caucasus, the mountains there to the top being covered with it. It appears from Turner's herbal that the *apricot* was procured out of Italy by Wolfe, a French priest, gardener to Henry VIII. The fruit appears to have been known in Italy in the time of Dioscorides under the name of *præcocia*, probably as Regnier supposes from the Arabic *berkech*, whence the Tuscan *bacocha* or *alhjococco*, and the English *apricock*, or as professor Martin observes, a tree, when first introduced, might have been called a *præcox* or early fruit, and gardeners taking the article *a* for the first syllable of the word, might easily have corrupted it to *apricocks*. The orthography seems to have been finally changed to *apricot* about the end of the last century, as Justice in 1764 writes *apricock*, and Kyle and Moredun in 1782 *apricot*.

**Use.** The fruit is used in a raw state at the dessert, and is esteemed next to the peach and nectarine; it is also made into marmalades, jellies, and preserves. Grossier says, that lozenges are made by the Chinese from the clarified juice, which, dissolved by water, yield a cool refreshing beverage; oil may be extracted from the nut, and the young shoots yield a fine golden cinnamon colour to wool.

**Varieties.** Parkinson in 1629 enumerates six; Rea in 1720 seven; the Luxembourg garden catalogue in 1800 fifteen; but the catalogue published by the Horticultural Society in the present year enumerates 41. They are as follow:

#### 1. *Kernels bitter.*

\* *Fruit small, round, early. Flowers small.*

1 *Red masculine apricot* (Forsyth, treat. p. 2.), *early red masculine* (Hort. soc. cat. no. 9.), *brown masculine* of some collections, *abricot précoce* or *abricotin* (Nois. man. 489.), *frühe muscateller aprikose* (Baum. tasch. p. 389.), *abricot hatif musqué* (Duham. fruct. 1. p. 133. Mayer, nom. no. 1. t. 2. f. 1. Nois. jard. fr. t. 1.), *musqué hatif*, Hort. Leaves roundish, cordate. Fruit small. Skin dull, honey yellow. Flesh pale yellow, juicy, and tender, parting from the stone. An early and excellent fruit.

2 *White masculine* (Hort. trans. 2. ser. 1. p. 59.), *early white*

*masculine* (Hort. soc. cat. no. 8.), *abricot blanc* (Duham. arb. fr. 1. p. 134.), *abricot pêche* (Mayer, pom. fr. 1. p. 30, &c.), *white Algiers* of some gardens. The chief recommendation of this and the former kind is their early time of ripening.

\* \* *Fruit large.*

† *Channel of the stone closed up.*

‡ *Flesh parting from the stone.*

3 *Large early apricot* (Hort. trans. 2. ser. 1. p. 66. Hort. soc. cat. no. 47. Pom. mag. t. 142.), *abricot gros précoce*, and *abricot de Jaen* (Aud. cat.), *abricot de St. Jaen rouge* in Languedoc, *abricot gros d'Alexandrie* in Provence, *die grosse frühe aprikose*, (Sickler, teutsche 12. t. 12.) Leaves large, broad, oval, tapering to the petiole. Fruit large, oblong, the back nearly straight. Skin downy, bright orange, red next the sun, pale orange on the other side. Flesh orange-coloured, juicy, rich. An excellent early sort, ripening about the middle of July.

4 *Roman apricot* (Langl. pom. p. 89. t. 15. f. 4. Pom. mag. t. 13. Hort. trans. 2. ser. 1. p. 61.), *Roman* or *common* (Switzer, fruit. gard. p. 100.), *common* (Forsyth), *abricot commun* (Duham. arb. fr. 1. p. 135. t. 2. Nois. jard. fr. p. 2. t. 1.), *gemeine aprikose* (Kraft, pom. austr. 1. p. 31. &c.), *grosse gemeine aprikose* (Mayer, pom. fr. 1. p. 31. t. 3.), *Brussels apricot* and *Turkey apricot* of some collections. Leaves broad, cordate. Fruit middle-sized, dull straw-coloured, with a little dotting on the sunny side, of an orange red, inclining to oval. Flesh of a dull pale straw-colour, soft, soon becoming mealy, and requiring to be eaten rather before its maturity. This sort bears abundantly, and ripens about the beginning of August; but it is more fit for preserving than for the dessert, the juice being much less highly flavoured than that of many sorts.

5 *Blotched-leaved Roman apricot* (Hort. trans. 2. ser. 1. p. 62.), *blotched Turkey*, *variegated Turkey*, *striped Turkey* (Hort. soc. cat. no. 27.), *maculé* of the French, *abricotier à feuilles panachées* (Duham. arb. fr. 1. p. 145.), *abricot commun à feuilles panachées de Jaune* (Noisett. jard. fr. p. 2.), *abricot bunte oder gefleckte aprikose*, (Mayer, pom. fr. 1. p. 34. t. 4.) Leaves blotched with a pale yellow or golden colour. Fruit much like that of the *Roman* or *common apricot*.

6 *Royal apricot* (Pom. mag. 1. t. 2. Hort. trans. 2. ser. 1. p. 63.), *abricot royal*, (Bon. jard. 1827. p. 288. Nois. man. 2. p. 490.) Leaves large, roundish cordate or ovate. Fruit about the size of that of the *moorpark*, rather oval, of a dull yellow colour, slightly coloured with red in a small space. Flesh pale orange, very firm, juicy, sweet, and high flavoured, with a slight degree of acidity. This is a very valuable sort, and ripens about 10 days sooner than the *moorpark*.

7 *Brussels apricot*, (Hort. trans. 2. ser. 1. p. 64.) Fruit oval, compressed, of a pale orange colour, acquiring a brown tinge, with deep blood red specks next the sun. The flesh is juicy, rather crisp, and the fruit is most excellent for preserving.

8 *Shipley's apricot* (Hort. soc. cat. no. 24. trans. 2. ser. 1. p. 64.) *Blenheim*, *Shipley's large*, *Miss Shipley's*, of various collections. A fine looking fruit, very like the *Roman*, but larger, oval, compressed. Skin clear, yellow, minutely speckled with brown. Flesh of a very bright deep orange, juicy, with a pleasant sweetish acid flavour, without much scent. The fruit is rather more downy than the *Roman*, which it resembles. It ripens about the last week in July.

9 *Almond apricot* (Hort. trans. 2. ser. 1. p. 65.), *abricot amandier*, (Hort. soc. cat. no. 34.) In form like the *Roman*. Skin pale straw coloured, blotched with pinkish spots next the sun. Flesh pale yellow, dry, with very little flavour. This sort has little or no merit. It ripens about the end of July.

‡ ‡ *Flesh adhering to the stone.*

10 *Montgamet apricot* (Hort. trans. 2. ser. 1. p. 65.), *albergier de Montgamet* (Hort. soc. cat. no. 31.) Leaves broad and rounded at the base, and acuminate at the apex. Fruit small, about half as large as the *white masculine*, which it resembles outwardly. Skin pale clear yellow, slightly tinged with red next the sun. Flesh firm, watery, juicy, but without much flavour. This sort is not much esteemed, and is chiefly used for preserving. It ripens at the end of July.

† † *Channel of the stone imperious.*

11 *Moorpark apricot* (Nicol, gard. kal. p. 167. Brookshaw, pom. brit. t. 23.), *Anson's*, *Dunmore's*, *Dunmore's Breda*, *Temple's*, *imperial Anson*, *Oldaker's moorpark*, *Sudlow's moorpark* (Hort. soc. cat.), *peach apricot* (Forsyth, treat. 1. p. 4.), *abricot de Nancy* (Duham. arb. fr. 1. p. 144. t. 6. &c.), *abricot pêche* (Duham. arb. fr. 1. p. 144.), *abricot de Tours* (Hort. soc. cat. no. 51.), *abricot pêche*, *abricot de Nuremberg ou de Wirtemberg*, *abricot de Piemont*, Aud. cat. Leaves large, roundish, acuminate. Fruit large, roundish, compressed. Skin of a brownish orange colour. Flesh dull reddish-orange, juicy, and of a high and excellent flavour, peculiar to this sort, never liable to become mealy. This is one of the best of the kinds.

12 *Hemskirke apricot* (Hort. soc. cat. no. 4. Pom. mag. 1. t. 11. Hort. trans. 2. ser. 1. p. 69.). Leaves broad, much like those of the *moorpark*. Fruit rather large, roundish, slightly compressed, very like the *moorpark*. Flesh very bright, deep, clear orange, tender, and juicy, with a particular rich delicate flavour. This sort comes next to *moorpark* for its excellence.

II. *Kernels sweet.*

\* *Flesh parting from the stone.*

13 *Breda apricot* (Hort. soc. cat. no. 2. Pom. mag. t. 146.), *Brussels or Breda* (Langley, pom. p. 89.), *abricot de Hollande ou Amande Aveline* (Duham. arb. fr. 1. p. 138. t. 4. &c.), *Holländische Bredäusche oder Ananas apricose* (Baumann, taseh. p. 389.) *Holland* (Forsyth, treat. p. 5.), *abricot de Nancy* (Sickler, teutsche, p. 299.) Leaves broadly cordate, acuminate. Fruit rather small, roundish. Skin of a deep brownish colour where exposed to the sun. Flesh deep orange, juicy, rich and high flavoured. Kernel sweet, like a hazel-nut. Ripens from the beginning to the middle of August on walls, and its perfection is considerably prolonged on standards.

14 *Angoumois apricot* (Duham. arb. fr. p. 137. t. 3. Hort. trans. 2. ser. 1. p. 71.), *apricose aus dem Angoumois die rothe abricose* (Mayer, pom. fr. p. 32.), *rothe Angoumois* (Baumann, taseh. p. 388.). Leaves rather small, oval, tapering to both extremities. Fruit about the size of the *Breda*, and like it in shape. Skin yellow where shaded, but of a very deep reddish brown on the exposed side. Flesh reddish orange, juicy, sweet, mixed with a slight acidity, very agreeable. Kernel sweet, like a nut. This sort ripens rather earlier than the *Breda*.

15 *Musch-musch apricot* (Nois. man. p. 410. Hort. trans. 2. ser. 1. p. 72. t. 1.) *Abricot d'Alexandrie*, (Kraft, pom. austr. p. 29. t. 58. f. 1.). Leaves roundish, subcordate, acuminate, doubly serrated. Fruit about the size of the *masculine*, roundish, compressed. Skin straw coloured next the wall, deep orange in the sun, slightly downy. Flesh tender, very sweet, semi-transparent. Kernel very sweet, like a nut. It appears to be a native of the oases of Upper Egypt, where the fruit is gathered and dried in large quantities for sale. It is not sufficiently known to judge how far it may become a valuable variety in this country.

16 *Turkey apricot* (Mill. dict. no. 5. Hort. trans. 2. ser. 1. p. 73.). *Large Turkey* of some nurseries, *Abricot de Nancy*,

*La Bretonnerie* (Nois. jard. fr. p. 3.) Leaves middle-sized, roundish, acuminate. Fruit rather largish, very handsome, deep yellow, with a number of orange red spots and blotches next the sun, nearly spherical, not compressed. Flesh pale yellow, firm, juicy, sweet, with a little acid, very rich and excellent. Kernel sweet, like that of the almond. Ripens on a south wall about the middle of August, and in other situations may be prolonged to the end of the month. It is an excellent sort.

\* \* *Flesh adhering to the stone.*

17 *Orange apricot* (Switzer, fruit gard. p. 100. Hort. trans. 2. ser. 1. p. 74.), *early orange*, *royal orange*, *royal George*, *royal Persian* (Hort. soc. cat.), *D'orange* (Knoop, pom. p. 65.), leaves flat, pendulous, tapering. Fruit almost spherical, downy, of a more intense orange colour than other *apricots*, interspersed with some minute specks. Flesh tender, bright orange, in some seasons juicy, but not highly flavoured. Kernel sweet. Generally an abundant bearer, and is chiefly useful for preserving.

The remaining sorts are described in books, upon which no sufficient information has been procured, but none of these are of any importance.

† *List of apricots not sufficiently known, but the greater part of them are not worth notice in this country.*

1 *Albergier ordinaire*. 2 *Albergier à fruit long*. 3 *Albergier à fruit rond*. 4 *Albergier de Tours*. The *albergiers* are of little value in this country; in France they are produced from the stone, and are preferred for stocks. 5 *Algiers*. 6 *Angoumois hatif*. 7 *Angoumois tardif*. 8 *Angoumois rouge*. 9 *Blanc gros*. 10 *Brussels*. 11 *De Carpentras musqué*. 12 *George the Fourth*. 13 *De Luxembourg*. 14 *White masculine, early white masculine, blanc, white Algiers?* 15 *Musqué mi-nain*. 16 *Royal peach apricot*. 17 *Persian*. 18 *Persique*. 19 *De Portugal, male*. 20 *De Provence*. 21 *Russian*. 22 *Saint Cross*. 23 *Transparent*. 24 *Turkey*, *De Nancy* of some, *large Turkey*.

*Choice of sorts.* Those grown in the Dalkeith gardens are as follow:—1 *Moorpark*. 2 *Breda early*. 3 *Masculine, early*. 4 *Brussels*. 5 *Orange, early*. The list given should be examined, and the sorts chosen according to their quality.

*Propagation.*—New varieties are procured from the seed as in the peach, and approved sorts are perpetuated by budding, generally on muscle or plum stocks. The *Brussels* and *Breda*, when intended for standards, are budded on the St. Julian plum, which produces a strong clean stem, but for the rest any stock will do, provided it be free and thriving. Knight (hort. trans. 2. p. 19.) recommends budding the *moorpark* on an *apricot* stock, which he has found prevents the trees from becoming diseased and debilitated, which they generally do on plum stocks. Budding *apricots* is generally performed early in the season, from the middle of June to the end of July. For dwarfs, the bud is inserted 6 or 8 inches from the ground; and the sorts are sometimes twice budded, or one variety budded on another, which is said to keep the trees in a more dwarf state. For riders or standards they are budded on plum stocks, 4 or 5 feet from the ground. Miller prefers half standards, budded 3 or 4 feet from the ground; the trees so produced being less liable to suffer from high winds.

*Choice of plants.*—Abercrombie prefers trees of 2 or 3 years' growth from the bud, and fit for immediate bearing. Forsyth makes choice of those plants which have the strongest and cleanest stems; and if he can such as have been headed down of 2 or 3 years' growth, as they will bear and fill the walls much sooner than those which have not been so treated. He says,

"make choice of trees with one stem, or if they have two, one of them should be cut off; for by planting those with two stems, the middle of the tree is left naked, and, of course, one third of the wall remains uncovered."

*Season of planting.*—Abercrombie says the best season is from the fall of the leaf until February or March. Forsyth says the best time is in August, when the leaf begins to fall.

*Final planting.*—The *Breda* and *Brussels* are occasionally planted as standards or espaliers in warm situations; and in these states, in fine seasons, produce more highly flavoured fruit than on walls. The other varieties are generally planted against walls, which Miller and Forsyth say should have an east or west aspect, for if they are planted full south, the heat causes them to be mealy before they are eatable. The borders should not be less than 6 or 8 feet wide, and 2 or 2½ feet deep. The soil a light rich loam, perfectly dry below. Standard *apricots*, according to Abercrombie, do not come into bearing under a considerable number of years, sometimes 10 or 12; but then the fruit, in a congenial situation, is abundant, and of the finest flavour. The training of the plant to a trellis, almost touching the south wall, will improve the flavour of the *apricot*, and render it more succulent than if trained against the wall.

*Mode of bearing.* The varieties of the *apricot* in general bear upon the young shoots of last year, and casually upon small spurs, rising on the two or three years' old fruit branches. The *Moorpark* bears chiefly on last year's shoots, and on close spurs formed on the two years' old wood. The bearing shoots emit the blossom-buds immediately from the eyes along the sides; and the buds have a round and swelling appearance.

*Pruning wall trees.*—The general culture of wall *apricots* comprehends a summer and winter course of regulation by pruning and training.

*Summer pruning.*—Begin the summer pruning in May, or early in June, and continue it occasionally in July and August, &c. This pruning is principally to regulate the young shoots of the same year. In the first place take off close all the foreright shoots, and others that are ill-placed or irregular, or too luxuriant in growth, taking care to retain a competent supply of choice, well-placed, moderately growing side shoots, with a good leader to each mother branch. Continue these mostly at their full length all the summer, regularly trained in close to the wall, to procure a sufficiency to choose from in the general winter pruning for new bearers next year. If the summer regulation commence early, while the shoots are quite young, and, as it were, herbaceous, 1, 2, 3, or 4 inches long, those improper to retain may be detached with the finger and thumb; but when of firmer growth they must be removed with the knife. If any very strong shoot rise in any casually vacant part, it may be topped in June, which will cause it to produce several laterals the same year of more moderate growth, eligible for training in to supply the vacancy.

*Thinning the fruit.*—Sometimes the fruit are much too numerous, often growing in clusters, in which case thin them in May and the beginning of June in their young green state, leaving the most promising singly at 3 or 4 inches' distance, or from about 3 to 6 on the respective shoots, according to their strength. The *apricots* so thinned off, and the first principal green crop are esteemed very fine for tarts.

*Winter pruning.*—This may be performed either at the fall of the leaf, or in mild intervals from that time until the beginning of March. When it is deferred until the buds begin to swell, the promising shoots can be the better distinguished. It comprehends a general regulation, both of the last year's shoots and the older branches. A general supply of the most regular placed young shoots must be every where retained for successional bearers the ensuing year. Cut out some of the most

naked part of the two last years' bearers, and naked old branches not furnished with competent supplies of young wood or with fruit-spurs, either to their origin, or to some well-directed lateral, as most expedient, to make room for training a general supply of the new bearers retained, and cut away all the decayed wood and old stumps. Generally observe in this pruning to retain one leading shoot at the end of each branch, either a naturally-placed terminal, or one formed by cutting, where a vacancy is to be furnished with a proper leader. Let the shoots retained for bearers be moderately shortened; strong shoots reduced in the least proportion, cutting off one-fourth or less of their length; from weak shoots take away the third, and sometimes half. This shortening will conduce to the production of a competency of lateral shoots the ensuing summer from the lower and middle placed eyes; whereas without it, the new shoots would proceed mostly from the top, and leave the under part of the mother branches naked, and the lower and middle part of the tree unfurnished with proper supplies of bearing wood. Never prune below all the blossom-buds, except to provide wood, in which case, cut nearer to the origin of the branch, as in these trees, small fruit-spurs, an inch or two long, often appear on some of the two or three years' branches, furnished with blossom-buds; these spurs should generally be retained for bearing; but when any project foreright from the wall, cut them in accordingly, for the spurs projecting above 3 inches, though they may set their fruit, seldom ripen it, unless the season and situation are both favorable. The thick clusters of spurs, which are apt to form on aged trees, ought also to be thinned. As each tree is pruned, nail it, laying in the branches and shoots from 3 to 6 inches' distance, straight, and close to the wall.

*Pruning espaliers.*—As directed for wall trees.

*Pruning standards.*—Half standards will require only occasional pruning, to regulate any branches which are too numerous, too extended, or cross placed, and to remove any casually unfruitful parts, and dead wood. At the same time the regular branches forming the head of the tree should not be generally shortened, but permitted to advance in free growth.—Abercrombie.

*Training the apricot tree.*—This is generally done in the fan manner, which is the method of training not only for the *apricot*, but for wall trees generally. Forsyth recommends a mode between the fan and horizontal manner.

*Renovating old decaying trees.*—Forsyth had the greatest success in this department of fruit tree culture, by cutting down to within a foot or 18 inches, or more occasionally, of the ground, and then renewing the soil of the border.

*Gathering.*—The *apricot* is apt to become mealy if left on the tree till over ripe. It should be gathered with the peach-gatherer while moderately firm.

*Insects, diseases, &c.*—As the fruit ripens early, it is very liable to be attacked by wasps and large flies, which should be kept off by a net, stretched a foot or more apart from the wall or trellis. The other insects, and the diseases of the tree are the same as in the peach tree; but it is not nearly so obnoxious to their attacks, probably owing to the comparatively hard nature of its bark and wood, and coriaceous leaves.

*Forcing the apricot.*—The *apricot* does not force well; but a few are sometimes tried in pits, and placed in a peach-house and forced in the same manner as peaches and nectarines, see p. 492.

*Common Apricot.* Fl. Feb. Mar. Clt. 1548. Tr. 10 to 15 ft. 2 A. *DASYCARPA* (Pers. ench. 2. p. 36.) leaves ovate, acuminate, serrated; petioles glandular; flowers pedicellate; pedicels filiform. h. H. Native country unknown. A. *atropurpurea*, Lois. in Duham. edit. nov. 5. p. 172. t. 15. f. 1. *Prunus dasycarpa*, Ehrh. biert. 6. p. 90. Lodd. bot. cab. 1250. Lindl. bot. reg. 1243.

*Prunus Armeniaca nigra*, Desf. cat. ed. 2. p. 206. In a specimen that flowered in the Botanical Garden at Geneva, the calyx was purple and 6-lobed, the petals 6 in number, and the stamens 24. This species is called *Abricot noir* in French gardens, the fruit black and eatable. It is supposed to be a native of the Levant. The flowers are white.

*Thick-fruited Apricot*. Fl. Apr. Clt. 1800. Tr. 10 to 15 ft.

3 *A. PERSICIFOLIA* (Lois. in Duham. ed. nov. 5. p. 172. t. 552. f. 1.) leaves ovate, short, or lanceolate, lobulate; petioles glandular; flowers pedicellate. *h. H.* Native country unknown. Flesh of fruit variegated with yellow and red, eatable. Called in France *Abricot noir à feuilles de pêcher*, or *peach-leaved black apricot*. Corolla white.

*Peach-leaved Apricot*. Fl. Mar. April. Clt. 1800. Tree 10 to 15 feet.

4 *A. SIBIRICA* (Pers. ench. 2. p. 36.) leaves ovate, acuminate; petiole glandless. *h. H.* Native of the ulterior mountains of Siberia. Amm. ruth. 272. t. 29. *Prunus Sibirica*, Lin. spec. p. 679. Pall. ross. 1. p. 15. t. 8. This tree is much like the common *apricot* in appearance, but smaller in all its parts; the petioles are longer and destitute of any gland; the leaves are of the form of those of the birch tree; the fruit is small, juiceless, and sour or acid, and contains a bitter kernel. In transalpine Dauria, the north side of the mountains in May are clothed with the purple flowers of *Rhododendron Dauricum* and the south side with the rose-coloured blossoms of this tree.

*Siberian Apricot*. Fl. Apr. May. Clt. 1788. Sh. 4 to 6 ft.

5 *A. BRIGANTICA* (Pers. ench. 2. p. 36.) leaves somewhat cordate, acuminate, sharply toothed; the teeth numerous, and lapping over each other; flowers glomerate, almost sessile. *h. H.* Native of Dauphiny, near (Brigantia) Briançon. *Prunus Brigantica*, Vill. dauph. 3. p. 535. Lois. in Duham. ed. nov. 5. t. 59. Flowers white or pink. From the seeds of this tree a fixed oil, commonly called *huile de marmote* is obtained by expression. It is used instead of olive or almond oil. Perhaps sufficiently distinct from *A. Sibirica*.

*Briançon Apricot*. Fl. Mar. April. Clt. 1819. Sh. 6 to 8 ft.

*Cult.* The species are all increased by budding on the same kind of stocks recommended for the common *apricot*. They grow in any kind of soil, and are very ornamental for shrubberies in spring.

IV. PRUNUS (said to be a word of Asiatic origin, the wild plant, according to Galen, being called *πρωπρως*, in Asia, from the Greek *πρωρη*, which occurs in Theophrastus). Tourn. inst. t. 398. Juss. gen. 341. D. C. fl. fr. 4. p. 483. prod. 2. p. 532.—*Prunophora*, Neck. elem. no. 719. *Prunus*, species of Lin. and others.

LIN. SYST. *Icosandria, Monogynia*. Drupe ovate, or oblong, fleshy, quite glabrous, covered with a kind of glaucous bloom, containing a compressed nut or putamen, which is acute at both ends, and a little furrowed on the margin, the rest smooth. Trees or shrubs. Leaves convolute when young. Flowers usually disposed in umbellate fascicles, solitary on the pedicels, rising either after or before the leaves.

1 *P. SPINOSA* (Lin. spec. 681.) branches spinose; peduncles solitary; calyx campanulate, with obtuse lobes, which are longer than the tube; leaves obovate-elliptic, or ovate, smooth except when young, sharply and doubly serrated; fruit globose. *h. H.* Native of Europe and America; plentiful in Britain, in hedges and thickets. Vahl. fl. dan. t. 926. Smith, engl. bot. 842. Woodv. med. bot. t. 84. Blackw. icon. t. 494. *P. sylvestris*, Bauh. pin. 444. *Σπρωτιας*, Theophrastus. *Spinus*, Virgil. Flowers white, rising before or with the leaves. Fruit sour or acid, black, roundish, covered with bluish bloom. The *black thorn*

is not so good as the *white thorn* for hedges, because it spreads its roots wide and encroaches upon the pastures; but it is excellent for dead fences, and to lay in covered drains. The fruit, when ripe, makes an excellent preserve; unripe the inspissated juice forms the German acacia, and affords an almost indelible ink, used to mark linens. It is used in home-made wines, to communicate the colour and roughness of red port. The tender leaves, dried, are sometimes used as a substitute for tea, and is the best substitute that has been yet tried, and it is said they have been used in mixing with the Chinese tea. Knight and others consider the *sloe* as the parent of the bullace plum (*P. insititia*) and the varieties of the common plum (*P. domestica*). Sloes have been employed as a styptic medicine from the time of Dioscorides. They have been recommended in diarrhoeas and hæmorrhages, and as gargles in the swellings of the tonsils and uvula. Dr. Cullen considers them as the most powerful of acerb fruits, and as agreeable and useful astringents. The flowers with their calyxes, are moderately purgative: the dose is an ounce infused in water. As a shrubby plant the *sloe* is most ornamental, blossoming before all others of the *Prunus* tribe.

*Var. α, vulgaris* (Ser. mss. in D. C. prod. 2. p. 532.) leaves obovate-elliptic; fruit dark purple. *P. spinosa*, Lois. in Duham. ed. nov. 5. p. 185. t. 54. f. 1. There is a variegated-leaved kind of this.

*Var. β, microcarpa* (Wallr. exsic. cent. 1. no. 45.) leaves elliptic, narrow, bluish; fruit smaller.

*Var. γ, macrocarpa* (Wallr. exsic. cent. 1. no. 45.) leaves obovate, bluish; fruit large, dark purple. Native of Germany. Perhaps this is *P. domestica*, var. ζ, *Juliæna*.

*Var. δ, orata* (Ser. mss. in D. C. prod. 2. p. 532.) leaves ovate-roundish.—Blackw. herb. t. 494.

*Thorny Plum, Black-thorn, or Sloe*. Fl. Mar. Apr. Brit. Shrub 10 to 15 feet.

2 *P. INSITITIA* (Lin. spec. 680.) branches spiny at the apex; peduncles twin; leaves ovate or ovate-lanceolate, convolute, downy beneath; fruit roundish. *h. H.* Native of Germany and France, as well as of Britain, in hedges. Smith, engl. bot. 841. —Duham. arb. 2. t. 41. Black Bullace tree, Mill. dict. no. 31. The stipulas are fringed. The flowers are white. The fruit is globular, black, or white, of an acid taste, but so tempered by sweetness and roughness as not to be unpleasant, especially after it is mellowed by frost. A conserve is prepared by mixing its pulp with thrice its weight of sugar. The bark of the roots and branches is considerably styptic. An infusion of the flowers, sweetened with sugar, is a mild cathartic. It varies with black and white or wax-coloured fruit.

*Grafted or Bullace-plum*. Fl. Mar. Apr. Brit. Sh. 10 to 15 ft.

3 *P. CANDICANS* (Balb. cat. taur. 1813. p. 62.) peduncles short, twin, or tern, and are as well as the branches pubescent; leaves broadly ovate, white beneath; stipulas very narrow, deeply toothed, length of petioles; calyx campanulate. *h. H.* Native country unknown. Willd. enum. suppl. p. 32. Lindl. bot. reg. 1135. Flowers white.

*White-leaved Plum*. Fl. Apr. Clt. 1820. Shrub 4 to 6 ft.

4 *P. COCOMILIA* (Tenore, prod. suppl. 2. p. 67. cat. 1819. p. 46.) peduncles short, twin; leaves obovate, glabrous on both surfaces, crenulated, with the crenatures glandular; drupe ovate-oblong, mucronulate. *h. H.* Native of Calabria, in hedges. Flowers white. Fruit yellow, bitter, or sour. The bark of this shrub is febrifugal, and is spoken very highly of by Tenore: it is a specific for the cure of the dangerous fevers of Calabria, where it grows.

*Cocomilia or Calabrian Plum*. Fl. April. Clt. 1824. Sh. 2 to 3 feet.

5 *P. TOMENTOSA* (Thunb. fl. jap. 203.) branches unarmed;

peduncles solitary; leaves ovate, acute, serrated, villous above, tomentose beneath as well as the petioles. *h. F.* Native of Japan. Flowers white. Drupe the size of a pea.

*Tomentose Plum-tree.* Shrub 6 to 8 feet.

6 *P. MARITIMA* (Wangh. amer. 103. ex Willd. enum. 519.) peduncles twin; leaves ovate-lanceolate, serrated; fruit small, round, sweet, dark blue. *h. H.* Native of North America, in sand by the sea-side. Flowers white. Fruit size of a pigeon's egg, dark purple, good to eat.

*Sea-side Plum.* Fl. Apr. May. Clt. 1818. Sh. 5 to 8 feet.

7 *P. ACUMINATA* (Michx. fl. bor. amer. 284.) flowers? calyx glabrous; leaves oblong-oval, ending in a long, acute acumen; drupe ovate, acuminate, on a long peduncle. *h. H.* Native of Virginia. Perhaps the same as *P. maritima*.

*Acuminate-leaved Plum.* Shrub 6 to 10 feet.

8 *P. PUBESCENS* (Poir. suppl. 4. p. 584. but not of Pursh) flowers usually solitary, almost sessile; leaves ovate, thickish, and roundish, or ending in a short acumen, hardly pubescent, unequally toothed; petioles pubescent, short; fruit oval. *h. H.* Native country unknown. Flowers white.

*Pubescent Plum.* Fl. May. Clt. 1818. Shrub 2 to 3 feet.

9 *P. DOMESTICA* (Lin. spec. 680.) flowers usually solitary; leaves ovate-lanceolate, convolute; branches unarmed. *h. H.* Native of the south of Europe, in elevated places. Smith, engl. bot. 1783. Flowers white. Fruit variable, both in shape and colour. All the varieties of garden plums belong to this species. The plum is called *prune*, in French, *prugno* in Italian, and *pflaumen-baum* in German. It rises usually to the height of 15 feet, branching into a moderately spreading head. The natural colour of the fruit is generally considered to be black, but the varieties in cultivation, yellow, blue, and green, and of different shapes and flavours. It is a native of or naturalized in Britain, very frequently found in hedges; but its original country is supposed to be Asia Minor; and according to Pliny it was brought from Syria into Greece, and thence into Italy.

*Use.*—The best varieties are esteemed a delicious dessert fruit, and the others are used in pies, tarts, conserves, and sweetmeats. A wholesome wine is also occasionally made from them, with or without other fruits or ingredients. Plums, Professor Martin observes, when sufficiently ripe and taken in moderate quantity, are not unwholesome, but in an immature state they are more liable to produce diarrhoea and similar diseases than any other fruit of the class. Considered medicinally, they are emollient, cooling, and laxative, especially the French prunes, which are peculiarly useful in costive habits. The wood of the plum is used in turnery, cabinet work, and in making musical instruments.

*Varieties.*—Tusser enumerates 10, Parkinson 60. In the Luxembourg Catalogue are 68, but in the Horticultural Catalogue for the present year there are 274, which are here disposed according to the colour and shape of the fruit.

*Var. a, armenioides* (Ser. ex D. C. prod. 2. p. 533.) fruit oval or roundish, yellow or greenish yellow; stone blunt. To this belong the following varieties of plum.

1 *Apricot, abricotée* (Duham. arb. fr. 2. p. 93. no. 20. t. 13.). Wood smooth. Fruit yellow, oval, middle-sized; flesh adhering to the stone. A bad kitchen fruit, ripening in the end of August.

2 *Abricotée hâtive*, Lois. in Duham. ed. nov. 5. p. 195. no. 23.

3 *Bonne deux fois l'an.* Wood downy. Fruit small, greenish-yellow, oblong; flesh adhering to the stone. An useless fruit, ripening in August and September.

4 *Bryanston-gage.* Wood smooth. Fruit roundish, greenish-yellow, middle-sized; flesh adhering to the stone. A second-rate dessert fruit, ripening in the beginning of October.

5 *White bullace.* Wood downy. Fruit round, yellow, small;

flesh adhering to the stone. A kitchen and preserving fruit, ripening in October. An abundant bearer.

6 *Yellow Roman bullace.*

7 *Coe's golden drop, Coe's imperial golden. Golden drop, new golden drop, Burry seedling, Fair's golden drop, golden gage.* Wood smooth. Fruit oval, large; flesh adhering to the stone. One of the most valuable plums either for the table or for preserving, and a good bearer. Ripens in the end of September.

8 *White damson, small round damson.* Wood downy. Fruit oval, yellow; flesh adhering to the stone. A second-rate kitchen fruit, ripening about the end of September.

9 *Dennison's Albany.* Fruit yellow.

10 *Dennison's late.* Fruit oval, yellow, middle-sized. A good preserving fruit, ripening in October.

11 *Drap d'Or, mirabelle double* (Duham. arb. fr. 2. p. 96.), *mirabelle grosse, abricotée hâtive* (Lois. in Duham. ed. nov. 5. p. 195. no. 23.). Wood downy. Fruit small, round, yellow; flesh separating from the stone. An excellent dessert fruit, precedes the *green-gage* in ripening, and resembles it in quality.

12 *Chancellor gage.* Wood smooth. Fruit middle-sized, round, yellow. A second-rate dessert fruit.

13 *Gisborn's, Gisborn's early, Paterson's.* Wood downy. Fruit oblong, middle-sized, yellow; flesh separating from the stone. A second-rate kitchen fruit, ripening in the middle of August. A great bearer.

14 *Superior green-gage.* Wood downy. Fruit oval, yellow, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the beginning of September.

15 *Guimaraen.* Wood downy. Fruit middle-sized; flesh adhering to the stone. A first-rate preserving fruit, ripening in the beginning of September.

16 *Mirabelle, mirabelle petite, mirabelle jaune.* Wood downy. Fruit small, roundish-ovate, yellow; flesh separating from the stone. A first-rate dessert fruit, and good for preserving. Ripens in the middle of August.

17 *Yellow Orleans.*

18 *Peter's large yellow.* Wood downy. Fruit middle-sized, oval; flesh adhering to the stone. A good dessert fruit, ripening in August. Bears considerable resemblance to the *green-gage*, but is not so good.

19 *Washington, new Washington, Franklin, Bolmar, Bolmar's Washington.* Wood downy. Fruit large, roundish-oval, yellow. Tree vigorous, bears well as a standard. A first-rate dessert fruit, ripening in September.

*Var. β, Claudiāna* (Pers. ench. 2. p. 35.) fruit roundish, rather depressed, green, and usually spotted with purple, rarely purple; flesh greenish yellow, more or less sugary; umbilicus hardly depressed; putamen or stone ending in a short mucrone. To this variety belong the following sorts of plums.

1 *Green-gage, brugnion green-gage, Reine Claude, abricot vert, vert bonne, Dauphine, Reine Claude blanche, grosse reine, grosse reine Claude* (Duham. arbr. fr. 2. p. 89. no. 25. t. 11.), *Damas vert, Sucrin vert, Drap d'Or* of some. Wood smooth. Fruit middle-sized, round, greenish yellow; flesh separating from the stone, ripening about the middle of August. Allowed by all to be one of the very best plums both for the dessert and for preserving.

2 *Aston green-gage.*

3 *Conperthwait's green-gage.*

4 *Derbyshire green-gage.*

5 *Gonne's green-gage.*

6 *Hoo green-gage.*

7 *Isleworth green-gage, Wilmot's green-gage, Wilmot's new green-gage, Wilmot's late green-gage.*

8 *Late green-gage*.

9 *New green-gage*.

10 *Isle vert, de Savoie, Grüne inselpläume*.

11 *Luscombe's nonsuch*. Wood smooth. Fruit large, greenish-yellow, round; flesh adhering to the stone. A second-rate dessert fruit, ripening in the end of August.

12 *White Orleans*. Wood smooth. Fruit round, greenish white; flesh adhering to the stone. A kitchen fruit, ripening in the middle and end of August.

13 *Reine Claude blanche, petite espèce, petite reine Claude*. Duham. arb. fr. 2. p. 91. no. 26.

14 *Reine Claude à fleur semidouble, reine Claude à fleurs demidoubles*. Flowers semidouble.

15 *Reine Claude violette* (Lois. in Duham. ed. nov. vol. 5. p. 195. no. 22. t. 57. f. 2.), *purple gage*. Wood smooth. Fruit middle-sized, purple; flesh separating from the stone. A first-rate dessert fruit, ripening in October. Succeeds as a standard, and is a good bearer.

*Var. γ, Catherinea* (Ser. mss. in D. C. prod. 2. p. 534.) fruit roundish-obovate or roundish, wax-coloured or yellow; umbilicus exerted; flesh sweet, hardly sapid; stone bluntish, usually rather prominent at the base, and truncate. *Prunus domestica cærea*, Lin. spec. 680. To this variety belong the following sorts of plums.

1 *Abricotée blanche*. Lois. in Duham. ed. nov. 5. p. 205. t. 60. f. 10.

2 *Abricotée blanche à longue queue grosse*.

3 *Bingham's*. Wood downy. Fruit large, yellow, oblong; flesh adhering to the stone. A second-rate dessert kind, ripening in September.

4 *Bricette*. Duham. arb. fr. 2. p. 97. no. 31. t. 29. t. 5.

5 *Damas ambré*.

6 *Damas ballon*.

7 *Damas ballon jaune et vert*.

8 *Damas ballon rouge et jaune*.

9 *Gros damas blanc* (Duham. arb. fr. 2. p. 72. no. 7. t. 3. f. 2.), *gros damas blanc hâtif, damas blanc très hâtif*. Wood smooth. Fruit yellow, oval, middle-sized; flesh separating from the stone. A second-rate kitchen fruit, ripening in the middle of September.

10 *Petit damas blanc* (Duham. arb. fr. 2. p. 71. no. 6. t. 3.). Fruit small, yellow, oval. Wood smooth. Flesh separating from the stone. A second-rate kitchen fruit, ripening in the beginning and middle of September.

11 *Damas dronet*. Wood smooth. Fruit oval, middle-sized, yellow; flesh separating from the stone. Ripens in August.

12 *Damas d'Espagne*.

13 *White damask*.

14 *Downton impératrice*. Wood smooth. Fruit obovate, middle-sized; flesh separating from the stone. A first-rate dessert and preserving fruit, ripening in October.

15 *White impératrice, impératrice blanche* (Duham. arb. fr. 2. p. 106. t. 18. f. 2.). Wood smooth. Fruit white, obovate, middle-sized; flesh separating from the stone. A second-rate dessert and preserving fruit, ripening in the beginning and middle of August.

16 *Jaune hâtive* (Duham. arb. fr. 2. p. 66. f. 1.), *jaune de Catalogne, Catalonian, white primordian, amber primordian, St. Barnabé, D'Avoine*. Wood downy. Fruit oval, yellow, middle-sized; flesh separating from the stone. A dessert fruit, ripening in the end of July. Only to be recommended for its earliness.

17 *Mirabelle tardive*. Fruit oval, purple and yellow, small; flesh separating from the stone. A preserving fruit, ripening in the beginning of September.

18 *White perdrigon, perdrigon blanc* (Duham. arb. fr. 2. p. 84. no. 2. t. 8.), *brignole* (Calv. pep. 2. p. 187.). Wood downy. Fruit middle-sized, yellow, oval; flesh adhering to the stone. A first-rate preserving fruit, ripening in the end of August. This and the *blue perdrigon* furnish the brignole prunes of the shops.

19 *Yellow perdrigon*.

20 *Gros perdrigon de brignole*.

21 *Saint Catharine* (Duham. arb. fr. 2. p. 109. t. 19.). Wood smooth. Fruit oblong, middle-sized, yellow; flesh adhering to the stone. A first-rate dessert and preserving fruit, ripening in the middle of September. It is a good bearer.

22 *Saint Julien*. Like the last. Used chiefly for stocks for peaches.

23 *Grosse virginale blanche*. Lois. in Duham. ed. nov. 5. p. 206. no. 62. t. 62. f. 1.

24 *White pear*. Fruit pale yellow, obovate, middle-sized; flesh adhering to the stone. A worthless kitchen fruit, ripening in the end of August. Bears abundantly. Grown chiefly for stocks for peaches.

*Var. δ, Aubertiàna* (Ser. mss. in D. C. prod. 2. p. 534.) fruit ovate, obtuse, yellow on all sides; umbilicus depressed; stone hardly prominent at the base. To this variety belong the following kinds of plums.

1 *White magnum bonum, yellow magnum bonum, dame Aubert* (Duham. arb. fr. 2. p. 107. no. 41. t. 2.), *dame Aubert blanche, dame Aubert jaune, grosse luisante, impériale blanche* (Nois. jard. fr. 143. no. 37. t. 57. and t. 58. f. 4.), *impératrice jaune* (Calv. pep. 2. p. 196. ex Lois. l. c.), *egg plum, Wentworth, white Holland, white Mogul*. Wood smooth. Fruit large, oval, yellow, and white; flesh adhering to the stone. A second-rate kitchen fruit, ripening in September.

2 *New magnum bonum*.

3 *Prune datte* (Duham. arb. fr. 2. p. 202.). Fruit yellow, oval, middle-sized. A preserving fruit, ripening in September.

4 *Rognon d'aue*. Calv. pep. 2. p. 202.

5 *Prune moyenne de Bourgogne*. Calv. pep. 2. p. 202. ex Lois. l. c. p. 206. no. 61.

*Var. ε, Myrobálana* (Lin. spec. 680.) fruit globose, depressed at the base, red; umbilicus depressed; stone mucronulate; sepals narrow. *Prunus cerasifera*, Ehrh. Beitr. 4. p. 17. *Prunus Myrobálana*, Lois. l. c. 5. p. 184. t. 57. f. 11. To this variety belong the following garden plums.

1 *Cerisette*. Lois. l. c. p. 190. no. 58. t. 5.

2 *Cherry plum, Virginian cherry, Myrobálan* (Duham. arb. fr. 2. p. 111. no. 46. t. 2. f. 15.), *De Virginie, early scarlet, D'Amérique rouge*. Wood smooth. Fruit middle-sized, cordate, red. A second-rate dessert and kitchen fruit, ripening in the beginning and middle of August.

*Var. ζ, Damascèna* (Lin. spec. 680.) fruit globose, depressed, violaceous; stone short; keel prominent, blunt at the apex. To this variety belong the following garden plums.

1 *Azure hâtive*. Wood downy. Fruit round, purple, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the beginning of August.

2 *De chypre* (Duham. arb. fr. 2. p. 82. no. 18.). Wood smooth. Fruit middle-sized, round, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the end of August.

3 *Coe's fine late red*. Wood downy. Fruit middle-sized, purple, round; flesh separating from the stone. A first-rate dessert fruit, ripening in October. Valuable for its lateness.

4 *Damas de Maugeron* (Duham. arb. fr. 2. p. 76. no. 18. t.

5.). Wood smooth. Fruit middle-sized; flesh adhering to the stone. A worthless fruit.

5 *Damas musqué* (Duham. arb. fr. 2. p. 74. no. 10. t. 20. f. 3.), *prunier des Vacances* (Lois. l. c. 5. p. 192. no. 10. t. 55. f. 3. but not of Duham.). A worthless sort.

6 *Damas noir hâtive*. Lois. l. c. but not of Duham.

7 *Damas violette gros*.

8 *Damas rouge, gros damas rouge tardif*. Lois. l. c. 5. p. 198. no. 33. t. 58. f. 1.

9 *Damas rouge de Christ*.

10 *Petit damas rouge*. Lois. l. c. 5. p. 198. no. 32. t. 56. f. 8.

11 *Monsieur* (Duham. arb. fr. 2. p. 78. no. 15. t. 7.), *monsieur ordinaire*. Wood downy. Fruit middle-sized, purple, round; flesh separating from the stone. A second-rate dessert and kitchen fruit, ripening in the middle of August. Differs very little from the *Orleans*.

12 *Royale*. Duham. arb. fr. 2. p. 88. no. 24. t. 10.

13 *Kirke's*. Wood smooth. Fruit middle-sized, purple, round; flesh separating from the stone. A first-rate dessert fruit, ripening in the beginning and middle of August.

*Var. η, Turonensis* (Ser. mss. in D. C. prod. 2. p. 533.) fruit obovate or globose; stone blunt at the apex or mucronulate. To this variety belong the following kinds of plums.

\* *Fruit obovate.*

1 *D'Agen*. Fruit purple, obovate, middle-sized; flesh separating from the stone. A good bearer, and a first-rate table and preserving fruit. Ripening in the end of September.

2 *Cornemuse*. Wood downy. Fruit middle-sized, obovate, purple; flesh separating from the stone. A second-rate preserving fruit, ripening in the beginning of September.

3 *Figue grosse rouge*. Wood downy. Fruit oblong-obovate, large; flesh separating from the stone. A second-rate fruit, ripening in September.

4 *Blue impératrice, impératrice violette, véritable impératrice, violette*. Wood smooth. Fruit large, purple, obovate; flesh adhering to the stone. A first-rate dessert and preserving fruit, ripening in October. A good bearer.

5 *Imperial diadem, Mimms*. Wood smooth. Fruit obovate, large, purple; flesh separating from the stone. A first-rate dessert and kitchen fruit, ripening in the beginning of September.

\*\* *Fruit oval or oblong.*

6 *D'Autriche, prune datte, prune datte violette*. Fruit middle-sized, purple, oblong; flesh separating from the stone. A preserving fruit, ripening in the end of July.

7 *Bifère*. Fruit purple, oblong.

8 *Chesnut*. Wood smooth. Fruit middle-sized, purple, oblong; flesh adhering to the stone. A second-rate dessert fruit, ripening in the beginning of September.

9 *Cooper's large, Cooper's large red, Cooper's large American, La délicateuse*. Wood smooth. Fruit oval, purple, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the end of September.

10 *Fotheringham*. Wood smooth. Fruit middle-sized, oblong, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the middle and end of August.

11 *Goliath, Caledonian, nectarine* of some, *Wilmot's late Orleans, Saint Cloud*. Wood downy. Fruit large, purple, oblong; flesh adhering to the stone. A second-rate kitchen fruit, ripening in the middle of August. The tree bears well.

12 *Gwalsh*. Wood smooth. Fruit large, oval, purple. A second-rate dessert fruit, ripening in September, resembling the *red magnum bonum*.

13' *Red magnum bonum, impériale, red imperial, impériale rouge*. Wood smooth. Fruit large, oval; flesh separating from the stone. A second-rate kitchen fruit, ripening in September.

14 *Orleans, red damask*. Wood downy. Fruit middle-sized, round, purple; flesh separating from the stone. A second-rate kitchen and dessert fruit, ripening in the middle and end of August. A good bearer.

15 *Coul Orleans*.

16 *Early Orleans, Grimwood's early Orleans, monsieur hâtif, monsieur hâtif de Montmorency, new early Orleans, new Orleans, Hampton Court*. Wood downy. Fruit middle-sized, round, purple; flesh separating from the stone. A second-rate kitchen and table fruit, ripening in the beginning and middle of August.

17 *Late or black Orleans*.

18 *Knevet's late Orleans*.

19 *Smith's Orleans*.

20 *Wilmot's new early Orleans, Wilmot's Orleans, Wilmot's early Orleans, Wilmot's large Orleans*. Wood downy. Fruit middle-sized, round, purple; flesh separating from the stone. A dessert and kitchen fruit, very like the *early Orleans*.

21 *Perdrigon des Alpes*. Fruit small, purple, oval; flesh separating from the stone. A worthless sort.

22 *Blue perdrigon, perdrigon violette* (Duham. arb. fr. 2. p. 82. no. 21. t. 9. f. 1), *perdrigon de brignole*. Wood downy. Fruit oval, middle-sized, purple; flesh adhering to the stone. A first-rate dessert and preserving fruit, furnishing the brignole prunes of the shops.

23 *Perdrigon Normand*. Duham.

24 *Perdrigon rouge* (Duham. arb. fr. 2. p. 86. no. 22. t. 20. f. 6. f. 7). Wood downy. Fruit middle-sized, purple, oval; flesh separating from the stone. A second-rate dessert fruit, ripening in the beginning and middle of September.

25 *Perdrigon tardif*.

26 *Perdrigon violet des Alpes*. Wood downy. Fruit middle-sized, oval, purple; flesh separating from the stone. A second-rate dessert and preserving fruit, ripening in the middle of August.

27 *Perdrigon violette hâtif*.

28 *Pigeon's heart*. Wood smooth. Fruit middle-sized, oval, purple; flesh adhering to the stone. A second-rate sort, ripening in the beginning of September.

29 *Précoce de Tours, Noire hâtive, early violet, perdrigon violet* of some, *blue perdrigon*. Wood downy. Fruit middle-sized, oval, purple; flesh adhering to the stone. A second-rate dessert and kitchen fruit, ripening in the beginning of August.

30 *Rodney, Rodney gage*. Wood downy. Fruit large, purple, oval; flesh adhering to the stone. A second-rate dessert fruit, ripening in August.

31 *Royal Dauphin*. Wood smooth. Fruit large, red, and oval; flesh separating from the stone. A second-rate sort, ripening in the beginning of September.

32 *Royale de Tours* (Duham. arb. fr. 2. p. 81. no. 17. t. 20. f. 8.). Wood downy. Fruit large, round, purple; flesh adhering to the stone. A first-rate dessert and kitchen fruit, equal to the *Orleans*, if not better.

33 *Saint Martin rouge, Saint Martin* (Lois. l. c. 5. p. 193. no. 12. t. 58. f. 7.). Wood downy. Fruit middle-sized, purple, oval; flesh adhering to the stone, ripening in October. A very good kind, considering its lateness.

34 *Sharp's emperor*. Wood downy. Fruit oblong, purple, large; flesh adhering to the stone. A second-rate dessert fruit, ripening in the end of September.

35 *Valance, Saint Lou*. Wood smooth. Fruit oblong, large, purple; flesh adhering to the stone, ripening in the middle and end of September. Seems only fit for drying.

36 *Suisse, prunier Suisse* (Duham. arb. fr. 2. p. 82. no. 19. t. 20. f. 7.), *Altesse, monsieur tardive, Simiana*.

37 *Gros damas de Tours* (Duham. arb. fr. 2. p. 69. no. 4.). Wood downy. Fruit middle-sized, oval, purple; flesh adhering to the stone. A second-rate table fruit, ripening in the beginning of August.

38 *Damas de Tours*.

39 *Damas d'Italie* (Duham. arb. fr. 2. p. 65. no. 12. f. 4.). Wood smooth. Fruit middle-sized, purple; flesh separating from the stone. A second-rate table and preserving fruit, ripening in the beginning of September.

40 *Jerusalem, prunier de Jerusalem* (Lois. l. c. 5. p. 194. no. 16. t. 56. f. 2.), *Œil de Bœuf, de Bordeaux*. Wood downy. Fruit large, purple, round; flesh adhering to the stone. A second-rate table fruit, ripening in the middle of September.

41 *Tardive de châlons*. Lois. l. c. 5. p. 193. no. 13. t. 58. f. 6.

*Var. 2, Juliàna* (Lin. spec. 580.) fruit ovate-globose, round, oblong or oval, small, blue or purple; umbilicus not depressed, the suture hardly evident; stone mucronulate. *Prunus damascena*, Black. herb. t. 305. ? To this variety belong the following garden plums.

1 *Aston*. Fruit small, round, purple; flesh adhering to the stone. A second-rate preserving fruit, ripening in September.

2 *Auchtertyre*. Wood downy. Fruit small, purple, oval; flesh separating from the stone. A second-rate sort, ripening in August.

3 *Black bullace*. Wood downy. Fruit small, round, purple; flesh adhering to the stone. A worthless fruit, ripening in October.

4 *New large bullace*.

5 *Damas d'Espagne*. Lois. l. c. 5. p. 196. no. 25. t. 56. f. 4.

6 *Damas noir de Septembre*. Duham. arb. fr. 2. p. 77. no. 14. t. 6.

7 *Damas noir tardif* (Duham. arb. fr. 2. p. 73. no. 9. t. 20. f. 4.). Wood downy. Fruit middle-sized, purple, roundish; flesh adhering to the stone. A second-rate dessert fruit, ripening in the beginning of September.

8 *Damas petit tardif*. Wood downy. Fruit small, roundish, purple. A worthless sort, ripening in the end of September.

9 *Damas de Provence*.

10 *Damas de Provence hâtif*. Lois. l. c. 5. p. 197. no. 27.

11 *Damas Quiné*.

12 *Damas de Septembre* (Duham. arb. fr. 5. p. 77. no. 14. t. 6.), *prune de l'avance*. Wood downy. Fruit small, purple, oval; flesh adhering to the stone. A second-rate sort, ripening in the end of September.

13 *Damas de Valence*.

14 *Damas violet* (Duham. arb. fr. 2. p. 192. no. 11. t. 56. f. 5. ?). Wood downy. Fruit small, oval, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the end of August.

15 *Damas violet tardif*.

16 *Blue damask*.

17 *Domine Dull's*. Wood smooth. Fruit oval, purple, middle-sized; flesh adhering to the stone. A second-rate kitchen fruit, ripening in the beginning of September.

18 *Morocco, black Morocco, black damask, early Morocco, early black Morocco, early damask*. Wood downy. Fruit middle-sized, round, purple; flesh adhering to the stone. A second-rate dessert fruit, ripening in the beginning of August.

19 *Moyes de Bourgogne*. Wood downy. Fruit middle-sized, round, purple; flesh adhering to the stone. A second-rate kitchen fruit, ripening in the middle of August.

20 *Nelson's victory*. Wood smooth. Fruit round, purple,

middle-sized; flesh adhering to the stone. A worthless kind, ripening in the middle of August.

21 *Muscle*. Wood downy. Fruit purple, oval, middle-sized; flesh adhering to the stone. A third-rate kitchen fruit.

22 *Perdrigon hâtif*. Wood downy. Fruit round, purple, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the middle and end of August.

23 *Saint Julien* (Lois. in Duham. ed. nov. 5. p. 189. t. 54. f. 2. and 56. f. 9.). Used chiefly for stocks for peaches.

24 *Petit Saint Julien*.

25 *Gros Saint Julien*. Lois. l. c. p. 190. no. 2. t. 58. f. 3.

26 *Stonewood*. Fruit purple, roundish, middle-sized; flesh separating from the stone. A second-rate table fruit, ripening in the beginning of September.

27 *Virgin, prunier de Virginie* (Duham. arb. fr. 2. p. 111. no. 45.). Wood smooth. Fruit roundish, middle-sized, purple; flesh separating from the stone. A first-rate dessert fruit, resembling the *reine Claude violette*, ripening in the beginning of September.

28 *Virginale rouge*. Lois. l. c. p. 192. no. 11. t. 56. f. 5.

29 *Prunier noir de Montreuil*. Duham. arb. fr. 2. p. 68. no. 3.

30 *Gros noir de Montreuil*.

*Var. 1, prunecauliana* (Ser. in D. C. prod. 2. p. 534.) branches pyramidal; fruit ovate, more or less obtuse or elongated, violaceous, rarely green; umbilicus exerted; nut very much compressed, elongated, prominent at the base, more or less acute at the apex. *Prunus pyramidalis*, D. C. fl. fr. 4. p. 485. Perhaps not distinct from var. *Juliàna*. To this variety belong the following garden plums.

1 *Abricotée rouge*. Lois. l. c. p. 196. no. 24. t. 46. f. 11.

2 *Ashridge black*.

3 *D'Amérique noire*.

4 *Black ball, black hill*.

5 *Bonne rouge*.

6 *Damas rouge*.

7 *Damatic rouge*.

8 *Damson, common damson, round damson, small round damson*. Wood downy. Fruit small, purple, roundish, obovate; flesh separating from the stone. A kitchen fruit, ripening in September. *Damsons* are all raised from the stone.

9 *Black damson*.

10 *Round black damson*.

11 *Early damson*.

12 *Long damson*.

13 *Shailer's white damson*.

14 *Shropshire damson, prune damson*.

15 *Sweet damson*.

16 *Violet damson*.

17 *White damson*.

18 *Diaprée blanche*. Duham. arb. fr. 2. p. 104. no. 38. t. 20. f. 11.

19 *Diaprée blanche longue*.

20 *Diaprée rouge* (Duham. arb. fr. 2. p. 102. no. 37. t. 20. f. 12.), *roche carbon*. Wood smooth. Fruit middle-sized, oval, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the middle of September.

21 *Cheston, matchless, Diaprée violette* (Duham. arb. fr. 2. p. 111. no. 36. t. 17.). Wood smooth. Fruit oval, purple, middle-sized; flesh separating from the stone. A second-rate table and preserving fruit.

22 *French prune*.

23 *Elfreth's prune*.

24 *Hungarian prune*. Fruit oblong, purple, middle-sized; flesh adhering to the stone. A preserving fruit, ripening in the end of September. A sort of *quetsche*.

- 25 *Horse plum, Irish horse plum.*  
 26 *Impériale de Milan.*  
 27 *Impériale Ottoman.*  
 28 *Impériale violette.* Duham. arb. fr. 2. p. 98. no. 32. t. 15.  
 29 *Impériale violette à feuilles panachées.* Duham. arb. fr. 2. p. 99. no. 33.  
 30 *Isabella.* Wood downy. Fruit oval, red, middle-sized; flesh adhering to the stone. A first-rate dessert and kitchen fruit, ripening in the end of August.  
 31 *Jacinthe.* Duham. arb. fr. 2. p. 100. no. 34. t. 16.  
 32 *Prunallier.*  
 33 *Prunallier petit.*  
 34 *Quetsche* (Nois. jard. fr. 144. no. 42.), *common quetsche*, *Zwetschen* (Lois. l. c. p. 203. t. 55. f. 6.), *Zwetsche*, *Zwetschke*, *grosse quetsche*, *prune d'Allemagne*, *prunier Allemand* (Lois. l. c. p. 202. no. 45.), *gros quetsche d'Allemagne*, *German prune*, *Leipzig*, *impératrice-violette* of many, *grosse impératrice violette*, *damask*, *gros damas*, *damas violette* of some, *gros damas violette*. Wood smooth. Fruit oval, middle-sized, purple; flesh separating from the stone. A second-rate kitchen and preserving fruit. Bears well in this country. In Germany it is much cultivated for the purpose of drying. It is the German prune of the shops.  
 35 *Austrian quetsche.* Wood smooth. Fruit oval, purple, middle-sized; flesh separating from the stone. A second-rate preserving and kitchen fruit, ripening in the end of September.  
 36 *Quetsche de Brême.* Wood smooth. Fruit oblong, middle-sized, purple; flesh separating from the stone. A first-rate preserving fruit, ripening in September.  
 37 *Hungarian quetsche.* Wood smooth. Fruit purple, oblong, middle-sized; flesh separating from the stone. A preserving fruit, ripening in September.  
 38 *Quetsche d'Italie.*  
 39 *Early Leipzig quetsche.* Wood smooth. Fruit middle-sized, oblong, purple; flesh separating from the stone. A preserving fruit, ripening in the beginning of September.  
 40 *Long green quetsche.*  
 41 *Saint James's quetsche.* Fruit oblong, purple; flesh adhering to the stone. A preserving fruit, ripening in September.  
 42 *Saint Martin's quetsche.*  
 43 *Quetsche précoce.*  
 44 *Quetsche Rognon de Coq.*  
 45 *Turkish quetsche.*  
 46 *Quetsche verte.*  
 47 *Wetherell's sweet.* Fruit round, purple, small; flesh separating from the stone. A preserving fruit, ripening in the end of September. A sort of *damson*.  
 48 *Wheat, wheaten, whitton, great whitton, nutmeg.* Wood smooth. Fruit roundish-oblong, middle-sized, red; flesh adhering to the stone. A second-rate dessert fruit, ripening in the middle and end of August. Remarkable for its bright fiery red-colour.  
 49 *Wine sour, Rotherham.* Wood downy. Fruit small, purple, roundish-oblong; flesh adhering to the stone. A first-rate preserving fruit, ripening in the middle of September.  
 50 *New nine sour.*  
 51 *Prunier haricot.* Ser. ined.

† *A list of plums not sufficiently known, but none of them are probably worth notice.*

- 1 *Belle de Riom.* 2 *Brompton.* 3 *Brussels.* 4 *Buchanan.* 5 *Burnet.* 6 *De Canada.* 7 *Court royal.* 8 *Cydmarine.* 9 *Dame Aubert rouge.* 10 *Dame Aubert violette.* 11 *Winter damson.* 12 *Davies's seedling.* 13 *Deron's.* 14 *Dittisham.* 15 *Double blossomed, à fleurs doubles.* 16 *Duke of Devonshire.* 17 *Dumferline.* 18 *Elfy's.* 19 *Elton.* 20 *Emperor.* 21 *Prunier à fleur semidouble.* 22 *Fall copper.* 23 *Eyench copper.*

- 24 *Blucher's gage.* 25 *Banker's gage.* 26 *Flushing gage.* 27 *Schuyler's gage.* 28 *White gage.* 29 *Garlick's early.* 30 *Goldsmith's Vienna.* 31 *Green plum of Tours.* 32 *Grove-house purple.* 33 *Honey Julien.* 34 *Horse jag.* 35 *Jean moreau.* 36 *Julien gros à feuilles panachées.* 37 *Kencellan.* 38 *Lammas.* 39 *Large green drying.* 40 *Luscombe's seedling.* 41 *Maitre Claude.* 42 *Mignonne.* 43 *Mirabelle de Lory.* 44 *Mirabelle rouge.* 45 *Miriam.* 46 *Monsieur d'Agen.* 47 *Wild Oakley park.* 48 *Oddy's.* 49 *Orange.* 50 *Panachée.* 51 *Blue primordian.* 52 *Pseudo Mirabelle.* 53 *Queen mother.* 54 *Raisin.* 55 *Roi d'Agen.* 56 *Saint Antonio.* 57 *Saint Maurin.* 58 *Saint Réme.* 59 *Scaldateito.* 60 *Scaldateone.* 61 *Small green drying.* 62 *Steer's emperor.* 63 *Svedske Ungersk.* 64 *Tidlilig Leipziger Svedske.* 65 *Sweet prune.* 66 *Triancon.* 67 *La Victorine.* 68 *Violet gage.* 69 *Violet de Tours.* 70 *White corn.* 71 *Yellow gage.* 72 *Yellow Jack.*

*Cultivation of the plum in orchards* appears to be deserving of more encouragement than it generally meets with. Not only does the fruit make excellent pies and tarts, but it may be kept in large quantities, so as to be ready for that purpose at any period of the year. They also make a good wine, and with other fruits and ingredients form one of the substitutes for port. The *damson*, *bullace*, and some other kinds will grow and bear high flavoured fruit in hedges, where the soil is dry below, and not too thin. The fruit of the *sloe* is for wine-making superior to that of the plum, and nearly as good for tarts.

*Selection of sorts.* The following are recommended by Forsyth for a small garden: 1 *Jaune hâtive.* 2 *Morocco.* 3 *Orleans.* 4 *Royal.* 5 *Green-gage*, different sorts. 6 *Drap d'Or.* 7 *Saint Catharine and impératrice.* 8 *Magnum bonum*, for baking. 9 *Wine-sour*, for preserving.—The table fruit in the Dalkeith garden are as under, placed in the order of their ripening, all of them being planted against walls. 1 *Violet de hâtive.* 2 *Early hâtive.* 3 *New Orleans.* 4 *Early Morocco.* 5 *Green-gage.* 6 *Blue-gage.* 7 *Blue perdrigon.* 8 *Apricot plum.* 9 *Potheringham.* 10 *White magnum bonum.* 11 *Imperial.*

*Propagation.* Most of the varieties are propagated by grafting or budding on the *muscle*, *St. Julien*, *magnum bonum*, or any free growing *plums*, raised from seed or from suckers, but seedlings are preferable to stocks for a permanent plantation. The common baking plums, as the *damson*, *bullace*, *Wentworth*, &c. are generally propagated by suckers, without being either budded or grafted. *Plum* grafting is performed in February or March; budding in July or August. Miller prefers budding, because plums are very apt to gum wherever large wounds are made on them. New varieties are procured by propagating from seeds on the general principles already stated. T. A. Knight (Hort. trans. 3. p. 214.) in an attempt to combine the bulk of the *yellow magnum bonum* with the richness and flavour of the *green-gage*, produced a fruit which partook of both parents; and a good variety of the *Orleans plum* has been raised from seed by J. Wilnot, Hort. trans. 3. p. 392.

*Soil.* *Plums*, according to Miller, should have a middling soil, neither too wet and heavy, nor over light and dry, in either of which extremes they seldom do well. Abercrombie recommends any mellow fertile garden or orchard ground; and where a soil is to be made, "one-half fresh loam, one-fourth sharp sand, one-sixth road stuff, and one-twelfth vegetable remains or decomposed dung, or animal matter."

*Site.* The *plum* is cultivated like other indigenous fruit-trees, the hardier sorts as standards, and the finer varieties against walls. It is sometimes forced; but the blossom, like that of the cherry, is difficult to set, and on the whole it is a fruit not well adapted for forcing. The finer varieties are almost always planted against walls, which, Miller says, should have an east south-east aspect, which is more kindly to these fruits than a

full south aspect, on which they are subject to shrivel and be very dry, and many sorts will be extremely mealy if exposed too much to the heat of the sun; but most sorts will ripen extremely well as espaliers if rightly managed. Some, he adds, plant *plums* for standards, in which method some of the ordinary sorts will bear very well, but then the fruit will not be near so fair as those produced on espaliers, and will be more in danger of being bruised or blown down by strong winds. Abercrombie says, "have some choice sorts against south walls for earlier and superior fruit; others on east and west walls, and espaliers to ripen in succession, with full and half standards in the orchard."

*Choice of plants.* Miller recommends trees of not more than one year's growth from the bud, for if they are older they are very subject to canker, or if they take well to the ground commonly produce only two or three luxuriant branches. Abercrombie and Nicol take plants from one to five years old. Forsyth chooses "clean straight plants, with single stems, and of two or three years' growth."

*Final planting.* Miller says it is common to see *plum* trees planted at the distance of 14 or 16 feet, so that the walls are in a few years covered with branches, and then all the shoots are cut and mangled with the knife, so as to appear like a stumped hedge, and produce little fruit; therefore the only way to have *plum* trees in good order is to give them room, and extend their branches at full length. Abercrombie directs full and half standards to be planted at 40, 30, 25, and 20 feet distance; dwarfs generally 20 feet apart, and wall trees or espaliers 15, 20, or 25 feet from stem to stem. Forsyth says *plums* and cherries thrive best by themselves, and he prefers a wall for each, placing *plums* on walls 10 feet high, 8 yards apart, and at 7 yards distance on 12 feet walls.

*Mode of bearing.* All the sorts produce their fruit on small natural spurs, rising at the ends and along the sides of the bearing shoots, on one, two, or three years' growth. In most sorts new fruit branches are 2 years old before the spurs bear. The same branches and spurs continue fruitful in proportion to the time which they take to come into bearing. After the formation of the head is begun, it takes from 2 to 6 years before the different sorts come into bearing. Miller trains horizontally, and is against shortening the branches of *plum* trees, since the more these trees are pruned, the more luxuriant they grow, until the strength of them is exhausted, and then they gum and spoil; therefore the safest method to manage these trees, is to lay in their shoots horizontally, as they are produced at equal distances, in proportion to the length of their leaves, pinching off the points of young shoots, where lateral branches are desired, and displacing foreright and irregular shoots, or such as shade the fruit. With thus carefully going over these trees in the growing season, there will be but little work to do to them in the winter. Abercrombie agrees with Miller in not shortening the fruitful branches. Standards, he says, must be allowed to "expand in free growth, occasionally pruning long, rambling, and cross-placed or other irregular branches. Thin crowded parts, cut away worn out bearers, also decayed and cankerous wood." Forsyth says, "never cut the stems of young *plum* trees when first planted, but leave them till the buds begin to break, then you may head them down to 5 or more eyes, always observing to leave an odd one for the leading shoot; remember to cut sloping towards the wall, and as near to an eye as possible: thus managed, the shoots will soon fill the wall with fine wood. If you find that some of the shoots are too luxuriant, you may pinch the tops off with your finger and thumb about the beginning of June, in the first year after planting; by doing which you will obtain plenty of wood to fill the bottom of the wall. A great deal depends on the first and second years' management of your trees."

*Renovating decaying trees.*—Proceed as directed for the peach, but observe that the *plum* tree, when cut down, is very apt to run to wood, therefore the new soil must neither be very rich nor laid on in a very deep stratum.

*Protecting blossoms.*—This is sometimes done with the tenderer sorts, in the same way as for peaches and apricots.

*Taking the crop.*—The different sorts of the *plum* ripen in succession for about 3 months in summer and autumn. Some early sorts begin to ripen in July; the main varieties reach full maturity in August and September; late sorts continue ripening till the end of October or beginning of November. Each kind should be brought to table presently after being gathered, as they will not keep long in a natural state.

*Insects and diseases.*—See peach. The gum and canker are the most common diseases, and, as in almost every other case, the acarus is the most noxious insect. As a remedy for the former, Abercrombie directs to head down. The insects are destroyed by the common means. The *gages*, or *reine Claudes*, when nearly ripe, are very apt to be eaten by wasps.

*Forcing plums.* Mr. J. Aiton (Hort. trans. 4. p. 531.) says, when an early crop of plums is desired, they are best forced in large tubs or pots, as this method admits of their being removed at pleasure into different temperatures; but for a general crop to ripen by the end of May or beginning of June, he prefers having the trees planted in the forcing house. The temperature required for cherries answers well for plums, and plenty of air must be admitted. He prefers, for forcing, the *Précoce de Tours*, *green gage*, *azure hâtive*, *white perdrigon*, *Orleans*, *new Orleans*, and *Morocco*.

*Domestic or Garden-plum.* Fl. April, May. Britain. Tree 10 to 20 feet.

10 *P. DIVARICATA* (Led. fl. ros. alt. ill. t. 13. fl. alt. 2. p. 211.) branches unarmed; petioles glandless; leaves oblong-elliptic, attenuated at both ends, convolute, serrated, glabrous, having the middle rib beneath bearded longitudinally; peduncles solitary; calyx reflexed; fruit elliptic, yellow.  $\frac{1}{2}$  H. Native of Caucasus. Flowers white, very numerous.

*Divaricate Plum.* Fl. April. Clt. 1820. Shrub 8 to 10 ft.

11 *P. MICROCARPA* (Meyer, verz. pfl. p. 166.) unarmed; leaves quite glabrous, conduplicate, ovate-elliptic, or oblong, obtuse, sharply serrated; serratures immarginate and glandless; umbels many-flowered; calyx tubular; drupe and nut oblong.  $\frac{1}{2}$  H. Native of Caucasus, on mount Bechvarmak.

*Small-fruited Plum.* Shrub.

12 *P. CHINENSIS* (Blum. bijdr. p. 1104.) leaves oblong, acuminate, furnished with 2 glands at the base, and unequally and glandularly serrated, glabrous, except in the axils of the veins beneath, where they are pubescent; flowers rising from the buds in umbellate fascicles; sepals glandularly serrated; fruit round, yellowish red.  $\frac{1}{2}$  G. Native of China.

*China Plum.* Tree.

*Cult.* All the species grow in any kind of soil, and are either increased by seeds, by suckers from the roots, or by grafting or budding for to continue rare sorts.

V. CERASUS (said to have been first brought from Cerasus, a town in Pontus, in Asia). Juss. gen. 340. D. C. fl. fr. 4. p. 479. D. C. prod. 2. p. 535.—Cerasus and Lauro-cerasus, Tourn.—Prunus species of Lin.

LIN. SYST. *Icosándria*, *Monogýnia*. Drupe globose or umbilicate at the base (f. 64. d.), fleshy, quite glabrous, destitute of bloom, containing a smooth, rather globose, compressed stone (f. 64. f.).—Trees. Leaves when young conduplicate. Flowers white. Pedicels 1-flowered, rising before the leaves in fascicled umbels (f. 64.) from scaly buds, but sometimes rising after the evolution of the leaves in racemes from the tops of the branches.

**SECT. I. CERASOPHORA** (κερασος, *kerasos*, the cherry, and φορεω, *phoreo*, to bear; bearing cherries). D. C. prod. 2. p. 535. *Cerasophora*, Neck. elem. no. 720.—*Cérusus*, Tourn. 431. exclusive of the species wherein the flowers are disposed in racemes. Flowers umbellate (f. 63.). Pedicels 1-flowered, rising from the buds (f. 64.).

1 *C. PHOSHIA* (Hamil. ex. D. Don, fl. nep. p. 239.) leaves elliptic-oblong, acuminate, doubly serrated, pilose beneath; stipulas pectinated, bearing glands; umbels few-flowered, sessile.  $\frac{1}{2}$  H. Native of Nipaul, at Narainhetty. *Prunus cerasoides*, D. Don, prod. fl. nep. 289. Flowers of a pale rose colour. *Phoshia* is the name of the tree in Nipaul.

*Phoshia* Cherry. Tree 15 to 20 feet.

2 *C. AVIUM* (Mœnch. meth. 672. D. C. fl. 4. p. 482. Lois. in Duham. ed. nov. 5. p. 10. no. 16. var. 1-4.) flowers rising with the leaves; fruit roundish-ovate, depressed; peduncles slender; flesh of fruit very succulent and sugary, with the juice usually coloured; epicarp adhering to the flesh; leaves white beneath, rather pubescent; branches strong, divaricate; flower-bud oblong, acute.  $\frac{1}{2}$  H. Native of Europe, in woods. *Prunus Cérusus avium*, Lin. spec. 679. *Prunus nigra*, Mill. dict. no. 2. but not of Aiton. Fruit black.

*Var. a, sylvestris* (Ser. in D. C. prod. 2. p. 535.) fruit small, blackish purple, having the suture hardly depressed; flesh tender, hardly sweet. *Prunus avium*,  $\alpha$  and  $\beta$ , Willd. baum. ed. 2. p. 308. *Prunus nigricans*, and *P. varia*, Ehrh. Beitr. 7. pp. 126. and 127. *Merisier à petits fruits*, Duham. arb. fr. 1. p. 156. To this variety belong the small *Merisier* cherries, which are not better than the wild cherries.

1 *Merise petite ronde*.

2 *Merise petite rouge*.

3 *Black Mazzard*; wild black-fruited; small wild black; *Whitley's black*. *Merisier à petit fruit noir*. Very like the *Black heart* cherry.

*Var. β, macrocarpa* (Ser. in D. C. prod. 2. p. 535.) tree middle-sized; nerves of leaves red; peduncles longer; fruit large, blackish-purple, containing a red stone. This kind is cultivated in Switzerland, under the name of *Kirschwasser*, where the inhabitants distil a spirit from the fruit. To this variety belong the cherries known under the following names:

1 *Merisier à gros fruit noir*, Duham. abr. fr. 1. p. 180. and Lois. in Duham. ed. nov. 1. p. 12. t. 4. f. D.

2 *Merise rouge*.

3 *Merise grosse noire*.

4 *Merise grosse rose oblongue*.

5 *Corone*; large wild black; *Hertfordshire black*. Fruit roundish. Flesh tender. Ripens in July and bears abundantly. Does best as a standard. A second-rate sort of cherry.

*Var. γ, pallida* (Ser. mss. in D. C. prod. 2. p. 535.) fruit of a pale wax colour; leaves bearing twin glands at the base. To this variety belong the following sorts of cherry.

1 *Merisier à fruit blanc*. Lois. in Duham. abr. fr. ed. nov. 5. p. 12. no. 3. t. 4. f. B.

2 *Merisier à fruit jaune*. Lois. l. c. 5. p. 12. no. 4. t. 4. f. A.

*Var. δ, multiplex* (Ser. l. c.) smaller; leaves ovate, small, bearing 2 or 3 glands at the base. This variety is frequently cultivated in gardens, under the names of *double-flowering cherry*, *merisier à fleurs doubles*, *merise à fleur double*. Only fit for ornament.

*Bird's Corone*, *Merise*,  $\delta$  *Merisier* Cherry. Fl. April, May. Britain. Tree 20 to 40 feet.

3 *C. DURACINA* (D. C. fl. fr. 4. p. 483.) tree large; branches ascending when young, but in the adult state hardly spreading; flowers rising with the leaves; fruit heart-shaped; peduncles long, slender; suture of the fruit much depressed, rarely almost obsolete; flesh hard and brittle; epicarp adhering firmly to the flesh; stone of fruit ovate.  $\frac{1}{2}$  H. Native of the south of Europe. *Prunus Cérusus*, var. *bigarëlla* and *duracina*. Lin. spec. 679. Flowers white. To this species the *bigarreutiers*, *bigarreau*, and *heart cherries* belong.

*Var. a, cordigera* (Ser. in D. C. prod. 2. p. 353.) fruit ovate, more or less heart-shaped or 2-lobed at the apex, with the suture much depressed. To this variety belong the cherries known under the following names:

1 *Bigarreau belle de Rockmond*, *cœur de pigeon* (Lois in Duham. arb. fr. ed. nov. 5. p. 15. no. 20. t. 18.), *bigarreau commun*.

2 *Black bigarreau*, *black heart*.

3 *Bigarreau blanc*.

4 *Bigarreau blanc tardif de Hildesheimer*. Fruit pale yellow and red, small. A worthless fruit, ripening in August.

5 *Bigarreau couleur de chair* (Lois. in Duham. ed. nov. 5. p. 16. no. 24.), fruit pale yellow and red, large, ripening in the beginning of July. A second-rate table fruit. Does best as a standard.

6 *Bigarreau cœurct*, *cœur de poulet*.

7 *Bigarreau dur*.

8 *Bigarreau à fruit jaune*.

9 *Bigarreau gros cœurct*.

10 *Bigarreau gros commun*.

11 *Bigarreau à gros fruit blanc* (Duham.), Fruit pale yellow and red, tender, ripening in July. A first-rate table fruit, having the flesh more tender than that of the *bigarreau*. Does best as a standard.

12 *Bigarreau à gros fruit rouge*, Duham. 1. t. 2.

13 *Bigarreau à gros fruit rouge tardif*.

14 *Bigarreau gros monstrueux*. Fruit long, heart-shaped, dark red, firm, ripening in the beginning of July. A first-rate table fruit. Does best against a south wall.

15 *Knevet's late bigarreau*.

16 *Bigarreau de Mai*.

17 *Bigarreau monstrueux*.

18 *Bigarreau à petit fruit blanc*. Fruit small, pale yellow, ripening in July. A fruit of little value. Does best as a standard.

19 *Bigarreau à petit fruit rouge hâtif*.

20 *Bigarreau princesse ambré*.

21 *Turkey bigarreau*.

22 *White bigarreau*.

23 *Black American*.

24 *Black bud of Buckinghamshire*.

25 *Belcher's black heart*.

26 *Black heart of Buckinghamshire*.

27 *Goldsmith's black heart*.

28 *Jenkins's black heart*.

29 *Black Tartarian*, *Ronalds's black heart*, *black Russian*.

30 *Spanish black heart*.

31 *Amber heart*.

32 *Early amber heart*.

33 *American heart*.

34 *Tradescant's black heart*, *El-horn*.

35 *Elton*. Fruit pale red and yellow, large. Flesh half tender, ripening beginning of July. An excellent table fruit. Does best against a south wall.

36 *Taversham heart*.

37 *Florence*. Fruit pale yellow and red, large, ripening about

the end of July. Flesh firm. A first-rate table fruit. Does best against a south wall.

38 *Churchill's heart*. Fruit large, pale yellow and red. Flesh firm. A first-rate table fruit. Does well as a standard.

39 *Guigne grosse blanche*. Fruit pale yellow and red. Flesh firm. A second-rate table fruit, ripening about the middle of July. Does best against a south wall.

40 *Guigne grosse rouge hâtive*. Fruit red. Flesh firm. A second-rate table fruit, ripening about the beginning of July. Does best as a standard.

41 *Kruger's herz Kersche zu Frankfort*. Fruit red and pale yellow; flesh firm. Ripening in July. Does best against a south wall.

42 *Lady Southampton's yellow*. Fruit yellow. Flesh firm. A second-rate table fruit, ripening in July and August. Does best as a standard. *Lady Southampton's duke cherry*, *Lady Southampton's golden-drop*, yellow or golden cherry.

43 *Large heart cherry*.

44 *Late or Spanish heart*.

45 *Lukward's heart*. Fruit blush. Flesh half tender. A second-rate table fruit, ripening in July. A bad bearer. Does well as a standard.

46 *Maple heart*. Fruit red. Flesh firm. A bad fruit.

47 *Red heart*. Fruit red. Flesh firm, ripening in July. A second-rate sort and a shy bearer.

48 *Remington heart*.

49 *Shailer's new grizzly*. Fruit yellow and red. Flesh hard. An useless sort, ripening in July. Does as a standard.

50 *Guigne grosse blanche*, *guigne à gros fruit blanc* (Duh. arb. fr. 1. p. 161. t. 1. f. 3.). Fruit pale yellow and red, heart-shaped. Flesh firm. A worthless fruit, ripening middle of July.

*Var. β, obtusata* (Ser. mss.) fruit ovate, obtuse, or 2-lobed at the apex, with the suture hardly depressed. To this variety belong the following kinds of cherries:

1 *Bigarreau*, *graffion*, *bigarreau gros*, *bigarreau d'Hollande*, *Italian heart*, *Harrison's heart*, *West's white heart*. Fruit pale yellow and red, obtuse, heart-shaped, large, ripening in July and August. Flesh firm. A first-rate table fruit. Does best as a standard.

2 *Bigarreau Napoléon*, *bigarreau Laucermann*, *Laucermann's grosse Kirsche*. Fruit large, pale yellow and red, obtuse, heart-shaped. Flesh firm. A first rate dessert fruit. Does best on a south wall.

3 *Bigarreau rouge*. Fruit large, pale yellow and red, obtuse, heart-shaped. Flesh firm. Hardly different from the *bigarreau*. A good dessert fruit.

4 *Guigne grosse noir luisante*. Fruit middle-sized, blood-coloured, obtuse, heart-shaped. Flesh firm. A second-rate dessert fruit, ripening in the beginning of July. Does well as a standard; the branches are pendulous. A good bearer.

5 *Black Tartarian*, *Tartarian*, *Fraser's black*, *Fraser's Tartarian*, *Fraser's black heart*, *Ronald's black heart*, *Circassian*, *black Russian*. Fruit blood-coloured, large, obtuse, heart-shaped. Flesh half tender. A first-rate table fruit, ripening about the end of June. In appearance it is the finest. Does best against a wall.

6 *White Tartarian*, *Fraser's white Tartarian*, *Fraser's white transparent*. Fruit middle-sized, pale yellow, obtuse, heart-shaped. Flesh half tender. A second-rate dessert fruit, ripening beginning of July. Does well as a standard.

7 *Bigarreau noir*, *cerise de Norwège*, Lois. in Duham. ed. nov. 5. p. 17. no. 36. t. 18. f. B.

8 *Bigarreau noir tardif*, Lois. in Duham. ed. nov. p. 17. no. 27. t. 18. f. A.

*Var. γ, mamillaris* (Ser. mss.) fruit ovate, ending in a drop-like process at end, with the suture more profound at the base. To this variety belong the following sorts of cherries:

1 *Four to the pound*, *bigarreau à grandes feuilles* (Nois. jard. fr. p. 17. no. 6.), *cerisier de quatre à la livre*, *guigne à feuilles de tabac*, *Prunus macrophylla* (Poir. suppl. 5. p. 584.), *Cerasus nicotianæfolia* (Hortul.), *Cerasus decumana* (Delauny). Leaves large. Fruit middle-sized, heart-shaped. Flesh firm. A worthless fruit, ripening about the end of July.

2 *Guscoigne's heart*, *red heart of some*, *bleeding heart*, *Herefordshire heart*, *guigne rouge hâtive*. Fruit middle-sized, dark red, heart-shaped, the apex terminating in the form of a drop. Flesh half tender. A second-rate fruit, ripening in July.

3 *Bigarreau piquant*, *guigne piquante*, *guigne à piquet*, Lois. in Duham. ed. nov. 5. p. 13. no. 12. t. 16. f. A.

*Hard or Bigarreau Cherry*. Fl. April, May. Tr. 10 to 20 ft.

4 *C. JULIANA* (D. C. fl. fr. 4. p. 482.) branches ascending when young, but when in an adult state hardly spreading; flowers rising with the leaves; fruit ovate, depressed, heart-formed; flesh of fruit sweet, rather soft, epicarp adhering to the flesh; leaves glabrous.

h. H. Native of Europe. The varieties of this species of cherry are commonly called *guigniers*, *geans*, or *heaumiers*. The sorts are as follow:

1 *Black eagle*. Fruit middle-sized, black, obtuse, heart-shaped; flesh tender. A first-rate dessert fruit, ripening beginning of July. A good bearer. Does either as a standard or wall tree.

2 *Bowyer's early heart*. Fruit obtuse, heart-shaped, middle-sized. Flesh tender. A good bearer and excellent middle-sized cherry, ripening about the end of June.

3 *Amber gean*. Fruit pale red, obtuse, heart-shaped, small. Flesh tender. A first-rate table fruit, ripening end of July. Does well as a standard. An abundant bearer.

4 *Black gean*. Useless fruit.

5 *Black caroon gean*.

6 *Early gean*.

7 *Flemish gean*. Fruit small, red, obtuse, heart-shaped. Flesh half tender. A second-rate dessert fruit, ripening end of July. Does well as a standard.

8 *Hungarian gean*. Fruit middle-sized, amber-coloured, obtuse, heart-shaped. Flesh half tender. A second-rate dessert fruit, ripening in July. Does best as a standard.

9 *Black Hungarian gean*. Fruit middle-sized, black, round. Flesh tender. A second-rate dessert fruit, ripening in July.

10 *White Hungarian gean*. Fruit middle-sized, amber-coloured, obtuse, heart-shaped. Flesh tender, transparent. A second-rate dessert-fruit, ripening in July. Does best as a standard.

11 *Late gean*. Fruit black, heart-shaped, small. A worthless fruit, ripening about the end of July.

12 *Large black gean*. Fruit black, middle-sized, heart-shaped. Flesh firm. A worthless kind, ripening end of July.

13 *Lundie gean*. Fruit black, heart-shaped, middle-sized.

A second-rate dessert fruit, ripening in July. Does well as a standard.

- 14 *Polton gean*.
- 15 *White gean*.
- 16 *Guigne d'Argovie, Tokeli seiler*.
- 17 *Guigne ecarlate*. Fruit red, oval, middle-sized. Flesh firm. A worthless sort, ripening in July.
- 18 *Guigne blanche*, Lois, in Duham. ed. nov. 5. p. 13. no. 7.
- 19 *Guigne noir, guigne à petit fruit noir*, Duham. arb. fr. 1. p. 166. t. 1. f. 2.
- 20 *Guigne rose hâtive*.
- 21 *Guigne rouge hâtive*, Lois. in Duham. ed. nov. 5. p. 12. no. 6.
- 22 *Guigne grosse noire*.
- 23 *Guigne grosse rouge tardive, guigne à fruit rouge tardif*, Duham. arb. fr. 1. p. 162.
- 24 *Guigne jaune*.
- 25 *Guigne noir*. Resembles the black heart.
- 26 *Guigne petite blanche*.
- 27 *Guigne petite rouge*. Worthless.
- 28 *Guigne de Russie à fruit blanc*.
- 29 *Guigne précoce, guigne de Pentécôte*, Lois. in Duham. ed. nov. 5. p. 12. no. 5. f. 15.
- 30 *Guigne de dure peau*, Lois. l. c. p. 14. no. 13. t. 16. f. D.
- 31 *Guigne à petit fruit noir*, Duham. arb. 1. p. 160. t. 1. f. 2.
- 32 *Guigne bigandelle*, Le Berr. trait. jard. 1. p. 231. ex. Lois. l. c.
- 33 *Guigne ou cerise cœur de poule*, Calv. pepin. 2. p. 139. ex. Lois. l. c.
- 34 *Hertfordshire black*. Fruit black, obtuse, heart-shaped. Flesh tender. A second-rate dessert fruit, ripening about the middle of July. Does well as a standard.

*Var. β? Heaumiāna* (Ser. mss.) taller trees; leaves thin, large, elongated, finely serrulated; flesh of fruit not brittle. To this variety belong the following sorts of cherry:

- 1 *Heaumier blanc*, Lois. in Duham. ed. nov. 5. p. 17. no. 28.
- 2 *Heaumier rouge*, Lois. l. c. p. 17. no. 29. t. 19. B.
- 3 *Heaumier noir*, Lois. l. c. p. 17. no. 30. t. 19. f. A.

*Var. γ, péndula* (Ser. mss. in D. C. prod. 2. p. 536.) branches pendulous.—*Allsaints, weeping cherry, cerise de la Tout-saint, cerise tardive, cerise de St. Martin, guignier à rameaux pendans* (Lois. in Duham. ed. nov. 5. p. 15. no. 16.). Fruit round, red, small, watery, ripening in July and October. This sort is of little value as a fruit, being more curious than useful.

*St. Julian, Guigniers, or Gean-cherry*. Tree 20 to 40 feet.

5 C. CAPRONIA NA (D. C. fl. fr. 4. p. 482.) small trees, with spreading branches; flowers rising with the leaves; calyx large, campanulate; peduncles usually thick, stiffish, not long; fruit globose, depressed, with the suture hardly depressed; flesh soft, more or less acid and styptic; epicarp not adhering to the flesh; stone roundish. *h. H.* Native of Europe. C. vulgāris, Mill. dict. no. 1. Lois. in Duham. ed. nov. 5. p. 18. var. 1-3. *Prunus austera* and *P. ācida*, Ehrh. beitr. 7. p. 129. Commonly called *round cherries, Morellos, May-dukes*, and in France *cerises de Paris, cerises à fruits ronds*, and *griottiers*. In consequence of this species containing a greater number of the best cherries than any of the other species, we have given the history and cultivation of all kinds of cherries under it. The cherry is a middle-sized tree, with ash-coloured, shining, roundish branches, ovate, serrated leaves, and white flowers, produced in umbellate fascicles, and succeeded by a red drupe with an acid pulp. The leaf and flower-buds are distinct, the former terminal, the latter produced from the sides of the 2 or more years' old branches. The cultivated cherry was brought to Italy by the Roman

general Lucullus in 73 A.C. from a town in Pontus in Asia, called Cerasus, whence the generic name, and was introduced to Britain 120 years afterwards. Many suppose that the cherries introduced by the Romans into Britain were lost, and that they were re-introduced in the time of Henry VIII. by Richard Haines, the fruiterer to that king. But though we have no proof that cherries were in England at the time of the Norman Conquest, or for some centuries after it, yet Warton has proved by a quotation from Lidgate, a poet who wrote about or before 1415, that the hawkers in London were wont to expose cherries for sale, in the same manner as is now done, early in the season. The tree is now very generally cultivated, both as a wall and standard fruit, and has been forced for upwards of two centuries.

*Use*.—The cherry is a refreshing summer fruit, highly grateful at the dessert, and affording pies, tarts, and other useful and elegant preparations in cookery and confectionery. Steeping cherries in brandy qualifies and improves its strength and flavour; a fine wine is made from the juice, and a spirit is distilled from the fermented pulp. The gum which exudes from the tree is equal to gum arabic; and Hasselquist relates, that more than 100 men, during a siege, were kept alive for nearly two months without any other sustenance than a little of this gum taken sometimes into the mouth and suffered gradually to dissolve. Cherry wood is hard and tough, and is used by the turner, flute-maker, and cabinet-maker.

*Varieties*.—The Romans had 8 sorts: red, black, tender fleshed, hard fleshed, small, bitter flavoured, and a dwarf sort. Tusser, in 1573, mentions cherries red and black. Parkinson mentions 34 sorts, Ray 24, and Miller has 18 sorts, to which he says others are continually adding, differing little from those he has described. The catalogue of the Luxembourg contains 42, and the catalogue of the London Horticultural Society, published last February, 219 sorts, the greater part of which are not well known.

The French divide their cherries into *griottes*, or those belonging to the present species; *bigarreau*, or hard-fruited cherries, the *Cerasus durācina*; *Merisiers*, or wild cherries; the *Cerasus āvium*, and *guignes* or *geans*, the *Cerasus Juliāna*.

The varieties of the present species are as follow:

*Var. α, Montmorencyāna* (Ser. mss. in D. C. prod. 2. p. 536.) fruit globose, depressed, pale red, generally hardly depressed at the suture; flesh white, more or less acid; peduncles rather long; leaves ovate, acumined. To this variety appertain the following sorts of cherry:

1 *Adam's crown*. Fruit pale red, round, heart-shaped, middle-sized. Flesh tender. A first-rate dessert fruit, worthy of cultivation for its earliness, being ripe about the beginning of July.

2 *Arch-duke, late arch-duke, late duke*.

3 *D'Arenberg*. Fruit middle-sized, dark red, roundish. Flesh tender. A first-rate dessert fruit, ripening beginning of July, allied to the *May-duke*. Does either as a standard or wall fruit.

4 *Belle de Choisy, ambrée de Choisy, cerise de La Palembre, cerise doucette, griottier de Palembre* (Lois. in Duham. ed. nov. p. 25. no. 20. t. 11.). Fruit very handsome and good, large, red, round. Flesh tender and sweet. A first-rate dessert fruit, ripening beginning and middle of August. Answers well either as a wall or standard fruit.

5 *Carnation, English bearer* of some, *cerise nouvelle d'Angleterre, cerise de Portugal, griotte de Villenes, Guindoux rouge* (Lois. in Duham. ed. nov. 5. p. 22. no. 14. t. 7.), *grosse cerise rouge pâle* (Nois. jard. fr. p. 20. no. 17. t. 5.), *griottier rouge pâle, cerise à gros fruit pale* (Duham. arbr. fr. 1. p. 182. t. 9.). Fruit large, round, pale red; flesh tender. A first-rate sort, ripening in July.

6 *English bearer*. Fruit large, dark red, round. Flesh

tender. A first-rate kitchen fruit, ripening in July. Does well as a standard. It is a variety of the *Kentish cherry*.

7 *English cherry, cerise d'Angleterre*. Fruit middle-sized, round, red. Flesh tender. A first-rate kitchen fruit, ripening in July. It is a variety of the *Kentish*. Does well as a standard.

8 *English preservee*. Fruit round, red, middle-sized. Flesh tender. A first-rate kitchen fruit, ripening about the beginning of July. It is a sort of *Kentish*, and good for drying.

9 *Large honey cherry*. Fruit roundish, red, small. Flesh sweet. A second-rate table fruit, but too small for cultivation.

10 *Jeffries' duke*. Fruit middle-sized, round, red. Flesh tender. A first-rate dessert fruit, ripening about the beginning of July. Answers either as a wall or standard fruit.

11 *D'Ostheim*. Fruit round, dark red. Flesh tender. A first-rate table and kitchen fruit. Answers best as a dwarf standard.

12 *De Soissons*. Fruit round, dark red. Flesh tender. A second-rate dessert fruit, ripening middle of July. Answers best as a standard.

13 *Cerise de Montmorency*, Duham. arb. fr. 1. p. 181.

14 *May-duke, early duke, early May-duke, large May-duke, Morris's duke, Benham's fine early duke, Thomson's duke, Portugal duke, Buchanan's early duke, Anglaise, royale hâtive, De Hollande, Courlande, De Hollande à larges feuilles, d'Espagne, griotte d'Espagne, griotte précoce* of some, *cerise nain à fruit rond précoce* (Duham. arb. fr. 1. p. 168. t. 3.). Fruit middle-sized, obtuse, heart-shaped. Flesh tender. This is certainly one of the best dessert cherries, when all its properties are taken into consideration. It answers either as a wall or standard fruit.

15 *Cerise griot marasquin*, Lois. in Duham. 5. p. 21. no. 7.

16 *Cerise à crochet*, Duham. arb. fr. 1. p. 175.

17 *Cerise à noyau tendre*, Duham. l. c. p. 174.

18 *Cerise d'Italie, cerise du pape goix*, Lois. in Duham. ed. nov. 5. p. 27. no. 35.

*Var. β, palléscens* (Ser. in D. C. prod. 2. p. 536.) fruit globose, depressed, or ovate-globose, amber-coloured. To this variety belong the following cherries:

1 *Blanche, cerise à fruit blanc, cerise ambre* (Duham. arb. fr. 1. p. 185. no. 18. t. 11.). Fruit small, pale yellow. Flesh tender. Not worthy of cultivation.

2 *Downton*. Fruit roundish, heart-shaped, pale yellow and red. Flesh tender. A good bearing and excellent dessert cherry, ripening about the beginning of July. Does well either as a wall or standard fruit.

3 *White heart*. Fruit heart-shaped, pale yellow and red. Flesh tender. A second-rate dessert fruit, ripening end of July.

*Var. γ, gobbetta* (Ser. in D. C. prod. 2. p. 536.) fruit red, depressed, the suture also depressed; flesh white; peduncles short; leaves tapering to both ends. To this variety belong the following sorts of cherry:

1 *Early May, griotte naine précoce*. Fruit red, round, small. Flesh watery. A poor fruit, owing to its smallness and acidity, ripening in the middle of June.

2 *Flemish, Kentish* of many, *yellow Ramonde, cerise de Kent* (Lois. in Duham. 5. t. 12.), *cerise de Montmorency à gros fruit* (Duham. arb. f. 1. p. 180. t. 8.), *Montmorency à courte queue, cerise à courte queue, gros gobet, gobet à courte queue, double volgers* of the Dutch. Fruit round, red, middle-sized. Flesh watery. A first-rate kitchen fruit, ripening in July. Does best as a standard.

3 *Kentish, common red, Flemish* of many, *Virginian May, early Richmond, Kentish red or pie cherry, Sussex, de Montmorency, Montmorency à longue queue, commune à Trochet* of some.

Fruit middle-sized, round, red. Flesh watery. A good bearer and a first-rate kitchen fruit, ripening end of July. Does best as a standard.

4 *Kentish drier*. Fruit round, red, middle-sized. Flesh watery. A first-rate kitchen fruit, ripening in July. Does best as a standard.

5 *Wild Rosshire*. Fruit small, red, round. Flesh watery. A wild cherry, allied to the *Kentish*.

*Var. δ, polygyna* (Ser. mss. in D. C. prod. 2. p. 537.) flowers numerous, usually polygynous; fruit numerous, on the same peduncle; flesh white? leaves glandular at the base. *C. polygyna*, D. C. herb.—*Cerise à bouquet*, Duham. arb. fr. 1. p. 173. t. 53.—*Cluster cherry, chevreuse*. Fruit round, red, small. Flesh watery. A cluster of fruit is formed from several styles in the same flower. A kitchen fruit. Does best as a standard.

*Var. ε, multiplex* (Ser. in D. C. prod. 2. p. 537.) flowers semi-double or double; pistils simple, fertile, or petaloid; fruit pale red; flesh thin and very acid.—*Double-flowering cherry, cerise à fleurs doubles, semi-double-flowering cherry, cerise à fleurs semi-doubles*. Only cultivated for ornament.

*Var. ζ, persiflora* (Ser. in D. C. prod. 2. p. 537.) flowers double, red.—*Cerise à fleur de pêcher, peach-flowered cherry*.

*Var. η, persifolia*; leaves narrow, like those of the peach or willow.—*Willow-leaved May-duke cherry, fern-leaved cherry, cerise à feuilles de pêcher, cerise à feuilles de saul de balsamine* (Lois. in Duham. ed. nov. 5. p. 25.), *cerise de Hollande à feuilles de saul*. This kind of cherry bears but an inferior fruit.

*Var. θ, variegata* (Ser. l. c.) leaves variegated with white.—*Cerise à feuilles panachées* (Lois. in Duham. ed. nov. 5. p. 20. no. 4.), *variegated-leaved cherry*.

*Var. ι, griotta* (Ser. l. c.) fruit globose, depressed, dark purple; flesh red. To this variety belong the following sorts of cherries:

1 *Griotte de chaux, griotte d'Allemagne* (Duham. arb. fr. 1. p. 192. t. 141.), *grosse cerise de M. le Comte de Maur*.

2 *Griotte commune, griottier*, Duham. arb. fr. 1. p. 187. t. 12.

3 *Early purple griotte*. Fruit dark red, heart-shaped, middle-sized. Flesh tender. A first-rate dessert fruit, ripening about the beginning of June. A valuable cherry, particularly on account of its earliness. Does well either as a standard or wall fruit.

4 *Griotte de Kleparow, la bonne Polonoise*. Fruit middle-sized, round, red. Flesh tender. A second-rate dessert fruit, ripening in July. Does best as a standard.

5 *Griotte à petit fruit, griotte à petit fruit noir*, Duham. arb. fr. 1. p. 190.

6 *Griotte de Portugal* (Duham. arb. fr. 1. p. 190. no. 18. t. 13.), *arch-duke* of some. A kind of *May-duke*.

7 *Griotte de Ratafia, griotte à Ratafia, cerise à tres petit fruit noir* (Duham. arb. fr. 1. p. 189. no. 16.), *cerise or griotte du nord tardive, de St. Martin, wild Russian, brune de Bruxelles, gros griotte noire tardive* (Lois. in Duham. ed. nov. 5. p. 26. no. 21. t. 14.), *cerise du nord* (Lois. l. c. p. 26. no. 22. t. 5.). Fruit roundish, dark red. Flesh watery. A good bearer, but inferior in size to the *Morello*, which it closely resembles; ripens in August. It is a kitchen fruit.

8 *Griotte de Turquie*. Fruit round, red, large. Flesh tender. A first-rate dessert fruit, ripening end of July. Like the *belle de Choisy*. Does well either as a wall or standard fruit.

9 *Griotte ou cerise de Prusse*, Lois. in Duham. ed. nov. 5. p. 29. t. 53. t. 13. f. A.

10 *Griotte ou guindoux de Poitou*, Le Berr. trait. jard. 1. p. 252. ex. Lois. l. c. p. 27. no. 29. t. 12. f. C.

11 *Morella extra noir*.

12 *Morella dobbete*.

13 *Sweet Morello.*14 *Langstilkede sode Moreller.*

15 *Morello, small Morello of some, Dutch Morello, large Morello, black Morello, late Morello, Ronald's large Morello, du nord, griotte ordinaire du nord.* Fruit dark red, round, heart-shaped, large. Flesh tender. A first-rate kitchen fruit, ripening in July and August. For north walls and for preserving the *Morello* is well known to be most valuable.

16 *Wild Morello.*

*Var. x, cordigera* (Ser. in D. C. prod. 2. p. 537.) fruit ovate-globose; flesh red. To this variety belong the following sorts of cherry:

1 *Cerise guigne*, Duham. arb. fr. 1. p. 195. t. 16. f. 1.

2 *Griotte guigne, cerise d'Angleterre*, Lois. in Duham. ed. nov. 5. p. 28. no. 32. t. 14. f. B.

3 *Griotte ou cerise cœur*, Le Berr. trait. jard. 1. p. 257. ex Lois. l. c.

4 *Plumstone Morello.* Fruit red, round, heart-shaped. Flesh watery, inferior to the *Morello*.

*Capronian, Griotte, Duke, and Morello Cherry.* Fl. April. May. Tree 20 feet.

† Names of cherries not so well known as to be placed in either species or varieties.

1 *Adlington.* 2 *Affane.* 3 *Ambrée à gros fruit.* 4 *Ambrée à petit fruit.* 5 *American heart.* 6 *Ansell's fine black.* 7 *Belle Bosc.* 8 *Black American.* 9 *Black Orleans.* 10 *Black Spanish.* 11 *Broughton's early black duke.* 12 *Bount's Dantzic cherry.* 13 *Buttner's herz kirsche.* 14 *Buttner's October zucker weichsel.* 15 *Buttner's schrspate.* 16 *Denner's black.* 17 *Double Natte.* 18 *Franche.* 19 *Grosse blanche carrée.* 20 *Grosse blanche.* 21 *Hartlib.* 22 *Hâtire ou précoce.* 23 *Hâtire de St. Jean.* 24 *De Jacap.* 25 *Læder kirsche.* 26 *Lamper's knorpel-kirsche.* 27 *Millet's late heart-duke.* 28 *Monstrucuse Hennequine.* 29 *Muscat de Prague.* 30 *New Royal.* 31 *Nouvelle d'Angleterre, cerise guigne.* 32 *Noyau tendre.* 33 *Cerise à petit fruit blanc.* 34 *Précoce.* 35 *Prince's duke.* 36 *Black prolific.* 37 *De Prusse.* 38 *Rainer's French cherry.* 39 *Remington heart.* 40 *Rothmelirt Bernstein kirsche.* 41 *Rouge pale tardive.* 42 *Royal tardive, duke cherry.* 43 *Russie à fruit blanc.* 44 *Thramer's Muscateller aus Minorca.* 45 *Tilger's Weisse herz kirsche.* 46 *Robertson's Tradescant's.* 47 *Turkine.* 48 *Transparent.* 49 *White transparent.* 50 *Cerise à trochet, commune à trochet, très fertile.* 51 *Unique nouvelle, early unique, early unique norcelle.* 52 *De l'arenne.* 53 *Wellington.* 54 *White Spanish.* 55 *Winter's schwarze knorpel kirsche.*

*Selection of sorts.*—Forsyth recommends for a small garden: 1 *May-duke.* 2 *Morello.* 3 *Archduke.* 4 *Black heart.* 5 *Bigarreau.* 6 *Graffion.* 7 *Turkey heart.* 8 *Kensington duke cherry.*

Those in the Dalkeith garden are:—1 *May-duke, two sorts.* 2 *Harrison's heart.* 3 *Black heart.* 4 *White heart.* 5 *Amber heart.* 6 *Morello.* All against walls.

Miller says the best sorts for an orchard are: *the common red or Kentish, the duke cherry, and the Lukeward's heart*; all of which are plentiful bearers.

*Propagation.*—Varieties of the *cherry* are continued by grafting or budding on stocks of the *black or wild red cherries*, which are strong growers and of a longer duration than any of the garden kinds. The *hearts*, which are all ill bearers, are sometimes grafted on *bird cherry* stocks, which are said to have the same effect on the *cherry* that the *paradise stock* has on the *apple*, that of dwarfing the tree and rendering it more prolific. Some graft on the *Morello* for the same purpose. The stones of the cultivated *cherries* are sometimes, but improperly, sub-

stituted for those of the wild sort, as being more easily procured. New varieties are produced by propagating from seed.

The *cherry*, Mr. T. A. Knight observes, (Hort. trans. 2. p. 38.) “sports more extensively in variety when propagated from seeds, than any other fruit which I have hitherto subjected to experiments; and this species is therefore probably capable of acquiring a higher state of perfection than it has ever yet attained. New varieties are also much wanted; for the trees of the best old kinds are every where in a state of decay in the cherry orchards; and I am quite confident that neither healthy nor productive trees will ever be obtained from grafts of old and expended varieties of this or any other species of fruit tree.”

Cherry stones, whether for stocks or new varieties, are sown in light sandy earth in autumn, or are preserved in sand till spring and then sown. They will come up the same season, and should not be removed till the second autumn after sowing. They may then be planted out in rows, 3 feet apart, and the plants about 1 foot asunder in the rows. The succeeding summer they will be fit to bud, if intended for dwarfs; but if for standards they will require to stand one or more seasons, generally till four years old. They should be budded or grafted near 6 feet from the ground; the usual way is to bud in summer, and graft those which do not succeed the following spring.

*Soil.*—The *cherry* delights in dry sandy soil and elevated situations; but some sorts, as the *May-duke*, will thrive in all soils and aspects, and all the varieties may be planted in a common mellow garden or orchard ground. In Kent, this tree prospers in the deep loam lying on rock. Miller says, the soil which *cherries* thrive best in, is a fresh hazel loam; if it be a dry gravel they will not live many years, and will be perpetually blighted in the spring.

*Site.*—To obtain fruit early, some sorts, as the *May-duke*, are planted against walls; but all the varieties will do well as dwarfs or espaliers in general situations, and most of them as standards. The *May-duke*, Nicol observes, does well as a standard; but against a south wall the fruit becomes considerably larger, and contrary to what happens in other fruits, it seems to acquire flavour. The *Morello* is much improved in flavour when planted against a wall of good aspect. Abercrombie says, “allot to the finest of the early kinds south walls for fruit in May and June, train others against west and east walls, for supplies in succession, and some on north walls for the latest ripeners, particularly the *Morello*; which, so situated, will continue in perfection till September and October; but it is also proper to plant some trees of this sort on south walls, to have the fruit ripen earlier, with an improved flavour.”

*Final planting.*—Plant full standards from 20 to 30 feet apart; small standards 15, 18, or 20 feet apart. The proper season for planting is from the middle or end of October, or any time in November or December, if open weather, till February or March. Miller says, never plant standard or rider *cherry* trees over other fruits; for there is no sort of fruit that will prosper under the drip of *cherries*. He allows 40 feet square for standards in orchards for the same reason.

*Mode of bearing.*—*Cherry* trees in general produce the fruit upon small spurs or studs, from half an inch to 2 inches in length, which proceed from the side and ends of the two year or 3 year and older branches; and as new spurs continue shooting from the extreme parts, it is a maxim in pruning both standard and wall trees, not to shorten the bearing branches where there is room for their regular extension. The *Morello* is, in some degree, an exception.

*Pruning cherry trees in general.* To standards give only an occasional pruning to reform or remove any casual irregularity from cross-placed or very crowded branches, and take away all cankerous and decayed wood. To wall trees a summer pruning

should commence in May or June, in order to regulate the shoots of the same year. Disbud the superfluous or foreright shoots, or if they have been suffered to spring, pinch or cut them off with such as are disorderly. Retain a competent supply of the best well placed side and terminal shoots, to remain for selection at the winter pruning. Nail or lay in the reserve close to the wall at their full length, and so train them all summer. The winter pruning may be performed at the fall of the leaf, or at any time in moderate weather till February or March. It comprises a regulation both of the old and young wood. Carefully preserve the sound and productive branches and bearers in their full expansion, and reduce or remove such only as are irregular in growth, too crowded, unfruitful, decayed, or cankered. Any branches extending out of bounds prune into some good lateral shoot or fruit-bud. According to the time the bearers have already lasted, look to some promising shoots for successors to those which may first wear out. To fill immediate vacancies retain select shoots of the last year and the year before, with uniformly a leader to the advancing branch where there is room, and with lateral shoots in any open or unproductive space nearer the origin of the branches, to be trained as bearers between the main branches. Some cut superfluous fruit-shoots clean away; others leave a sprinkling of short stubs cut very short if foreright. The new laterals and terminals are to be trained in at full length as far as room will permit. They will come into bearing the first and second year. In pruning *cherry* trees in general be careful to preserve the small clustering fruit spurs, except where on wall trees any old spurs project considerably, and assume a rugged disorderly appearance; cut such clean out smoothly.

*Pruning the Morello cherry.* "The *Morello* *cherry* bears principally on the shoots of last year, the fruit proceeding immediately from the eyes of the shoots, and bears but casually, and in a small degree, on close spurs formed on the two year old wood, and hardly ever on wood of the third year. Therefore both in the summer and winter pruning leave a supply of last year's shoots on all the branches, from the origin to the extremity of the tree, for next year's bearers, cutting out past bearers to make room. It is plain that the *Morello* ought to have no stubs left with a view to spurs, and all foreright shoots ought to be disbudded while young. To leave a convenient space for young wood train the present bearers 6 inches apart; lay in between each of these one young shoot for bearing next year, which will make the promiscuous distance 3 inches." Underwood (Caled. hort. mem. 1. p. 427.) has often observed, when the branches of *cherry* trees are laid in too near to one another, or are crossed by branches of the same kind, or by plum-tree branches, as is sometimes the case, that although there be abundance of blossom, yet there is no crop even in good seasons. On examining the blossoms produced on such crowded shoots he found that in 50 flowers there were not above two styles, of course no fruit could be expected. By not laying in the branches so close, and by removing all superfluous summer shoots, more light and air was admitted, and he had in consequence plentiful crops.

*Renovating old or decayed trees.* Proceed as in the renovating the plum, see p. 504.

*Growing cherry trees in orchards.* Near large towns cherries might be cultivated in orchards to a certain extent. In Kent and Hertfordshire are the *cherry* orchards which afford the chief supply for the London market. The sorts are chiefly the *caroon*, *small black* or *Kentish*, the *May-duke*, and the *Morello*; but *Holman's duke*, the *black heart*, and *large black gean* will do well in orchards.

*Protecting from birds.* "As cherries in the ripening state are frequently attacked by birds, it is advisable to have choice

wall-trees or espaliers defended with large nets in due time. Old fishing nets may also be spread over the branches of dwarf standards. To protect other standard trees let scare-crows and clap-boards be put up."

*Gathering the fruit.* Use the hand, taking hold of the fruit-stalk in gathering from the wall, and the *cherry* gatherer, in gathering from the distant branches of high standards.

*Insects and diseases, &c.* Wall *cherry* trees are often infested with the red-spider, but standards are generally not much injured by insects. Nasmith says, "our *cherry* trees both in the open air, and on the natural walls, particularly the tops of young shoots, are much attacked with a small black insect, provincially called the black beetle. The remedy I have found most effectual for their destruction is a mixture of pitch with one-sixteenth part of powdered orpiment, one-sixteenth part of sulphur, dissolved over a slow fire in an earthen pipkin, until they be well incorporated; when cold, divide it into small pieces about the size of a hen's egg, and burn it under the trees with damp straw, directing the smoke as much as possible where the insects are most numerous. In an hour afterwards, if the state of the fruit will admit, give the trees a good washing with a garden engine, which generally clears off the half dead beetles, and prevents the spreading of the red-spider." Caled. hort. mem. 2. p. 90.

#### *Of the culture of the cherry-house.*

Though the *cherry* be a native of Britain no fruit is more difficult to force. M'Phail observes, "no tree forced for obtaining fruit early is more liable to fail of a good crop than the *cherry*; the blossoms are apt to fall off before the fruit is set, and the fruit will keep falling off before and after they are as large as peas. This is occasioned by a kind of stagnation of air about them, which affects the tender blossoms and young shoots."

*Soil.* M'Phail says, "take light, sandy, rich, mellow earth, and make a border of it the whole width of the house, and 4 feet deep." According to Nicol, "the border should be from 24 to 30 inches deep; the bottom, if not naturally mild and dry, to be drained and paved. The soil should be a sandy loam or light hale garden earth, made moderately rich with stable-yard dung well reduced, or with other light compost. If a small portion of lime, or a moderate quantity of marl, were mixed with it so much the better. The soil for *cherries* to be forced in pots or tubs should be considerably richer than the above." Torbron (Hort. trans. 4. p. 116.) uses fresh virgin soil and rotten dung.

*Choice of sorts.* M'Phail, Nicol, and all gardeners agree in giving the preference to the *May-duke*. Nicol says, "none of the other kinds set so well, except the *Morello*, which I do not hesitate to say well deserves a place; it is a good bearer, and the fruit when forced acquires superior size and flavour." Nicol, kal. p. 295.

*Choice of plants.* M'Phail takes standards of different heights in a bearing state; Nicol clean, healthy, young plants, that have been one or two years in training against a wall; Torbron trees 8 or 10 years from the bud, and selected of such various heights as best suits the size of the house.

*Choice of situation.* M'Phail and Torbron plant in rows, beginning with the tallest in the back side, reserving the shortest for the front, letting them slope to the south gradually, somewhat in the form in which plants are set in the green-house." (Gard. remem. 146. and Hort. trans. 4. p. 116.) Nicol has a trellis against the back wall for wall-trained trees, and a border in front in which he plants dwarf standards. The dwarfs against the back trellis he plants 8 or 10 feet apart. Riders that have been 3 or 4 years trained, and are well furnished with fruit-spurs, may be planted between the dwarfs. They may probably yield a few fruit the first season, and will hardly fail to produce plentifully in that following. In the border may be

planted, as dwarf standards, to be kept under 5 feet in height, some well furnished plants that have been kept in large pots or tubs for a year or two; such being more fruitful, and less apt to go to wood, than plants that have grown in the open ground. In planting these the ball of earth should not be much reduced, only a few of the under roots should be spread out, for if the ball were reduced, and the whole roots spread out as in the ordinary way of planting, when it is wished that the plant may push freely, the intention here would be thwarted, which is to have the plant dwarf and fruitful, growing little to wood. Along with these may be planted in the same way an apricot or two, or figs, or both, that have been dwarfed in pots or tubs as above. If they succeed it would give a pleasant variety, of which there need be little doubt, as the temperature, soil, and general treatment for cherries will suit apricots, and not far disagree with figs. These little standards may be allowed a space of about 4 feet square each, which is sufficient, as they must not be suffered to rise high or spread far, on account of shading the trees on the trellis. In planting of the principal dwarfs and riders, let the work be carefully performed. They should be raised with as good roots, and be kept as short time out of the ground as possible, placing them just as deep as they have been before, spreading out their roots and fibres, and filling in with fine earth. The whole should have a moderate quantity of water, and have air freely admitted every day, defending them, however, from snow or much rain. The house should not be forced the first year; and it will be better to defer heading in the plants till the middle or end of March than to prune them now. I shall, therefore, take no further notice of them till then, supposing they are to be attended to with respect to air and moderate waterings. It is necessary, however, to remark, that the plants should be carefully anointed with the liquor recommended for vines, see vol. 1. p. 708. either just now or sometime in the course of the month.

*Time of planting.* According to Nicol and M'Phail January and February; to Torbrön early in the autumn.

*Pruning.* Trees planted in January may be pruned about the middle or end of March. The dwarfs planted against the trellis should be well cut in, that is, each shoot of last year should be shortened back to three or four buds, that the plants may throw out a sufficiency of young shoots to fill the rail from the bottom. The dwarfs planted in the border as little standards need not be headed in so much, as the intention is to have the fruit full, and that they may grow little to wood from the beginning. Their short shrubby shoots need not be touched, unless bruised or hurt in transplanting, shortening back the longer and weaker ones a few inches, according to their strength. The riders planted against the back trellis may be treated very much in the same manner, the sole intention being to obtain a few crops of them while the dwarfs are making wood, and filling their spaces. In November following the trees may be pruned for the succeeding season. In order to produce wood to fill the trellis as soon as possible, the dwarfs should be pretty much headed in. The shoots may be pruned very much in the manner of the trees in the early house, shortening no shoots that are fully ripened, except a few of those at the extremities of the tree, in order to make them throw out others for its full extension upwards next year. November is also the proper time for pruning an established cherry-house preparatory to forcing for the next year. As cherry trees which have been forced make very little wood, the pruning required is probably nothing further than moderately to thin out the spurs, and to prune off any accidental breast-wood or water-shoots that may have risen since the crop was gathered. "The leading shoots, except for the purpose of producing wood to fill up any blank or vacancy, need not be shortened; nor need those in the lower parts of the tree, except for the same reason. But if it be necessary to shorten these, let

them be cut pretty well in, as otherwise they will push very weakly. Shoots on the extreme parts of the tree that should be shortened for the above purpose, need not however be cut so closely in. If they be headed back one-third or to half their lengths, it will generally be found sufficient."

*Summer pruning.* Very little of this is requisite, such water-shoots or breast-wood as arise among the spurs are to be pinched off as they appear, laying in such shoots only of this description as may be wanted to fill an occasional vacancy. Train in the summer shoots of the dwarfs as they advance at the distance of about 8 or 9 inches from each other; and otherwise observe the general rules for pruning cherries on walls and espaliers.

*Stirring the soil.* After pruning, the borders are to be forked up, and a little well-rotted dung mixed with sand worked in if thought necessary. In summer they may be slightly stirred on the surface, and weeded to keep them fresh, clean, and neat, and where a part of the border is outside the house cover with horse-dung or litter in the early part of the season.

*The time of beginning to force* is sometimes December, but more generally January and February. "Newly planted trees," Nicol observes, "will bear gentle forcing next spring, from the first or middle of March, which ought to be considered merely as preparatory to forcing them fully, till about the first of February the third year." Torbrön, if the trees have been removed with good balls, admits of gentle forcing the first spring, but prefers deferring it till the third year. He says, "I have had an abundant crop of fine cherries from trees which had been planted only a few months before forcing, but would not recommend the risking of a whole crop, unless the trees have been longer established." Where cherries are to be ripened early in the season he "shuts in about the beginning of December, and lights the fires about the third or last week of that month." Hort. trans. 4. p. 116.

*Temperature.* Abercrombie begins at 40°, "and throughout the first week lets the minimum be 40°, and the maximum 42°, giving plenty of air. By gradual advances in the second, third, and fourth week, raise the course to 42° min. and 45° max. In strong sunshine admit air freely rather than have the temperature above 52°, by collecting the warm air. In the fifth and sixth week the artificial minimum may be gradually elevated to 45°, but the maximum should be restrained to 48° from fire heat, and to 55° from sun heat, until the plants are in flower. After the blossoms are shown, and until the fruit is set, aim to have the heat from the flues at 48° min. and 52° max. At this stage maintain as free an interchange of air as the weather will permit, and when the sun heat is strong do not let the temperature within exceed 60°. As the fruit is to be swelled and ripened, the requisite heat is 60° min. and 65° max." In January M'Phail does not let the cherry-house rise higher than 50°. In February "if the thermometer in the morning is as low as 35° there is no danger, but it should rise in the course of the day to imitate nature as near as possible. In the month of March the thermometer in the open air in the shade seldom rises above 55°. In the month of April it seldom rises above 65°. But it is observed that when the sun shines on a cherry tree or other trees in the open air, the heat on them is higher than in the shade. The cherry tree is of such a delicate nature to force, that it is impossible for any person to write down the exact temperature of the air, which would insure a crop from it in the forcing way." When the fruit is beginning to colour and swell off for ripening, the temperature may be raised 4 or 5 degrees. Torbrön (Hort. trans. 4. p. 119.) says, "for the first three, four, or five weeks of lighting fires, if the weather be so severe as to depress the thermometer in the open air from 22° to 12° degrees; then let the thermometer inside the house be kept from 35° to 40°, or just sufficient to exclude the frost. If the weather be not severe

during the above period the thermometer may be kept to 45° inside the house. As the season advances and becomes more mild, and the days longer, probably about the first or middle of February, the thermometer may be raised to 50°, and then it is expedient to give gentle sprinklings by an engine or syringe two or three times a week in the evening. Whilst the trees are in bloom no sprinkling must be used, but the flues when only moderately hot are to be steamed morning and evening, and every day and hour of sunshine, and in calm and mild weather fresh air must be copiously admitted. When the petals begin to drop, and when the fruit is set, the temperature may be raised to 55°, the house being engined three or four times a week in the evening, but never till the bloom is all down. When the cherries are completely stoned the thermometer may be raised to 60° by fire heat, sprinkling every evening by the engine till the fruit is nearly ripe; the house may be kept higher by day as well as by night after stoning.

*Watering.* M'Phail waters occasionally at the root and over the top till the trees are in blossom; but when the stones in the fruit are become hard, the trees may be washed all over occasionally with clean water, not too cold. Let this be done in a fine sunny morning. In April, when the cherries are grown large, give the border a good watering now and then, which will enable the trees to swell their fruit to a good size; by keeping them in a healthy growing state the fruit will be fine flavoured, and the trees will make strong flower-buds for the ensuing season. If the fruit is not ripening, wash the trees occasionally, in a sunshiny morning, with sweet clean water. According to Torbrön, "from the time the flower begins to open till the fruit is completely stoned, the soil should be but sparingly watered; but when the stoning is effected water may be applied to the roots freely till the fruit is nearly ripe, when he desists." (Hort. trans. 4. p. 119.) Before the fruit begins to colour the engine should be exercised with force, and often for a week or two, to subdue the red spider. After the crop is gathered the watering must be resumed, and continued till the foliage begins to drop. The border may be kept in a moderately moist state until the leaves begin to fall, or till the house be exposed or be uncovered.

*Air.* In forcing the *cherry* it is essential to continue a free circulation of air; always sustaining the minimum heat in the different stages. The blossoms will sometimes fall abortive, or the young fruit drop off after setting, from no other cause than a stagnant atmosphere. At first beginning to force M'Phail gives plenty of air night and day. In February, when the trees are in blossom, "let the house have air day and night, and as much as you can when the fruit are swelling off." Nicol says, "the airing of the cherry-house may be performed by the sashes with every safety till the buds begin to expand, and after that in frosty or bad weather air may be admitted by the ventilators. In February nothing is more conducive to the health of the plants, and the setting of the fruit, than a regular and free circulation of air. A day should never pass without less or more air being admitted. As the fruit begins to ripen give as large and regular portions of air as possible, opening the sashes by 8 or 9 o'clock in the morning, giving full air about 10 o'clock, reducing about 2 or 3, and shutting up about 4 or 5, sooner or later according to the state of the atmosphere. In conducting this matter, however, regard must be had to the temperature, but air may be admitted in sunshine to such an extent as to keep down the mercury or spirits in the thermometer to 65°, and at other times to 60°." Gard. kal. p. 339. Torbrön says, "the *cherry* in forcing requiring more fresh air than most other fruits, particular attention must be paid to its admission, by the gardener having it in his power occasionally to make as many inlets or openings as convenient. It will be conducive to this end that

the roof and the upright or front sashes, if any, be moveable, and all with little difficulty, because in changeable weather the current of air may be required to be augmented or reduced many times in one day. Air must be admitted freely and copiously when the weather is mild and calm, and accompanied with sunshine, during the time the cherries are in bloom, and also near the time of their ripening." Hort. trans. 4. p. 119.

*Insects and diseases.* "The *cherry* is liable to be infested by a small grub-worm, which rolls itself up in the leaves, and extends its ravages to the fruit. As soon as the insect is perceived the trees should be searched daily, that it may be destroyed by the hand, and prevented from spreading. It usually shows itself first about the time of flowering." Pract. gard. p. 661. The cherry-house, as the season advances, may be smoked once a week or ten days, which will prevent the trees from being infested with a blackish kind of insect, frequently very pernicious. Birds are apt to get into the house and eat the fruit, therefore narrow nets should be employed, which will prevent birds as well as wasps and flies from getting to the fruit. Torbrön fumigates for the black fly, and picks off the grub.

*Gathering and keeping the fruit.* If it be found necessary cherries will keep some time on the trees, provided the birds can be kept from them. Keep the house for the purpose dry, cool, and well aired. Gard. rem. p. 246.

*Exposing the wood.* This, according to all the authors quoted, may be done from the time the fruit is gathered till within a week or ten days of the recommencement of forcing. The glass should be entirely taken off, unless the cherry-house is in part used for some other purpose, to which this practice would be injurious.

*Forcing cherry trees in pots.* M'Phail and Nicol concur in approving the very general practice of planting *cherry* trees in pots; in which, or in tubs of a foot or 15 inches in diameter, they may be successfully forced. Three or four dozen good plants managed in this way would give a great deal of fruit, which might be had in succession for a considerable length of time by dividing the plants into 3 or 4 classes or divisions, and shifting them from one compartment to another. In January the first 12 trees may be placed in the green-house or conservatory, if there be one, or in a peach-house now at work, placing them in the coolest part of the house, but in the full light, and where they may have plenty of air. They must be duly attended to with water at the roots, and be frequently syringed at top, generally once in two days. The pots being occasionally watered with the drainings of the dung-hill would add much to the vigour of the plants; there is no method of manuring more effectual or so readily accomplished. The plants may remain here till the fruit be fairly set, the stoning over, and all danger of dropping past. They may then be placed in a vinery or stove to ripen off, where they would come in early, and be very high flavoured, if placed near the light, and so as that they may have free air daily. In February a second and third dozen should be taken in, and a fourth in the beginning of March, and each similarly treated. Gard. kal. It is very common with early forced *cherry* trees to bear a second crop late in the same season. Hort. trans. 3. p. 367. Mr. B. Law (Hort. trans. series 2. vol. 1.) finds the following method of forcing *cherries* attended with greater success than any other he is acquainted with. He puts the *cherry* trees into his houses, giving them but very little water at the close of the year, by which he finds them better prepared for blooming in the spring. Their pots have a capacity of from two quarts to two gallons, according to the size of the plants, but the soil in which they are planted is by no means rich, for he finds that highly manured soil makes the shoots too luxuriant, and causes them to gum. When he begins to force he waters but sparingly, and admits air both by night and by day as much as

the weather will permit; for he finds alternate ventillation by day and confinement by night to be very injurious. He opens his back lights in any kind of weather close to the trees. In frosty weather he increases his fires, to enable him to give constant air without actually allowing the temperature to fall to 32°. In this manner he proceeds very slowly until the blossoms are all set. He subsequently raises the temperature to 65°, and afterwards gradually to 70°, increasing the moisture of the atmosphere at the same time, and always taking care to keep the ventillation as abundant as he possibly can. By which means he finds the crop certain and abundant without the use of any kind of bottom heat, as tan leaves, &c.

**Forcing by a temporary structure.** Torborn observes, that "where a portion of wall (especially with a southern aspect) already well furnished with *may-dukes* perfectly established, and in a bearing state, can be spared for forcing, a temporary glass case may be put up against it; the flue may be built on the surface of the border without digging or sinking for a foundation; neither will any upright or front wall be requisite, the wooden plate on which the lower end of the rafters are to rest may be supported by piles sunk or driven into the soil of the border, one pile under every or every alternate rafter. The place between the surface and the soil should be filled by boards nailed against the piles to exclude the external air, for the plate must be elevated above the level of the surface from 18 to 30 inches, or whatever height may be sufficient to let the sashes slip down, in order to admit fresh air. I believe this to be an uncommon structure, and it may perhaps be objected to; but I am confident it will suit well for cherries, for I have constructed such places even for forcing peaches with good success, as well as for maturing and preserving a late crop of grapes." Hort. trans. 4. p. 117.

6 *C. SEMPERFLORENS* (D. C. fl. fr. 4. p. 481. Lois. in Duham. ed. nov. p. 50. no. 18. t. 5. f. A.) branches drooping; leaves ovate, serrated; flowers late, axillary, solitary; calyxes serrated; fruit globose, red.  $\frac{1}{2}$ . H. Native country unknown. *Prunus semperflorens*, Ehrh. Beitr. 7. p. 132. *Prunus serotina*, Roth. cat. 1. p. 58. Flowers white. This is the *All-saints* or *weeping-cherry*, the *cerise de la toussaint*, *cerise tardive*, *cerise de Saint Martin*, and *Guignier à rameaux pendans* of the French. The fruit is small, round, red, watery, but it is of little value.

**Var.  $\beta$ , sessiliflora** (Ser. mss. in D. C. prod. 2. p. 537.) This is a monstrosity, bearing earlier sessile flowers, and foliaceous styles.

**Ever-flowering Weeping or All Saints' Cherry.** Fl. May. Tree 10 to 20 feet.

7 *C. CHAMÆCERASUS* (Lois. in Duham. ed. nov. 5. p. 29. t. 5. f. A.) flowers umbellate; umbels usually sessile; peduncles longer than the leaves when in fruit; fruit round, reddish purple, very acid; leaves obovate, shining, crenated, bluish, quite glabrous, rather coriaceous, hardly glandular.  $\frac{1}{2}$ . H. Native of Siberia and Germany. *C. intermedia*, Lois. l. c. p. 30. *Prunus intermedia*, Poir. dict. 5. p. 674. *Prunus fruticosa*, Pall. fl. ross. 1. p. 19. t. 8. B. *Chamæcerasus fruticosa*, Pers. ench. 2. p. 34. Lower serratures of leaves glandular. Flowers white.

**Ground-cherry or Siberian-cherry.** Fl. May. Clt. 1597. Tree 2 to 4 feet.

8 *C. PERSICIFOLIA* (Lois. l. c. p. 9.) flowers umbellate, numerous; peduncles rather capillary; leaves ovate-lanceolate, acuminate, unequally-serrulated; petioles biglandular.  $\frac{1}{2}$ . H. Native of North America? *Prunus persicifolia*, Desf. arbr. 2. p. 205. This kind of *cherry* was raised from seeds sent by Michaux from North America.

**Peach-leaved Cherry.** Fl. May. Tree 8 to 10 feet.

9 *C. PUDDUM* (Roxb. Wall. pl. rar. asiat. 2. p. 37. t. 143.)

VOL. II.

leaves ovate, lanceolate, acuminate, sharply serrulated; flowers umbellate; umbels on short peduncles; bractæ ciliated; calyx tubular, length of the peduncle; limb of calyx reflexed; fruit roundish, red.  $\frac{1}{2}$ . H. Native of Nipaul, between Hurdwar and Sirinagur. Flowers rose-coloured. The wood is reckoned very useful in Nipaul. The fruit is like that of a common *cherry*; it is refreshing, but not very sweet. The tree is found in the south of Hindostan, Nipaul, Kamaon, Deyra, Sirmore, and elsewhere in great abundance. *Puddum* is the vernacular name of the tree.

**Puddum Cherry.** Fl. Oct. Nov. Tree 20 to 30 feet.

10 *C. PUMILA* (Michx. fl. bor. amer. 2. p. 286.) striated; branches twiggy; flowers subumbellate, pedunculate; calyx short, campanulate; leaves obovate-oblong, erect, glaucous beneath, glabrous, hardly serrulated; fruit ovate, red.  $\frac{1}{2}$ . H. Native of Canada. Lois. in Duham. ed. nov. 5. p. 31. *Prunus pumila*, Lin. mant. 73. Mill. fig. t. 89. f. 2. *Cerasus glauca*, Moench. meth. 672. Stature of *Amygdalus nana*. In Canada it is commonly called *Ragoumier*. Flowers white. Fruit red, acid.

**Dwarf Canadian-cherry.** Fl. May. Clt. 1756. Sh. 3 to 4 ft.

11 *C. PYGMÆA* (Lois. in Duham. ed. nov. 5. p. 32. no. 21.) unarmed; umbels sessile, few-flowered; leaves ovate-elliptic, acutish, glabrous on both surfaces, tapering to the base, sharply serrated, bearing 2 glands at the base; fruit black, hardly succulent, about the size of a large pea.  $\frac{1}{2}$ . H. Native of North America. *Prunus pygmæa*, Willd. spec. 2. p. 993. Flowers white, size of those of *Prunus spinosa*.

**Pigmy Cherry.** Fl. May. Clt. 1823. Shrub 3 to 4 feet.

12 *C. NIGRA* (Lois. l. c. p. 32. no. 22.) unarmed; umbels sessile, few-flowered; lobes of calyx obtuse; leaves ovate, acuminate; petioles biglandular.  $\frac{1}{2}$ . H. Native of Canada, and from Fort William in lat. 48 deg. to the Saskatchewan, Lake Huron, and Newfoundland. Sims, bot. mag. 1117. *Prunus nigra*, Ait. hort. kew. ed. 1. vol. 2. p. 165. ed. 2. vol. 3. p. 198. Calyx purple, with obtuse segments, having glandular margins.

**Black Canadian-cherry.** Fl. April, May. Clt. 1773. Shrub.

13 *C. BOREALIS* (Michx. fl. bor. amer. 1. p. 286. Lois. l. c. 5. p. 32. no. 23.) flowers sub-corymbose; pedicels longish; leaves oval-oblong, acuminate, membranous, glabrous, closely denticulated; fruit small, egg-shaped, red, with sweet flesh.  $\frac{1}{2}$ . H. Native of North America, on the high mountains of New England. *Prunus borealis*, Poir. dict. 5. p. 674. Leaves like those of the common almond, with the serratures inflexed, and tipped by glands at the apex.

**Northern Cherry or Choke-cherry.** Fl. May. Clt. 1822. Sh.

14 *C. GLANDULOSA* (Lois. in Duham. ed. nov. 5. p. 33. no. 26.) flowers solitary; peduncles pendulous; leaves oblong, acute, with glandular serratures, glabrous, of the same colour on both surfaces; branches unarmed.  $\frac{1}{2}$ . H. Native of Japan. *Prunus glandulosa*, Thunb. fl. jap. 203. Corolla flesh-coloured.

**Glandular-leaved Cherry.** Shrub 5 to 8 feet.

15 *C. ASPERA* (Lois. l. c. 5. p. 33. no. 24.) branches dotted; flowers solitary, terminal, pedunculate; leaves ovate, acuminate, serrated, scabrous on both surfaces.  $\frac{1}{2}$ . H. Native of Japan. *Prunus aspera*, Thunb. fl. jap. 201. Poir. dict. 5. p. 675. Drupe the size of pepper, blue, glabrous, edible, containing a hard acutish stone. The upper surface of the leaf is so hard that it is used for polishing in Japan.

**Rough-leaved Cherry.** Shrub 5 to 6 feet.

16 *C. INCISA* (Lois. l. c. 5. p. 33. no. 27.) branches unarmed; flowers solitary; peduncles capillary, twice the length of the leaves; leaves ovate, deeply serrated, vilous; calyx cylindrical, ferruginous.  $\frac{1}{2}$ . H. Native of Japan. *Prunus incisa*, Thunb. fl. jap. 202. Petals rose-coloured.

3 U

*Cut-leaved Cherry.* Shrub 6 feet.

17 *C. DEPRE'SSA* (Pursh. fl. amer. sept. 1. p. 331.) branches angular, depressed, prostrate; umbels few-flowered, sessile, aggregate; leaves lanceolate-cuneate, a little serrated, glabrous, glaucous beneath; fruit ovate.  $\frac{1}{2}$ . H. Native of North America, from Canada to Virginia, throughout Canada, and as far as the Saskatchewan. *Cerasus pumila*, Michx. fl. bor. amer. 1. p. 286. but not the *Prunus pumila* of Lin. *Prunus Susquehæna*, Willd. enum. 519. baumz. ed. 2. p. 286. Flowers white.

*Depressed or Sand-cherry.* Fl. May. Clt. 1805. Shrub prostrate.

18 *C. HYEMALIS* (Michx. fl. bor. amer. 1. p. 284.) umbels sessile, aggregate; segments of the calyx lanceolate; leaves oval-oblong or obovate, abruptly acuminate; fruit subovate.  $\frac{1}{2}$ . H. Native of Canada, Virginia, and in the shady woods of Carolina. Lois. in Duham. ed. nov. 5. p. 194. Flowers white. Fruit black and astringent, eatable only in the winter.

*Winter or Black Choke-cherry.* Fl. May. Clt. 1805. Shrub 3 to 4 feet.

19 *C. PROSTRATA* (Ser. in D. C. prod. 2. p. 538.) decumbent; flowers usually solitary, almost sessile; calyx tubular; leaves ovate, deeply-serrated, glandless, clothed with hoary tomentum beneath; fruit ovate, red, with tender flesh, and with the sutures of the stone very blunt.  $\frac{1}{2}$ . H. Native of the mountains of Candia, and on mount Lebanon, and of Siberia. *Prunus prostrata*, Labill. syr. dec. 1. p. 15. Lois. in Duham. ed. nov. 5. p. 182. t. 53. f. 2. good. Curt. bot. mag. 136. *Prunus incana*, Steven in mem. soc. mosq. 3. p. 263. Petals ovate, retuse, rose-coloured.

*Prostrate Cherry.* Fl. April, May. Clt. 1802. Sh. pros.

20 *C. HUMILIS* (Moris, clenck. sard. p. 17.) stems depressed; flowers usually solitary, pedicellate; calyx tubular; leaves oblong or ovate, unequally serrated, glabrous, and green on both surfaces, reticulately veined beneath; fruit ovate.  $\frac{1}{2}$ . H. Native of Sardinia. Habit of *C. prostrata*, but differs from it in the nerves being hoary. Petals ovate, of a pale rose colour.

*Humble Cherry.* Fl. June, July. Shrub depressed.

21 *C. CHICASA* (Michx. fl. bor. amer. 1. p. 284.) branches rather spinescent, quite glabrous; flowers usually twin; pedicels very short; calyx glabrous, with very short segments; leaves oval-oblong, acute or acuminate; fruit nearly globose, small, yellow.  $\frac{1}{2}$ . H. Native of Carolina, to which country it has been introduced by the Indians, and by them called *Chicasaw*.

*Chicasaw Cherry or Plum.* Fl. April, May. Clt. 1806. Shrub 6 feet.

22 *C. PUBESCENS* (Ser. in D. C. prod. 2. p. 538.) umbels sessile, few-flowered; peduncles and calyxes pubescent; leaves short, oval, serrulated, for the most part biglandular at the base; fruit globose.  $\frac{1}{2}$ . H. Native of New England and Pennsylvania. *Prunus pubescens*, Pursh. fl. bor. amer. 1. p. 331. *Prunus sphaerocarpa*, Michx. fl. amer. sept. 1. p. 284. but not of Swartz. Young branches pubescent. Fruit on short pedicels, of a brownish purple-colour, and astringent.

*Pubescent Cherry.* Fl. April, May. Clt. 1820. Shrub.

23 *C. JAPONICA* (Lois. in Duham. ed. nov. 5. p. 33.) leaves ovate, acuminate, glabrous, shining; peduncles solitary; lobes of calyx shorter than the tube.  $\frac{1}{2}$ . G. Native of Japan. *Prunus Japonica*, Thunb. fl. jap. p. 201. *Prunus Sinensis*, Pers. ench. 2. p. 36. Flowers red. Drupe the size of a pea.

*Var.  $\beta$ , multiplex* (Ser.) flowers semidouble, with the petals white on the upper side, and red on the under. *Prunus Japonica*, Ker. bot. reg. 27.

*Japan Cherry.* Fl. March, May. Clt. 1810. Sh. 2 to 4 feet.

24 *C. CHINE'NSIS*; leaves ovate-lanceolate, doubly serrated, wrinkled from veins beneath; peduncles sub-aggregate.  $\frac{1}{2}$ . H. Native of China. *Amygdalus pumila*, Lin. mant. 74. Sims, bot.

mag. 2176. exclusive of the synonyme of Pluck. Flowers semidouble, red.

*China Cherry.* Fl. March, May. Clt. 1810. Sh. 2 to 3 ft.

25 *C. SERRULATA* (G. Don, in Loud. hort. brit. p. 480.) leaves obovate, acuminate, setaceously serrulated, quite glabrous; petioles glandular; flowers in fascicles.  $\frac{1}{2}$ . G. Native of China, where it is called *Yung-to*. *Prunus serrulata*, Lindl. hort. trans. 7. p. 238. This species is generally known by the name of *double Chinese-cherry*. The flowers are pale white, and very ornamental.

*Serrulated-leaved Cherry.* Fl. April. Clt. 1822. Shrub 4 to 6 feet.

26 *C. SALICINA* (G. Don, in Loud. hort. brit. p. 480.) flowers usually solitary, shorter than the leaves; leaves obovate, acuminate, glandularly serrated, glabrous; stipulas subulate, glandular, length of the petiole; petiole glandless.  $\frac{1}{2}$ . F. Native of China, where it is called *Ching-cho-lee* or *Tung-chok-lee plum*. *Prunus salicina*, Lindl. hort. trans. Flowers small, white. Fruit about the size of those of the *Myrobalan plum*. It seems to come nearest to *C. glandulosa*.

*Willow Cherry.* Fl. April, May. Clt. 1822. Shrub 4 to 6 feet.

SECT. II. LAUROCE'RASUS (the name indicates it is a cherry in fruit, and laurel in leaves). *Laurocerasus* and *Cerasus* species, Tourn. inst. t. 493. Flowers disposed in racemes, rising from the branches.

§ 1. *Pädus* (from  $\pi\alpha\delta\omicron\varsigma$ , *pados*, a name given by Theophrastus to a tree analogous to the cherry). *Leaves caducous*.

27 *C. PENNSYLVANICA* (Lois. in Duham. ed. nov. 5. p. 9.) umbels almost sessile, aggregate, sometimes in the form of panicles; leaves oblong-lanceolate, acuminate, glabrous, biglandular at the base.  $\frac{1}{2}$ . H. Native of North America, Canada as far as the Saskatchewan, and from Newfoundland to the Rocky Mountains. *Prunus Pennsylvanica*, Lin. fil. suppl. 252. *Prunus lanceolata*, Willd. arb. 240. t. 3. f. 3. Flowers white. Fruit smaller than those of the *cherry*, agreeable to eat.

*Pennsylvanian Bird-cherry.* Fl. May. Clt. 1773. Shrub 6 to 8 feet.

28 *C. PANICULATA* (Lois. l. c. 5. p. 9. Ker. bot. reg. t. 80.) flowers paniced, spreading; leaves ovate.  $\frac{1}{2}$ . G. Native of Japan. *Prunus paniculata*, Thunb. fl. jap. 200. Flowers large, white. Very like *C. Mahaleb*, but differs in the panicle of flowers being larger and more spreading, in the flowers being smaller, in the leaves being more oblong and attenuated at the base, and acutely serrated.

*Paniced-flowered Bird-cherry.* Fl. May. Shrub.

29 *C. PSEUDO-CERASUS* (G. Don, in Loud. hort. brit. 200.) leaves obovate, acuminate, flat, serrated; flowers racemose; branches and peduncles pubescent; fruit small, pale red, of a pleasant subacid flavour, with a small smooth stone.  $\frac{1}{2}$ . H. Native of China, where it is called *Yung-to*. *Prunus pseudo-cerasus*, Lindl. hort. trans. 6. p. 90. *Prunus paniculata*, Ker. bot. reg. 800. but not of Thunb. Flowers white. This species of *cherry* forces well.

*False-cherry.* Fl. April, May. Clt. 1821. Sh. 6 to 10 feet.

30 *C. MAHALEB* (Mill. dict. no. 4. D. C. fl. fr. 4. p. 480.) racemes somewhat corymbose, leafy; leaves broad, roundish-cordate, denticulated, glandular, folded together; fruit ovate-roundish, black.  $\frac{1}{2}$ . H. Native of the south of Europe. Lois. in Duham. ed. nov. 5. p. 6. t. 2. *Prunus Mahaleb*, Lin. spec. 678. Jacq. fl. austr. t. 227. Resembling the apricot in foliage. Flowers white. The wood is red, very hard, and sweet-scented, and on that account is greatly esteemed by the French for making cabinets and other furniture, under the name of *bois de Sainte*

*Lucie*. The fruit is black, yielding a bitter purple juice, the stain of which is not easily effaced. A fragrant and pleasant distilled water is made from both leaves and flowers.

*Mahaleb Bird-cherry*. Fl. Ap. May. Clt. 1714. Tree 10 ft. 31 *C. PÄDUS* (D. C. fl. fr. 4. p. 580.) racemes elongated, leafy, drooping; petals obovate; leaves ovate-lanceolate, rather acuminate; fruit round, black, astringent.  $\frac{1}{2}$ . H. Native of Europe and Siberia, in hedges and in woods; plentiful in some parts of Britain. *Prunus Pädus*, Lin. spec. 677. Smith, engl. bot. t. 1383. Flowers white. Fruit black, called *bird-cherry*, *fowl-cherry*, *cluster-cherry*, and in Scotland *hag-berry*. A strong decoction of the bark is used by the Finlanders to cure venereal complaints. The fruit is nauseous to most palates, but infused in gin or whiskey it greatly improves these spirits, and is only surpassed by an infusion of peach leaves.

*Var. a, vulgäris* (Ser. in D. C. prod. 2. p. 539.) flowers large, loose, on long peduncles; fruit black. *Prunus pädus a*, D. C. fl. fr. 4. p. 580. Lois. in Duham. ed. nov. 5. p. 2. t. 1.

*Var. ß, parviflora* (Ser. l. c.) flowers smaller; peduncles shorter and denser; fruit black. Oed. fl. dan. t. 205.

*Var. γ, rubra* (Ser. in D. C. prod. 2. p. 539.) fruit red. *C. Pädus fructu rubro*, D. C. fl. fr. 4. p. 580. Lois. l. c. *Prunus rubra*, Willd. arbr. 237. t. 4. f. 2. ex Ait. hort. kew. ed. 2. p. 299. This is the *Cornish* or *red-bird-cherry*.

*Var. δ, bracteösa* (Ser. mss. in D. C. prod. 2. p. 539.) flowers very numerous; pedicels furnished with long bractæas. *C. Pädus δ*, D. C. herb.

Common *Padus* or Bird-cherry. Fl. April. May. Britain. Tree 10 to 30 feet.

32 *C. ACUMINATA* (Wall. pl. rar. asiat. 2. p. 78. t. 181.) leaves lanceolate, acuminate, remotely serrated, and are, as well as the flowers, glabrous, sometimes with a few glands beneath; racemes axillary, solitary, or in fascicles, a little shorter than the leaves.  $\frac{1}{2}$ . G. Native of the mountains of Nipaul. Flowers white. Racemes nodding. *Aron* is the Nipaul name of the tree.

*Acuminate-leaved Bird-cherry*. Tree 20 to 30 feet.

33 *C. VIRGINIANA* (Michx. fl. bor. amer. 1. p. 285.) racemes erect, elongated; petals orbicular; leaves oblong, acuminate, doubly-toothed, smooth; petioles usually bearing about 4 glands; fruit red.  $\frac{1}{2}$ . H. Native of Virginia, Carolina, and Canada. *Prunus rubra*, Ait. hort. kew. ed. 1. vol. 2. p. 162. Willd. arb. 238. t. 5. f. 1. *Prunus arguta*, Bigelow in litt.—Catesb. ear. 2. t. 19. —Park. par. 599. t. 597. f. 6. Flowers white. Fruit globose. Wood beautifully veined with black and white. The tree retains its foliage late in autumn.

*Virginian Bird-cherry*. Fl. May, June. Clt. 1724. Tree 20 to 80 feet.

34 *C. CANADENSIS* (Lois. in Duham. ed. nov. 5. p. 3.) leaves without glands, broad-lanceolate, wrinkled, pubescent on both surfaces, and green, drawn down into the petiole.  $\frac{1}{2}$ . H. Native of Canada. *Prunus Canadensis*, Willd. spec. 2. p. 986.—Pluk. alm. t. 158. f. 4. Flowers white.

*Canada Bird-cherry*. Fl. May, June. Clt. 1820. Tree 20 to 30 feet.

35 *C. MOLLIS* (Dougl. mss. Hook. fl. bor. amer. 169.) racemes short, pubescently tomentose, as well as the calyxes; calycine segments reflexed; leaves obovate-oblong, crenated, pubescent beneath; fruit ovate.  $\frac{1}{2}$ . H. Native of the north-west coast of America, near the mouth of the Columbia, and on subalpine hills near the source of the river. Like *C. pubescens* in habit. Young branches dark brown and downy. Flowers white.

*Soft Bird-cherry*. Tree 12 to 24 feet.

36 *C. EMARGINATA* (Dougl. mss. Hook. fl. bor. amer. p. 169.) racemes corymbose; pedicels elongated, glabrous; calyx glabrous, with ovate, obtuse, reflexed segments; leaves oval, den-

ticularly serrulated, glabrous, acute at the base, and biglandular, but obtuse at the apex, and usually emarginate; fruit globose.  $\frac{1}{2}$ . H. Native of north-west America, on the upper part of the Columbia river, especially about the Kettle Falls. Flowers white. Fruit astringent. Wood red spotted with white. Leaves 2 inches long.

*Emarginate-leaved Bird-cherry*. Shrub 4 to 8 feet.

37 *C. CAPOLLIN* (D. C. prod. 2. p. 539.) racemes rather compound, lateral, and terminal; leaves lanceolate, serrated, glabrous; fruit globose.  $\frac{1}{2}$ . G. Native of Mexico, in cold and temperate places. *Prunus Virginiana*, Moc. et Sesse, fl. mex. icon. ined. *Prunus Canadensis*, pl. mex. ined.—Hern. mex. 95. with a figure. The leaves are about the size and form of those of *Salix fragilis*. The fruit is the colour and form of that of *C. arium*. The bark of this tree is employed in Mexico as a febrifuge.

*Capollin Bird-cherry*. Shrub.

38 *C. NIPAULENSIS* (Ser. in D. C. prod. 2. p. 540.) leaves long, lanceolate, acuminate, bluntly serrated, glabrous, conspicuously and reticulately veined beneath, and whitish, pilose in the axils of the nerves; peduncles short, rather villous, as well as the rachis; calyx glabrous; fruit?  $\frac{1}{2}$ . H. Native of Nipaul. The leaves are almost the form of those of *Salix fragilis*.

*Nipaul Bird-cherry*. Clt. 1820. Shrub.

39 *C. CAPRICIDA*; leaves elliptic, acuminate, coriaceous, glabrous, quite entire, with undulately curled margins; petioles glandless; racemes either solitary or aggregate by threes, many-flowered, glabrous, shorter than the leaves.  $\frac{1}{2}$ . G. Native of Nipaul, at Narainhetty. *Prunus capricida*, Wall. in litt. *Prunus undulata*, Hamilt. ex D. Don, prod. p. 239. *Cerasus undulata*, Ser. in D. C. prod. 2. p. 540. The leaves of this shrub contain so large a quantity of prussic-acid as to kill the goats of Nipaul. This shrub is probably evergreen.

*Goat-killing Bird-cherry*. Sh.

40 *C. ELLIPTICA* (Lois. in Duham. ed. nov. 5. p. 4.) leaves elliptic, serrated, bluntish, veiny, glabrous.  $\frac{1}{2}$ . H. Native of Japan. *Prunus elliptica*, Thunb. fl. jap. 199. Drupe oblong, about the size of a small grape.

*Elliptic-leaved Bird-cherry*. Tree.

41 *C. SEROTINA* (Lois. in Duham. ed. nov. 5. p. 3.) racemes loose, at length pendulous; leaves oval or obovate, acuminate, simply serrated, opaque, shining above, naked on both surfaces, bearded in the axils of the veins beneath; petioles biglandular; fruit dark purple, globose.  $\frac{1}{2}$ . H. Native of North America, in Canada and Newfoundland. *Prunus serotina*, Willd. arbr. 239. t. 5. f. 2. *Prunus Virginiana*, Mill. dict. no. 2. Leaves rather coriaceous, shining, the floral ones very narrow at the base. Flowers white. This is the *Tanquoy-meen-ahlik* of the Cree Indians. Its fruit is termed *Tanquoy-mena* or *Choke-cherry*; it is not very edible in a fresh state, but when dried and bruised it forms an esteemed addition to pemmican. Dr. Richardson says it is the *C. Virginiana*.

*Var. ß, retusa* (Ser. mss. in D. C. prod. 2. p. 540.) leaves roundish, obovate, rather villous beneath, very blunt, and rather retuse at the apex; the middle nerve pilose on both sides.  $\frac{1}{2}$ . S. Native of South America.

*Late Bird-cherry, or Choke-cherry*. Fl. May, June. Clt. 1629. Tree 20 feet.

§ 2. *Laurocerasus* (*laurus*, the laurel, and *cerasus*, the cherry; the trees are cherries in fruit but Laurels in the leaves). *Leaves coriaceous, permanent, evergreen*.

42 *C. OCCIDENTALIS* (Lois. in Duham. ed. nov. 5. p. 4.) racemes lateral; leaves glandless, oblong, acuminate, quite entire, glabrous on both surfaces.  $\frac{1}{2}$ . S. Native of the West

Indies. *Prunus occidentalis*, Swartz, fl. ind. occ. 2. p. 925.—Catesb. car. 2. p. 94. t. 94. ? Flowers white.

*Occidental Bird-cherry*. Fl. year. Clt. 1784. Tree 20 ft.

43 *C. LUSITANICA* (Lois. in Duham. ed. nov. 5. p. 5.) racemes erect, axillary, longer than the leaves; leaves ovate-lanceolate, serrated, glandless.  $\frac{1}{2}$ . H. Native of Portugal and Pennsylvania. *Prunus Lusitânica*, Lin. spec. 678. Mill. fig. 131. t. 196. f. 1.—Dill. hort. elth. 193. t. 159. f. 193. Fruit ovate, red when ripe. The *Portugal laurel* is one of the most elegant shrubs which we have in our plantations, especially when planted in a proper situation and soil. The evergreen shining leaves and the long racemes of white flowers make altogether a very striking appearance. It was brought to England from Portugal, but whether it is a native of that country is doubtful.

*Var.  $\beta$ , Hixa* (Ser. in D. C. prod. 2. p. 540.) leaves larger; racemes more elongated; flowers looser.  $\frac{1}{2}$ . H. Native of Teneriffe, the Grand Canary, and Palma. *Prunus Hixa*, Brouss. ex Willd. enum. 517. *Prunus multiglandulosa*, Cav. ann. sci. nat. 3. p. 59. The lower serratures of the leaves are glandular, according to Willdenow.

*Portugal Laurel*. Fl. June. Clt. 1648. Tree 10 to 20 feet.

44 *C. LAURO-CERASUS* (Lois. in Duham. ed. nov. 5. p. 6.) racemes shorter than the leaves; leaves ovate-lanceolate, remotely serrated, furnished with 2 or 4 glands beneath; fruit ovate, acute.  $\frac{1}{2}$ . H. Native of the Levant, Caucasus, the mountains of Persia, and the Crimea. *Prunus Laurocerasus*, Lin. spec. 678. Clusius received it in 1576 from David Ungand, then ambassador from the Emperor of Germany at Constantinople, with some other rare trees and shrubs, all of which perished except the common *laurel* and horse-chestnut. It was sent by the name of *Trabison Cumasi* or *Date of Trebisonde*. The leaves have a bitter styptic taste, accompanied with a flavour resembling that of the bitter almond; this flavour has caused them to be used for culinary purposes in custards, puddings, blanc-mange, &c., and as the proportion of the sapid matter of the leaf to the quantity of milk is inconsiderable, no bad effects are produced. Laurel-water is prepared, according to the Prussian pharmacopœia, by drawing off 3 pounds of distilled water from 2 pounds of the fresh leaves. See *Amygdalus*.

*Cherry-laurel* or *Common Laurel*. Fl. April, May. Clt. 1629. Shrub 6 to 10 feet.

45 *C. SPHEROCARPA* (Lois. l. c. 5. p. 4.) racemes axillary, erect, small, shorter than the leaves; leaves glandless, quite entire, shining; flowers distant; fruit nearly globose.  $\frac{1}{2}$ . S. Native of Jamaica, St. Domingo, Hispaniola, and Brazil, in woods. *Prunus sphaerocarpa*, Swartz, fl. ind. occ. 2. p. 927. but not of Michx.—Sloane, hist. 2. p. 9. t. 193. f. 1. Wood very hard and white. Leaves 2 inches long and about an inch and a half broad, nearly round. Fruit purple when ripe.

*Round-fruited Evergreen Bird-cherry*. Fl. June, July. Clt. 1820. Tree 10 to 12 feet.

46 *C. BRASILIENSIS* (Cham. et Schlecht. Linnæa. 2. p. 542.) racemes axillary, shorter than the leaves, erect; leaves elliptic, acuminate at both ends, quite entire, with revolute edges, furnished with a gland on both sides of the middle nerve at the base beneath.  $\frac{1}{2}$ . S. Native of Brazil. Drupe black.

*Brazilian Evergreen Bird-cherry*. Tree.

47 *C. CAROLINIANA* (Michx. fl. bor. amer. 1. p. 285.) leaves on short petioles, oblong-lanceolate, mucronate, smooth, rather coriaceous, almost entire; racemes axillary, dense, shorter than the leaves; flowers rather large; fruit nearly globose, mucronate.  $\frac{1}{2}$ . H. Native of North America, from Carolina to Florida. Lois. in Duham. ed. nov. 5. p. 5. *Prunus Caroliniana*, Ait. hort. kew. 2. p. 163. Leaves about 2 inches long,  $\frac{3}{4}$  of an inch broad, with a few indentures on their edges. Flowers white.

*Carolina Evergreen Bird-cherry*. Fl. May. Clt. 1759. Tree 20 to 30 feet.

48 *C. SALICIFOLIA* (D. C. prod. 2. p. 540.) quite glabrous; leaves oblong-lanceolate, ending in a very long acumen, sharply serrulated, smooth, permanent; calyx permanent, with the lobes denticulated; petioles furnished with 1 or 2 glands; style curved.  $\frac{1}{2}$ . S. Native of New Granada. *Prunus salicifolia*, H. B. et Kunth, nov. gen. amer. 4. p. 241. t. 563. Leaves like those of *Salix fragilis*. Flowers white.

*Willow-leaved Evergreen Bird-cherry*. Tree 20 to 30 feet.

49 *C. FERRUGINEA* (D. C. prod. 2. p. 540.) leaves obovate, permanent, on short petioles, retuse; petioles and branches clothed with rusty velvety down; racemes length of leaves.  $\frac{1}{2}$ . S. Native of Mexico. Fruit unknown.

*Rusty Evergreen Bird-cherry*. Shrub.

50 *C. CAPULI* (Ser. mss. in D. C. prod. 2. p. 541.) leaves lanceolate, sharply serrated, glandless, glabrous.  $\frac{1}{2}$ . S. Native of Peru. *Prunus Capuli*, Cav. ex Spreng. syst. 2. p. 477. Perhaps the same as *C. Capollin* of Mexico.

*Capuli Evergreen Bird-cherry*. Tree.

*Cult.* All the hardy kinds of this genus are well adapted for shrubberies; they are generally increased by cuttings or layers, which should be planted in September, in as sheltered a border as possible; some of them are raised more readily by seeds, as the *Portugal laurel*. Ripened cuttings of the stove and greenhouse kinds root freely if planted in a pot of sand, with a hand-glass placed over them; those of the stove species require bottom heat to make them strike root.

VI. POLYDONTIA (from *πολυ*, *poly*, many, and *ὄδους* *odous odontos*, a tooth; calyx having more teeth than other genera in the order). Blum. bijdr. 1104.

LIN. SYST. *Icosandria*, *Monogynia*. Calyx inferior, campanulate, with a 6-cleft deciduous limb. Petals 6, very minute, inserted in the limb of the calyx. Stamens 12-18, nearly equal, inserted with the petals. Ovary free, 1-celled. Stigma peltate. Drupe kidney-shaped, dry, 1-seeded. Embryo exalbuminous, inverted.—A tree 30 to 50 feet high, with alternate, oblong, quite entire, exstipulate leaves, for the most part biglandular at the base. Racemes axillary and lateral, solitary or crowded, tomentose. Flowers small, furnished with 1 bractea each. This genus is hardly distinct from *Amygdalus*.

1 *P. ARBorea* (Blum. bijdr. p. 1105.).  $\frac{1}{2}$ . S. Native of Java, in mountain woods.

*Tree Polydontia*. Tree 30 to 50 feet.

*Cult.* A mixture of loam, peat, and sand will suit this tree; and ripened cuttings will strike root, if planted in sand, under a hand-glass, in heat.

LXXXI. SPIRÆACEÆ (plants agreeing with *Spiræa* in important characters). *Ulmariæ*, Vent. t. 3. p. 351.—*Rosacææ*, Tribe III. *Spiræacææ*, D. C. prod. 2. p. 541.

Calyx 5-cleft (f. 65. a. f. 66. a. f. 67. a.), imbricate in æstivation, with a disk either lining the tube (f. 67. b.), or surrounding the orifice, the fifth lobe next the axis. Petals 5 (f. 65. b. f. 66. b. f. 67. c.), perigynous, equal. Stamens from 20-50, arising from the calyx or the disk, with the petals curved inwards in æstivation; anthers innate, 2-celled, bursting lengthwise. Ovaries superior, several together (f. 65. d.), free from the calyx. Follicles or carpels several (f. 65. d.), distinct, disposed in a whorl, around an imaginary axis of the flower, usually 5 (f. 65. d.) in number, but sometimes fewer from abortion, apiculate by the styles, they at length become capsular, and open

inwardly, somewhat 2-valved. Seeds 2-4, rarely solitary from abortion, rising from the margin of the inner suture, at the middle or near the base, suspended, without aril and without albumen. Embryo straight, inverted in *Spiræa*, but probably erect in the other genera. Cotyledons flat, thickish. This order is composed of shrubs or herbs, with simple, trifoliate, or pinnate leaves. The roots of all the plants contained in it are so astringent as to be sometimes used for tanning. The *Gillenia trifoliata* is remarkable in having, in addition to its astringency, an emetic property, on which account it is employed in North America as *Ipecacuanha*. It is said a similar power exists in other plants of this order.

This order is distinguished from *Chrysobalanææ* by the numerous follicular deliscent carpels, and from *Rosaceæ* in the carpels, and in the styles being terminal, not lateral, as in that order.

#### *Synopsis of the genera.*

1 PU'RSHIA. Lobes of calyx all obtuse. Stamens about 25, rising from the calyx. Carpels 1-2, ovate, oblong, containing 1 seed, which is inserted at the base of the carpel. Leaves cuneated, deeply toothed at the apex.

2 KE'RRIA. Lobes of calyx 5, 3 of which are obtuse, and the other 2 mucronate. Stamens about 20, arising from the calyx. Carpels 5-8, globose, containing 1 seed each, which adheres to the side.

3 SPIRÆA. Calyx 5-cleft (f. 65. a. f. 66. a.). Stamens 20-50, inserted with the petals in the torus, which adheres to the calyx. Carpels 2-5 (f. 65. d.), rarely solitary, free, rarely joined, containing 2-6 seeds in each, fixed to the inner suture.

4 GILLE'NIA. Calyx 5-cleft (f. 67. a.). Petals linear, contracted at the base (f. 67. c.), rising from the top of the tube. Stamens 10-15, inclosed (f. 67. b.). Carpels 5, somewhat connate into a 5-celled fruit; cells 2-seeded.

† A genus doubtful whether it belongs to the present order.

5 ADENILE'MA. Calyx glandular, 5-cleft. Stamens numerous, inserted with the petals in the calyx. Ovary simple. Style 1. Capsule inclosed in the calyx, 1-celled, deliscent, many-seeded. Seeds albuminous.

I. PU'RSHIA (in honour of Frederick Pursh, author of *Flora Americæ Septentrionalis*, 2 vols. 8vo. London, 1817). D. C. in *Lin. trans.* 12. p. 154. prod. 2. p. 541.—*Tigarea*, Pursh, *fl. amer. sept.* 1. p. 33. t. 15. but not of Aublet.

LIN. SYST. *Icosándria, Mono-Digýnia*. Calyx 5-cleft; lobes ovate, obtuse. Petals 5, obovate. Stamens about 25, rising with the petals from the calyx. Carpels 1-2, ovate-oblong, pubescent, tapering into the style at the apex, at length opening by a longitudinal chink. Seed 1, inserted in the base of the carpel.—A much-branched shrub, with scaly buds. Leaves crowded, wedge-shaped, deeply 3-toothed at the apex, smoothish above, but clothed with hoary tomentum beneath. Stipulas very small. Flowers yellow.

1 P. TRIDENTA'TA (D. C. l. c.).  $\frac{1}{2}$ . H. Native of North America, on the banks of the Columbia river, and in the prairies of the Rocky Mountains, &c. Hook. *fl. bor. amer.* t. 8. *Tigarea tridentata*, Pursh, *fl. amer. sept.* 1. p. 33.

*Tridentate-leaved Purshia*. Clt. 1826. Shrub 1 to 2 feet.

*Cult.* A dry light sandy soil will answer this shrub best. Cuttings may be rooted under a hand-glass, but the shrub is easier increased by seeds.

II. KE'RRIA (in honour of — Kerr, sometime superintendent of the botanic garden in Ceylon). D. C. in *Lin. trans.* 12. p. 156. prod. 2. p. 541.

LIN. SYST. *Icosándria, Pentagýnia*. Calyx 5-cleft; lobes ovate, 3 of which are obtuse, and the other 2 callosely mucronate at the apex, imbricate in æstivation. Petals 5, orbicular. Stamens about 20, arising from the calyx with the petals, exserted. Carpels 5-8, globose, free, glabrous, each ending in a filiform style. Seed solitary in the carpels, adhering laterally.—An evergreen shrub, with smooth green bark, twiggly branches, ovate-lanceolate, coarsely and unequally serrated, feather-nerved, conduplicate leaves, linear-subulate stipulas, and large yellow flowers, which are usually double in the gardens.

1 K. JAPÓNICA (D. C. l. c.).  $\frac{1}{2}$ . H. Native of Japan. *Rubus Japonicus*, Lin. mant. 245. *Córchorus Japonicus*, Thunb. *fl. jap.* p. 227. Andr. bot. rep. 587. Sims, bot. mag. 1296. *Spiræa Japonica*, Cambess. ann. sc. nat. 1. p. 389. Flowers yellow. The single-flowered *Kerria* has not yet been introduced to the gardens, but the double-flowering variety is very common.

*Japan Kerria*. Fl. all the year. Clt. 1700. Sh. 4 to 10 ft.

*Cult.* *Kerria* is an elegant shrub when in blossom, being clothed with double yellow flowers all the summer. It is hardy enough to stand the winter in the open air, if planted against a south wall. Cuttings, taken off at a joint when in a young state, root readily, if planted under a hand-glass.

III. SPIRÆA (said to be from *σπειραιω*, *speirao*, to become spiral; in allusion to the fitness of the plants to be twisted into garlands). Lin. gen. 630. Gaertn. fruct. 1. p. 337. t. 69. D. C. prod. 2. p. 541.—*Spiræa*, *Ulmária*, and *Filipéndula*, Tourn. inst. —*Spiræa* species, Cambessedes, mon. spir. in ann. sc. nat. 1. p. 227.

LIN. SYST. *Icosándria, Di-Pentagýnia*. Calyx 5-cleft (f. 65. a. f. 66. a.), permanent. Stamens 10-50, inserted in the torus, lining the calyx along with the petals. Carpels solitary, or several together (f. 65. d.), rarely connected at the base, ending in short points, sessile, rarely stipitate. Seeds 2-6, fixed to the inner suture of the carpel. Embryo inverted. Cotyledons thickish.—Unarmed shrubs or perennial herbs, with alternate branches. Leaves usually simple, but sometimes pinnately cut, as in Section *Ulmária*, having pinnate or palmately ternate nerves. Flowers white or reddish, never yellow.

SECT. I. PHYSCOPROS (*φυσα*, *physa*, a bladder, and *καρπος*, *karpus*, a fruit; in reference to the bladdery carpels). Cambess. in ann. sc. nat. 1. p. 385. D. C. prod. 2. p. 542. Ovaries connected at the base. Torus lining the calycine tube. Carpels bladdery, rather membranous. Ovula 2-3, fixed to the seminiferous margin of the carpel, ovoid, at first horizontal, but at length suspended. Flowers hermaphrodite, disposed in umbels; pedicels 1-flowered. Leaves toothed or somewhat lobed, usually stipulate.

1 S. OPULIFOLIA (Lin. spec. 702.) leaves cordate, 3-lobed, biserrated, stalked; corymbs pedunculate, hemispherical; flowers numerous; pedicels slender, glabrous; sepals spreading; carpels large, diverging; seeds obovate, shining, yellow.  $\frac{1}{2}$ . II. Native of North America, from Canada to Carolina, on the mountains. Cambess. in ann. sc. nat. 1. p. 386. Lois. in Duham. ed. nov. 6. p. 61. t. 14.—Comm. hort. 1. p. 169. t. 87. Flowers white. Carpels 3.

*Var.  $\beta$ , tomentella* (Ser. in D. C. prod. 2. p. 542.) peduncles and calyces tomentose. Native at the grand rapids of the Columbia river.

*Guelder-rose-leaved Spiræa*. Fl. June, July. Clt. 1690. Sh. 5 to 6 feet.

2 *S. MONOGYNA* (Tofrey, in ann. lyc. 2. p. 194.) leaves broad-ovate, slightly 3-lobed, deeply serrated, glabrous; corymbs umbellate; flowers monogynous; lobes of calyx erectly spreading; ovaries villous.  $\frac{1}{2}$ . II. Native of North America, on the Rocky Mountains. Flowers white. Carpel solitary.

*Monogynous Spiræa*. Shrub 3 to 4 feet.

3 *S. CAPITATA* (Pursh, fl. amer. sept. 1. p. 342.) leaves ovate, a little lobed, doubly serrated, tomentose, and reticulated beneath; corymbs terminal, crowded, somewhat capitate, on long peduncles.  $\frac{1}{2}$ . II. Native of North America, on the eastern coast, and at the river Columbia. Cambess. l. c. 1. p. 365. Flowers white. Carpels 2. Said by Hooker to be a variety of *S. opulifolia*.

*Capitate-flowered Spiræa*. Shrub 3 to 4 feet.

SECT. II. CHAMÆDRYON (*Chamædryn*, the name of the germander; form of leaves). Ser. mss. in D. C. prod. 2. p. 542. — *Spiræa* species, Cambess. mon. spir. in ann. sc. nat. 1. p. 384. Ovaries free. Torus free at the apex, but adhering to the calycine tube at the base. Shrubs, with hermaphrodite flowers, disposed in umbels or corymbs; pedicels undivided, 1-flowered. Leaves entire or toothed, exstipulate.

4 *S. ULMIFOLIA* (Scop. fl. carn. ed. 2. vol. 1. p. 349. t. 22.) leaves ovate-lanceolate, acute, flat, sharply serrated, glabrous; flowers disposed in sub-hemispherical, terminal corymbs; sepals reflexed.  $\frac{1}{2}$ . II. Native of Carinthia and Siberia. Cambess. l. c. 1. p. 367. Lois. in Duham. ed. nov. 6. p. 40. t. 13. *S. chamædrifolia*, Jacq. hort. vind. t. 140. Lindl. bot. reg. t. 1222. Lodd. bot. cab. 1042. Flowers white.

*Var.  $\beta$ , phyllantha* (Ser. mss. in D. C. prod. 2. p. 542.) sepals distinct, stipitate, transformed into verticillate, lanceolate, sharply serrated leaves; petals and stamens wanting, or if present more or less deformed. *S. foliosa*, Poir. dict. 7. p. 353.

*Elm-leaved Spiræa*. Fl. June, July. Clt. 1790. Sh. 3 to 5 ft.

5 *S. FLEXUOSA* (Fisch. in litt. and Cambess. l. c. p. 365. t. 26.) leaves lanceolate, glabrous, dentately serrated from the apex to the middle; flowers disposed in corymbs.  $\frac{1}{2}$ . II. Native country unknown. *S. alpina*, Hort. par. ex Cambess. and Fisch. in litt. Perhaps only a variety of *S. ulmifolia*. Flowers white.

*Flexuous Spiræa*. Fl. Ju. Jul. Clt. 1820. Sh. 4 to 6 feet.

6 *S. CRATÆGIFOLIA* (Link. enum. 2. p. 10.) leaves obovate, obtuse, doubly serrated in front, glabrous; corymbs terminal, compound, subcapitate.  $\frac{1}{2}$ . II. Native country unknown. Flowers white.

*Hawthorn-leaved Spiræa*. Fl. June, July. Clt. 1823. Sh. 4 to 6 feet.

7 *S. BELLA* (Sims, bot. mag. 2126.) stems glabrous, rufous; leaves ovate, glabrous, serrated, petiolate, glaucous beneath; lobes of calyx deflexed; cymes terminal, spreading, and are as well as the branches pubescent.  $\frac{1}{2}$ . II. Native of Nipaul. Shrub erect, branched, with the habit of *S. chamædrifolia*. Flowers beautiful red. Carpels 5, shining.

*Pretty Spiræa*. Fl. July, Aug. Clt. 1820. Sh. 2 to 3 feet.

8 *S. CHAMÆDRIFOLIA* (Lin. spec. 701.) leaves ovate, deeply serrated at the apex, pubescent; flowers disposed in hemispherical corymbs; pedicels slender, elongated; sepals veiny, reflexed.  $\frac{1}{2}$ . II. Native of Siberia, Kamtschatka, Dahuria, and north-west coast of America. Cambess. l. c. 1. p. 362. Pall. fl. ross. 1. p. 32. t. 15. Flowers white.

*Germander-leaved Spiræa*. Fl. June, July. Clt. 1789. Sh. 1 to 2 feet.

9 *S. BLUMEI*; leaves obovate, obtuse, deeply toothed at the apex, smoothish; cymes pedunculate, terminal, and are as well

as the calyxes glabrous.  $\frac{1}{2}$ . G. Native of Java and Japan. *S. chamædrifolia Japonica*, Blum. bijdr. 1114. Flowers white.

*Blume's Spiræa*. Shrub 3 to 6 feet.

10 *S. MEDIA* (Pursh, fl. amer. sept. 1. p. 342.) leaves obovate, few-toothed at the apex, rather villous; corymbs pedunculate.  $\frac{1}{2}$ . II. Native of Canada. *S. chamædrifolia  $\beta$ , media*, Ser. in D. C. prod. 2. p. 542. Flowers white.

*Intermediate Spiræa*. Fl. June, Jul. Clt. ? Sh. 1 to 2 feet.

11 *S. OBLONGIFOLIA* (Waldst. et Kit. pl. hung. 3. p. 261. t. 235.) leaves oblong-lanceolate, narrowed at the base, deeply serrated at the apex, or entire, pubescent, ciliated; corymbs pedunculate.  $\frac{1}{2}$ . II. Native of Hungary. Flowers white. Like *S. chamædrifolia* in the form of the leaves, but sufficiently distinct.

*Oblong-leaved Spiræa*. Fl. May, Ju. Clt. 1816. Sh. 3 to 6 ft.

12 *S. LANCEOLATA* (Poir. dict. 7. p. 354.) leaves lanceolate, deeply serrated, glabrous, paler beneath; umbels few-flowered, axillary, pedunculate.  $\frac{1}{2}$ . G. Native of the Mauritius and China. *S. Cantonensis*, Lour. coch. p. 322. ex Cambess. l. c. p. 366. t. 25. Leaves like those of *S. salicifolia*. Flowers white. Leaves deeply serrated only at the apex.

*Lanceolate-leaved Spiræa*. Shrub 2 to 4 feet.

13 *S. CANA* (Waldst. et Kit. pl. hung. 3. p. 252. t. 227.) leaves ovate, acute, quite entire, or a little toothed, clothed with hoary villi; corymbs somewhat spicate, lateral, pedunculate, few-flowered, loose; sepals spreading; styles thick; carpels diverging, and rather villous.  $\frac{1}{2}$ . II. Native of Croatia on high rocks. Cambess. l. c. 1. p. 364. Leaves about the size of those of *Salix repens*, var. *argentea*. Flowers white.

*Hoary Spiræa*. Fl. June, July. Clt. 1825. Sh. 1 to 2 ft.

14 *S. VACCINIFOLIA* (D. Don, prod. fl. nep. p. 227.) leaves elliptic, acute, glabrous, glaucous beneath, serrated at the apex; branches hairy; cymes terminal, few-flowered, tomentose.  $\frac{1}{2}$ . II. Native of Nipaul. Lodd. bot. cab. 1403. Shrub small, erect. Flowers white.

*Whortle-berry-leaved Spiræa*. Fl. July, Aug. Clt. 1820. Shrub 2 feet.

15 *S. INCISA* (Thunb. fl. jap. 213.) leaves ovate, deeply 5-parted, serrated, pale and villous beneath; cymes terminal.  $\frac{1}{2}$ . II. Native of Japan. Cambess. l. c. p. 262. Flowers small, white.

*Cut-leaved Spiræa*. Shrub 2 to 3 feet.

16 *S. TRILOBA* (Lin. mant. 244.) leaves roundish, 3-lobed, crenated, glabrous, glaucous beneath and reticately veined; flowers disposed in corymbose umbels; sepals ascending; carpels glabrous.  $\frac{1}{2}$ . II. Native of the Altaian mountains. Cambess. l. c. p. 361. Wats. dent. brit. 68. Pall. ross. 1. p. 33. t. 17. Flowers white. Carpels glabrous.

*Three-lobed-leaved Spiræa*. Fl. May. Clt. 1801. Sh. 2 to 4 ft.

17 *S. ALPINA* (Pall. fl. ross. 1. p. 35. t. 20.) leaves lanceolate, sessile, serrulated, glabrous, with the middle nerve pinnate; corymbs terminal, pedunculate, nearly leafless; sepals ascending.  $\frac{1}{2}$ . II. Native on the alps of Siberia, in woods. Flowers white.

*Alpine Spiræa*. Fl. June. Clt. 1806. Shrub 4 to 6 feet.

18 *S. THALICTROIDES* (Pall. fl. ross. 1. pp. 34. and 78. t. 18.) leaves obovate, obtuse, somewhat 3-lobed; umbels lateral, sessile.  $\frac{1}{2}$ . H. Native of Dahuria, on the alps. *S. aquilegifolia*, Pall. itin. 3. append. 734. no. 94. t. P. f. 3. Leaves glaucous beneath, finely 3-nerved. Flowers white.

*Meadow-rue-like Spiræa*. Fl. May, June. Clt. 1816. Sh. 2 to 3 feet.

19 *S. ARGENTEA* (Mutis, in Lin. fil. suppl. 261.) plant clothed with silky silvery down; leaves crowded, obovate, or oblong, serrated towards the apex, fan-nerved; racemes axillary and terminal, panicle; ovaries silky, biovulate.  $\frac{1}{2}$ . S. Native

of New Granada. H. B. et Kunth, nov. gen. amer. 6. p. 235. t. 562. Flowers white.

*Silvery Spiræa.* Shrub 4 to 6 feet.

20 *S. PIKOWIENSIS* (Besser, enum. pl. pod. p. 46. no. 1428.) leaves lanceolate-cuneate, obtuse, rarely cuspidate, triple-nerved, unequally serrated at the apex; corymbs pedunculate.  $\frac{1}{2}$ . H. Native of Podolia, about Pikow. Flowers white.

*Pikow Spiræa.* Fl. June, July. Clt. 1827. Sh. 3 to 4 feet.

21 *S. HYPERICIFOLIA* (Lin. spec. 701.) leaves obovate, 3-4-nerved, quite entire, glabrous; corymbs sessile; pedicels glabrous; sepals ascending.  $\frac{1}{2}$ . H. Native of Canada. *S. hypericifolia*, var.  $\beta$ , Plukenetiana, Ser. in D. C. prod. 2. p. 543.—Pluk. phyt. t. 218. f. 5. Leaves full of dots. Flowers white.

*St. John's-wort-leaved Spiræa.* Fl. June, July. Clt. 1640. Shrub 4 to 6 feet.

22 *S. ACUTIFOLIA* (Willd. enum. p. 540.) leaves ovate-cuneate, acute, quite entire, rarely a little toothed, puberulous; corymbs sessile.  $\frac{1}{2}$ . H. Native of Siberia. *S. Sibirica*, Hort. par. ex Cambess. l. c. p. 356. *S. hypericifolia*, var.  $\delta$ , acuta, Ser. in D. C. prod. 2. p. 543. *S. ambigua*, Pall. Flowers white.

*Acute-leaved Spiræa.* Fl. May, Ju. Clt. 1817. Sh. 3 to 4 ft.

23 *S. CRENATA* (Lin. spec. 701.) leaves obovate, rather pubescent, crenulated at the apex; corymbs stalked; pedicels puberulous.  $\frac{1}{2}$ . H. Native of Spain, Hungary, and other parts of Europe. *S. obovata*, Walld. et Kit. in Willd. enum. p. 541. Cambess. l. c. p. 359.—Barr. icon. rar. no. 1376. t. 564. *S. hypericifolia*  $\gamma$ , D. C. fl. fr. 5. p. 645. *S. hypericifolia*, var.  $\delta$ , crenata, Ser. in D. C. prod. 2. p. 543. Led. fl. ross. alt. ill. t. 428. *S. hypericifolia* var.  $\alpha$  Uralensis, Ser. in D. C. prod. 2. p. 215. Flowers small, white.

*Crenate-leaved Spiræa.* Fl. May, June. Clt. 1739. Shrub 4 to 6 feet.

24 *S. SAVRANICA* (Bess. in litt.) plant clothed with pubescence in every part; leaves obovate, entire, elongated; corymbs terminal, dense.  $\frac{1}{2}$ . S. Native of Siberia, about Barnaul, and of Podolia. *S. crenata*, Pall. fl. ross. 1. p. 35. t. 19. *S. hypericifolia*, var.  $\epsilon$ , Savranica, Ser. in D. C. prod. 2. p. 543. *S. hypericifolia* var.  $\beta$  longifolia, Led. fl. ross. alt. ill. t. 429. Flowers small, white.

Var.  $\beta$ , *Besseriuna* (Ser.) smoothish; leaves usually entire, glabrous; corymbs terminal, loose.  $\frac{1}{2}$ . H. Native of Podolia and Caucasus. Lodd. bot. cab. 1252. *S. crenata*, Besser, in litt.

*Savranic Spiræa.* Fl. May, June. Clt. 1819. Sh. 3 to 6 ft.

25 *S. THUNBERGII* (Blum. bijdr. 1115.) leaves linear-lanceolate, acuminate at both ends, smoothish, sharply serrated towards the apex; fascicles of flowers sessile, lateral, racemose in consequence of the leaves falling off; calyx glabrous.  $\frac{1}{2}$ . G. Native of Java and Japan. Thunb. fl. jap. p. 210. Flowers white.

*Thunberg's Spiræa.* Shrub 3 to 6 feet.

26 *S. CANESCENS* (D. Don, fl. nep. p. 227.) leaves oval or obovate, obtuse, stalked, quite entire, villous; corymbs crowded, and are as well as the branches tomentose.  $\frac{1}{2}$ . G. Native of Sirinagur. *S. cuneata*, Wall. Shrub erect, branched, canescent, with the habit of *S. hypericifolia*. Flowers apparently red. Carpels 5, connivent.

*Canescent Spiræa.* Shrub.

27 *S. CEANTHIFOLIA* (Horn. hort. hafn. 2. p. 466.) leaves ovate, rounded at the base, sharply and unequally serrated from the middle to the apex; corymbs terminal, on short peduncles.  $\frac{1}{2}$ . H. Native country unknown. Flowers white.

*Ceanothus-leaved Spiræa.* Fl. June, July. Clt. 1823. Sh. 3 to 4 feet.

28 *S. CORYMBOSA* (Rafin. prec. som. 36. and Desv. journ. bot. 1814. p. 168.) leaves oval-oblong, unequally serrated, gla-

brous, discoloured; corymbs terminal; flowers trigynous.  $\frac{1}{2}$ . H. Native of Virginia. Lodd. bot. cab. 671. Flowers white.

*Corymbous Spiræa.* Fl. June, Jul. Clt. 1819. Sh. 2 to 3 ft.

SECT. III. SPIRÆRIA (an alteration of the generic name). Ser. in D. C. prod. 2. p. 544.—*Spiræa* species, Cambess. mon. spir. in ann. sc. nat. 1. p. 354. Ovaries free (f. 65. d.). Torus free at the base, but lining the bottom of the calycine tube. Carpels not inflated.—Shrubs with hermaphrodite, paniculate flowers, and serrated exstipulate leaves.

29 *S. BETULIFOLIA* (Pall. fl. ross. 1. p. 33. t. 16.) leaves broadly oval, serrated, on short petioles, glabrous; flowers disposed in fastigate panicles; carpels 5, erect, glabrous.  $\frac{1}{2}$ . S. Native of Siberia and North-west America, and in valleys of the Rocky Mountains. Camb. l. c. p. 368. t. 27. Flowers pink. Wats. dend. brit. 67. Perhaps the same as *S. cratægifolia* of Link. enum. 2. p. 40.?

*Birch-leaved Spiræa.* Fl. Ju. Jul. Clt. 1812. Sh. 2 to 4 ft.

30 *S. LÆVIGATA* (Lin. mant. p. 244.) leaves obovate-oblong, smooth, glaucous, quite entire, sessile, mucronate; branches of panicles cylindrical; bractæ linear, hardly the length of the calyx; calycine segments triangular, ascending.  $\frac{1}{2}$ . H. Native of Siberia. Camb. l. c. p. 369. *S. Altaicensis*, Laxm. nov. act. petrop. 15. p. 555. t. 29. f. 2. *S. Altaica*, Pall. fl. ross. 1. p. 272. t. 23. Flowers white, disposed in thyrsoid racemose panicles. The leaves being gently astringent, may serve as a substitute for tea.

*Smooth-leaved Spiræa.* Fl. May, June. Clt. 1774. Shrub 4 to 6 feet.

31 *S. MAGELLANICA* (Poir. dict. 7. p. 350.) leaves petiolate, lanceolate, unequally serrated, nerved; racemes terminal, almost simple.  $\frac{1}{2}$ . H. Native of the Straits of Magellan. Flowers white.

*Magellan Spiræa.* Shrub.

32 *S. JAPONICA* (Siebold, ex Blum. bijdr. 1114.) leaves rhomboid-lanceolate, acutish, deeply serrated from the middle to the apex, smooth, grey beneath; corymbs terminal, simple, and are as well as the calyces glabrous.  $\frac{1}{2}$ . G. Native of Japan. Said to be like *S. Magellanica*.

*Japan Spiræa.* Shrub.

33 *S. SALICIFOLIA* (Lin. spec. 700.) stem and peduncles glabrous; leaves lanceolate, glabrous, somewhat doubly serrated; racemes rather spicate; calycine lobes triangular, spreading; carpels 5, glabrous.  $\frac{1}{2}$ . H. Native of Siberia, Tartary, Bohemia, and Silesia. It is to be found in England, although perhaps not truly indigenous; in many parts of Westmoreland; in many places on the borders of Winandermere, and also between Poolbridge and Colthouse, near Hakshead, Cumberland, and in a wood at Hafod, Cardiganshire. Smith, engl. bot. 1468. Gmel. fl. sib. 3. t. 49. Pall. fl. ross. 1. p. 36. t. 21. Duham. arb. 2. t. 75. Flowers red or rose-coloured, disposed in thyrsoid racemes.

*Willow-leaved Spiræa.* Fl. Ju. Aug. Brit. Sh. 4 to 6 ft.

34 *S. ALPESTRIS* (Pall. fl. ross. 1. p. 36. t. 22.) leaves lanceolate, acute, deeply serrated almost to the base, canescent; racemes loose, thyrsoid.  $\frac{1}{2}$ . H. Native of Siberia, on rocks about the rivers Obi and Yenessee. Amman, ruth. 188. t. 28. Flowers pale red.

FIG. 65.

*Alp Spiræa*. Fl. June, Aug. Clt. 1800. Sh. 2 to 3 feet.  
 35 *S. PANICULATA* (Willd. spec. 2. p. 1055.) leaves lanceolate, acute, sharply serrated; racemes paniced, divaricate; bark of branches red.  $\frac{1}{2}$ . H. Native of North America, Canada, and Newfoundland. *S. alba*, Ehrh. Beitr. 7. p. 137. *S. salicifolia*, var.  $\gamma$ , paniculata, D. C. prod. 2. p. 544.—Mill. fig. 171. t. 257. f. 2. Flowers white, disposed in terminal thyrsoid panicles.

*Paniced Spiræa*. Fl. June, Aug. Clt. 1663. Sh. 4 to 5 ft.  
 36 *S. TOMENTOSA* (Lin. spec. p. 701.) stem and peduncles clothed with rufous tomentum; leaves ovate, somewhat doubly serrated, densely clothed with tomentum beneath; calycine lobes tomentose on the outside, triangular, deflexed; carpels 5, tomentose, divaricate.  $\frac{1}{2}$ . H. Native of Canada, and in many places of North-west America on mountains. Camb. l. c. p. 373.—Mill. fig. 257. f. 1. Schmidt, arb. l. t. 51.—Pluk. phyt. t. 321. f. 5. Flowers small, of a beautiful red colour, disposed in dense compound, terminal racemes.

*Tomentose Spiræa*. Fl. July, Sept. Clt. 1736. Sh. 4 to 6 ft.  
 37 *S. MENZIESII* (Hook, fl. bor. amer. p. 173.) branches pubescent at the apex, as well as the peduncles and calyxes; sepals reflexed; leaves elliptic, coarsely and unequally serrated towards the apex, glabrous, the same colour on both surfaces; panicle crowded with flowers, oblong, obtuse; flowers small, stamens twice the length of the corolla; ovaries 5, glabrous.  $\frac{1}{2}$ . H. Native of North America, on the west coast. Flowers rose-coloured.

*Menzies's Spiræa*. Shrub.

38 *S. DOUGLASSII* (Hook, fl. bor. amer. p. 172.) branches and peduncles pubescent; leaves elliptic, coarsely and unequally serrated towards the apex, clothed with hoary tomentum beneath; panicle crowded with flowers, oblong, obtuse; flowers small; stamens twice the length of the corolla; calycine lobes triangular, reflexed; carpels 5, glabrous, shining.  $\frac{1}{2}$ . H. Native of the north-west coast of America, about the Columbia and the Straits of Fuca.

*Douglas's Spiræa*. Shrub 4 to 5 feet.

39 *S. CARPINIFOLIA* (Willd. enum. p. 510. Wats. dend. brit. t. 66.) leaves ovate-elliptic, acute at both ends, glabrous, coarsely serrated; racemes divaricate, paniced.  $\frac{1}{2}$ . H. Native of North America. *Spiræa salicifolia*  $\delta$ , *latifolia*, Willd. spec. 2. p. 1056. *S. obovata*, Rafin. but not of Walld. et Kit. Flowers white.

*Hornbeam-leaved Spiræa*. Fl. Ju. Aug. Clt. ? Sh. 3 to 6 ft.  
 40 *S. ARLÆFOLIA* (Smith, in Rees' cycl. vol. 33.) leaves elliptic-oblong, toothed, pale, somewhat lobed, villous beneath; panicle large, branched, villous; pedicels bracteate; lobes of calyx acute, spreading; carpels 5, compressed, hairy.  $\frac{1}{2}$ . H. Native of North America, principally on the north-west coast. Flowers rose-coloured.

*Aria-leaved Spiræa*. Shrub.

41 *S. CALLOSA* (Thunb. fl. jap. 209.) leaves lanceolate, acutely serrated, tapering to both ends, glaucous, smoothish beneath; corymbs terminal, compound, fastigiate, and are as well as the calyxes villous; stem and peduncles villous.  $\frac{1}{2}$ . G. Native of Japan and Nepaul. *S. expansa*, Wall. Differs from *S. salicifolia*, in the leaves being stalked. Flowers red.

*Callous-leaved Spiræa*. Shrub 4 feet.

42 *S. CÆRULESCENS* (Poir. dict. 7. p. 350.) leaves almost sessile, lanceolate-oblong, entire, bluish; panicles axillary, branched; sepals obtuse, shorter than the corolla.  $\frac{1}{2}$ . G. Native of India. Cambess. l. c. p. 374. Flowers white.

*Bluish-leaved Spiræa*. Shrub.

43 *S. DISCOLOR* (Pursh, fl. amer. sept. 1. p. 342.) leaves ovate, lobed; lobules toothed, and somewhat plicate, clothed with white tomentum beneath; panicle pedunculate, much branched.  $\frac{1}{2}$ . H.

Native of North America, on the banks of the river Koooskoosky.

*Discoloured-leaved Spiræa*. Shrub.

SECT. IV. *SORBARIA* (so named from the leaves being pinnate, resembling those of the mountain ash, *Sorbus*). Ser. in D. C. prod. 2. p. 545.—*Spiræa*, spec. Lin. Camb. l. c. 1. p. 375. Ovaries 5, joined. Torus wholly lining the tube of the calyx. Flowers hermaphrodite, disposed in thyrsoid panicles.

44 *S. SORBIFOLIA* (Lin. spec. 702.) leaves pinnate; leaflets sessile, lanceolate, opposite, doubly and sharply serrated; panicles thyrsoid.  $\frac{1}{2}$ . H. Native of Siberia, in bogs. Pall. fl. ross. 1. t. 88. t. 24.—Gmel. fl. sib. 3. p. 190. t. 46. Flowers white, sweet scented. The hollow shoots are used for tobacco-pipes in Siberia. *S. pinnata*, Moench. meth. 663.

*Sorbus-leaved Spiræa*. Fl. July, Aug. Clt. 1759. Shrub 3 to 4 feet.

45 *S. PALLASII*; leaves pinnate; leaflets sessile, ovate-lanceolate, deeply serrated, almost pinnatifid, opposite; flowers corymbose.  $\frac{1}{2}$ . S. Native of Siberia, on the high mountains about Lake Baikal. *S. sorbifolia*, var.  $\beta$ , *alpina*, Pall. fl. ross. 1. p. 34. t. 25. Flowers white, larger than those of the preceding species.

*Pallas's Spiræa*. Fl. July, Aug. Clt. ? Shrub.

SECT. V. *ARUNCUS* (from *aporygos*, *aroggos*, a goat's beard). Ser. in D. C. prod. 2. p. 545. *Spiræa* species, Cambess. l. c. 1. p. 376. Carpels 5, free, pendulous. Torus very thick, free at the apex.—Herbs, with tripinnate leaves, without stipulas, and dioecious flowers.

46 *S. ARUNCUS* (Lin. spec. p. 702.) leaflets acuminate, terminal ones ovate, lateral ones oblong; flowers very numerous; carpels glabrous.  $\frac{1}{2}$ . H. Native of Europe, in woods, &c. in Germany, Carniola, Piedmont, Siberia, Kamtschatka, &c. Camb. l. c. p. 376. Pall. fl. ross. 1. p. 39. t. 26.—Cam. hort. 26. t. 9. Flowers white, disposed in long spikes, forming a terminal panicle.

*Var.  $\beta$ . Americana* (Michx. fl. bor. amer. 1. p. 294.) leaves more shining; flowers more loose on the spikes.  $\frac{1}{2}$ . H. Native of North America.

*Goat's-beard Spiræa*. Fl. Ju. Jul. Clt. 1633. Pl. 4 to 6 ft.

SECT. VI. *ULMARIA* (from *ulmus*, the elm; form of leaflets of most of the species). Cambess. l. c. 1. p. 378.—*Ulmæria*, Moench. meth. p. 663. Torus obsolete. Style clavate, retroflexed. Ovula 2, about the middle of each ovary, fixed to the suture, and pendulous. Carpels hardly double the size of the ovaries, erect, rarely twisted.—Herbs with pinnate, stipulate leaves and cymose umbels of hermaphrodite flowers.

47 *S. ULMARIA* (Lin. spec. 702.) leaves interruptedly pinnate, white from tomentum beneath; leaflets coarsely serrated, terminal one the largest and 3-lobed; sepals reflexed; styles elongated; carpels glabrous, twisted.  $\frac{1}{2}$ . H. Native of Europe and Siberia, in meadows and bogs; plentiful in Britain. Smith, engl. bot. 960. Curt. fl. lond. 5. t. 33. *Ulmæria palustris*, Moench. meth. 663. Stem and peduncles puberulous. Stipulas roundish, joined to the petiole. Flowers white, in large compound cymes. The *Meadow-sweet* abounds in moist meadows, about the banks of rivers, brooks, and ditches, perfuming the air with the sweet hawthorn-like scent of its numerous blossoms, from June to August. The green parts of the herb partake of a similar aromatic flavour when rubbed or chewed. The flowers, infused in boiling water give it a very fine flavour, which rises in distillation. The leaves and tops have been used in medicine.

*Var.  $\alpha$ . variegata*; leaves variegated with white or yellow.

*Var.  $\beta$ . multiplex*; flowers double. Cultivated in gardens.

*Meadow-sweet.* Fl. June, Aug. Britain. Pl. 2 to 3 feet.

49 *S. DENUATA* (Presl. fl. cech. 101.) leaves interruptedly pinnate, green, and glabrous on both surfaces; leaflets coarsely serrated, terminal one the largest and 3-lobed; sepals reflexed; carpels glabrous, twisted.  $\mathcal{U}$ . H. Native of Sicily and the south of Europe. *S. ulmarioides*, Bory, voy. sout. p. 124. *S. ulmária*  $\beta$ , *denudata*, Cambess. l. c. p. 380. Stem and peduncles smoothish. Flowers white, sweet scented, disposed in compound cymes.

*Naked-leaved Meadow-sweet.* Fl. June, Aug. Clt.? Pl. 2 to 3 feet.

50 *S. LORATA* (Murr. syst. ed. 14. p. 472.) leaves palmately pinnate, glabrous beneath; lower leaves palmately bipinnate; stipulas reniform; styles short; sepals reflexed; carpels glabrous, parallel, not curved.  $\mathcal{U}$ . H. Native of North America. Jacq. hort. vind. 1. p. 38. t. 88. *S. palmata*, Lin. fil. but not of Thunb. nor Pall. Leaflets lobed, terminal ones 5-lobed, lateral ones 3-lobed. Flowers red, disposed in compound cymes.

FIG. 66.

*Lobed-leaved Meadow-sweet.* Fl. July, Aug. Clt. 1765. Pl. 2 feet.

51 *S. PALMATA* (Thunb. fl. jap. 212. but not of Lin. nor Pall.) leaves 5-7-lobed; lobes oblong, acuminate, acutely and doubly serrated.  $\mathcal{U}$ . H. Native of Japan. Cambess. l. c. p. 384. Flowers white or red. Panicle cymose, decompound. It comes nearest to *S. opulifolia*, according to Thunberg.

*Palmate-leaved Meadow-sweet.* Fl. June, Aug. Clt. 1823. Pl. 1 to 2 feet.

52 *S. KAMTSCHATICA* (Pall. fl. ross. 1. p. 41. t. 28.) leaves palmately lobed, upper stem leaves somewhat hastate or lanceolate; petioles appendiculate; flowers corymbose; sepals pilose, reflexed; carpels very hairy, parallel; styles subcapitate.  $\mathcal{U}$ . H. Native of Kamtschatka and Behring's Island. Cambess. l. c. 385. Root leaves often a foot wide and 8 inches long, white, with hairs beneath, 5-lobed; lobes acute, doubly serrated, lower stem leaves 3-lobed. Flowers white, sweet-scented, larger than those of *S. Ulmária*, disposed in branched cymes.

*Kamtschatka Meadow-sweet.* Pl. 6 to 9 feet.

53 *S. VESTITA* (Wall. miss.) leaves cordate, 5-lobed, tomentose beneath, sharply and unequally serrated; petioles furnished with numerous unequal leaflets, generally the 2 in the centre very large; flowers corymbose, terminal.  $\mathcal{U}$ . H. Native of Kamaon. Flowers white. Like *S. Kamtschatica* and *S. Ulmária*.

*Clothed Meadow-sweet.* Pl. 2 to 3 feet.

54 *S. QUINQUELOBA* (Baumg. ex Spreng. syst. 2. p. 503.) leaves pinnately ternate, clothed with white tomentum beneath; lateral leaflets 5-cleft, outer one 7-cleft; segments acute, serrated; panicle corymbose.  $\mathcal{U}$ . H. Native of Transylvania.

*Five-lobed-leaved Meadow-sweet.* Pl. 1 to 2 feet.

55 *S. DIGITATA* (Willd. spec. 2. p. 1061.) leaves pinnate, clothed with tomentum beneath; terminal leaflet largest and 7-lobed, lateral ones 5-lobed; corymbs branched, contracted; carpels parallel, villous; styles thickish, capitate.  $\mathcal{U}$ . H. Native of Eastern Siberia, in meadows and moist valleys in the subalpine regions beyond the Baikal, especially in Dauria. *S. palmata*, Pall. fl. ross. 1. p. 40. t. 27. itin. 3. append. 735. no. 95. t. 2. f. 1. but not of Thunberg nor Lin. Flowers white. Allied to *S. lobata*.

*Digitate-leaved Meadow-sweet.* Fl. July, Aug. Clt. 1823. Pl. 1 to 2 feet.

VOL. II.

56 *S. FILIPENDULA* (Lin. spec. 702.) root tuberous; leaves interruptedly pinnate; leaflets uniform, oblong-linear, acutely toothed; stipulas somewhat reniform, clasping the stem, toothed; corymbs loose; sepals reflexed; carpels parallel, villous, numerous; stigmas thick.  $\mathcal{U}$ . H. Native of Europe, in meadows, and very common in high pastures on a calcareous soil. Smith, engl. bot. 284. Oed. fl. dan. 635.—Black. herb. 647. Root consisting of tubers hanging by threads, hence called *Filipendula* or *Dropwort*. Flowers white inside and red on the outside, sweet-scented, disposed in loose terminal corymbs. The whole herb is astringent, and was formerly used in medicine, but it is now altogether neglected.

*Var. a, vulgaris* (Cambess. l. c. p. 379.) stems tall, and are as well as the leaves glabrous; leaves with scabrous margins; teeth usually piliferous at the apex.

*Var. b, multiplex* (Ser. in D. C. prod. 2. p. 546.) flowers double. Cultivated in gardens.

*Var. c, minor* (Cambess. l. c. p. 380.) stem humble; leaves much smaller.

*Var. d, pubescens* (Cambess. l. c. p. 379.) leaves clothed with hairy pubescence.  $\mathcal{U}$ . H. Native of Provence, about Fontchâteau. *S. pubescens*, D. C. fl. fr. 5. p. 546.

*Dropwort.* Fl. June, Oct. Britain. Pl. 1 to 1½ foot.

*Cult.* The hardy shrubby species of *Spiræa* are very pretty when in flower, and are therefore well adapted for shrubberies; they thrive well in any soil, and are easily increased by cuttings or layers. The greenhouse species are also of easy cultivation. The hardy herbaceous kinds will grow in any kind of soil, but prefer a moist situation; they are well fitted for flower borders, and are increased by dividing the plants at the root.

IV. GILLENIA (probably from Gillen, the name of some obscure botanist). Moench. suppl. 286. Nutt. gen. amer. 1. p. 307. D. C. prod. 2. p. 546.—*Spiræa* species of Lin. Cambess. and others.

LIN. SYST. *icosándria, Pentagýnia*. Calyx tubularly campanulate, 5-cleft. Petals 5, linear-lanceolate (f. 67. c.), contracted near the claws, rather unequal, rising from the top of the calycine tube. Stamens 10-15, inclosed (f. 67. b.). Carpels 5, terminated by a filiform erect style (f. 67. d.), which is capitate at the apex, somewhat connate into a 5-celled capsule, with 2 seeds in each cell.—Perennial herbs, with trifoliate leaves and stalked serrated leaflets. Flowers from white to red, axillary and terminal, on very long peduncles. Roots emetic and cathartic.

1 *G. TRIFOLIATA* (Moench. suppl. p. 286.) stipulas linear, acuminate, entire.  $\mathcal{U}$ . H. Native of North America, in shady humid woods, from Florida to Canada. *Spiræa trifoliata*, Lin. spec. 702. Curt. bot. mag. 486. Bigel. med. bot. t. 41. Mill. fig. 171. t. 256. Flowers in panicles. The roots of this plant possess properties analogous to *Ipecacuanha*. It requires, however, a larger dose, and then it is not so certain in its effects. Some authors have attributed a tonic power to the roots of *Gillenia* in small doses.

*Trifoliate Gillenia.* Fl. June, Jul. Clt. 1713. Pl. 1½ foot.

2 *G. STIPULACEA* (Nutt. gen. amer. 1. p. 307.) stipulas foliaceous, ovate, deeply cut.  $\mathcal{U}$ . H. Native of North America, in humid woods from Tennessee to Kentucky. *Spiræa stipula* 3 X

FIG. 67.

lata, Willd. enum. 542. Pursh, fl. amer. sept. 1. p. 343. Bart. med. bot. p. 71. t. 6. Cambess. l. c. t. 28. Radical leaves pinnatifid. Flowers from white to rose colour.

*Stipulaceous* Gillenia. Fl. Ju. Aug. Clt. 1805. Pl. 1 to 1½ ft.

*Cult.* The species of *Gillenia* are elegant plants, and therefore are worth cultivating in every collection of hardy herbaceous plants. They grow best in a peat border, and are readily increased by dividing the plants at the root, in spring.

† *A genus doubtful whether it belongs to the present order.*

V. ADENILEMA (from *ἀδην*, *aden*, a gland, and *ἰλημή*, *hilemi*, to be near; glands on calyx). Blum. bijdr. 1120.

LIN. SYST. *Icosándria*, *Monogýnia*. Calyx campanulate, 5-cleft, clothed with glandular pili on the outside. Petals 5, small, inserted in the calyx. Stamens numerous, inserted with the petals. Ovary 1. Style 1, crowned by a subpeltate stigma. Capsule inclosed in the calyx, beaked by the permanent style, 1-celled, opening at the side, containing 8-12 seeds, which are 1-ribbed, and fixed in a twin order on the sides of the opening suture. Spermatoderm testaceous. Embryo albuminous, with leafy cotyledons and a short centripetal radicle.—A sarmentose, unarmed shrub, with the habit of *Rubus*, with alternate, cordate, acuminate, 3-lobed, deeply serrated, bistipulate leaves. Flowers unibracteate, disposed in terminal racemose panicles. This genus apparently approaches the *Neillia*.

1 A. FALLAX (Blum. l. c. 1121.). ½. S. Native of Java, on mount Gede.

*Fallaceous* Adenilema. Shrub rambling.

*Cult.* For culture and propagation, see *Kageneckia*.

ORDER LXXXII. QUILLAJEÆ (plants agreeing with *Quillaja* in important characters). D. Don, in edinb. phil. journ. for Jan. 1831.

Calyx 5-cleft (f. 68. a.), valvate in æstivation (f. 68. d.). Petals 5 (f. 68. b.), alternating with the calycine segments, but sometimes wanting. Stamens definite in number from 10-15, inserted in the calyx; anthers bilocular. Ovaries 5 (f. 68. c.), connate at the base, 1-celled, containing numerous erect ovula. Styles 5 (f. 68. f.). Stigmas unilateral, papillous. Follicles 5 (f. 68. e.), disposed in a circle, connate at the base. Seeds disposed in 2 rows, inserted on the inner suture of the follicles, ascending, winged at the apex, with the umbilicus at the base; the testa simple and membranous. Albumen wanting. Embryo erect, with foliaceous convolute cotyledons, and a terete radicle, which is shorter than the cotyledons, pointing to the umbilicus.—South American trees, with alternate undivided leaves, small caducous stipulas, and terminal dioecious flowers. This order differs essentially both from *Rosaceæ* and *Spiræaceæ* in the erect ovula, and from the latter also in the valvular æstivation of the calyx. The habit of the plants composing this order is likewise abundantly different.

#### *Synopsis of the genera.*

1 KAGENECKIA. Calyx saucer-shaped, furnished with a ring a little elevated on the inside, girding the ovaries. Petals wanting? Stamens 15, 5 of which alternate with the lobes of the calyx, the rest by pairs opposite the lobes.

2 QUILLAJA. Calyx 5-cleft (f. 68. a.). Disk 5-lobed (f. 68. c.), stellate, fleshy. Petals 5 (f. 68. b.), spatulate, unguiculate. Stamens 10, disposed in 2 series, 5 of which are inserted

in the middle of the calycine lobes, and the other 5 in the throat of the calyx.

3 VAUQUELINIA. Calyx 5-cleft. Petals 5. Stamens 15-20, exserted with the petals from the throat of the calyx.

4 LINDLEYA. Calyx 5-cleft. Petals 5. Stamens 15-20, inserted in the disk in the throat of the calyx. Carpels 5, connate their whole length. Styles 5, concrete.

I. KAGENECKIA (the authors of the Flora Peruviana have dedicated this genus to Frederick de Kageneck, ambassador from the king of Holland to the king of Spain). Ruiz et Pav. fl. per. prod. t. 37. II. B. et Kunth, nov. gen. amer. 6. p. 236. D. C. prod. 2. p. 547. D. Don, in edinb. phil. journ. Jan. 1831.

LIN. SYST. *Icosándria*, *Pentagýnia*. Calyx saucer-shaped, 10-ribbed on the outside, permanent; limb 5-cleft, furnished on the inside with an elevated hardly membranous ring girding the ovaries; lobes recurved, acuminate or obtuse. Petals wanting? or 5, orbicular? Stamens 15, 5 of which alternate with the calycine lobes; the rest by pairs opposite the calycine lobes; filaments dilated at the base. Anthers cordate, oblong. Stigmas with cucullate disks. Carpels 5, foliular.—Trees, with dotless, glandularly serrulated leaves. Stipulas small, gland-formed. Flowers terminal, polygamous.

1 K. OBLONGA (Ruiz et Pav. fl. per. syst. 1. p. 289.) leaves oblong, obtuse, coriaceous, serrulated; glands of teeth deciduous; flowers solitary. ½. G. Native of Chili, on mountains about Concepcion. Lydæa Lyday, Mol. chil. ed. 2. p. 300. In its native country it is commonly called *guayo colorado*, but according to Molino, *Lyday*. The wood is used to build houses in Chili. The leaves being very bitter are used by the inhabitants of Chili to cure intermittent fevers, as also those of the following species.

*Oblong-leaved* Kageneckia. Fl. Aug. Dec. Tree 30 feet.

2 K. LANCEOLATA (Ruiz et Pav. fl. per. syst. p. 290. gen. p. 145. t. 37.) leaves lanceolate or obovate, membranous, serrulated; glands of teeth permanent; flowers corymbose. ½. G. Native of Peru, on hills in the province of Canta.

*Lanceolate-leaved* Kageneckia. Fl. Nov. Dec. Tree 20 ft.

3 K. GLUTINOSA (H. B. et Kunth, nov. gen. amer. 6. p. 237.) leaves oblong and oblong-lanceolate, acute, narrow at the base, sharply crenately serrated; branches clammy. ½. G. Native of South America, on the Andes in the province of Jaen de Bracamoros.

*Clammy-branched* Kageneckia. Tree 12 to 20 feet.

*Cult.* These trees will grow well in a mixture of loam, peat, and sand, and ripened cuttings will probably root if planted in a pot of sand, with a hand-glass placed over them in a little bottom heat.

II. QUILLAJA (*Quillai* or *Cullay* is the name of *Q. saponaria* in Chili). Mol. Juss. gen. 444. Kunth, nov. gen. amer. 6. p. 236. in a note. D. C. prod. 2. p. 547. D. Don, in edinb. phil. journ. Jan. 1831. Smegmadermos, Ruiz et Pav. fl. per. prod. 2. t. 31.

LIN. SYST. *Dicándria*, *Pentagýnia*. Calyx 5-cleft (f. 68. a.); segments ovate, bluntish, thick, tomentose, with truncate margins. Disk concrete, with the calyx 5-lobed (f. 68. c.), stellate, fleshy, smooth, nectariferous; lobes elevated from the calyx, roundish, emarginate. Petals 5 (f. 68. b.), spatulate, unguiculate, alternating with the segments of the calyx. Stamens 10 (f. 68.), disposed in a double order, 5 of which are inserted in the middle of the calycine lobes, rising from the notches of the lobes of the disk (f. 68. a.), the other 5 inserted in the throat of the calyx, and opposite the petals (f. 68. b.); filaments subulate. Carpels 5 (f. 68. e.), connate, spreading. Styles 5 (f. 68. f.),

terminal, permanent. Stigmas unilateral.—Evergreen trees, with undivided leaves. Stipulas 2, petiolar, caducous. Flowers corymbose, polygamous.

1 *Q. SAPONARIA* (Mol. chil. p. 182. ed. 2. p. 298.) leaves oval, for the most part toothed. *h. G.* Native of Chili, very plentiful in the woods of the provinces of Rire d Richacay. *Q. Molinæ*, D. C. prod. 2. p. 547. *Q. Smegmadermos*, D. C. prod. 2. p. 547. *Smegmadermos emarginatus*, Ruiz et Pav. fl. per. syst. 1. p. 288. *Smegmària emarginata*, Willd. spec. 4. p. 1123. In Chili the bark is used as a substitute for soap.

*Soap* Quillaja. Fl. Dec. Feb. Tree 60 feet.

2 *Q. LANCEOLATA* (D. Don, in edinb. phil. journ. Jan. 1831.) leaves lanceolate, acute, entire. *h. S.* Native of Brazil. (f. 68.)

*Lanceolate-leaved* Quillaja. Tree.

*Cult.* See *Kagenèckia* for culture and propagation, p. 522.

FIG. 68.

III. VAUQUELINIA (in honour of M. Vauquelin, the celebrated French chemist, whose discoveries have been extended to the vegetable kingdom). Corr. in Humb. et Bonpl. pl. æquin. 1. p. 140. t. 40. D. C. prod. 2. p. 547.

LIN. SYST. *Icosándria*, *Pentagynia*. Calyx 5-cleft, permanent. Petals 5, permanent. Stamens 15-20, permanent, exserted with the petals from the calyx. Anthers oblong. Carpels 5, joined into a 5-celled, 5-styled ovarium. Styles 5. Stigmas capitate. Capsule ovate, 5-celled; cells 2-valved, dehiscent, 2-seeded. Seeds ending in a membranous wing, as in the rest of the genera, erect.—A tree, with alternate, lanceolate, unequally toothed, exstipulate? leaves, and terminal corymbs of white flowers. Flowers probably dioecious.

1 *V. CORYMBOSA* (Corr. l. c.) *h. S.* Native of Mexico, in temperate parts near Actopan. II. B. et Kunth, nov. gen. amer. 6. p. 238.

*Corymbose-flowered* Vauquelinia. Tree 50 feet.

*Cult.* See *Kagenèckia* for culture and propagation, p. 522.

IV. LINDLEYA (in honour of John Lindley, F.R.S. F.L.S. professor of botany in the London university). H. B. et Kunth, nov. gen. amer. 6. p. 239. D. C. prod. 2. p. 548.

LIN. SYST. *Icosándria*, *Pentagynia*. Calyx 5-cleft, permanent. Petals 5. Stamens 15-20, inserted in the disk in the throat of the calyx. Anthers lanceolate, uncinately reflexed at the base. Carpels 5, connected into a 5-celled, 5-styled ovarium, containing 2 pendulous? ovula each. Capsule 5-celled, propped by the calyx, woody, 5-angled. Seeds with winged margins.—A smooth tree, with scattered simple crenulated bistipulate leaves, and axillary solitary white bracteate flowers. This genus approaches very near *Vauquelinia*.

1 *L. MESPILOIDES* (H. B. et Kunth, nov. gen. amer. 6. p. 239. t. 562.) *h. S.* Native of Mexico, very common about the village of Magdalena. Habit of *Pyrus malus*, or the apple-tree.

*Mespilus-like* Lindleya. Tree 20 to 30 feet.

*Cult.* See *Kagenèckia* for culture and propagation, p. 522.

ORDER LXXXIII. ROSACEÆ (plants agreeing with *Rosa* in important characters). Juss. gen. 334. part.

Calyx 4-5-lobed, valvate in æstivation, with the disk sur-

rounding the orifice (f. 74. g. f. 75. e.), having the fifth lobe next the axis. Petals 5 (f. 71. b. f. 72. b. f. 75. c. &c.), perigynous, equal. Stamens indefinite (f. 69. c. f. 71. c.), arising from the calyx, just within the petals; they are curved inwards in æstivation; anthers innate, 2-celled, bursting lengthwise. Ovaries superior (f. 71. d.), several, 1-celled, 1-seeded. Ovula usually suspended, rarely erect. Styles lateral, near the apex of the ovaries. Stigmas simple and emarginate on one side. Fruit either 1-seeded nuts or akenia (f. 71. d. f. 72. c.). Seeds erect or inverted. Embryo straight, with a taper short radicle, pointing to the hylum, and flat cotyledons. Albumen wanting.—This order is composed of herbaceous plants or shrubs, but never trees. Leaves simple or compound, with 2 stipulas at the base. *Rosaceæ* are distinguished from *Pomaceæ* by their superior fruit, and usually suspended seeds; from *Leguminosæ* by their regular petals and stamens, and especially by the odd segment of the 5-lobed calyx of that order, which is anterior, not posterior, as in *Rosaceæ*; from *Chrysobalanææ* in their styles proceeding from the side of the ovarium near the apex, and not from the base, as in that order, by their more regular petals and stamens, and by their fruit not being a drupe; *Amygdalaceæ* differ from *Rosaceæ* by their terminal styles, drupaceous fruit, and presence of prussic-acid, along with the formation of gum; *Sanguisorbeæ* differ from *Rosaceæ* in their apetalous flowers and definite stamens, alternating with the segments of the calyx; *Spiræaceæ* and *Quillajææ* differ from *Rosaceæ* by their follicular fruit, and in the æstivation of the calyx.

Rosaceous plants are always wholesome; they are chiefly remarkable from the presence of an astringent principle, which has caused several of them to be reckoned febrifugal. The root of *Tormentilla repens* is used for tanning in the Feroe Islands; *Potentilla anserina* has been used by tanners; *Potentilla repens* as a febrifuge. *Cicum urbànum* and *ricale* have been compared for efficacy to *Cinchona*. The fruit of many species of *Fragaria* or strawberry, and *Rubus* or raspberry and cloudberry, are valuable articles for the dessert. The leaves of *Rubus arcticus* and *Rosa rubiginosa* have been employed as a substitute for tea. *Agrimonia eupatoria* yields a decoction useful as a gargle. The root of *Rubus villösus* is a popular astringent in North America in cholera infantum. One of the most powerful anthelmintics in the world belongs to this family, an Abyssinian plant, *Brayèra anthelmintica*. Upon the authority of Dr. Brayer two or three doses of the infusion are sufficient to cure the most obstinate case of tænia. The various species of roses form some of the greatest beauties of the garden. The fruit of *Rosa canina*, and other allied species, is astringent, and is employed against chronic diarrhœa and other maladies. The petals of *Rosa damascena* yield a highly fragrant essential oil, called attar of roses; those of *Rosa gallica* are astringent when dried with rapidity, and are sometimes found useful in cases of debility, such as leucorrhœa and diarrhœa, &c.

#### Synopsis of the genera.

##### TRIBE I.

DRYADEÆ. Calyx 8-10-cleft (f. 70. b.), rarely many parted

(f. 69. a.), *valvate in æstivation, the outer lobes accessory* (f. 70. b.), *and alternating with the inner lobes.* Petals 4-5, *rarely more* (f. 69. b. f. 70. c.). Carpels numerous (f. 70. d.), *free, inserted in a dry or fleshy polyphore, dry* (f. 70. d.) *or baccate* (f. 71. d.), *1-seeded.* Herbs or shrubs, *usually with compound leaves, with 2 stipulas adnate to the sides of the petiole.*

1 DRY'AS. Calyx 8-9-parted (f. 69. a.). Petals 8-9 (f. 69. b.). Stamens numerous (f. 69. c.). Carpels dry, numerous, ending each in the feathery style (f. 69. c.). Seed ascending.

2 GE'UM. Calyx 10-cleft, the 5 outer segments accessory. Petals 5. Stamens numerous. Carpels numerous, dry, ending each in a kneed style.

3 SIEVE'RSIA. All as in *Geum*, but differs in the carpels ending in a feathery (f. 70. d.) jointless style or awn.

4 COLU'RIA. Calyx 10-parted, the 5 outer lobes accessory. Petals 5. Stamens numerous. Carpels numerous, scrobiculate, tailless.

5 COWA'NIA. Calyx 5-cleft. Petals 5. Stamens numerous. Carpels awned by the feathery styles.

6 WALDSTE'NIA. Tube of calyx turbinate, crowned by a crenulated ring under the stamens, bearing bracteas on the outside. Petals 5. Stamens numerous. Carpels 2-4, globose, naked at the apex, coriaceous. Seed erect.

7 COMARÓPSIS. Calyx 5-cleft. Petals 5. Stamens numerous. Carpels few, dry, ending in filiform styles. Seeds erect.

8 RU'BUS. Calyx 5-cleft. Petals 5. Stamens numerous. Carpels fleshy, inserted on an elevated torus. Seed inverted.

9 DALIBA'RDA. Calyx 5-6-cleft; lobes toothed. Petals 5. Stamens numerous, deciduous. Carpels 5-10, ending in short styles, subdrupaceous. Seed pendulous.

10 FRAGA'RIA. Calyx 10-cleft (f. 71. a.) the outer segments accessory (f. 71. c.). Petals 5 (f. 71. b.). Stamens numerous. Carpels dry, seated on an elevated fleshy torus (f. 71. d.). Styles lateral. Seed pendulous (f. 71. d.).

11 DUCHE'SNEA. Calyx 10-parted, the outer segments accessory, foliaceous, and tridentate. Petals 5. Stamens numerous. Carpels numerous, seated on a fleshy, succulent, elevated torus.

12 POTENTÍLLA. Calyx 10-cleft (f. 72. a.), the outer segments accessory. Petals 5 (f. 71. d. f. 72. b.). Stamens numerous. Carpels numerous, dry (f. 72. c.), seated on an elevated torus. Styles lateral.

13 TORMENTÍLLA. Calyx 8-parted, the 4 outer segments accessory. Petals 4. Stamens 16. Akenia dry, naked, numerous, wrinkled, seated on a depressed receptacle. Styles lateral.

14 CO'MARUM. Calyx 10-parted, the 5 outer segments accessory. Petals 5, small. Stamens numerous. Akenia numerous, seated on an elevated spongy receptacle.

15 HORKÉLIA. Calyx 10-cleft, the outer segments accessory. Petals 5. Stamens 10. Akenia inserted on a conical receptacle, inclosed in the calyx.

16 SIBBA'LDIA. All as in *Potentilla*, but the petals are very minute, and the carpels and stamens are usually 5. Seed inverted. Polyphore dry.

17 CHAMÆRHODOS. Calyx campanulate, 5-cleft. Petals 5,

obovate. Stamens 5. Styles lateral, 10, rarely 5. Carpels 5-10 or more, seated on a villous receptacle. Plants beset with glandular hairs.

18 AGRIMÓNIA. Calyx turbinate, 5-cleft (f. 73. a. d.), involucreted by bristles (f. 73.). Petals 5. Stamens 15. Carpels 2, with terminal styles. Seed pendulous.

19 AREMÓNIA. Calyx 5-cleft, surrounded by a 10-12-cleft involucre. Petals 5. Stamens 5-10. Carpels 2, with terminal styles. Seed pendulous.

20 BRAY'E'RA. Calyx double, both 5-cleft; lobes of the outer large and oblong, of the inner spatulate and shorter. Petals 5, small, linear. Stamens 15-20. Carpels 2, ending in exserted styles. Seed pendulous.

## TRIBE II.

NEURA'DEE. Calyx 5-cleft (f. 76. b.), *with a short tube adhering to the ovary, valvate in æstivation.* Petals 5. Carpels 10, *connected into a 10-celled capsule* (f. 76. c.), *which is depressed at the apex.* Seed bony, *obliquely pendulous.*—*A decumbent suffruticose herb.*

21 NEURA'DA. Petals 5, inserted in the base of the calycine lobes (f. 76. a.). Stamens 10. Styles 10.

## TRIBE III.

ROSEÆ. Tube of calyx contracted at the mouth (f. 76. a. c.), *with a 5-parted limb* (f. 76. d. f. 75. b.); *lobes somewhat spirally imbricated in æstivation, usually pinnatifid* (f. 75. b. f. 76. d.). Petals 5 (f. 75. c. f. 76. e.). Stamens numerous. Carpels numerous, *inserted inside the tube of the calyx, which at length becomes baccate and incloses them* (f. 75. f. f. 76. a.). Seeds inverted. —*Shrubs, with impari-pinnate leaves, serrated leaflets, and with the stipulas adnate to the petiole.*

22 ROSA. Character the same as that of the tribe.

## Tribe I.

DRYA'DEÆ (plants agreeing in important characters with *Dryas*). Vent. tabl. 3. p. 349.—*Fragariaceæ*, Rich. in Nestl. pot. p. 14. Calyx 10-cleft, rarely 8-cleft or many parted, *valvate in æstivation, the outer segments accessory, and alternating with the inner ones.* Petals 4-5, *rarely more, alternating with the inner segments of the calyx.* Stamens numerous, *rarely few, inserted in the apex of the calycine tube.* Carpels or akenia numerous, *rarely few, crowded, inserted in the torus, distinct from each other, and free from the calyx, bearing the styles at the side near the apex.* Styles with a furrow on the inside, and expanded into an oblique stigma at the apex. Akenia 1-ovulate, *free from each other, dry or baccate.* Seeds solitary, erect or inverted, exalbuminous. Embryo erect, with flattish cotyledons.—*Herbs or subshrubs, with usually compound bistipulate leaves, the stipulas adnate to the sides of the petioles.*

I. DRY'AS (so named by Linnaeus from the dryades or nymphs of the oaks, in consequence of the leaves bearing some resemblance to those of the oak). Lin. gen. no. 637. Lam. ill. t. 443. Nestl. pot. 16. D. C. prod. 2. p. 549.

LIN. SYST. *Icosándria, Polygýnia.* Calyx 8-9-parted (f. 69. a.), *with a somewhat concave tube* (f. 79. a.). Petals 8-9 (f. 69. b.). Stamens numerous. Carpels numerous, each termin-

ated by a style, which at length becomes a feathery tail (f. 69. e.). Seed ascending.—Humble suffruticose herbs, with simple permanent leaves, which are clothed with white tomentum beneath. Flowers white, or yellow.

FIG. 69.

1 *D. OCTOPETALA* (Lin. spec. 717.) leaves ovate or subcordate, crenately serrated.  $\frac{1}{2}$ . H. Native of Europe on the Alps, and of Siberia. In Scotland, as in Breadalbane, Isle of Sky, Perthshire, Rosshire, Sutherland, and Argyshire; in Ireland, between Gort and Gallaway, and near Sligo; in England, on Amdifclowder, in Littendale, and near Settle in Yorkshire. Smith, eng. bot. 451. Oed. fl. dan. t. 31. This delicate evergreen plant, with its white flowers and germander-like leaves, is a great ornament to alpine heights.

*Eight-petalled Dryas.* Fl. Ju. Aug. Britain. Shrub prostrate.

2 *D. DRUMMONDI* (Richards, mss. Hook. in bot. mag. t. 2972.) leaves elliptic, rather attenuated at the base, deeply crenated, clothed with white tomentum beneath, and on the scapes; calycine segments ovate.  $\frac{1}{2}$ . H. Native of North America, Canada, and the Rocky Mountains as far as Slave Lake. *D. octopetala*, Pursh, fl. amer. sept. 1. p. 350. *D. chamaedrifolia*, Richards in Frankl. journ. append. p. 740. Flowers yellow. An elegant plant when in flower.

*Drummond's Dryas.* Fl. June, July. Clt. 1800. Sh. pros.

3 *D. INTEGRIFOLIA* (Vahl. act. soc. hafn. 4. p. 2. p. 151.) leaves quite entire, acute, cordate at the base.  $\frac{1}{2}$ . H. Native of Greenland. Oed. fl. dan. 1216. Flowers white, very like those of the first species.

*Entire-leaved Dryas.* Fl. June, Aug. Clt. 1810. Sh. pros.

4 *D. TENELLA* (Pursh, fl. amer. sept. 1. p. 350.) leaves small, ovate, acute, quite entire, cordate at the base, flat, clothed with white tomentum beneath.  $\frac{1}{2}$ . H. Native of North America, in New Hampshire, Rocky Mountains, &c. *D. integrifolia*, Hook. exot. fl. t. 220. but not of Vahl. *D. integrifolia* var.  $\beta$ , *tenella*, D. C. prod. 2. p. 550. Flowers white, one-half smaller than those of the last species. An elegant plant when in flower.

*Slender Dryas.* Fl. June, Aug. Clt. 1820. Sh. proc.

*Cult.* *Dryas* is a genus of elegant little evergreen, prostrate plants; they thrive best in a border of peat soil, and sometimes they are grown in pots in the same kind of soil, and placed among other alpine plants. They are usually increased by dividing the plants at the root, and sometimes by seed.

II. *GEUM* (from *γεω*, *geo*, to give a relish; roots of *G. urbānum*). Lin. gen. 864. Lam. ill. 443. Nestl. pot. p. 16.

LIN. SYST. *Icosandra*, *Polygynia*. Calyx with a concave tube, and a 10-cleft limb, the 5 outer segments accessory. Stamens numerous. Carpels dry, disposed in a head, ending each in a style, which at length becomes kneed. Seed ascending.—Herbs, with variously dissected leaves, the terminal lobe or leaflet always large. Flowers usually yellow or copper-coloured, red or white.

SECT. I. *CARYOPHYLLA'STRUM* (*Caryophyllus*, the name of the clove pink; the roots of *G. urbānum* have a taste like cloves). Ser. in mem. soc. gen. 2. p. 138. D. C. prod. 2. p. 550. Flowers ascending. Calyx reflexed. Styles deflexed, kneed. Appendages for the most part shorter than the styles.

1 *G. CANADENSE* (Murr. comm. goet. 5. p. 33. t. 4. but not of Jacq.) stem erect, rough, dichotomous; radical leaves interruptedly pinnate, the terminal leaflet large, nearly orbicular, 3-5-lobed, and crenated; cauline leaves quinate and ternately pinnate, with the leaflets lobulate and toothed; stipulas ovate, 3-5-lobed; peduncles elongated; petals orbicular, retuse, length of the calyx; head of carpels obovate; ovaries pilose, very numerous; styles glabrous, but with the appendages pilose.  $\frac{1}{2}$ . H. Native of North America. *G. strictum*, Ait. hort. kew. ed. 1. vol. 2. p. 217. Petals yellow.

*Canadian Avens.* Fl. May, June. Clt. 1778. Pl. 1½ foot.

2 *G. STRICTUM* (Pursh, fl. amer. sept. 1. p. 351.) hairy; leaves all interruptedly pinnate, the terminal leaflet the largest; leaflets ovate, toothed; stipulas cut; the 5 outer calycine segments linear and short; petals nearly orbicular, longer than the calyx; awns of carpel naked and hooked.  $\frac{1}{2}$ . H. Native of North America, from Canada to New York, in dry wet meadows and bogs. *G. Allépicum*, Jacq. icon. rar. 1. t. 93. Flowers large, yellow and striped.

*Straight Avens.* Fl. May, July. Clt. 1778. Pl. 2 feet.

3 *G. MACROPHYLLUM* (Willd. enum. 557.) stem erect, rough, pilose, dichotomous; radical leaves interruptedly pinnate; leaflets nearly orbicular, terminal one cordate, large, and biserrated; cauline leaves bluntly 3-lobed and serrated; stipulas ovate, 3-5-toothed or nearly entire; peduncles when bearing the flowers very short, but when bearing the fruit they are much elongated; petals obovate, longer than the calyx; heads of carpels ovate-orbicular; ovaries very pilose; styles smoothish, but with the appendages pilose at the base.  $\frac{1}{2}$ . H. Native of Kamtschatka. Flowers yellow.

*Large-leaved Avens.* Fl. June, July. Clt. 1804. Pl. 1½ ft.

4 *G. HETEROPHYLLUM* (Desf. hort. par. D. C. prod. 2. p. 550.) stem erect, flexuous, beset with spreading pili, dichotomous; radical leaves bluntly 3-lobed; cauline ones somewhat pinnate; the leaflets cuneiform, lobulate, and toothed; stipulas oval, profoundly toothed; peduncles short and stiff; petals obovate, about equal in length to the calyx; heads of carpels spherical, quite glabrous; styles with short appendages.  $\frac{1}{2}$ . H. Native country unknown. Flowers white?

Var.  $\beta$ , *elongatum* (Ser. in D. C. prod. 2. p. 550.) peduncles elongated; appendages of styles longer and rather pilose; lobes of leaves more acute.

*Variable-leaved Avens.* Fl. May, July. Clt. 1816. Pl. 1½ foot.

5 *G. INTERMEDIUM* (Besser, cat. hort. crem. ex D. C. prod. 2. p. 550. but not of Willd.) stem erect, beset with spreading pili; radical leaves interruptedly pinnate; leaflets ovate-oblong, coarsely biserrated, terminal one large and 3-5-lobed; cauline leaves somewhat interruptedly pinnate or ternate; leaflets of the upper leaves rhomboid-lanceolate, and coarsely toothed; stipulas ovate, deeply toothed; peduncles when bearing the fruit much elongated; petals orbicular, length of the calyx; heads of carpels obovate-globose; ovaries very pilose; styles glabrous, but with the appendages pilose.  $\frac{1}{2}$ . H. Native of Volhynia and Altaia, in shady places. Flowers yellow.

*Intermediate Avens.* Fl. June, July. Clt. 1820. Pl. 1½ ft.

6 *G. VIRGINIANUM* (Lin. spec. 716.) stem branched, pilose; radical leaves quinate pinnate, cauline ones ternate; leaflets lanceolate-cuneiform, toothed, the uppermost leaves 1-lobed, and very acute; stipulas ovate, toothed; peduncles when in fruit much elongated, filiform, and divaricate; petals obovate, shorter than the calyx; heads of carpels spherical; carpels few, pilose; styles elongated, and are, as well as the appendages, pilose.  $\frac{1}{2}$ . H. Native of Virginia and Carolina. This species comes very near *G. urbānum*, and differs from it principally in the small white flowers, and in the leaflets and stipulas being narrower.

*Virginian Avens.* Fl. July, Aug. Clt. 1739. Pl. 1 to 2 feet.

7 *G. ALBUM* (Gmel, syst. nat. 2. p. 861. Willd. enum. 556.) radical leaves pinnate, cauline ones ternate, uppermost cauline ones simple, and somewhat trifid; petals about equal in length to the calyx; styles glabrous, with pilose appendages.  $\mathcal{A}$ . H. Native of Canada and Pennsylvania. *G. Canadense*, Jacq. hort. vind. 2. t. 175. ex Willd. l. c. Flowers small, white.

*White-flowered Avens.* Fl. June, July. Clt. 1730. Pl. 1 to  $1\frac{1}{2}$  foot.

8 *G. PORTENSCHLAGIANUM* (Tratt. ros. 3. p. 116.) stem terete, pubescent; branches straight, dichotomous; radical leaves pinnate, middle cauline ones dilutely 3-lobed, but the upper cauline ones are lanceolate and coarsely toothed, pubescent; peduncles elongated, erect; petals about equal to the calyx; ovaries hispid; awns of carpels glabrous, glochidate at the apex.  $\mathcal{A}$ . H. Native country unknown. According to Trattineck it is allied to *G. album*. Flowers smaller than those of *G. urbanum*.

*Portenschlag's Avens.* Fl. June, July. Clt. 1820. Pl.  $1\frac{1}{2}$  ft.

9 *G. RUBIFOLIUM* (Lejeune, rev. fl. spa. 103.) flowers erect; petals length of the calyx; radical leaves lyrate-pinnate; leaflets of upper leaves cuneiform, acute, auricled at the base; awns of carpels at first geniculate twisted, but at length hooked.  $\mathcal{A}$ . H. Native about Spa. Flowers yellow.

*Bramble-leaved Avens.* Pl.  $1\frac{1}{2}$  foot.

10 *G. URBANUM* (Lin. spec. 716.) stem erect, branched, pilose; radical leaves pinnate, with 5 leaflets, cauline leaves ternate, 3-lobed or 3-parted; leaflets ovate, broad, dentately crenate; upper cauline leaves ovate, 1-lobed; stipulas large, nearly orbicular; petals obovate, length of the calyx; heads of carpels spherical; ovaries pilose, numerous; styles glabrous, with pilose appendages.  $\mathcal{A}$ . H. Native of Europe, in woods and hedges; plentiful in all parts of Britain. Smith, engl. bot. 1400. Sturm, deutsch. fl. fasc. 5. Woody, med. bot. 5. p. 33. t. 4. A. Fl. dan. 672. Flowers erect, small, yellow. The roots have a mildly astringent aromatic taste, somewhat like cloves, whence this plant has the name of *Caryophyllata*. They have much more virtue in a dry warm situation. Gathered in the spring, and put fresh into ale, they give it a pleasant flavour, and prevent its turning sour. Infused in wine it is esteemed a good stomachic.

*Var.  $\beta$ , opulifolium* (Ser. in D. C. prod. 2. p. 551.) cauline leaves usually 3-lobed at the apex, small, toothed; stipulas ovate-orbicular. Native about Bern and Geneva.

*City or Common Avens or Herb Bennet.* Fl. May, Aug. Britain. Pl. 1 to 2 feet.

11 *G. COCCINEUM* (Smith, fl. græc. t. 485.) leaves lyrate-pinnate; lower leaflets small, terminal one very large, roundish, cordate, all deeply crenated; cauline leaves 3-lobed, cut; stipulas deeply toothed; flowers panicked, erect; plant villous or pilose.  $\mathcal{A}$ . H. Native of Bithynia, on Mount Olympus. Flowers large, scarlet.

*Scarlet-flowered Avens.* Pl.  $\frac{1}{2}$  to 1 foot.

12 *G. CHILOENSE* (Balb. in litt. Loud. hort. brit. p. 214.) plant villous; stem glandular; radical leaves interruptedly pinnate; leaflets crenate-serrated, the terminal one large, roundish, cordate, lobed, and crenated; cauline leaves 3-parted, deeply cut; stipulas large, roundish, toothed; flowers panicked, erect.  $\mathcal{A}$ . H. Native of Chiloe. *G. coccineum*, Lindl. bot. reg. 1088. G. Quéllyon, Sweet, fl. gard. 2. ser. vol. 2. with a figure. Flowers scarlet, sometimes copper-coloured.

*Chiloe Avens.* Fl. May, July. Clt. 1826. Pl. 1 to 2 feet.

13 *G. HEDERÆFOLIUM* (Gmel. fl. bad. 2. p. 460.) leaves simple, somewhat 3-lobed, clothed with pilose tomentum; stem erect; carpels pilose, with feathery awns.  $\mathcal{A}$ . H. Native country unknown. *Caryophyllata foliis hederæ terrestres*. Bauh. pin. 322. Perhaps a variety of *G. urbanum*.

*Ivy-leaved Avens.* Pl. 1 to 2 feet.

14 *G. ELATUM* (Wall. cat. 711.) stem erect, pubescent; 1-2-flowered; leaves interruptedly pinnate; leaflets obtuse, crenately lobed, outer ones the largest, rather hairy and ciliated; cauline leaves pinnatifid; flowers large, erect; stipulas large, deeply lobed.  $\mathcal{A}$ . H. Native of the Himalaya.

*Tall Avens.* Pl. 2 to 3 feet.

15 *G. RANUNCULOIDES* (Ser. in mem. soc. phys. gen. 2. p. 138.) stem erect, branched; radical leaves interruptedly pinnate; leaflets bifid, dentate; cauline leaves somewhat interruptedly pinnate, or palmate; leaflets obovate-cuneate, toothed; stipulas ovate, large, lobed, or coarsely serrated; peduncles very long, filiform; petals roundish, nearly twice the length of the calyx; heads of carpels spherical; carpels numerous, pilose; styles glabrous, with the appendages ascending and glabrous, nearly the length of the styles.  $\mathcal{A}$ . H. Native country unknown. *G. heterophyllum*, Hortul. but not of Desf. Flowers golden yellow, about the size of those of *Ranunculus acris*.

*Crowfoot-like Avens.* Fl. June, July. Clt. 1823. Pl. 1 foot.

SECT. II. *CARYOPHYLLATA* (the same as last section). Ser. in mem. soc. gen. 2. p. 139. D. C. prod. 2. p. 551.—*Caryophyllata*, Tourn. inst. t. 151. Flowers erect or drooping. Calyxes erect. Styles deflexed, jointed, with the appendages about equal in length to the style.

16 *G. RIVALE* (Lin. spec. 717.) plant pilose; stems erect, simple, 1-4-flowered; leaves interruptedly and lyrate-pinnate; leaflets obovate, biserrate; cauline leaves 3-lobed; lobes acute; stipulas ovate, toothed; peduncles pilose, elongated; flowers nodding; petals obcordate, on long claws, length of calyx; heads of carpels spherical, at length stipitate; ovaries very pilose; styles elongated, bent, pilose.  $\mathcal{A}$ . H. Native of Europe, Siberia, and North America, in moist pastures and woods, indicating, according to Linnaeus, a barren soil, not fit for corn; plentiful in many parts of Britain. Smith, engl. bot. 106. Sturm, deutsch. fl. fasc. 8. with a figure. Oed. fl. dan. 722. *Caryophyllata nutans*, Moench. meth. 661. *G. nutans*, Rafin. in litt. Flowers nodding, of a coppery red colour. The powder is beneficial in diarrhoeas and hæmorrhages, and is much used by the Canadians in tertian agues.

*Var.  $\beta$ , intermedium* (Ser. in D. C. prod. 2. p. 551.) plant less pilose; lobes of upper leaves narrower; peduncles slenderer.  $\mathcal{A}$ . H. Native about Berlin, in groves. *G. intermedium*, Willd. hort. berl. t. 69. Tratt. ros. 3. p. 122.

*Var.  $\gamma$ , proliferum* (Ser. l. c.) flowers semi-double; segments of the calyx tridentate; carpels transformed into leaves.

*River or Water Avens.* Fl. June, Jul. Britain. Pl. 1 foot.

17 *G. HYBRIDUM* (Jacq. pl. rar. t. 94.) pilose; stems few-flowered; radical leaves interruptedly pinnate; terminal leaflets broad, rounded, and cordate, lobed and serrated; cauline leaves 3-lobed; lobes rounded; stipulas large, lobed; flowers erect; petals obcordate; carpels pilose, with hooked, pilose awns.  $\mathcal{A}$ . H. Native of Europe, in woods. *G. rivale*, var.  $\beta$ , *luxurians*, Tratt. ros. 3. p. 121. Flowers erect, reddish.

*Hybrid Avens.* Fl. June, July. Clt.? Pl. 1 foot.

18 *G. PYRENAICUM* (Ram. bull. phil. no. 42. t. 10. f. 3.) plant pilose; stems erect, simple, 1-4-flowered; leaves interruptedly pinnate; lower leaflets ovate, dentate, small, terminal one large, cordate-reniform, biserrate; stipulas ovate, bluntly toothed; flowers nodding; petals roundish, obcordate, on short claws, longer than the calyx; heads of carpels spherical, depressed; styles deflexed, stiff, length of carpels; carpels very pilose, with the appendages also pilose.  $\mathcal{A}$ . H. Native of the Pyrenees. D. C. fl. fr. 4. no. 3765. *G. Tournefortii*, Lapeyr. abreg. p. 292. *G. inclinatum*, Schleich. cat. 1815. Flowers yellow.

*Pyrenean Avens.* Fl. June, July. Clt. 1804. Pl.  $1\frac{1}{2}$  foot.  
 19 *G. BRACHYPETALUM* (Ser. in mem. soc. phys. gen. 2. p. 139.) plant rather pilose; stems erect, simple, 1-3-flowered; lower leaves interruptedly pinnate, ultimate ones approximate, 1-lobed, lanceolate, all biserrated; lower stipulas large, and nearly orbicular, coarsely serrated; flowers axillary, drooping; petals obovate, loose, much shorter than the calyx; heads of carpels roundish.  $\mathcal{U}$ . II. Native country unknown, but cultivated in the garden at Geneva. Flowers pale yellow, marked with rose-coloured lines.

*Short-petalled Avens.* Fl. June, Aug. Clt. 1818. Pl.  $1\frac{1}{2}$  ft.  
 20 *G. THOMASIANUM* (Ser. in mem. soc. phys. gen. 2. p. 140.) plant pilose; stems erect, 1-3-flowered; radical leaves somewhat interruptedly pinnate; leaflets nearly equal, obovate, somewhat doubly serrated; cauline leaves ternate; the terminal leaflets 3-lobed or lanceolate; stipulas ovate, doubly serrated; flowers ascending; calycine lobes ovate, short; petals obovate, hardly longer than the calyx; heads of carpels nearly spherical; styles appendiculate.  $\mathcal{U}$ . H. Native of the eastern Pyrenees, about Mount Louis. Flowers small, yellow.

*Thomas's Avens.* Fl. May, Aug. Pl. 1 foot.

21 *G. PARVIFLORUM* (Commers, ex Smith in Rees's cycl. vol. 16. no. 12.) stem few-flowered, tomentose; radical leaves pinnate, crenated, longer than the stem; stipulas dissected; flowers almost sessile, nodding; calycine segments longer than the corolla; carpels villous.  $\mathcal{U}$ . II. Native of the Straits of Magellan. Flowers small, white. Allied to *G. rivale*, according to Smith.

*Small-flowered Avens.* Pl.  $\frac{1}{2}$  foot.

22 *G. CALTHIFOLIUM* (Menzies, ex Smith, in Rees's cycl. vol. 16.) stem erect, few-flowered; radical leaves pinnate; leaflets acutely-toothed, pilose, terminal one large, roundish-reniform; cauline leaves round, profoundly-toothed; calyx erect; petals ovate-roundish, about equal in length to the calyx; carpels pilose; styles straight?  $\mathcal{U}$ . H. Native of north-west America. Flowers yellow. Perhaps the same as *Sieversia radiata*.

*Caltha-leaved Avens.* Pl.  $\frac{1}{2}$  foot.

23 *G. MAGELLANICUM* (Comm. ex Pers. ench. 2. p. 57.) scape elongated; leaves interruptedly pinnate; terminal leaflet large and lobed, lower ones small.  $\mathcal{U}$ . II. Native of the Straits of Magellan. Probably a species of *Sieversia*.

*Magellan Avens.* Pl.  $\frac{1}{2}$  foot.

24 *G. INVOLUCRATUM* (Juss. herb. ex Pers. ench. 2. p. 57.) stem 5-flowered; leaves pinnate; terminal leaflet roundish and crenated; flower involucreted by the leaves; petals white, smaller than the calyx.  $\mathcal{U}$ . II. Native of the Straits of Magellan. Perhaps the same as *G. parviflorum*.

*Involucreted-flowered Avens.* Pl. 1 foot.

25 *G. HISPIDUM* (Fries, fl. hall. p. 90. ex Tratt. ros. 3. p. 140.) plant hairy; flowers erect; petals longer than the calyx; awns of carpels kneed above the middle, hispid, glabrous above; stigma clavate; radical leaves almost equally pinnate; cauline leaves pinnatifid.  $\mathcal{U}$ . II. Native of Sweden. Reichb. icon. rar. cent. 5. t. 3. ex Tratt. Flowers yellow, 2 terminal on long peduncles.

*Hispid Avens.* Fl. June, July. Pl. 1 foot.

26 *G. CAPEENSE* (Thunb. prod. fl. cap. p. 91.) stem erect; radical leaves pinnate; terminal leaflet large; cauline leaves tripartite or pinnatifid; petals roundish, obovate, longer than the calyx; awns of carpels naked, twisted and kneed in the middle.  $\mathcal{U}$ . G. Native of the Cape of Good Hope. Wicks. in acad. handl. 1822.

*Cape Avens.* Pl. 1 foot.

27 *G. JAPONICUM* (Thunb. fl. jap. 220.) stem flexuous, hairy; leaves 3-5-lobed, hairy; stipulas ovate, cut; flowers erect; petals length of calyx; fruit hairy, ending in naked recurved awns.  $\mathcal{U}$ . H. Native of Japan. Flowers yellow.

*Japan Avens.* Pl. 1 foot.

+ *A species not well known.*

28 *G. OBLIQUUM* (Steud. nom. phan. 366.) stem oblique, simple, hairy; radical leaves pinnate; outer leaflet very large, ovate, 5-parted, crenated; cauline leaves 3-lobed; stipulas oblong, toothed; carpels awnless.  $\mathcal{U}$ . II. Native country unknown. *Caryophyllata obliqua*, Moench, suppl. 280. *Waldsteinia Moenchii*, Tratt. ros. 3. p. 106. Perhaps a true species of *Waldsteinia* on account of the want of awns to the carpels.

*Oblique Avens.* Pl.  $\frac{1}{2}$  to 1 foot.

*Cult.* The plants will grow in any common soil, and are easily increased by dividing the plants at the root or by seeds.

III. *SIEVERSIA* (in honour of M. Sievers, a Russian botanist and traveller). Willd. berl. mag. 1811. p. 397. R. Brown, in Parry, voy. append. p. 276. *Adamia*, Fisch. in litt. *Geum* sect. 3. *Oreogalum*, Ser. in mem. soc. phys. gen. p. 139.

*Lin. syst. Icosandria, Polygynia.* Calyx 10-cleft (f. 70. b.), the outer alternate segments accessory. Petals 5 (f. 70. c.). Stamens numerous. Ovaries indefinite; ovula ascending. Styles terminal, continuous. Carpels or akenia awned by the whole style (f. 70. d.). Awns feathery (f. 70. d.), articulated. Embryo erect. Habit nearly of *Geum*, but differs in the styles being jointed, the superior joint dissimilar to the lower joint, and usually deciduous. Flowers and calyxes erect, never reflexed.

1 *S. ATLANTICA*; plant pilose; stems erect, simple; leaves interruptedly pinnate; lower leaflets ovate, toothed, terminal one large, somewhat cordate, biserrated, cauline leaves simple, deeply toothed; stipulas lanceolate, a little toothed; flowers ascending; petals obcordate, longer than the calyx; heads of carpels spherical, depressed; styles deflexed, stiff, length of ovaries, which are pilose; tails villous.  $\mathcal{U}$ . II. Native of the south of Europe and north of Africa, in woods. *Geum Atlanticum*, Desf. fl. atl. 1. p. 401. *G. sylvaticum*, Pourr. act. toul. ex D. C. fl. fr. 5. p. 544. *G. biflorum*, Brot. fl. lus. 2. p. 533. Flowers large, yellow.

*Atlantic Sieversia.* Fl. June, Aug. Clt. 1810. Pl. 1 foot.

2 *S. REPTANS* (Spreng. syst. 2. p. 553.) sterile stems creeping, but the floriferous ones are erect, and undivided; radical leaves interruptedly pinnatifid, larger lobes obovate, profoundly toothed at the apex, smaller ones ovate, entire or tridentate at the apex; cauline leaves 3-lobed; flower large, solitary on the top of the stem; calycine segments elongated, usually trifid at the apex; petals obcordate, longer than the calyx; styles spreading, very pilose.  $\mathcal{U}$ . H. Native on the higher Alps of France, Switzerland, and Germany. *Geum reptans*, Lin. spec. 717. Jacq. austr. 5. append. t. 22. *Adamia reptans*, Fisch. Mor. hist. 2. p. 431. sect. 4. t. 26. f. 5.—Barrel. icon. t. 400.—Boeck. mus. t. 128. Flowers large, yellow.

*Var.  $\beta$ , macrophylla* (Ser. in D. C. prod. 2. p. 553.) leaves and stolons large; leaflets coarsely and doubly serrated.  $\mathcal{U}$ . H. Native of Vallais, at Gallenstock.

*Creeping Sieversia.* Fl. May, Sept. Clt. 1597. Pl.  $\frac{1}{2}$  foot.

3 *S. ANEMONOIDES* (Willd. berl. mag. 5. p. 398.) stems 1-flowered; stolons creeping; leaves pinnate, glabrous; leaflets cuneiform, toothed at the apex; stipulas filiform; petals longer than the calyx; styles bearded.  $\mathcal{U}$ . H. Native of Siberia and Kamtschatka. *Dryas pentapétala*, Lin. amœn. 2. p. 353. *Caryophyllata*, Kamtschatica, Lam. dict. 1. p. 400. *Geum anemonoides*, Willd. spec. 2. p. 1117.—Pall. itin. 3. p. 733. t. E. c. f. 4. Flowers large, white.

*Anemone-like Sieversia.* Fl. June, Aug. Clt. 1775. Pl.  $\frac{1}{2}$  ft.

4 *S. ADNATA*; stem 1-flowered, downy; radicle leaves long, interruptedly pinnate; leaflets crenately lobed, villous above, and glabrous beneath, ciliated; cauline leaves small, lower ones rather

pinnatifid, uppermost ones trifid.  $\mathcal{A}$ . H. Native of Gosaings-than. *Gœum adnatum*, Wall. cat. no. 712. Like *S. reptans*.

*Adnate Sieversia*. Pl.  $\frac{1}{2}$  foot.

5 *S. ROSSII* (R. Br. in chl. melv. p. 18. t. C.) radical leaves interruptedly pinnate, glabrous; leaflets 3-lobed, but the accessory and lower ones are small and undivided; stem 1-flowered, usually 2-leaved; awns of carpels naked.  $\mathcal{A}$ . H. Native of Melville Island. *Gœum Rossii*, Ser. in D. C. prod. 2. p. 553. Flowers large, yellow, distinctly veined.

*Ross's Sieversia*. Pl.  $\frac{1}{2}$  foot.

6 *S. GLACIALIS* (Spreng. syst. 2. p. 543.) whole plant densely clothed with yellowish villi; leaves interruptedly pinnate; leaflets ovate-oblong, upper and lower ones small, middle ones large and usually unidentate; flowers large, terminal, solitary.  $\mathcal{A}$ . H. Native of Siberia, on the Alps at the mouth of the river Lena. *Adamia glacialis*, Fisch. ex Steud. nom. *Gœum glaciale*, Adams, act. mosk. 5. p. 96. Flowers large, yellow. Allied to *S. reptans* according to Adam.

*Icy Sieversia*. Fl. May, Aug. Clt. 1819. Pl.  $\frac{1}{2}$  foot.

7 *S. MONTANA* (Spreng. syst. 2. p. 543.) stem erect, 1-flowered; stolons none; radical leaves interruptedly pinnatifid, terminal leaflet ovate, large, oblong, obtuse, and bluntly biserrate, lateral leaflets smaller and toothed; cauline leaves 3-lobed, and are as well as the stipulas deeply toothed; calycine segments undivided; petals obcordate, longer than the calyx; styles spreading, very pilose.  $\mathcal{A}$ . H. Native of the Alps of Europe, Switzerland, Austria, Silesia, Dauphiny, &c. *Gœum montanum*, Lin. spec. 717. The leaflets becoming gradually smaller from the apex. Flowers large, yellow. Jacq. austr. 4. t. 373. Sturm. deutsch. fl. fasc. 14. with a figure.

*Var.  $\beta$ , minus* (Pers. ench. 2. p. 57.) stems and leaves smaller than those of the species.  $\mathcal{A}$ . H. Native on the higher Alps of Europe. *G. alpinum*, Mill. dict. no. 5.—Barr. icon. t. 399.

*Mountain Sieversia*. Fl. May, Sept. Clt. 1597. Pl.  $\frac{1}{2}$  foot.

8 *S. TRIFLORA* (R. Br. in chl. melv. p. 18.) plant pilose; stems simple, usually 3-flowered; radical leaves interruptedly pinnate, leaflets cuneatd, and deeply toothed; petals oblong, length of the calyx; awns of carpels long, and villous.  $\mathcal{A}$ . H. Native of Upper Louisiana. Hook. bot. mag. t. 2858. *Gœum triflorum*, Pursh. fl. amer. sept. 2. p. 736. Leaves connate at the base. Stipulas divaricate, adnate to the petiole. Petals reddish?

*Three-flowered Sieversia*. Fl. June. Clt. 1826. Pl.  $\frac{1}{2}$  foot.

9 *S. PECKII* (R. Br. in chl. melv. p. 18.) plant smoothish; stem 1-5-flowered; radical leaves pinnate; lateral leaflets small, ovate, and toothed, terminal one reniform-cordate, lobed, large, doubly toothed; cauline leaves almost wanting; petals obovate, longer than the calyx.  $\mathcal{A}$ . H. Native of North America, on the white hills in New Hampshire. Hook. bot. mag. t. 2863. *Gœum Peckii*, Pursh. fl. amer. sept. 2. p. 554.

*Peck's Sieversia*. Fl. June, Aug. Clt. 1826. Pl.  $\frac{3}{4}$  foot.

10 *S. CILIATA*; plant pubescent; stem simple; leaves smoothish, pinnate, with ciliated margins; upper leaves palmate, with linear-cut leaflets; flowers corymbose.  $\mathcal{A}$ . H. Native of North America, on the banks of the river Koooskoosky. *Gœum ciliatum*, Pursh. fl. amer. sept. 1. p. 352. Flowers yellow.

*Ciliated-leafletted Sieversia*. Fl. Ju. July. Clt. 1818. Pl. 1 ft.

11 *S. RADIATA*; plant very hairy; stem simple; radical leaves pinnate; the terminal leaflet very large, radiantly nerved; cauline leaves stem-clasping, and deeply jagged; petals obcordate, cuneatd; awns of carpels glabrous.  $\mathcal{A}$ . H. Native of the high mountains of Carolina, and on the west coast of America. *Gœum radiatum*, Michx. fl. bor. amer. 1. p. 300. Flowers yellow.

*Ray-leaved Sieversia*. Fl. June, July. Clt. 1815. Pl. 1 ft.

12 *S. CAROLINIANA*; stems decumbent, a little branched; radical leaves obtuse, serrated, sub-pinnate; terminal lobe large,

lateral ones small; cauline leaves ovate-lanceolate, serrated, hairy, on short petioles; flowers erect; petals ovate.  $\mathcal{A}$ . H. Native of Carolina. *Gœum Carolinianum*, Walt. fl. carl. 150. Flowers white.

*Carolina Sieversia*. Pl.  $\frac{1}{2}$  foot.

13 *S. PARADOXA* (D. Don, in Lin. trans. 14. p. 576. t. 22. f. 2.) leaves in fascicles, linear, obtuse, sessile, entire or 3 or 5-cleft; flowers sub-corymbose; styles plumose; stem shrubby.  $\mathcal{A}$ . G. Native of Mexico. *Gœum cercocarpoides*, D. C. prod. 2. p. 554. A branched stiff shrub, with large yellow flowers. (f. 70.)

*Paradoxical Sieversia*. Shrub 1 to 3 feet.

*Cult.* For culture and propagation see *Gœum*. *S. paradoxa* should be treated in the way recommended for *Cowania*.

IV. COLURIA (from *κολουρος*, *kolouros*, deprived of a tail; the seed is without the tail so conspicuous in the three preceding genera). R. Brown, chl. melv. 1. p. 392. Led. fl. alt. 2. p. 262.

*Lin. syst.* *Icosándria*, *Polygýnia*. Calyx campanulate, 10-cleft, the 5 outer segments accessory. Petals 5, cordate, orbicular. Filaments inserted in the throat of the calyx, permanent. Ovaries numerous. Styles straight, thickened at the base, and articulated with the ovary. Carpels tailless, serobiculately wrinkled, inclosed in the calyx.—A small plant, with interruptedly pinnate leaves, the terminal leaflets large, the lateral ones unequal in size and shape, all canescent beneath, cauline leaves trifid or entire. Stipulas connate, entire. Stem 1-3-flowered. Flowers yellow.

1 *C. GEOIDES* (R. Br. l. c.)  $\mathcal{A}$ . H. Native of Siberia, on rocks in the less elevated mountains. *Dryas Geoïdes*, Pall. itin. 3. append. 732. t. Y. f. 1. *Gœum Laxmanni*, Gærtn. fruct. 1. p. 352. t. 74. f. 1. *Gœum potentilloïdes*, Ait. hort. kew. ed. 1. vol. 2. p. 219. *Caryophyllata potentilloïdes*, Lam. ency. 1. p. 395. *Laxmannia geoïdes*, Fisch. mss. *Laxmannia potentilloïdes*, Fisch. ex Steud. nom.

*Geum-like Coluria*. Fl. May, Ju. Clt. 1780. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

*Cult.* A light soil suits this plant best, and it is easily propagated by dividing at the root, or by seed.

V. COWANIA (in honour of James Cowan, who, as a merchant, had several times visited Mexico and Peru, from whence he has introduced a great many plants, now common in our gardens). D. Don, in Lin. trans. 14. p. 574.

*Lin. syst.* *Icosándria*, *Polygýnia*. Calyx 5-cleft. Petals 5. Stamens indefinite. Ovaries 5-11, densely villous, adnate to the bottom of the calyx. Ovula erect. Styles terminal, continuous. Carpels or akenia awned by the plumose permanent styles. Embryo erect.—A much branched shrub, with alternate small linear coriaceous leaves, with entire revolute edges, glandular above, and clothed with white wool beneath, dilated and tripartite at the apex; segments linear, blunt, with revolute edges. Stipulas twin, membranous, dilated, entire, silky, adnate by the base to the petiole, but free and acuminate at the apex. Flowers yellow, numerous, sessile, solitary on the tops of the branches, about the size of those of *Potentilla fruticosa*.

1 *C. MEXICANA* (D. Don, l. c. t. 22. f. 1.)  $\mathcal{A}$ . G. Native of Mexico. *Gœum dryadoides*, D. C. prod. 2. p. 554.

*Mexican Cowania*. Shrub 1 to 2 feet.

**Cult.** This shrub will do well in a mixture of sand, peat, and a little loam; and cuttings will root if planted in a pot of sand with a bell-glass placed over them, or the plant may be increased by seeds.

**VI. WALDSTEINIA** (in honour of Francis Von Waldstein, a German botanist, author of *Descriptiones et Icones plantarum rariorum Hungaricæ*, 3 vols. fol. Vienna, 1802. 1812. in conjunction with Paul Kitaibel). Willd. nov. act. nat. cur. ber. 2. p. 103. Nestl. pot. 17. t. 1. D. C. prod. 2. p. 555.

**LIN. SYST.** *Icosándria, Di-Pentagýnia*. Calyx with a turbinate tube, crowned with a crenulated ring under the stamens, bearing bracteas on the outside. Petals 5. Stamens numerous. Carpels 2-4, fixed to the bottom of the calyx, connate at the base. Styles terminal. Akenia 1-4, globose, naked, and somewhat umbilicate at the apex, rather fleshy. Seeds erect.

1 *W. GEOIDES* (Willd. l. c. p. 105. t. 4. f. 1.)  $\gamma$ . H. Native of Hungary, in shady woods. Leaves petiolate, palmately 5-lobed, having the lobes acutely toothed. Flowers yellow, smaller than those of *Potentilla vérna*. Waldst. et Kit. pl. rar. hung. 1. t. 77. Lodd. bot. cab. 492.

*Geum-like Waldsteinia*. Fl. June, July. Clt. 1804. Pl.  $\frac{3}{4}$  ft.

**Cult.** See *Geum* for culture and propagation, p. 527.

**VII. COMAROPSIS** (*κομαρον, komaron*, the *Cómarum*, and *οψις, opsis*, resemblance). Rich. in Nestl. pot. p. 16. t. 1. D. C. prod. 2. p. 555.—Waldsteinia species, Tratt. ros.

**LIN. SYST.** *Icosándria, Polygýnia*. Calyx with a turbinate tube and a 5-cleft limb, destitute of bracteas. Petals 5, unguiculate. Stamens numerous. Carpels few, ending each in the filiform elongated style. Akenia dry, not coarctate at the base. Seed erect.—Herbs, with the habit of *Waldsteinia*, but differs from it in the calyx being without bracteas. Leaves trifoliolate.

\* *Lobes of calyx entire.*

1 *FRAGARIOIDES* (D. C. prod. 2. p. 555.) carpels smoothish; peduncles branched, 3-flowered; petals 3 times the length of the calyx; leaflets cuneiform, sessile, terminal one stalked.  $\gamma$ . H. Native of Canada, in shady beech woods, and on the Alleghany mountains. Dalibárda fragarioides, Michx. fl. bor. amer. t. 300. t. 28. Sims, bot. mag. 1567. Waldsteinia fragarioides, Tratt. ros. Dryas, trifoliata, Pall. ined. Comaropsis Doniána, D. C. prod. 2. p. 555.—Waldsteinia Doniána, Tratt. ros. Leaves petiolate, trifoliolate. Leaflets cuneate, deeply serrated. Flowers yellow. There is a variety of this with petals shorter than the calyx.

*Strawberry-like Comaropsis*. Fl. May, June. Clt. 1800. Pl.  $\frac{1}{2}$  foot.

2 *C. SIBIRICA* (D. C. prod. 2. p. 555.) carpels hairy; peduncles branched, 3-flowered; petals 3 times larger than the calyx; leaflets cuneiform, sessile.  $\gamma$ . H. Native of Siberia, beyond the Baikal. Dalibárda ternata, Steph. mem. soc. mosc. 1. p. 92. t. 10. Waldsteinia Sibírka, Tratt. ros. Very like the preceding species, but the petals are said to be white.

*Siberian Comaropsis*. Pl.  $\frac{1}{2}$  foot.

\*\* *Lobes of calyx serrated.*

3 *C. PEDATA* (D. C. prod. 2. p. 555.) carpels glabrous; peduncles simple, glabrous, bracteate, 1-flowered; stems unarmed.  $\gamma$ . H. Native of North America, on the western coast. Rubus pedatus, Smith, icon. ined. t. 63. Dalibárda pedata, Steph. mem. soc. mosc. t. 92. Spreng. grundz. 510. Leaves petiolate, trifoliolate; lateral segments bipartite. Flowers white.

*Pedate-leaved Comaropsis*. Pl. 1 foot.

4 *C. RADICANS* (D. C. prod. 2. p. 555.) carpels glabrous; peduncles simple, pilose, bractless, 1-flowered; stems prickly, rooting.  $\gamma$ . G. Native of Chili, in woods. Rubus radicans, Cav. icon. 5. p. 7. t. 413. Spreng. grundz. p. 514. Leaves petiolate, trifoliolate; terminal leaflet large; lateral ones undivided. Flowers pale red.

*Rooting Comaropsis*. Pl. creeping.

**Cult.** See *Geum* for culture and propagation, p. 527.

**VIII. RUBUS** (from *rub*, red in Celtic; in reference to the colour of the fruit in some species). Lin. gen. 864. Lam. ill. t. 441. Nestl. pot. 16. Weilh. et Nees, rub. germ. p. 11. Wallr. sched. crit. p. 223. D. C. prod. 2. p. 556.

**LIN. SYST.** *Icosándria, Polygýnia*. Calyx flattish at the bottom, 5-cleft. Petals 5. Stamens numerous, inserted in the calyx along with the petals. Carpels or akenia numerous, fleshy, disposed in a head upon an elevated torus. Styles lateral, near the apex of the carpels. Seeds inverted.—Shrubs, rarely herbs, with the stems sometimes unarmed, but usually prickly. Leaves stalked, pinnate or palmate, with the leaflets usually stalked, sometimes the leaves are simple lobed or undivided. Fruit of all edible.

§ 1. *Leaves pinnate or ternately pinnate.*

\* *Leaflets glabrous beneath.*

1 *R. ROSEFOLIUS* (Smith, icon. ined. 3. p. 60. t. 60.) stems rather terete, pilose; prickles spreading, a little recurved; leaves pinnate, rather pilose; leaflets ovate-lanceolate, somewhat doubly serrated, full of glandular dots; stipulas linear-setaceous; peduncles usually 1-flowered; calycine segments lanceolate, acuminate, hardly longer than the corolla; carpels glabrous, very numerous, small, wrinkled from lacunæ when dry.  $\gamma$ . G. Native of the Mauritius. Flowers white. Fruit size of those of the common raspberry.

*Var.  $\beta$ , coronarius* (Sims, bot. mag. 1783.) petals very numerous, much longer than the calyx. *R. Commersonii*, Poir. dict. 6. p. 240. *R. Sinensis*, Hortul. Flowers large, semidouble, white.

*Var.  $\gamma$ , trilobus* (D. C. prod. 2. p. 556.) petals numerous, much longer than the calyx; leaves 3-lobed, large, glabrous. Flowers large, semidouble, white.

*Rose-leaved Bramble*. Fl. April, Oct. Clt. 1811. Shrub 2 to 6 feet.

2 *R. EGLANTERIA* (Tratt. ros. 3. p. 9.) stems shrubby, terete, glabrous, prickly; leaves pinnate; leaflets cordate-oblong, doubly serrated, glandular, pubescent; flowers solitary, axillary.  $\gamma$ . G. Native of New Holland. Like *R. rosefolius*, but differs in the leaflets being cordate-oblong, and in the flowers being axillary. Flowers white.

*Eglantine Bramble*. Fl. April, July. Clt. 1825. Shrub 3 to 6 feet.

3 *R. FRAXINFOLIUS* (Poir. dict. 6. p. 242.) branches glabrous, rather terete; prickles few, straightish; lower leaves with 3-5 pairs of leaflets, upper ones ternate, rarely simple; leaflets ovate-lanceolate, nearly sessile, glabrous, doubly serrated; flowers panicle, numerous; branches of panicle filiform; bracteas subulate, cut; calycine segments oval, acuminate, glabrous on the outside, hardly shorter than the petals; fruit large, globose; carpels numerous.  $\gamma$ . S. Native of Java. Flowers white.

*Ash-leaved Bramble*. Shrub 2 to 4 feet.

4 *R. PINNATUS* (Willd. spec. 2. p. 1081.) branches villous; prickles hooked, obtuse; leaves pinnate; leaflets ovate-lanceolate, glabrous on both surfaces, sharply and doubly serrated, wrinkling from veins, having the middle nerve prickly; flowers

racemose; peduncles villous and prickly; calycine segments longer than the petals.  $\frac{1}{2}$ . G. Native of St. Helena. Flowers pink.

*Pinnate-leaved Bramble.* Fl. Ju. July. Clt. 1789. Sh. 3 to 6 ft.

5 *R. AUSTRALIS* (Forst. prod. no. 224.) stem glabrous, terete; prickles of branches secund, recurved; leaves ternate and pinnate; leaflets oval, sharply toothed, rather coriaceous, glabrous on both surfaces; flowers racemose, dioecious; calycine segments blunt, spreading.  $\frac{1}{2}$ . G. Native of New Zealand.

*Southern Bramble.* Shrub 3 to 4 feet.

6 *R. CHINENSIS* (Ser. in D. C. prod. 2. p. 557.) stems terete, glabrous; prickles spreading, erect; leaves pinnate; petioles pilose; leaflets lanceolate, obsolete serrated, glandular, glabrous; flowers terminal, solitary; calycine segments ovate, glandular, pilose, ending in long taper points, which are longer than the corolla; petals obovate, very blunt.  $\frac{1}{2}$ . G. Native of China. Flowers white.

*China Bramble.* Shrub.

\* \* *Leaflets clothed with white tomentum or pubescence beneath.*

7 *R. RIGIDUS* (Smith in Rees's cyclop. vol. 30.) stem villous; prickles slender, numerous; leaves of sterile branches pinnate, of the fertile ones trifoliate; leaflets ovate, doubly and unequally serrated, rather villous beneath, and on the petioles; stipulas lanceolate; flowers racemose, terminal, numerous, small; calycine segments ending in a short acumen; petals very narrow; fruit small.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope.

*Stiff Bramble.* Shrub.

8 *R. TAGALLUS* (Cham. et Schlecht. Linnæa. 2. p. 9.) shrubby; branches terete, tomentose; prickles hooked, scattered; leaves pinnate, with 2-3 pairs of doubly serrated leaflets, which are pubescent on both surfaces, and glandless; stipulas setaceous; flowers usually solitary, terminal on the branches; calycine segments lanceolate, acuminate, equal in length to the petals, reflexed when in fruit.  $\frac{1}{2}$ . G. Native of the Island of Lucon, on the burning mount called Taal. Fruit eatable, red.

*Taal Bramble.* Shrub.

9 *R. CHRYSOCARPUS* (Mundt. in litt. Cham. et Schlecht. in Linnæa. 2. p. 17.) branches tomentose and glandular; prickles hooked, small; leaves of fertile branches trifoliate and pinnate; leaflets ovate, densely crenate-toothed, and curled on the margins, glabrous above, but clothed with yellowish tomentum beneath and on the petioles, and glandular; stipulas lanceolate-linear; panicle terminal, short, coarctate; calycine segments lanceolate; petals obovate, equal in length to the calyx.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope, at Hex river. Resembles *R. rigidus* of Smith.

*Golden-fruited Bramble.* Shrub.

10 *R. MUNDTI* (Cham. et Schlecht. in Linnæa. 2. p. 18.) branches tomentose; prickles hooked, strong, numerous; leaves of fertile branches trifoliate and pinnate; leaflets ovate, unequally and doubly serrated, pilose above, but clothed with hoary tomentum beneath, and glandless; stipulas lanceolate-linear; panicle terminal, coarctate; calycine segments ovate-lanceolate, acuminate; acumen foliaceous; petals obovate, shorter than the calyx.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope, at Hanglip.

*Mundt's Bramble.* Shrub.

11 *R. CELEBICUS* (Blum. bijdr. 1107.) lower leaves with 3-5 pairs of leaflets, floral ones simple; leaflets ovate-elliptic, acute, doubly serrated, smooth above, prickly on the middle nerve beneath, and pubescent on the veins; rameal prickles scattered, straight; stipulas wedge-shaped, jagged; panicle racemose; calycine segments ovate, cuspidate.  $\frac{1}{2}$ . S. Native of Java.

*Celebes Bramble.* Shrub.

12 *R. JAVAÏCUS* (Blum. bijdr. 1107.) leaves ternate or pinnate, with 2 pairs of leaflets; leaflets ovate-lanceolate, acuminate, deeply serrated, pubescent on both surfaces; rameal prickles straight; stipulas subulate; peduncles axillary and terminal, 1-flowered; calycine segments ovate, acuminate.  $\frac{1}{2}$ . S. Native of Java, in the province of Cheribon. Like *R. biflorus*, Hamilt.

*Java Bramble.* Shrub 4 to 6 feet.

13 *R. GRACILIS* (Roxb. ex herb. Lamb. D. C. prod. 2. p. 557.) stems finely puberulous; prickles numerous, reflexed; lower leaves pinnate, upper ones trifoliate; leaflets ovate, obtuse, obsolete crenate, rather villous beneath, with the nerves pilose; stipulas subulate, pilose; flowers few, subracemose, and axillary; peduncles short, hairy; calycine segments linear-spaulate, elongated, woolly, denticulated at the apex.  $\frac{1}{2}$ . S. Native of the East Indies.

*Slender Bramble.* Shrub 2 to 4 feet.

14 *R. BORBONICUS* (Pers. ench. 2. p. 51.) stems hoary; leaves pinnate; leaflets ovate-oblong, clothed with white tomentum beneath, acutely serrated; petioles tomentose, prickly.  $\frac{1}{2}$ . S. Native of the Island of Bourbon. *R. tomentosus*, Bory. voy. 2. p. 375. but not of Willd. Fruit like that of *R. cæsius*.

*Bourbon Bramble.* Shrub.

15 *R. MICRANTHUS* (D. Don, prod. fl. nep. 235.) leaves pinnate, with usually 7 or 9 leaflets, lanceolate, acuminate, deeply serrated, green above, but shining and glaucous beneath; petioles and rachis furnished with a few hooked prickles; corymbs panicled; petals unguiculate, shorter than the calyx; stem erect, furnished with inflexed prickles.  $\frac{1}{2}$ . H. Native of Nipaul. *R. pauciflorus*, Lindl. bot. reg. 854. An erect, branched shrub, armed with subulate prickles, which are inflexed at the apex. Young branches clothed with a kind of glaucous bloom at the apex. Stipulas lanceolate, acuminate, membranous. Flowers small, reddish purple.

*Small-flowered Bramble.* Fl. May, Aug. Clt. 1822. Shrub 4 to 6 feet.

16 *R. NIVEUS* (Wall. mss. in Lin. soc. herb.) stem trailing, terete, pubescent, prickly as well as the petioles and midrib of the leaves; prickles hooked; leaves pinnately trifoliate; leaflets elliptic, doubly serrated, acuminate, middle one slightly lobed, pilose above, but clothed with white tomentum beneath; calyx tomentose; the segments ending in a long acumen each, longer than the petals.  $\frac{1}{2}$ . H. Native of Nipaul.

*Snowy Bramble.* Shrub trailing.

17 *R. MYSORENSIS* (Heyne in Roth, nov. spec. 235.) stems nearly terete; prickles straight; leaves pinnate, with 5 or 7 leaflets, which are connate above, and somewhat plicate, rugulose, pubescent, ovate, acuminate, deeply and acutely doubly serrated, clothed with white tomentum beneath, the terminal leaflet trifid; racemes corymbose; peduncles 4-flowered; bracteas linear; calyx clothed with white tomentum; the segments terminating in a cartilaginous mucrone, and hardly longer than the petals.  $\frac{1}{2}$ . G. Native of Mysore.

*Mysore Bramble.* Shrub.

18 *R. DISTANS* (D. Don, prod. fl. nep. 256.) stems terete; prickles strong, compressed, recurved; leaves pinnate, with 7-9 leaflets, clothed with white tomentum beneath; leaflets ovate, lanceolate, acuminate, sharply serrated, distant, with numerous nerves; stipulas linear; racemes corymbose; peduncles short; calyx tomentose, with ovate hardly pointed segments, which are the length of the petals.  $\frac{1}{2}$ . H. Native of Nipaul. *R. pinnatus*, D. Don, prod. fl. nep. p. 254. Leaves resembling those of hemp.

*Distant-leafted Bramble.* Fl. June, July. Clt. 1818. Shrub 4 to 6 feet.

19 *R. APÉTALUS* (Poir. dict. 6. p. 242.) branches nearly

terete, pubescent; prickles scattered; leaves pinnate, with usually 7 oval serrulated leaflets, which are white beneath from tomentum; racemes axillary; flowers apetalous; calycine segments nearly linear, acute; carpels few.  $\frac{1}{2}$ . S. Native of the Isle of France.

*Apetalous Bramble.* Fl. June, July. Clt. 1823. Sh. 6 feet.

20 *R. MACRÓPODUS* (Ser. in D. C. prod. 2. p. 557.) branches tomentose; prickles numerous on the peduncles, slender, and recurved; leaves of the fertile branches pinnately trifoliate, clothed with hoary tomentum beneath, and rather pilose above; leaflets crenated, terminal one large and deeply 3-lobed; flowers axillary, solitary; peduncles longer than the leaves; calycine segments linear-lanceolate, 5-nerved, acuminate, rather woolly, prickly, rather foliaceous at the apex, twice the length of the corolla.  $\frac{1}{2}$ . G. Native of New South Wales.

*Long-petioled Bramble.* Shrub.

21 *R. STRIGOSUS* (Michx. fl. bor. amer. 1. p. 297.) stem terete, very hispid; leaves of the sterile branches quinate, pinnate, of the fertile branches 3-lobed; leaflets ovate, unequally serrated, obtuse at the base, lined beneath, and clothed with white tomentum, the terminal lobe or leaflet usually subcordate; peduncles usually 3-flowered, and are as well as the calyxes hispid.  $\frac{1}{2}$ . H. Native of Pennsylvania and Canada, on the mountains. *R. Pennsylvanicus*, Poir. diet. 6. p. 216. Petals white, longer than the calyx.

*Strigose Bramble.* Shrub.

22 *R. BIFLORUS* (Hamilt. ex Smith in Rees' cycl. vol. 30.) stem prickly at the base; leaves of the sterile branches with 5 leaflets, of the fertile branches trifoliate; leaflets ovate or elliptic, unequally serrated, cuneate at the base, clothed with white tomentum beneath, but villous above; petioles and branches tomentose and prickly; stipulas linear; peduncles elongated, twin or tern; calycine segments broad, oval, acuminate, length of the petals.  $\frac{1}{2}$ . H. Native of Upper Nipaul, on the banks of rivers, and in the vicinity of Chitlong. *R. pedunculatus*, D. Don, prod. fl. nep. 224. where the stem is said to be unarmed.

*Two-flowered Bramble.* Fl. April, June. Shrub 4 to 6 feet.

23 *R. OCCIDENTALIS* (Lin. spec. 706.) stems terete, pruinose; prickles recurved; leaves of the sterile branches pinnate, of the fertile ones trifoliate; leaflets ovate, deeply serrated, clothed with white tomentum beneath; stipulas very narrow, setaceous; peduncles umbellate, prickly; calycine segments lanceolate-linear, tomentose, pointed at the apex; petals obovate-cuneate, 2-lobed, spreading, shorter than the calyx; carpels numerous, smoothish, when dry wrinkled from lacunæ.  $\frac{1}{2}$ . H. Native of Canada and the West Indies.—Sloan. jam. t. 213. f. 1.—Dill. hort. elth. t. 287. f. 319. Stems covered with bloom. Fruit black, resembling that of the common raspberry.

*Western Bramble or Virginian Raspberry.* Fl. May, June. Clt. 1696. Shrub 4 to 6 feet.

24 *R. ASPER* (D. Don, prod. fl. nep. p. 234.) leaves pinnate, with usually 7 elliptic, acuminate, sharply serrated leaflets, which are green above, and rather pilose beneath; petioles and branches beset with gland-bearing bristles and prickles; stipulas lanceolate, cuspidate; peduncles terminal, usually tern.  $\frac{1}{2}$ . H. Native of Nipaul. Flowers white.

*Rough Bramble.* Fl. May, June. Clt. 1821. Sh. 4 to 6 feet.

25 *R. LASIOCARPUS* (Smith in Rees' cycl. vol. 30.) stems smooth; prickles strong, recurved; leaves pinnate, with 7 leaflets, clothed with white tomentum beneath, the terminal leaflet usually 3-lobed; nerves pilose; stipulas setaceous; flowers racemose, terminal; carpels tomentose, reticulated.  $\frac{1}{2}$ . S. Native of Mysore.

*Woolly-fruited Bramble.* Shrub.

26 *R. IDÆUS* (Lin. spec. 706.) villous; stems terete; prickles slender, straight; leaves of the sterile branches pinnate, of the

fertile ones trifoliate; leaflets ovate, deeply serrated, clothed with white tomentum beneath; stipulas setaceous; peduncles sub-corymbose; calyx clothed with white tomentum, with ovate-lanceolate segments; petals obovate, cuneate, entire, connivent, shorter than the calyx; carpels numerous, pubescent.  $\frac{1}{2}$ . H. Native of Europe, in woods and hedges; plentiful in some parts of Wales and Scotland. Smith, engl. bot. 2442. Woody. med. bot. t. 138. Oed. fl. dan. 788.—Blackw. herb. 289. *R. frambesians*, Lam. fl. fr. 3. p. 135.—Framboisier, Duham. arbr. fr. 2. t. 255. f. 260. The raspberry is called *framboisier* in French, *himbeerstrauch* in German, and *rovo idco* in Italian. The stems of the raspberry are biennial, upright, but the root is perennial. The flowers come out in panicles from the extremity of the year's shoots; they are white, and appear in May and June. It is a native of Britain, and not uncommon in woods in low situations.

*Use.* The fruit is grateful to most palates as nature presents it, but sugar improves the flavour; accordingly it is much esteemed when made into sweetmeats, and for jams, tarts, and sauces. It is fragrant, subacid, and cooling, allays heat and thirst. It is much used in distilling, to make the cordial spirituous liquor, from which it has its name. Raspberry syrup is next to the strawberry in dissolving the tartar of the teeth, as like that fruit it does not undergo the acetous fermentation in the stomach; it is recommended to gouty and rheumatic patients.

The varieties of raspberry are as follow.

#### \* Red raspberries.

1 *Red Antwerp, Burley, late-bearing Antwerp, Knerett's Antwerp, framboisier rouge à gros fruit.* A red fruit of the first quality.

2 *Barnet, Cornwall's prolific, Cornwall's seedling, Cornwall's red, large red, lord Exmouth's.* A very fine large red fruit, of the first quality, but does not bear carriage so well as the *red Antwerp*.

3 *Bromley-hill.* A red fruit of the first quality.

4 *Brentford cane.* A second-rate red fruit.

5 *Red cane.* A red fruit, of a second-rate quality.

6 *Rough cane.* A second-rate red fruit.

7 *Smooth cane.* A second-rate red fruit.

8 *Common red, old red, wild red.* A worthless red fruit.

9 *Cornish.* A red fruit, of the first-rate quality.

10 *Double bearing, red double bearing, perpetual bearing, Siberian, late cane.* A red fruit, having the merit of bearing late in the season.

11 *Williams's double bearing red.* Resembles the preceding, but seems rather more tender.

12 *Jilliards's seedling.* A second rate red fruit.

13 *Early prolific.* A second-rate red kind.

14 *Red malta.*

15 *Spring-groce.* A second-rate red sort, but an abundant bearer.

16 *Superb.* A second-rate red kind.

17 *Taylor's paragon, scarlet paragon.* A second-rate red fruit.

18 *Wilmot's early red.* A second-rate red fruit.

19 *Woodward's red glob.* A second-rate red kind.

#### \* \* White and yellow raspberries.

20 *Yellow Antwerp, white Antwerp, double bearing yellow.* A pale yellow fruit, of the first-rate quality.

21 *Old white.* A white fruit, of very inferior quality.

22 *Large white.*

*Estimate of sorts.* The red and yellow Antwerp may be said to hold the similar rank in this class of fruit as the red and the

white Dutch among currants; and although some may be found nearly to equal them, yet it is doubtful whether they are yet exceeded by any.

**Propagation.** The varieties can be perpetuated by the young suckers, which spring from the root in spring and summer; when these have completed one year's growth they are proper to detach with roots for planting, either in the autumn or the next spring in February or March, but never later than the middle of April. These new plants will bear some fruit the same year, and furnish a succession of strong bottom shoots for full bearing the second season. New varieties are easily raised from seed, and they will come into bearing the second year.

**Soil and site.** All the varieties will succeed in any common mould, trenched about 2 feet deep, and sufficiently manured; but the soil in which the *raspberry* bush prospers most and bears the finest fruit, is in a light rich loam. Allot the main crop a free exposure to the sun, that the berries may ripen in perfection. Be careful to favour the double bearers with a dry soil, and a sheltered sunny situation, to give the second crop every aid in coming to maturity. When *raspberries* are cultivated on a large scale it is best to keep them in plantations by themselves. Set them in rows from 4 to 6 feet asunder, as the bushes are of the smaller or larger kinds, and by 3 or 4 feet in the row. Scattered bushes may either occupy a small row lengthwise along the back part of a border, or stand in detached stools, at 10 or 15 feet distance. Select sorts are frequently trained against walls, stakes, or espaliers, from the most sunny to the most shady aspect, for early and late fruit of improved growth and flavour. Neill says "the *raspberry* bush grows freely in any good garden soil; but it is the better for being slightly moist. Although the place be inclosed by trees, and even slightly shaded, the plant succeeds. In an inclosed and well sheltered quarter, with rather a damp soil, containing a proportion of peat moss, we have seen very great crops of large and well flavoured berries produced; for example at Melville-house, the seat of the earl of Leven, in Fifeshire." Haynes also recommends well manured bog-earth, and a situation naturally or artificially shaded.

**New plantations.** *Raspberry* bushes are in their prime about the third and fourth year, and, if well managed, continue in perfection 5 or 6 years; after which they are apt to decline in growth, and the fruit to become small, so that a successive plantation should be provided in time. Select new plants from vigorous shoots, in full perfection as to bearing.

**Summer culture.** Keep them free from weeds during the summer by hoeing between the rows, at the same time loosen the earth about the plants; under this management the plants, if tolerably strong, will both yield a moderate crop the first season, and supply young stems for bearing in greater plenty and perfection the following season, and so from year to year the summer culture should be repeated. As the plants get established let all straggling suckers between the rows, or from the extreme roots of single shoots, be cleared out by hoeing, or twisted off to admit the air and sun freely to the fruit. The fruit of the *raspberry* may be obtained of a very large size, other circumstances being favourable, by destroying all the suckers; but in this way, the plant being destroyed, a double plantation is wanted, one to grow only suckers, and the other fruit.

**Pruning and winter dressing.** It is requisite every winter or spring to cut out the dead stems, and to thin and regulate the successional young shoots. This annual pruning may be performed any time during open weather from November till the beginning of April. When kitchen garden crops are cultivated between the rows it is most convenient to do this as soon as the old bearers begin to decay. As to pruning indiscriminately in the open weather of winter, it sometimes happens that severe

frosts immediately follow, and partially kill the plants; therefore it is safer to shorten the tender young shoots early in the spring, but let it not be deferred till the buds are making new shoots, as that would weaken the root. Cut out all the old dead stems close to the bottom, and having selected from the strongest young shoots on each main stool 3-4 or 5 to be preserved for a succession of bearers, cut away the superabundant shoots close to the ground. Let each of the shoots retained be pruned at the top below the weak bending part, cutting them in smaller plants to about 3 or 4 feet in length, and in the large sorts to the length of 5 or 6 feet. If any of the stems diverge irregularly, or straggle much asunder, they may be tied together at the top, and thus the strong ones will support the weaker, or the taller varieties may have the support of stakes. Prune plants against a wall or trellis in the same manner as directed above, and train the shoots to rise a little diagonally. After pruning, having cleared away the cuttings, dig the ground between and about the plants. To turn in a little rich compost will conduce to plentiful and fine returns; lay it at the extremities of the roots, and deeper as the plantation gets older. Eradicate all straggling suckers.

**Taking the crop.** "The fruit of the different varieties comes in from the end of June or July till October or later. As it ripens it should be timely gathered for immediate use, because when fully ripe it will not keep above 2 or 3 days before it moulds or becomes maggoty, and unfit to be used." Abercrombie.

*Var. β, microphyllus* (Wallr. sched. p. 226.) leaves all ternate; stems suffrutescent, bushy, humble.

*Raspberry.* Fl. May, June. Britain. Shrub 4 to 6 feet.

27 *R. MENZIESII* (Hook, fl. bor. amer. p. 179.) stems procumbent, terete, prickly, glabrous; branches short, pubescently tomentose, prickly; leaves pinnately trifoliate; leaflets broad, ovate, slightly lobed, unequally serrated, on short petioles, hairy above, paler and very hairy beneath; panicle terminal, few-flowered; pedicels and calyxes prickly; calycine segments ovate, acute, mucronate, tomentose, shorter than the corolla. *h. II.* Native of North-west America. Flowers red.

*Menzies's Bramble.* Shrub procumbent.

28 *R. MACROPHYLLUS* (Doug. mss. in Hook, fl. bor. amer. p. 178. t. 59.) hairy; stem tall, shrubby; branches angular, slender, elongated; petioles, peduncles, calyxes, and ribs of leaves beneath beset with bristly prickles; leaflets 3, ovate, acute, deeply-lobed, serrated, membranous, terminal one on a long petiole, but the lateral ones are on short petioles; stipulas lanceolate; peduncles 2-flowered; calycine segments long-acuminate, about equal in length to the petals, which are oblong and white. *h. II.* Native of North-west America, on the banks of rivers and in low woods in the valley of the Columbia. Flowers white. Habit of *R. spectabilis*.

*Var. β, myriacanthus* (Doug. mss.) leaflets obtuse.

*Long-petalled Bramble.* Shrub.

§ 2. *Leaves with 3-5 leaflets, disposed in a palmate manner.*

\* *Shrubby. Stipulas petiolar, linear.*

29 *R. LACINIATUS* (Willd. hort. berol. t. 82.) stem nearly terete; prickles dilated at the base, compressed, recurved, strong; leaves with 3-5 leaflets; leaflets dissected and sharply serrated, puberulous beneath; flowers in loose panicles; calycine segments lanceolate, tomentose, and prickly, somewhat foliaceous and reflexed at the apex; petals obovate-cuneate, 3-lobed at the apex; akenia roundish, black. *h. H.* Native country unknown. Wats. dend. brit. 69. Flowers white or rose-coloured.

*Jagged-leaved Bramble.* Fl. June, Sept. Clt.? Sh. straggling.

30 *R. cæsius* (Lin. spec. 706.) stems prostrate, terete, usually covered with glaucous, pruinose bloom; prickles slender, a little recurved; leaves with 3-5 ovate, doubly serrated leaflets, which are downy beneath; panicle simple; calycine segments ovate, acuminate; akenia thick, few, greyish.  $\frac{1}{2}$ . H. Native of Europe, about way sides and on the hedges of fields; plentiful in Britain. Smith, engl. bot. 826. and Weih. ex Ern. Meyer. Fl. dan. 1213. Panicle corymbose; petals blush-coloured. Fruit sweet, black, with a dew tinge or bloom.

*Var.  $\beta$ , arvënsis* (Wallr. sched. p. 228.) leaflets tomentose beneath; branches puberulous. *R. pseudo-cæsius*, Weih. ex Ern. Meyer in litt.

*Var.  $\gamma$ , grandiflorus* (Ser. in D. C. prod. 2. p. 559.) pubescent; petals and calycine segments elongated. Schleich. in litt.

*Var.  $\delta$ , parvifolius* (Wallr. sched. p. 228.) stems ascending, purplish, at length naked; leaflets small, deeply lobed; peduncles 1-3-flowered. •

*Grey Bramble or Dewberry.* Fl. June, July. Britain. Sh. prostrate.

31 *R. dumetorum* (Weih. et Nees, rub. germ. ex Lindl. syn. brit. fl. p. 95.) stem procumbent, rather angular, rather hairy, with a slight coat of bloom; bristles and glands very few; prickles unequal, recurved; leaflets generally 5, the lateral ones sessile; flowers in corymbis; fruit black.  $\frac{1}{2}$ . H. Native of Germany and Britain, in hedges. *R. nemorosus*, Willd.

*Hedge Bramble.* Fl. July, Aug. Britain. Sh. procumbent.

32 *R. hirtus* (Waldst. et Kit. pl. hung. 2. p. 150. t. 141.) stem procumbent, tapering, densely hairy, covered with purple glands and setæ; prickles long, numerous, straight, spreading; leaflets 3-5, pedate, cordate, ovate, covered with shining hairs beneath; stipulas leafy; panicle corymbose, with red setæ; bracteas long, trifid.  $\frac{1}{2}$ . H. Native of Hungary and Britain, in hedges and woods.

*Hairy Bramble.* Fl. July, Aug. Britain. Sh. procumbent.

33 *R. ellipticus* (Smith in Rees' cycl. vol. 30.) leaves trifoliate; leaflets oval, serrated, tomentose beneath; petioles and branchlets tomentose, covered with numerous bristles and prickles intermixed; stipulas linear-setaceous; flowers glomerate, racemosely corymbose.  $\frac{1}{2}$ . H. Native of Nipaul, at Hethaura, where it is called by the natives *toki swa*. *R. flavus*, Hamilt. ex D. Don, prod. fl. nep. p. 234. Flowers white. Fruit yellow.

*Elliptic-leafletted Bramble.* Fl. July. Clt. 1827. Sh. trailing.

34 *R. sulcatus* (Vest, ex Tratt. ros. 3. p. 42.) runners and stems costately furrowed and ringed, acute-angled, glabrous, branches pubescent, flattish on the sides; leaflets glabrous above, and pubescent beneath, the lower and larger ones cordate-ovate, of the flagella 5, ovate and acuminate, and of the floriferous branches obovate; prickles scattered, recurved; flowers racemose; sepals clothed with hoary tomentum on both surfaces, as well as the peduncles.  $\frac{1}{2}$ . H. Native of Styria. Fruit black, shining, composed of many akenia.

*Furrowed-stemmed Bramble.* Shrub straggling.

35 *R. foliolosus* (D. Don, prod. fl. nep. p. 256.) leaves with 3-5 leaflets; leaflets cuneate-obovate, serrated, clothed with white tomentum beneath; peduncles 3-flowered, and are as well as the petioles tomentose and prickly; calyx unarmed, densely tomentose; bracteoles simple; stems procumbent; prickles recurved.  $\frac{1}{2}$ . H. Native of Nipaul. *R. microphyllus*, D. Don, prod. fl. nep. p. 234. Very nearly allied to *R. parvifolius*, but differs in the leaves of that plant being twice the size, more rounded and more profoundly serrated, in the peduncles being 1-flowered, in the calyxes being prickly, in the bracteoles being tripartite, and in the stem being erect.

*Leafy Bramble.* Fl. June, July. Clt. 1818. Sh. proc.

36 *R. pubescens* (Vest, ex Tratt. ros. 3. p. 34.) branches

furrowed, pubescent, prickly; leaves with 3-5 leaflets; leaflets obovate, acuminate, sharply and unequally serrated, clothed with white tomentum beneath; racemes simple; lower flowers solitary among the leaves.  $\frac{1}{2}$ . H. Native of Styria, among bushes on mount Plabutsch above Eggenberg.

*Pubescent Bramble.* Shrub straggling.

37 *R. flagellaris* (Willd. enum. 549.) stems terete, procumbent; prickles scattered, hooked, short; branches teret glabrous; leaves trifoliate; leaflets glabrous, unequally serrated, intermediate one ovate and cuneate at the base, lateral ones rhomboid, with yellowish nerves.  $\frac{1}{2}$ . H. Native of North America. Flowers white.

*Var.  $\beta$ , inermis* (D. C. prod. 2. p. 559.) stems pruinose, and are as well as the peduncles unarmed; leaflets tomentose beneath.

*Runner Bramble.* Fl. June, July. Clt. 1789. Sh. proc.

38 *R. corylifolius* (Smith, fl. brit. p. 512. engl. bot. t. 827.) stem shrubby, angular; prickles straightish; leaves with 3-5 leaflets; leaflets roundish, cordate, firm, doubly serrated, pilose beneath; panicle nearly simple; calycine segments ovate, acuminate, at length reflexed.  $\frac{1}{2}$ . H. Native of Europe, in hedges and woods; plentiful in some parts of Britain. Flowers white. Akenia purplish blue, large. *R. nemorosus*, Heyne ex Spreng. et Goldb.

*Var.  $\beta$ , canus* (Wallr. sched. p. 231.) leaflets all about the same size, roundish cordate, and clothed with hoary tomentum on both surfaces.

*Var.  $\gamma$ , glandulosus* (Wallr. l. c.) stems, petioles, and peduncles glandular. *R. glandulosus*, Spreng. ex Wallr. l. c.

*Hazel-leaved Bramble.* Fl. June, July. Britain. Sh. tr.

39 *R. agrifolius* (Waldst. et Kit. pl. rar. hung. 3. p. 297. t. 268.) stems suffrutescent, procumbent, rather angular; prickles straight, setaceous; leaflets 3-5, roundish, lobately toothed, unequally serrated, pilose above, and tomentose beneath; calyx clothed with hoary tomentum, and beset with glandular bristles.  $\frac{1}{2}$ . H. Native of Hungary and Transylvania, in neglected parts of fields. Flowers white. Perhaps only a variety of *R. corylifolius*.

*Field Bramble.* Fl. June, July. Clt. 1820. Sh. trailing.

40 *R. spectabilis* (Pursh, fl. amer. sept. 1. p. 348. t. 16.) stem shrubby, glabrous, unarmed; leaflets 3, ovate, acute, unequally and doubly serrated, pubescent beneath; peduncles terminal, 1-flowered, solitary; calycine segments oblong, acuminate, shorter than the corolla.  $\frac{1}{2}$ . H. Native of North America, on the banks of the Columbia river, and on the shore of the western coast. *R. ribifolius*, Willd. herb. ex Stev. Flowers of a beautiful purple colour.

*Sherry Bramble.* Shrub.

41 *R. bogotensis* (H. B. et Kunth, nov. gen. amer. 6. p. 220.) branches and petioles beset with glandular hairs and prickles, as well as the nerves of the leaves; leaflets 3, ovate, acute, deeply cordate at the base, serrated, pubescent above, and canescent beneath; peduncles axillary, few-flowered, panicle.  $\frac{1}{2}$ . G. Native of South America, near Santa Fe de Bogota, at the height of 4200 feet above the level of the sea. Fruit blackish purple, like those of *R. fruticosus*.

*Bogota Bramble.* Shrub.

42 *R. plicatus* (Weih. et Nees, rub. germ. p. 15. t. 1.) stem erectish, angular, and prickly, glabrous; prickles rather conical, recurved, and rather compressed at the base; leaflets 5, smoothish above, and pubescent beneath; panicle nearly simple, corymbose; calycine segments ovate, acuminate, naked at the base, and at length reflexed; bracteas jagged.  $\frac{1}{2}$ . H. Native of Germany and Britain, in hedges and woods. Engl. bot. suppl. t. 2714. Flowers white. Akenia large, dark, shining.

*Var.  $\beta$ , glabriusculus* (D. C. prod. 2. p. 560.) *R. plicatus*

γ, Weih. et Nees. l. c. *R. corylifolius*, Hell. fl. wurceb. suppl. p. 46.

*Plicate-leaved Bramble.* Fl. June, Sept. Brit. Sh. strag. 43 *R. BIFRONS* (Vest. ex Tratt. ros. 3. p. 28.) stem obsoletely angled, flat, glabrous; flowering branches beset with villous pubescence; lower leaves with 5 obovate, coarsely toothed leaflets, upper ones with 3 roundish leaflets, all glabrous above, and clothed with white tomentum beneath; panicle cymose; sepals clothed with hoary tomentum on both surfaces. *h. H.* Native of Syria. Fruit black, usually large.

*Two-fronted Bramble.* Shrub trailing.

44 *R. AFFINIS* (Weih. et Nees. rub. germ. p. 22. t. 3. and 36.) stems recurved, angular, prickly, and glabrous; prickles strong, recurved; leaves with 3 or 5 leaflets; leaflets ovate, cordate, cuspidate, sharply serrated, flat at the base, but somewhat undulated towards the apex, clothed with tomentum beneath; panicle compound, with the branches cymose; calycine segments ovate, acuminate, naked on the outside, reflexed. *h. H.* Native of Germany and Britain, in hedges. Flowers white. Akenia thick, bluish black.

*Var. β, bracteatus* (D. C. prod. 2. p. 560.) bracteas broad, undivided. *R. affinis* γ et δ, Weih. et Nees. l. c. t. 36.

*Allied Bramble.* Fl. June, Sept. Britain. Sh. straggling.

45 *R. FLORIBUNDUS* (H. B. et Kunth, nov. gen. amer. 6. p. 219. t. 557.) branches and petioles villously tomentose, and are as well as the nerves prickly beneath; upper leaves with 3 leaflets, and the lower ones with 5 leaflets; leaflets on long petiolules, elliptic-oblong, sharply serrated, clothed with adpressed pubescence on both surfaces; panicle terminal, branched. *h. G.* Native of South America, on the Andes about Iloa in Quito, at the height of 2100 or 5100 feet above the level of the sea. Petals white or rose-coloured, exceeding the calyx. Fruit like that of *R. fruticosus*.

*Bundle-flowered Bramble.* Shrub straggling.

46 *R. ULMI-FOLIUS* (Schott. in isis. 1818. fasc. 5. p. 821. and Link. enum. 2. p. 61.) stems decumbent, very prickly; leaves with 3 or 5 leaflets; leaflets oval, rather cordate, acutely and doubly crenated, tomentose beneath and unarmed. *h. H.* Native of Gibraltar, on the mountains. Branches red. Flowers beautiful rose-coloured.

*Elm-leaved Bramble.* Fl. June, Sept. Clt. 1823. Sh. tr.

47 *R. LINKIANUS* (Ser. in D. C. prod. 2. p. 560.) stems prickly; leaves with 3 or 5 leaflets; leaflets unequal, ovate, acuminate, serrated, clothed with hoary tomentum beneath; flowers panicle. *h. H.* Native country unknown. *R. paniculatus*, Schlecht. ex Link. enum. 2. p. 61. and Tratt. ros. 3. p. 92. but not of Smith. Flowers double, white.

*Link's Bramble.* Fl. June, July. Clt. 1821. Sh. trailing.

48 *R. ALBICANS* (Kit. ex Tratt. ros. 3. p. 92.) leaflets 5, ovate, cordate, lateral ones almost sessile, all clothed with white tomentum beneath; stems angular, prickly; prickles recurved; petioles and peduncles scabrous from glands. *h. H.* Native of Hungary, in bushy places. Allied to *R. fruticosus* or *R. tomentosus*. Flowers white.

*Whitish-leaved Bramble.* Shrub trailing.

49 *R. NUBIGENUS* (H. B. et Kunth, nov. gen. amer. 6. p. 220.) branches and petioles villous, and are prickly as well as the nerves of the leaves; leaflets beset with adpressed pili above, but clothed with canescent pubescence beneath; panicles terminal, nearly simple; calyxes prickly; fruit clothed with silky pili. *h. H.* Native of the Andes, about Quito, at Paramo de Puntas, at the height of 5100 feet above the level of the sea.

*Cloud-born Bramble.* Shrub straggling.

50 *R. FRUTICOSUS* (Lin. spec. 707.) stems straggling, arching, angular, and rather tomentose; prickles recurved; leaves

with 3 or 5 leaflets; leaflets petiolate, ovate-oblong, acute, glabrous above, greyish tomentose beneath; panicle decomposed, narrow, and straight; calycine segments reflexed and unarmed. *h. H.* Native of Europe, in hedges and woods and by way-sides and in commons; plentiful in Britain. Smith, engl. bot. 826. Weih. et Nees, rub. germ. p. 25. t. 7. Flowers pinkish or white. Fruit dark purple, with a mawkish taste. The *bramble* may be useful in thickening hedges of white-thorn or briars, being of very quick growth. The green twigs will dye wool and silk black. Silkworms will eat the leaves; they are astringent, and a decoction of them may be used in gargarisms.

*Var. β, pomponius* (D. C. prod. 2. p. 561.) flowers semi-double; leaves pale green; leaflets obovate. *R. fruticosus*, var. δ, Weih. et Nees. l. c.

*Var. γ, leucocarpus.* Fruit white.

*Var. δ, incermis:* stem unarmed.

*Var. ε, cōncolor* (Wallr. sched. p. 233.) leaves pubescent beneath, the same colour on both surfaces. Native of Germany.

*Var. ζ, glandulosus* (Wallr. sched. p. 233.) stems, petioles, and peduncles glandular. Native of Germany.

*Shrubby or Common Bramble.* Fl. June, Aug. Britain. Shrub straggling.

51 *R. FAGIFOLIUS* (Schlecht. et Cham. in Linnaea. vol. 5. p. 571.) floral branches unarmed, angular, pubescent; leaflets 3-5, elliptic, acuminate, obtuse at the base, glabrous and shining above, but opaque beneath and puberulous on the nerves, sharply serrated; panicle large, terminal, clothed with silky tomentum. *h. G.* Native of Mexico, among bushes at Passantla. Flowers small, white.

*Beech-leaved Bramble.* Shrub.

52 *R. ABRUTUS* (Lindl. syn. brit. fl. p. 92.) stems arched, strong, angular, very glaucous, with very broad, equal, hooked prickles; leaflets 3 to 5, small, distant, undulated, shining, obovate, truncate, with an inflexed, cuspidate point, simply serrated, veiny, hoary beneath; panicles long, downy, armed with strong hooked prickles; the branches spreading and corymbose. *h. H.* Native of Scotland.

*Abrupt-leaved Bramble.* Fl. July, Aug. Scotland. Shrub straggling.

53 *R. TOMENTOSUS* (Weih. et Nees. rub. germ. p. 27. t. 8.) stems erect, angular, prickly, glabrous; leaves with 3 or 5 leaflets; leaflets on short petiolules, obovate-cuneate, clothed with hoary pubescence above and white tomentum beneath; panicle compound, narrow, spreading; calycine segments nearly unarmed, reflexed. *h. H.* Native of Europe, in dry places. *R. Thuillieri*, Poir. dict. suppl. 4. p. 694. Flowers white or pink.

*Var. α, acutè-serratus* (D. C. prod. 2. p. 561.) serratures of leaves serrated, approximate, and acute. *R. tomentosus*, var. α, Weih. et Nees. l. c.

*Var. β, latè-serratus* (D. C. l. c.) serratures of leaves remote and coarse, nearly simple. *R. tomentosus*, var. β, Weih. et Nees. l. c.

*Tomentose Bramble.* Fl. June, Sept. Clt. 1818. Shrub.

54 *R. SUBERECTUS* (Anders. in Lin. trans. 11. p. 218. t. 16. Smith, fl. engl. bot. 2572.) smoothish; stem angular, ascending; branches terete; prickles deflexed; leaves with usually 3-5 or 7 ovate, cordate, pointed leaflets, which are minutely hairy beneath; upper leaves with only 3 leaflets; flowers in loose panicles; calycine segments ovate, lanceolate, acuminate, slightly hairy, at length reflexed. *h. H.* Native of Scotland, on the banks of Lochness, Highlands of Aberdeen and Perthshire; hills of Forfarshire; in England in Wales and Yorkshire; also of North America, between Lake Superior and

Lake Winepeg, and of Newfoundland. Tratt. ros. 3. p. 90. Flowers white. Fruit pale purple.

*Erectish Bramble.* Fl. June, Sept. Britain. Shrub 3 to 4 feet.

55 *R. SA'NCTUS* (Schreb. dec. p. 15. t. 8.) stems rather angular, pubescent; prickles recurved; leaves with usually 3 leaflets, rarely undivided; leaflets ovate, obtuse, serrated, tomentose beneath; flowers subpanicked, lateral ones few; calycine segments ovate, tomentose, short, reflexed. *h. H.* Native of the Levant. Desf. cor. 80. t. 61. *R. obtusifolius*, Willd. enum. suppl. 38. ex Link. enum. 2. p. 61. Flowers pink.

*Holy Bramble.* Fl. June, July. Clt. 1823. Sh. straggling.

56 *R. VELUTINUS* (Vest, ex Tratt. ros. 3. p. 47.) stem prickly; prickles rather large, compressed, and rather recurved; leaves trifoliate; lateral leaflets ovate, terminal one obovate, acuminate, and sharply, deeply, and doubly serrated; floral leaves glabrous above, but clothed with hoary tomentum beneath; racemes compound; petals orbicular, on long claws. *h. H.* Native of Styria.

*Velvety Bramble.* Shrub straggling.

57 *R. HOLOSERICUS* (Vest, ex Tratt. ros. 3. p. 48.) stem and branches terete and simple; leaflets for the most part obovate, sharply and unequally toothed, clothed with hoary tomentum beneath; peduncles very prickly; calyxes prickly; petals roundish, on very short claws. *h. H.* Native of Styria, not far from Greece, according to Vest.

*Whole-silky Bramble.* Shrub.

58 *R. APPENDICULATUS* (Tratt. ros. 3. p. 31.) stems decumbent, angular, glabrous; prickles scattered, rather recurved, strong; floriferous branches pubescent; leaves trifoliate and many simple; leaflets different in shape, sharply and unequally serrated, plicate, pubescent beneath; racemes simple; calyx appendiculated. *h. H.* Native of Hungary. Said to be nearly related to *R. plicatus*.

*Appendiculate-calyxed Bramble.* Shrub decumbent.

59 *R. COCHINCHINENSIS* (Tratt. ros. 3. p. 97.) stems procumbent, prickly; leaves with 5 leaflets, which are clothed with yellowish tomentum beneath; racemes terminal; akenia small. *h. G.* Native of Cochinchina, in woods and in hedges. *R. fruticosus*, Lour. cochin. p. 325. Flowers white or pink?

*Cochin-china Bramble.* Shrub procumbent.

60 *R. CANESCENS* (D. C. cat. hort. monsp. p. 139. and fl. fr. 5. p. 545.) stem shrubby, tall; petioles and peduncles tomentose and prickly; leaves with 3 or 5 leaflets; leaflets obovate-oblong, coarsely but sparingly toothed, clothed with white velvety down on both surfaces; flowers panicked; calyxes tomentose. *h. H.* Native of the alps of Piedmont. Flowers white.

*Canescent Bramble.* Fl. June, Sept. Clt. 1820. Sh. tall.

61 *R. ROSEUS* (Poir. dict. 6. p. 237.) branches flexuous, glabrous, prickly; leaves trifoliate; leaflets ovate-lanceolate, crenulated, large, glabrous on both surfaces; stipulas oval, obtuse, large; flowers usually solitary, on long peduncles; petals smaller than the glabrous calyx; calycine segments lanceolate, acuminate. *h. G.* Native of Peru. Corolla rose-coloured.

*Rose-coloured-flowered Bramble.* Shrub.

62 *R. GLABRATUS* (H. B. et Kunth, nov. gen. amer. 6. p. 221. t. 558.) shrubby, glabrous; branchlets, petioles, and nerves of leaves prickly; leaves trifoliate; leaflets oblong, acute, crenately serrated; flowers solitary; calyxes pubescent and prickly. *h. G.* Native of South America, in the high plains of De Los Pastos, near Guachucal, on the banks of Rio Blanco, at the height of 3060 feet. Petals fan-veined, red. Immature fruit pubescent.

*Smoothish Bramble.* Shrub.

63 *R. ALTHÆÆFOLIUS* (Möst, ex Tratt. ros. 3. p. 37.) stems angular, glabrous, with a few prickles; branchlets, petioles, and

peduncles villously pubescent; leaves with 3 or 5 leaflets; upper leaflets rhomboid or obovate, lower ones ovate-deltoid, clothed with soft pubescence beneath, but sparingly above, deeply toothed and ciliated; racemes terminal, few-flowered; calyx tomentose, mucronate; petals obovate, larger than the calyx. *h. H.* Native of Austria, near Mauerbach.

*Althæa-leaved Bramble.* Shrub straggling.

64 *R. COLLINUS* (D. C. cat. hort. monsp. p. 139. and fl. fr. 5. p. 545.) stems shrubby, and are as well as the petioles prickly; leaves with usually 5 leaflets, rarely with 3 only; leaflets roundish, toothed, lateral ones almost sessile, white from tomentum beneath; flowers loosely panicked; panicle branched; calycine segments ovate, acuminate. *h. H.* Native on sterile hills about Montpellier. Nocea ex Balb. fl. ticin. t. 9.

*Hill Bramble.* Shrub straggling.

65 *R. FASTIGIATUS* (Weih. et Nees, rub. germ. p. 16. t. 2.) stems recurved, angular, glabrous, furnished with a few prickles; leaves with 3 or 5 leaflets, rarely with 7; leaflets ovate, cordate, lower ones ending in long points, sharply serrated, flat, glabrous above, but pubescent beneath; floriferous branches horizontal, simply panicked, fastigate; calycine segments lanceolate, acuminate, glabrous, and unarmed on the outside, when mature reflexed. *h. H.* Native of Germany, Switzerland, and Britain. *R. fruticosus*, Poll. pal. 2. p. 58. Flowers white. Fruit middle-sized. Carpels almost black, shining.

*Fastigate Bramble.* Fl. June, Sept. Britain. Sh. strag.

66 *R. CORDIFOLIUS* (Weih. et Nees, rub. germ. p. 21. t. 5.) stems recurved, angular, furrowed, prickly and glabrous; leaves with 3-5 leaflets; leaflets cordate-orbicular, cuspidate, clothed with canescent shining tomentum beneath; panicle compound, diffuse at the base; calycine segments spreading, prickly at the base. *h. H.* Native of Germany and Britain, in hedges. Flowers small, white. Fruit dark, covered with bloom.

*Heart-leaved Bramble.* Fl. June, Sept. Brit. Sh. straggl.

67 *R. MESSII* (Weih. ex Spreng. syst. 2. p. 528.) leaves with 3 or 5 leaflets; leaves ovate, rather cordate, clothed with tomentum beneath and on the calyxes; calycine segments at length reflexed. *h. H.* Native of Germany. *R. velutinus*, Vest, ex Spreng. l. c. Flowers white.

*Mess's Bramble.* Fl. June, Sept. Clt. 1816. Sh. straggl.

68 *R. KÖHLERII* (Weih. et Nees, rub. germ. p. 71. t. 25. Borr. engl. bot. suppl. 2605.) stems decumbent, rather angular, and furrowed, with scattered hairs, glands, and numerous hooked and straight unequal prickles; leaves of 5 stalked, ovate, elliptic, rather cordate pointed leaflets; panicle much divided, somewhat corymbose; calyx loosely reflexed. *h. H.* Native of Germany and England, in thickets and hedges. *R. glandulosus*, Smith, engl. fl. 2. p. 403. Flowers pale pink; berries black.

*Var. β, fusco-ater* (Weih. et Nees, rub. germ. p. 72. t. 26.)

*Var. γ, pallidus* (Weih. et Nees, l. c. p. 75. t. 26.) *R. affinis*, Smith, engl. fl. 2. p. 105.

*Köhler's Bramble.* Fl. June, Jul. Britain. Sh. decumbent.

69 *R. ECHINATUS* (Lindl. syn. brit. fl. p. 94.) stems arched, angular, densely covered with glands and bristles, mixed with short, numerous, nearly straight prickles; leaflets 5, roundish, cordate, coarsely and unequally serrated, taper-pointed, green and velvety beneath; panicle spreading, prickly, and glandular, leafy at the base; the branches corymbose; bracteas 3-toothed and entire; prickles of the peduncle scattered, with very few setae. *h. H.* Native of Britain, in hedges and woods.

*Echinated Bramble.* Fl. July, Aug. Brit. Sh. straggling.

70 *R. REBIS* (Weih. et Nees, rub. germ. ex Lindl. p. 94.) stems somewhat arched, angular, slightly furrowed, without hairs, but with abundance of glands and bristles; prickles equal, recurved, scattered; leaflets 5, ovate or obovate, acuminate, coarsely and unequally serrated, between hoary and pubescent:

panicle open, rather downy, bristly, with corymbosely, racemose branches; bractæ lanceolate, trifid; prickles and setæ of the peduncles not numerous. *h. H.* Native of Germany and Britain, in hedges.

*Rude Bramble.* Fl. July, Aug. Britain. Shrub straggling.

71 *R. SCHLECHTENDALII* (Weih. ex Spreng. syst. 2. p. 529.) leaves with 3 or 5 leaflets; leaflets oblong, acuminate, angular, serrated, pubescent beneath; prickles as well as branches deflexed; stems nearly terete, villous; racemes axillary, leafy; calyxes unarmed, reflexed. *h. H.* Native of Germany. Flowers white.

*Schlechtendal's Bramble.* Fl. Ju. Jul. Clt. 1823. Sh. proc.

72 *R. TILIFOLIUS* (Weih. ex Spreng. syst. 2. p. 529.) leaves with 5 leaflets, disposed in a pedate manner; leaflets ovate, rather cordate, acute, serrulated, smoothish on both surfaces; prickles straightish; stems terete, glabrous; calyxes tomentose, spreading. *h. H.* Native of Germany. Flowers white.

*Lime-tree-leaved Bramble.* Fl. June, Sept. Clt. 1819. Sh. straggling.

73 *R. MACROPHYLLUS* (Weih. et Nees, rub. germ. p. 35. t. 12.) stems arched, rather angular and furrowed, hairy, with thinly scattered small uniform prickles; leaves of 3 or 5 stalked elliptical or ovate leaflets; panicle repeatedly divided, somewhat corymbosely; calyx at length reflexed. *h. H.* Native of Germany and England, in Sussex, in hedges and thickets. Borr. engl. bot. suppl. t. 2635. Flowers white. Fruit black.

*Large-leaved Bramble.* Fl. June, July. Britain. Sh. dec.

74 *R. VULGARIS* (Weih. et Nees, rub. germ. ex Lindl. syn. brit. fl. 93.) stem arched, angular, prickly, rather hairy; leaflets 5, elliptical or roundish, bluntly wedge-shaped or subcordate at the base, pubescent beneath; panicle compound, spreading, few-flowered. *h. H.* Native of Germany and of Britain, in North Wales in thickets, common.

*Common Bramble.* Fl. July, Aug. Wales. Sh. straggling.

75 *R. SCHLEICHERI* (Weih. ex Spreng. syst. 2. p. 529. and Tratt. ros. 3. p. 22.) leaflets 5, oblong, acuminate, unequally serrated, hardly pubescent; stems angular, very prickly, and are as well as the branches villous; prickles recurved; panicle compound, with spreading branches, very prickly; calyxes prickly, reflexed. *h. H.* Native of Germany. Flowers white.

*Schleicher's Bramble.* Fl. Ju. Sept. Clt. 1818. Sh. trailing.

76 *R. HORRIDUS* (Weih. ex Spreng. syst. 2. p. 529.) leaflets 5, roundish, serrated, wrinkled, villous beneath; stems and branches rather angular, and very prickly, glandular; racemes axillary; calyx adpressed when in fruit. *h. H.* Native of Germany. *R. ferox*, Vest, et Tratt. ros. 3. p. 40. ex Spreng. l. c. Flowers white.

*Horrid Bramble.* Fl. June, Aug. Clt. 1818. Sh. prostrate.

77 *R. LEUCOSTACHYS* (Schlech. ex Smith, eng. fl. 2. p. 403. Borr. eng. bot. suppl. 2631.) stems arched, rather angular, and furrowed, hairy, with horizontal or deflexed, straight, uniform prickles; leaves of 3 or 5 stalked, roundish or ovate, rather cordate, flattish leaflets; panicle elongated, slender, its branches but little divided; calyx reflexed. *h. H.* Native of England, in hedges; Hampshire and Essex. Flowers red. Fruit large, black.

*White-spiked Bramble.* Fl. June, July. Britain. Shrub decumbent.

78 *R. DIVERSIFOLIUS* (Lindl. syn. brit. fl. p. 93.) stem arched, angular, hairy, as well as the scattered straight prickles; leaflets 3, orbicular, cordate, acute, wrinkled, equally serrated, velvety, and rather hoary beneath; panicle villous, contracted, with corymbosely branches, and roundish entire or 3-lobed leaves at the base. *h. S.* Native of Britain, in hedges and thickets.

*Diverse-leaved Bramble.* Fl. July, Aug. Britain. Shrub straggling.

79 *R. DISCOLOR* (Weih. et Nees, rub. germ. ex Lindl. syn. fl. brit. p. 93.) stem arched, angular, prickly, silky, brownish purple; flowering branches hairy; leaflets 5, roundish, acuminate, finely and doubly serrated, naked above, hoary beneath, with reticulated veins; racemes dense, decompound. *h. H.* Native of Germany and Britain, in hedges and woods.

*Two-coloured-leaved Bramble.* Fl. July, Aug. Britain. Sh. straggling.

80 *R. RHAMNIFOLIUS* (Weih. in Nees, rub. germ. p. 22. t. 6.) stems arched, obsoletely angular, furrowed, with horizontal or deflexed, straight, uniform prickles; leaflets 5, stalked, nearly ovate or roundish, rather cordate, pointed, clothed with hoary tomentum beneath; panicle compound, spreading, with the branches divaricate; calyxes loosely reflexed, prickly at the base. *h. H.* Native of Germany and Britain, in hedges. Borr. engl. bot. suppl. 2604. *R. fruticosus*, Spreng. grundz. p. 504. ex Weih. et Nees, l. c. *R. rubicaulis*, Weih. ex Spreng. syst. 2. p. 528. *R. Thuillieri*, Poir. suppl. 4. p. 694. ex Tratt. ros. 3. p. 24. Flowers white, tinged with pink. Fruit black.

*Buckthorn-leaved Bramble.* Fl. June, July. Britain. Sh. straggling.

81 *R. SETOSUS* (Bigelow in litt. D. C. prod. 2. p. 563.) stem erect at the base, at length reclinate, hispid; branches bristly at the apex; leaves with 3-5 leaflets, on long petioles; leaflets obovate-cuneiform, simply serrated, glabrous, and the same colour on both surfaces; stipulas spatulate-linear; flowers racemose; peduncles filiform; calycine segments lanceolate, tomentose, and bristly; petals obovate, cuneated, longer than the calyx. *h. H.* Native of North America, about Montreal.

*Bristly Bramble.* Shrub.

82 *R. NITIDUS* (Weih. et Nees, rub. germ. 17. t. 4. ex syn. D. C.) stems shrubby, spreading, angular, prickly, and glabrous; prickles short, dilated at the base, and straightish; leaflets 3-5, ovate, acute, flat, glabrous above and shining, but pubescent beneath; panicle compound; calycine segments ovate, acuminate, reflexed, prickly at the base. *h. H.* Native of Germany and Britain, in thickets. Flowers red or white. Akenia small, black.

*Shining-leaved Bramble.* Fl. Ju. Sept. Britain. Sh. trailing.

83 *R. CARPINIFOLIUS* (Weih. et Nees, rub. germ. p. 36. t. 13.) stem decumbent or arched, rather angular and furrowed, hairy, with numerous deflexed and uniform prickles; leaves of 5 stalked, ovate, pointed, plicate, doubly serrated leaflets, pale beneath; panicle compound, hairy, its branches ascending and corymbosely. *h. H.* Native of Germany and Britain, in Lancashire, Cheshire, North Wales. Borr. in engl. bot. suppl. t. 2664. Flowers pink. Fruit black, of few carpels.

*Hornbeam-leaved Bramble.* Fl. June, July. Britain. Sh. decumbent.

84 *R. ELLIPTICUS* (Smith in Rees' cycl. vol. 30.) stems angular, shrubby, prickly, and villous; leaves trifoliate or simple; leaflets elliptic, toothed, clothed with soft white tomentum beneath; flowers glomerate, numerous, racemosely corymbosely; nerves of leaves thick, parallel; calycine segments shorter than the corolla; akenia yellow, numerous. *h. H.* Native of Nipaul, where it is called *Toko-swa*. *R. flavus*, Hamilt. mss. ex D. Don, prod. fl. nep. p. 234. Petioles and branchlets tomentose, intermixed with numerous bristles and prickles. Stipulas linear, setaceous. Flowers white.

*Elliptic-leaved Bramble.* Clt. 1827. Sh. trailing.

85 *R. ALPESTRIS* (Blum. bijdr. 1108.) leaflets 3 or 5, lateral ones the smallest, sessile, ovate-lanceolate, doubly serrated above the base, prickly on the middle nerve beneath, and strigosely pubescent on the veins; branches terete, beset with glandular pili, along with scattered recurved prickles; stipulas linear-lanceolate, rather cut; peduncles axillary or terminal, few-flowered;

calycine segments ovate, acuminate, setaceously jagged.  $\frac{1}{2}$ . S. Native of Java, on the mountains.

*Alp Bramble.* Shrub.

86 *R. LINEATUS* (Herb. Reinw. ex Blum. bijdr. 1108.) leaflets 3-5, oblong-lanceolate, acuminate, setaceously serrated, lined from the veins, which are silky pubescent beneath; branches terete, tomentose; prickles scattered, minute; stipulas lanceolate, acuminate; flowers cymose, axillary, and terminal; calycine segments ovate, acuminate, clothed with white tomentum.  $\frac{1}{2}$ . S. Native of Java, on the higher mountains.

*Lined-leaved Bramble.* Shrub.

87 *R. THUNBERGII* (Blum. bijdr. 1109.) leaves trifoliate, terminal one a little 3-lobed; leaflets roundish, deeply toothed above the base, pubescent above, and clothed with white tomentum beneath; branches angular, subtomentose; prickles scattered, recurved; stipulas awl-shaped; pedicels axillary and terminal, prickly, 3-flowered at the apex; calycine segments ovate, acuminate, reflexed, densely clothed with tomentum, equal in length to the petals.  $\frac{1}{2}$ . H. Native of Japan. Like *R. tomentosus*, Willd.

*Thunberg's Bramble.* Shrub.

88 *R. SELLÖI* (Cham. et Schlecht. in Linnæa. 2. p. 15.) sterile branches pentagonal, finely pubescent; fertile ones terete, and tomentose, and are prickly, as well as the petioles and nerves of the leaves; prickles hooked; leaves of 5 leaflets, those of the fertile branches trifoliate, the same colour on both surfaces, rather pilose above, and somewhat velvety beneath; leaflets roundish-oval, cordate, ending in a short acumen; stipulas very narrow, short; panicle elongated, raceme-formed, terminal; calycine segments ovate, acuminate, clothed with hoary tomentum on both surfaces, shorter than the petals, when in fruit reflexed.  $\frac{1}{2}$ . S. Native of Brazil, in the provinces of Monte Video and Rio Grande do Sul. Fruit edible.

*Sello's Bramble.* Shrub.

89 *R. URTICÆFOLIUS* (Poir. dict. 6. p. 246.) branches angular, rather compressed, bristly; prickles few, straightish, small; leaves trifoliate, upper ones undivided, clothed with silky tomentum on both surfaces; leaves ovate, cordate, elongated; branches of panicle very hairy; calyx white, hardly shorter than the petals.  $\frac{1}{2}$ . G. Native of Peru.

*Nettle-leaved Bramble.* Shrub.

90 *R. IMPERIALIS* (Cham. et Schlecht. in Linnæa. vol. 2. p. 12.) sterile branches pentagonal, glabrous, fertile ones pubescent at the apex; both prickly, as well as the petioles, peduncles, and nerves of leaves; prickles strong, hooked, but those on the racemes are minute; leaves of 3 or 5 leaflets; leaflets ovate, acuminate, petiolate, finely serrated, green and puberulous on the under surface, but only on the nerves and veins above; stipulas lanceolate, mucronate, pubescent; calycine segments lanceolate, clothed with hoary tomentum on both surfaces, longer than the petals, when in fruit reflexed.  $\frac{1}{2}$ . S. Native of Brazil, on the Island of St. Catharine. Fruit eatable.

*Imperial Bramble.* Shrub.

91 *R. ARGUTUS* (Link. enum. 2. p. 60.) stems prickly and hairy; prickles straightish, small; leaflets 3-5, oblong, acuminate, sharply and doubly serrated, somewhat attenuated at the base, and pubescent beneath; flowers panicle.  $\frac{1}{2}$ . H. Native of North America. Petals white, attenuated at the base.

*Sharp-serrated Bramble.* Fl. June, July. Clt. 1823. Shrub straggling.

92 *R. HETEROPHYLLUS* (Willd. enum. suppl. p. 38. Spreng. grundz. p. 507.) stem pubescent, rather angular; prickles few, recurved; leaves trifoliate, smoothish; leaflets deeply serrated; calycine segments tomentose, reflexed.  $\frac{1}{2}$ . H. Native of Japan.

*Variable-leaved Bramble.* Shrub straggling.

93 *R. CUNEIFOLIUS* (Pursh, fl. amer. sept. 1. p. 347.) branches.

petioles, and peduncles tomentose; prickles scattered, recurved; leaflets 3-5, permanent; leaflets ovate-cuneate, plicate, unequally toothed above, with entire, revolute margins, clothed with tomentum beneath; flowers terminal, panicle; pedicels divaricate, nakedish.  $\frac{1}{2}$ . H. Native of Carolina and New York. *R. parvifolius*, Walt. fl. car. 149. Tratt. ros. 3. p. 49. Flowers white.

*Wedge-leafletted Bramble.* Fl. June, July. Clt. 1811. Sh. tr.

94 *R. SANGUINOLENTUS* (Link. enum. 2. p. 61.) stems beset with numerous prickles and strigæ; leaflets 5, lanceolate, acuminate, serrulated, glabrous; peduncles axillary, few-flowered.  $\frac{1}{2}$ . S. Native of the Isle of France. Branches, base of prickles, strigæ, nerves, and spots of leaves red. Flowers white.

*Bloody-veined Bramble.* Clt. 1824. Sh. 3 to 4 feet.

95 *R. VILLOsus* (Ait. hort. kew. ed. 1. vol. 2. p. 210.) prickly; stem glabrous, angular; young branches, leaves, and racemes clothed with glandular pubescence; prickles scattered, small, recurved; leaflets 3-5; racemes elongated, loose, simple, many-flowered; pedicels long, slender, bracteate at the base; segments of calyx mucronate, tomentose.  $\frac{1}{2}$ . H. Native of North America, in the United States; also in Canada, near Montreal, and about Lake Huron. Flowers white.

*Var. α, glandulosus* (Ser. in D. C. prod. 2. p. 563.) stem, peduncles, and petioles villous and glandular. *R. glandulosus*, Bell. app. fl. pedem. p. 24. *R. hybridus*, Vill. delph. 3. p. 559.

*Var. β, eglandulosus* (Ser. in D. C. l. c.) stem, peduncles, and petioles more or less glandless; leaflets ovate-lanceolate, clothed with hoary tomentum beneath. *R. glandulosus β*, Bertol. in litt.

*Var. γ, intermedius* (Ser. l. c.) stem, peduncles, and petioles villous and glandular; leaflets ovate-roundish, clothed with hoary tomentum beneath. *R. glandulosus β intermedius*, D. C. fl. fr. 5. p. 544.

*Var. δ, monophyllus* (Wallr. sched. p. 230.) leaves all simple, exactly cordate, rather tomentose beneath; peduncles corymbose.

*Villous Bramble.* Fl. June, Aug. Clt. 1777. Shrub.

96 *R. SPRENGELII* (Weih. ex Link. enum. 2. p. 62. and Spreng. syst. 2. p. 528.) leaflets 3-5, ovate-oblong, acuminate, unequally toothed, pilose beneath; prickles scattered, slender, reflexed; stems prostrate, terete, villous; panicle corymbose; sepals spreading, unarmed, hairy.  $\frac{1}{2}$ . H. Native of Europe. *R. vulpinus*, Desf. cat. hort. parq. p. 205. *R. villosus* var.  $\beta$ , Vulpinus, Ser. in D. C. prod. 2. p. 564. Flowers pink.

*Sprengel's Bramble.* Fl. Ju. Sept. Clt. 1823. Sh. straggling.

97 *R. JAMAICENSIS* (Lin. mant. 75.) stem puberulous, very hispid; prickles recurved, scattered; leaflets 3, puberulous above, and villously tomentose beneath, ovate, long-acuminate, and sharply serrated; flowers numerous, panicle; calycine segments ovate, somewhat mucronate, clothed with white tomentum.  $\frac{1}{2}$ . S. Native of Jamaica. Sloan. jam. 2. p. 213. f. 1. Tratt. ros. 3. p. 51. Flowers white, small. Fruit small.

*Jamaica Bramble.* Sh. 4 to 6 feet.

98 *R. M'RIDUS* (Lin. spec. 706.) stems sarmentose, procumbent, terete, very hispid; prickles recurved, and are scattered as well as the bristles; leaflets 3-5, unequally toothed, cuneate at the base, smoothish; pedicels solitary, elongated; petals ob-ovate; carpels black.  $\frac{1}{2}$ . H. Native of Canada.

*Hispid Bramble.* Fl. Aug. Clt. 1759. Sh. proc.

99 *R. TRIVIALIS* (Michx. fl. bor. amer. 1. p. 296.) stems procumbent, sarmentose, prickly; branches nearly unarmed; leaves trifoliate; leaflets oval, acute, unequally serrated, glabrous; stipulas linear, acuminate; flowers axillary, pedunculate, solitary, and terminal, racemose; calycine segments ovate, acute, clothed with white tomentum, one-half shorter than the calyx.  $\frac{1}{2}$ . H. Native of North America, Canada, near Quebec, and of New-

foundland. *R. procumbens*, Muhl.? *R. flagellaris*, Willd.? Flowers white.

*Trivial Bramble.* Fl. July. Pl. proc.

100 *R. ENSLENI* (Tratt. ros. 3. p. 63.) stem slender, sarmen-tose, procumbent, terete, prickly, glabrous; leaves trifoliate; leaflets deeply and unequally toothed or serrated, acute, narrow at the base, smoothish, and ciliated; flowers solitary, on long peduncles; petals narrow, elliptic, unguiculate.  $\frac{1}{2}$ . H. Native of North America.

*Enslen's Bramble.* Sh. prostrate.

101 *R. LANUGINOSUS* (Stev. obs. ined. in herb. Willd. D. C. prod. 2. p. 564.) floriferous stems a foot high; petioles and peduncles tomentose; prickles few, straight; leaves trifoliate; leaflets ovate, cordate, acuminate, sharply and mucronately toothed, villous on both surfaces; panicles terminal, many-flowered; calycine segments erect, villous on the outside, and clothed with white tomentum inside, ending in a short awn each; bractæas subulate.  $\frac{1}{2}$ . H. Native of Caucasus and Siberia.

*Woolly Bramble.* Fl. July, Aug. Clt. 1820. Sh. pros.

102 *R. PARVIFOLIUS* (Lin. spec. 707. but not of Walt.) stems terete, tomentose; prickles recurved, scattered; leaves trifoliate; leaflets clothed with white tomentum beneath; flowers racemose; calycine segments tomentose, ovate, short; fruit globose.  $\frac{1}{2}$ . S. Native of the East Indies. Ker. bot. reg. t. 196. Thunb. fl. jap. 215. *R. Mollucis*, Rumph. amb. 5. p. 88. t. 47. f. 1. Flowers red. Fruit red.

*Small-leaved Bramble.* Fl. Aug. Sept. Clt. 1818. Sh. 2 to 3 feet.

103 *R. CANADENSIS* (Lin. spec. 707. exclusive of the synonyme of Mill. fig.) stem purple, unarmed; leaflets 3-5-10, lanceolate, sharply serrated, naked on both surfaces; stipulas linear.  $\frac{1}{2}$ . H. Native from Canada to Virginia, among rocks in woods. *Cyclactis montana*, Rafin. in Sill. journ. 1. p. 377. Flowers white.

*Canadian Bramble.* Fl. June, July. Clt. 1811. Sh. pros.

104 *R. SETANS* (Wall. in litt. ex herb. Lin. soc.) stem, petioles, and calyxes beset with brown bristles; leaves trifoliate, beset with bristles on the nerves beneath; leaflets cuneate, slightly lobed, rather pilose, sharply serrated; stipulas broad, membranous; sepals ovate, elliptic, cuspidate; peduncles 1-flowered, axillary, and terminal; flowers drooping; petals ob-ovate, longer than the stamens, but about equal in length to the calyx.  $\frac{1}{2}$ . H. Native of Kamaon. Flowers apparently purple, large. Perhaps a species of *Dalibarda*.

*Nodding-flowered Bramble.* Sh. pros.

105 *R. DIGITATUS* (Spreng. pl. mon. cogn. pug. 1. p. 34. no. 62.) prickles recurved; leaves palmately pinnate, pilose; leaflets ovate, jagged; calyx tomentose.  $\frac{1}{2}$ . H. Native country unknown. Allied to *R. affinis*.

*Digitate-leaved Bramble.* Sh. trailing.

106 *R. MONTANUS* (Libert in Lejeune, fl. spa. 2. p. 317.) stem terete; prickles recurved; leaflets 3-5, acuminate, tomentose beneath; flowers paniced; peduncles 2-3-flowered; calycine segments tomentose.  $\frac{1}{2}$ . H. Native of Belgium, about Spa. Flowers white.

*Mountain Bramble.* Sh. trailing.

107 *R. ARDUENNE'NSIS* (Libert, l. c. 2. p. 317.) stem tetragonal; prickles recurved; leaflets 3-5, ovate-lanceolate, doubly serrated, tomentose beneath; panicle elongated; peduncles and calyxes elongated.  $\frac{1}{2}$ . H. Native of Belgium, about Spa. Flowers white.

*Arduenn Bramble.* Sh. trailing.

\* \* *Herbaceous. Stipulas ovate, rarely linear.*

108 *R. SAXATILIS* (Lin. spec. 708.) stem herbaceous, bluntly angular, bristly; leaves trifoliate, of the same colour on both

surfaces, smoothish; leaflets ovate-rhomboid, deeply toothed, lateral ones sessile; stipulas oblong, broadish; flowers on short peduncles, either solitary or sub-corymbose; calycine segments ovate-lanceolate, rather tomentose, deflexed, equal in length to the corolla; carpels globose, few, red, pellucid, large.  $\frac{1}{2}$ . H. Native of Asia and Europe; plentiful in the north of England, Scotland, Wales, and Ireland, in shady places among stones. Smith, engl. bot. 2233. Plant sending out many long running barren stems, the flower-bearing stems about  $\frac{1}{2}$  foot high. Petals narrow, white. In some parts of Scotland they call the fruit *rockbuck berries*. The Russians ferment them with honey, and extract a potent spirit from them.

*Var.  $\beta$ , Americanus* (Pers. ench. 2. p. 52.) leaflets lanceolate, acutish; peduncles elongated.  $\frac{1}{2}$ . H. Native of North America.

*Var.  $\gamma$ , spinulosus* (Wallr. sched. p. 225. Jacq. hort. vind. 245.) *R. Alpinus humilis*, Chabr. stirp. 109. f. 6.

*Stone Bramble.* Fl. June. Britain. Pl. creeping.

109 *R. ARCTICUS* (Lin. spec. 708.) stems herbaceous, smooth, unarmed; leaves trifoliate, almost glabrous; leaflets obovate, obtuse, crenately serrated; stipulas ovate, very blunt; flowers solitary, terminal; calycine segments lanceolate-linear, downy, shorter than the corolla; petals emarginate.  $\frac{1}{2}$ . H. Native of Siberia and Canada; in Britain in the Isle of Mull. Smith, engl. bot. 1585. Oed. fl. dan. 488.—Lin. fl. lapp. t. 5. f. 2. Curt. bot. mag. 132. Root creeping. Flowers deep rose-coloured. Fruit large, purple or red, sweet-scented. Linnaeus has accurately figured this species of *Bramble* in his *Fl. Lapponica*, out of gratitude, as he expresses himself, for the benefit he reaped from it in his Lapland journey; it having so frequently recruited his spirits when almost sinking with hunger and fatigue, by the vinous nectar of its berries. He informs us that the principal people in Norland make a syrup, a jelly, and a wine from these berries, which they partly consume themselves, and partly send to their friends at Stockholm, as a dainty of the rarest and most delicious kind; and he adds, of all the wild Swedish berries this holds the first rank.

*Var.  $\beta$ , subquincelobus* (Ser. mss. in D. C. prod. 2. p. 265.) leaflets 3, lateral ones bipartite. Native of the Ural mountains.

*Arctic Bramble* or *Dwarf Crimson Bramble.* Fl. June, July. Britain. Pl.  $\frac{1}{2}$  foot.

110 *R. ACUTIS* (Mich. fl. bor. amer. 1. p. 298.) stem very short, unarmed, 1-flowered, herbaceous; radical leaves trifoliate; leaflets ovate-trapeziform, coarsely serrated; stipulas oblong, acute; peduncles puberulous; calycine segments lanceolate-linear, acutish, much shorter than the petals, which are oblong; filaments dilated; styles rather club-shaped, approximate.  $\frac{1}{2}$ . H. Native of North America, in swamps. *R. pistillatus*, Smith, exot. bot. 2. p. 53. t. 86. Flowers rose-coloured. Root creeping.

*Stemless Bramble.* Fl. Ju. July. Clt. 1802. Pl.  $\frac{1}{2}$  foot.

111 *R. MUCRONATUS* (Ser. mss. in D. C. prod. 2. p. 565.) stem herbaceous, pilose, unarmed; leaves trifoliate, the same colour on both surfaces, pilose; leaflets rhomboid, acutely serrated; stipulas ovate-lanceolate, acuminate; flowers terminal, twin; calycine segments lanceolate, acute, puberulous, shorter than the corolla.  $\frac{1}{2}$ . H. Native of Newfoundland, Le Clerc. Flowers red.

*Mucronate Bramble.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

112 *R. TRIFLORUS* (Richards in Frankl. 1st journ. ed. 2. append. p. 19. Hook. fl. bor. amer. 181. t. 62.) unarmed, erect, herbaceous; stolons suffruticose; leaflets 3, rarely 5, acutely serrated; stipulas obovate; panicle usually 3-flowered, glandular.  $\frac{1}{2}$ . H. Native of North America, throughout Canada from Lake Huron to the Saskatchewan, and on the shores of Hudson's Bay near York Factory. *R. saxatilis*  $\beta$  *Canadensis*,

Michx. fl. bor. amer. 1. p. 298. *R. ægopodioides*, Ser. in D. C. prod. 2. p. 565. *R. Canadensis*, Torrey, fl. unit. st. 1. p. 488. ? *R. saxatilis*, Bigelow in litt. Petals white. Fruit red.

*Three-flowered Bramble*. Fl. June, July. Clt. 1825. Pl. tr.

113 *R. PEDATUS* (Smith, icon. ined. t. 63. Hook. fl. bor. amer. p. 181. t. 61.) stems filiform, creeping, usually simple; leaflets 5, obovate, deeply serrated, smoothish; peduncles axillary, solitary, 1-flowered; segments of the calyx lanceolate, cut, about equal in length to the corolla; carpels few, large.  $\gamma$ . H. Native of the north-west coast of America. *Dalibarda pedata*, Steph. mem. soc. mosc. p. 92. *Comaropsis pedata*, D. C. prod. 2. p. 555. Petals white. Fruit pulpy, red.

*Pedate-leaved Bramble*. Pl. proc.

114 *R. OBOVATUS* (Tratt. ros. 3. p. 94. Hook. fl. bor. amer. p. 180. t. 60.) stems weak, long, procumbent, beset with numerous bristly prickles; leaflets 3-5, evergreen, on short petioles, or almost sessile, obovate, coarsely and unequally serrated; flowers terminal, paniced, small; segments of the calyx ovate, acute, not half so long as the petals.  $\gamma$ . H. Native of North America, from New York to Carolina, and about Montreal, in stagnant bogs. *R. obovatis*, Michx. fl. bor. amer. 1. p. 298. *R. sempervirens*, Bigelow, fl. bor. ed. 2. p. 201. Petals obovate, white. Fruit small, black, and bitter, according to Bigelow.

*Obovate-leafletted Bramble*. Pl. proc.

115 *R. NIVALIS* (Dougl. mss. Hook. fl. bor. amer. p. 189.) plant small, frutescent; leaves cordate, 3-lobed, acutely toothed, glabrous; nerves and petioles beset with recurved prickles, stipulas ovate, acute; peduncles short, 2-flowered; calycine segments lanceolate, pilose.  $\gamma$ . H. Native of North America, on the high snowy ridges of the Rocky Mountains.

*Snow Bramble*. Pl.  $\frac{1}{2}$  foot.

### § 3. *Leaves simple, lobed.*

#### \* *Herbaceous plants.*

116 *R. PARVIFLORUS* (Nutt. gen. amer. 1. p. 308.) stem suffrutescent, unarmed; leaves palmately lobed; peduncles usually 3-flowered; calycine segments ovate, acuminate, villous; petals ovate, oblong, shorter than the calyx.  $\gamma$ . H. Native of the Island of Michillimackinac, in Lake Huron. Flowers small, white.

*Small-flowered Bramble*. Pl.

117 *R. TRIFIDUS* (Thunb. fl. jap. 217.) stem herbaceous, flexuous, erect, glabrous, unarmed; leaves cordate, 3-lobed, glabrous; lobes cut, unequally serrated; flowers almost solitary; peduncles and petioles villous; calyx white from tomentum.  $\gamma$ . H. Native of Japan. Fruit red, with a grateful taste.

*Trifid-leaved Bramble*. Pl. 1 foot.

118 *R. STELLATUS* (Smith, icon. ined. fasc. 3. t. 64.) stem simple, 1-flowered, villous, unarmed; leaves nearly reniform, flat, serrated, 3-lobed; stipulas ovate, obtuse; calycine segments linear, elongated, deflexed; petals spatulate, distant, longer than the calyx.  $\gamma$ . H. Native of North America and the Island of Unalashka. *R. chamaemorus*, Fisch. in litt. Flowers purple. Root creeping.

*Starry Bramble*. Fl. June, July. Clt. 1824. Pl.  $\frac{1}{2}$  foot.

119 *R. CHAMAEMORUS* (Lin. spec. 708.) stem simple, 1-flowered, puberulous, unarmed; leaves somewhat reniform, wrinkled, plicate, roundly lobed and toothed; stipulas oval, obtuse; flowers dioecious; calycine segments ovate, longer than the corolla; petals elliptical, rather incumbent; carpels nearly globose, large.  $\gamma$ . H. Native of Europe, Siberia near Salair, and of North America; plentiful on the highest mountains of Scotland, north of England and Wales, in peat soil. Smith, engl. bot. 716. Oed. fl. dan. t. 1. Lin. fl. lapp. 208. t. 5. Root creeping. Flowers white. Fruit large, of a dull orange-colour, acid, mu-

cilaginous, and pleasant to the taste. From their exalted situation they are called *cloud berries*, also *knot berries* or *knout berries* or *roc-buck berries*. The plant flowers in June soon after the snow is dissolved, and the berries are scarcely well ripened in August before the plant is again overwhelmed with its winter covering. The snow preserves the fruit, and is used by the Laplanders to keep it through the winter; for they, as well as the Scottish highlanders, esteem it one of their most grateful and useful fruits, especially on account of its long duration. Its taste is moderately acid and mucilaginous, with something of the flavour of tamarinds. They are held to be an excellent anti-scorbutic. The Norwegians pack them up in wooden vessels, and send them to Stockholm, where they are served up in deserts, or made into tarts. The Laplanders bruise and eat them with the milk of the rein-deer. Neill observes, that they are the most grateful kind of fruit gathered by the Scotch Highlanders. On the sides and near the bases of the mountains, it may be collected for several months in succession. It is not cultivated without difficulty, and it seldom yields fruit in a garden. By crossing the flowers with those of the bramble or raspberry, and raising from the seeds so impregnated, in all probability this plant might become a valuable accession to the kitchen garden.

*Dwarf-mulberry, Cloud-berry, or Mountain Bramble*. Fl. June. Britain. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

120 *R. FLORIDUS* (Tratt. ros. 3. p. 73.) stems straight, rather angular, glabrous; prickles recurved; lateral branchlets clothed with glandular pubescence, and bearing the flowers; leaves on the branches trifoliate, the upper one simple, unequal; leaflets coarsely toothed, glabrous above, hoary beneath, and pubescent on the nerves; calyxes tomentose, reflexed.  $\gamma$ . H. Native of North America. Flowers large, white.

*Flowerly Bramble*. Pl. 1 foot.

121 *R. CORIACEUS* (Poir. dict. 6. p. 237.) stem herbaceous, compressed; prickles scattered; leaves coriaceous, glabrous, ovate-oblong, serrated; stipulas ovate, toothed; peduncles usually solitary, terminal, hispid; calycine segments lanceolate, acuminate, large, glabrous; petals roundish, crenated at the apex, shorter than the calyx.  $\gamma$ . S. Native of Peru. Flowers yellow?

*Coriaceous-leaved Bramble*. Pl.  $\frac{1}{2}$  foot.

#### \*\* *Shrubs.*

122 *R. INCISUS* (Thunb. fl. jap. 217.) stem frutescent, erect, prickly; prickles spreading; leaves cordate, serrated, glabrous; petioles prickly; peduncles axillary, capillary, glabrous, solitary; calyx glabrous on the outside, but clothed with white tomentum on the inside.  $\gamma$ . H. Native of Japan.

*Cut-leaved Bramble*. Shrub.

123 *R. ONOCYTUS* (Lin. spec. 707.) stem erect, beset with glandular pili; leaves 5-lobed, unequally serrated, more or less glandular beneath; corymbs compound; calyx beset with glandular bristles, having the segments cuspidate, rather shorter than the petals; stipulas free, deciduous.  $\gamma$ . H. Native of North America, in woods. Curt. bot. mag. t. 150. Mill. fig. t. 223. Flowers large, rose-coloured. Fruit red, not palatable.

*Sweet-scented Bramble or Canadian Raspberry*. Fl. Ju. Aug. Clt. 1700. Sh. 4 to 6 feet.

124 *R. DELICIOSUS* (Torrey, in am. lyc. 2. p. 196.) stem branched, unarmed; branches and petioles pubescent; leaves roundish-cordate, slightly 3-5-lobed, downy, wrinkled; bractea lanceolate, unidentate; flowers terminal, subcorymbose; calycine segments ovate-oblong, acuminate, foliaceous at the apex, shorter than the petals.  $\gamma$ . H. Native of North America, among the Rocky Mountains. Flowers purple.

*Delicious Bramble*. Sh. 4 to 6 feet.

125 *R. NATKANUS* (Moc. pl. nutk. with a figure. D. C. prod. 2. p. 566.) stem erect, flexuous, stoloniferous, beset with glandular pili at the apex, and nakedish at the base; leaves 5-lobed, unequally toothed; corymbs simple; calyx unarmed, with equal cuspidate segments; stipulas connate, permanent. *h. H.* Native on the north-west coast of America, in Queen Charlotte's Sound, in lat. 51°, Nootka Sound, at Cape Oxford, in lat 43°, from New California to Nutka Sound, and from the coast throughout in woody hills to the head-springs of the Columbia, in lat. 52°, and in mountain woods on the east side of the Rocky Mountains. Lindl. bot. reg. 1368. Flowers white. Fruit red, insipid.

*Natka Bramble.* Fl. June, July. Clt. 1826. Sh. 3 to 6 ft.

126 *MICROPHYLLUS* (Lin. fil. suppl. 263.) stem shrubby; branches terete, flexuous, glabrous; prickles scattered, recurved; leaves cordate, trifid, unequally toothed, glabrous, but with the veins pubescent beneath; middle lobe elongated, lateral ones emarginate at the apex on the outside, peduncles solitary; calyxes villous. *h. H.* Native of Japan. *R. palmatus*, Thunb. fl. jap. 217. ? Flowers white. Fruit yellow, esculent, and sapid. Branches purple.

*Small-leaved Bramble.* Shrub 3 to 4 feet.

127 *R. TRILOBUS* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 566.) stem erect, branched, glabrous; branches, petioles, and peduncles hispid; leaves 3-lobed, unequally serrated, villous; lobes acute, serrated, lateral ones diverging, middle one the longest; stipulas and bracteas lanceolate, villous; flowers solitary at the tops of the branches; calycine segments ovate, concave, spreading, rather foliaceous, and spatulate at the apex, longer than the petals; carpels numerous, subglobose. *h. G.* Native of Mexico. Flowers large, white. Fruit purple.

*Three-lobed-leaved Bramble.* Shrub 3 to 4 feet.

128 *R. VITIFOLIUS* (Cham. et Schlecht. in Linnæa. 2. p. 10.) shrubby; branches prickly, pruinose, puberulous; peduncles, calyxes, petioles, and nerves of leaves prickly; prickles weak, straightish, somewhat reversed; leaves 3-lobed, unequally serrated, smoothish; lobes acute, lateral ones diverging, middle one the longest; stipulas setaceous, hairy; flowers terminal, corymbose; calycine segments lanceolate, each ending in a long acumen, longer than the petals, which are obovate. *h. H.* Native of California. Resembles *R. trilobus*.

*Vine-leaved Bramble.* Shrub 3 to 4 feet.

129 *R. REFLEXUS* (Ker. bot. reg. 461.) branches terete, clothed with rufous tomentum; prickles small, scattered; leaves oblong, cordate, 3-5-lobed, densely clothed with tomentum beneath; middle lobe elongated; veins numerous, reticulated; stipulas and bracteas lunate and fringed; racemes few-flowered, nearly sessile, reflexed; calycine segments ovate, bluntish, equal in length to the corolla. *h. G.* Native of China. *R. Mollucanus*, Ait. epit. 373. but not of Lin. Flowers white.

*Reflexed Bramble.* Fl. July, Aug. Clt. 1817. Sh. straggl.

130 *R. URSINUS* (Cham. et Schlecht. in Linnæa. 2. p. 11.) branches terete, tomentose; petioles, nerves of leaves, peduncles and calyxes silky; prickles numerous, slender, subulate, straight; leaves of the fertile branches simple and ternate, doubly serrated, pilose above, but clothed with hoary tomentum beneath; leaflets ovate, middle one cordate and slightly lobed; stipulas membranous, linear; flowers panicled; calycine segments ovate, acuminate; acumen usually foliaceous; petals obovate. *h. H.* Native of California, at St. Francisco. Allied to *R. vitifolius*.

*Bear's Bramble.* Shrub trailing.

131 *R. HAMILTONIANUS* (Ser. in D. C. prod. 2. p. 566.) leaves cordate, 5-lobed, serrated, beset with pustulæ above, but densely villous beneath; petioles and branchlets densely tomentose, intermixed with prickles; stipulas denticulated; flowers

in axillary, sessile clusters, and terminal; calyx villous, longer than the petals. *h. H.* Native of Upper Nipaul, at Suembu, where it is called by the natives *Fogi Ayshala*, and *Cumbuta*. *R. rugosus*, Hamilt. ex D. Don, prod. fl. nep. p. 234. Wall. pl. rar. asiat. 3. t. 234. Flowers white. Berries red. It differs from *R. Mollucanus*, in the leaves being flat and nakedish above, less deeply lobed, and in being tomentose beneath.

*Hamilton's Bramble.* Fl. July. Shrub straggling.

132 *R. MOLLUCANUS* (Lin. spec. 707.) branches hairy; prickles recurved; leaves cordate, 3-lobed, unequally clothed with silky tomentum beneath; flowers racemose and axillary, pedunculate; stipulas jagged; calycine segments ovate, acute, deeply toothed, tomentose. *h. S.* Native of Amboyna and the Moluccas. Rumph. amb. 5. t. 47. f. 2. Petals white. A decumbent plant.

*Var. β, ochraceus* (Blum. bijdr. p. 1109.) leaves ochraceous beneath.

*Molucca Bramble.* Fl. July, Aug. Clt. 1810. Sh. dec.

133 *R. RUGOSUS* (Smith, in Rees' cyclop. vol. 30.) stem unarmed; branches prickly; calyxes and under surfaces of leaves clothed with brown tomentum; leaves wrinkled, somewhat 5-lobed; lobes rounded; stipulas villous, denticulated; bracteas oval; flowers racemose, axillary; calycine segments oval, mucronate, a little denticulated. *h. S.* Native of the East Indies. Corolla white, shorter than the calyx. Carpels red. Link. enum. 2. p. 62. Allied to *R. alceæfolius*.

*Wrinkled-leaved Bramble.* Shrub straggling.

134 *R. TILIACEUS* (Smith, in Rees' cyclop. vol. 30.) stem and branches tomentose; prickles scattered; leaves roundish-ovate, slightly lobed, crenated, hoary beneath and smoothish above; racemes axillary; bracteas dissected, serrated, small; calycine segments lanceolate, villous, rather deflexed; petals spatulate. *h. H.* Native of Upper Nipaul. Flowers white. Leaves like those of *Tilia alba*.

*Lime-tree-leaved Bramble.* Shrub.

135 *R. CORDIFOLIUS* (D. Don, prod. fl. nep. p. 233.) leaves cordate, acuminate, serrated, flat, woolly beneath and on the branches, and furnished with a few prickles; stipulas cut; flowers disposed in brachiate panicles; calycine segments ovate-lanceolate, acute, tomentose. *h. H.* Native of Nipaul. *R. Mollucanus*, Wall. in litt. Leaves nearly entire, never lobed, rusty beneath. Perhaps the same as *R. tiliaceus*.

*Cordate-leaved Bramble.* Shrub.

136 *R. ALCEÆFOLIUS* (Poir. dict. 6. p. 247.) branches villous, somewhat tetragonal, prickly; prickles scattered, recurved; leaves roundish, cordate, palmately lobed, scabrous above, but tomentose beneath and prickly on the middle nerve, acutely toothed; bracteas dissected; cymes of flowers axillary and terminal, nearly sessile; calyx inflated, woolly, with the segments length of tube. *h. S.* Native of Java. Flowers white.

*Mallow-leaved Bramble.* Shrub.

137 *R. SIEBOLDI* (Blum. bijdr. 1110.) leaves roundish, cordate, acute, angular, unequally and sharply toothed, with the veins prickly on both sides, pale, and pubescent beneath; branches terete, tomentose; prickles dense, straight; stipulas setaceous jagged. *h. G.* Native of Java.

*Siebold's Bramble.* Shrub.

138 *R. PUBINERVIS* (Blum. bijdr. 1110.) leaves cordate, acuminate, 3-5-cleft, doubly serrated, pubescent on the veins on both surfaces; branches terete, smooth; prickles scattered, straight; stipulas semilanceolate; peduncles usually solitary, 1-flowered; calycine segments ovate, acuminate, villous. *h. G.* Native of Japan. Like *R. microphyllus*, Lin.

*Downy-nerved Bramble.* Shrub.

139 *R. GLOMERATUS* (Blum. bijdr. 1111.) leaves cordate, acute, obsoletely 3-5-lobed, sharply denticulated, hairy on both

surfaces, prickly on the middle nerve beneath; branches terete, tomentose; prickles scattered, recurved; stipulas jagged; racemes terminal, drooping, prickly; flowers glomerate; calycine segments ovate, acute, clothed with silky pubescence, nearly entire. *h. G.* Native of Java, on Mount Gede. Like *R. elongatus*, Smith.

*Glomerate-flowered Bramble.* Shrub.

140 *R. SUNDAICUS* (Blum. bijdr. 1111.) leaves cordate, acute, obsoletely angular, unequally toothed, smooth above, but covered with cobwebbed tomentum beneath, as well as on the branchlets, and with prickles on the middle nerve; prickles of branches scattered and recurved; racemes terminal; flowers sub-umbellate; calycine segments ovate, acuminate, rather serrated, tomentose. *h. S.* Native of the islands in the Malay Archipelago.

*Var. β, discolor* (Blum. l. c.) leaves smaller, denticulated, clothed with grey tomentum beneath; segments of the calyx entire. *h. S.* Native of Java. Perhaps a proper species.

*Sunda Bramble.* Shrub.

141 *R. ELONGATUS* (Smith, icon. ined. fasc. 3. t. 62.) branches clothed with cobwebbed tomentum; prickles scattered and recurved; leaves cordate, acuminate, acutely crenate, tomentose beneath; stipulas jagged; panicle drooping, prickly; peduncles tomentose; bracteas deciduous; calycine segments obtuse, hardly the length of the tube and shorter than the petals, which are obovate. *h. S.* Native of Java. Corolla white. Fruit red.

*Elongated Bramble.* Shrub.

142 *R. PANICULATUS* (Smith, in Rees' cycl. vol. 30. but not of Schlecht.) branches terete, villous; prickles scattered, recurved; leaves cordate, acuminate, slightly lobed, and serrated, tomentose beneath; panicle villous, rather loose; calycine segments oval, acute, villous, but not silky; petals small. *h. H.* Native of Nipaul. Fruit black. Panicles terminal.

*Panicked Bramble.* Shrub.

143 *R. PYRIFOLIUS* (Smith, icon. ined. fasc. 3. p. 61.) branches flexuous, hairy; prickles scattered; leaves oblong, acuminate, serrated, glabrous on both surfaces; panicle many-flowered, rather thyrsoid, with corymbose branches; bracteas cut, pubescent, deciduous; calycine segments lanceolate, acute, outer ones jagged; petals very minute, toothed at the apex. *h. S.* Native of Java.

*Pear-leaved Bramble.* Shrub.

144 *R. CORCHORIFOLIUS* (Lin. fil. suppl. 263.) stem and branches tomentose; prickles recurved; leaves ovate, cordate, acute, slightly lobed, clothed with hoary tomentum, the middle nerve furnished with prickles above; peduncles axillary, solitary, 1-flowered, tomentose. *h. G.* Native of Japan. *R. villosus*, Thunb. fl. jap. 218. but not of Ait. Petals hardly longer than the corolla.

*Corchorus-leaved Bramble.* Shrub.

145 *R. LAMBERTIANUS* (Ser. in D. C. prod. 2. p. 567.) branches nearly terete, rather pilose; prickles recurved; leaves cordate, acuminate, slightly lobed, serrulated; stipulas fringed; flowers paniced; peduncles pubescent; calycine segments puberulous, lanceolate, acuminate, with tomentose margins; petals obovate, cuneate, narrow, length of calyx. *h. G.* Native of China.

*Lambert's Bramble.* Shrub.

146 *R. ACUMINATUS* (Smith, in Rees' cycl. vol. 30.) leaves ovate, cordate, acuminate, smooth, unequally serrated, rounded at the base; stipulas minute, gland-formed; flowers sub-racemose; pedicels 2-6-together, naked as well as the calyxes; branches terete, glabrous, furnished with a few distant prickles as well as on the petioles. *h. H.* Native of Nipaul. *R. betulinus*, D. Don, prod. fl. nœp. p. 233. Leaves like those of the birch or hornbeam. Terminal flowers panicles.

*Acuminate-leaved Bramble.* Shrub 4 to 6 feet.

147 *R. INDICUS* (Leschen. in litt. D. C. prod. 2. p. 568.) branches terete, tomentose; prickles scattered, short, compressed, reflexed; leaves elliptic, acuminate, regularly serrated, glabrous; middle nerve prickly; stipulas wanting or setaceously fringed; flowers small, numerous, paniced; bracteas setaceously fringed; calycine segments lanceolate, acute, puberulous, reflexed; petals very narrow, length of calyx; carpels 3-4, ovate-triangular. *h. S.* Native of the East Indies. *R. hexagynus*, Roxb. Panicle large, downy.

*Indian Bramble.* Shrub 4 to 6 feet.

*Cult.* The shrubby kinds of *bramble* are easily propagated by suckers from the root or by cuttings. The herbaceous species thrive best in peat soil, and are also increased by suckers.

IX. DALIBARDA (in honour of Denis Dalibard, a French botanist). Lin. spec. ed. 1. p. 431. Michx. fl. bor. amer. 1. p. 299. Richard. in Nestl. pot. p. 16. t. 1. D. C. prod. 2. p. 568.

*Lin. syst. Icosandria, Polygynia.* Calyx with a short, concave tube, and with a 5-6-cleft or toothed limb; lobes toothed. Petals 5, deciduous. Stamens numerous. Ovaries 3-12, ending in short terminal styles. Akenia involucreted by the calyx, seated on a dry villous receptacle, dry or fleshy. Seed pendulous. Herbs or shrubs with petiolate simple leaves, with scape-formed 1-flowered peduncles or panicles of flowers.

\* *Herbaceous. Peduncles scape-formed, 1-flowered.*

1 *D. REPENS* (Lin. spec. ed. 1. p. 401.) stems creeping; leaves cordate, obtuse, crenate, pubescent; stipulas linear-setaceous; calyx pilose, reflexed. *q. H.* Native of Canada, about Quebec and Montreal, and about Lake Huron; New England, and Pennsylvania. *Rubus Dalibarda*, Lin. spec. 708. Smith, icon. ined. t. 20. *D. cordata*, Steph. act. soc. mosc. 1. p. 92. *D. violaeoides*, Michx. fl. bor. amer. 1. p. 299. t. 27. Flowers white.

*Creeping Dalibarda.* Fl. May, June. Ch. 1768. Pl. cr.

2 *D. CALYCINA* (D. C. prod. 2. p. 568.) stems creeping, and are as well as the petioles villous and bristly; leaves orbicular, cordate, crenate, villous; stipulas ovate, serrated; calyx villous and bristly, with the segments foliaceous and deeply toothed, longer than the petals. *q. H.* Native of Nipaul, in Gosaings-than. *Rubus calycinus*, Wall. in litt. ex D. Don, prod. fl. nœp. 235. Petals obovate, yellow. Habit of the preceding species, but differs in the stems being more elongated, bristly, and villous.

*Large-calyxed Dalibarda.* Pl. creeping.

3 *D. GEOIDES* (Pers. ench. 2. p. 53.) leaves usually trifid or ternate, the terminal lobe large and ovate, and irregularly serrated, the lateral ones small, usually wanting, or joined with the terminal one. *q. H.* Native of the Straits of Magellan. *Rubus geoides*, Smith, icon. ined. t. 19. Flowers yellow.

*Geum-like Dalibarda.* Pl. creeping.

\* \* *Shrubs. Flowers disposed in panicles.*

4 *D. PYRIFOLIA* (Blum. bijdr. 1112.) leaves simple, oblong, acuminate, serrated, pubescent on the veins; prickles scattered, recurved; branches of panicles sub-corymbose; flowers 3-4-gynous. *h. S.* Native of Java. *Rubus pyrifolius*, Smith, icon. ined. fasc. 3. t. 61. Calycine segments jagged. Petals small, yellow? toothed at the apex.

*Pear-leaved Dalibarda.* Shrub creeping?

5 *D. LATIFOLIA* (Blum. bijdr. 1112.) leaves simple, roundish-ovate, deeply serrated, pubescent beneath; prickles small, recurved; branches of panicle corymbose; flowers polygynous. *h. S.* Native of Java, in the province of Tjanjor. Flowers yellow?

*Broad-leaved Dalibarda.* Shrub creeping?

*Cult.* The herbaceous kinds of this genus do best in a

border of peat soil, or to be grown in pots in a mixture of peat and sand, and placed among other alpine plants; they are easily increased by detaching the runners. The shrubby species, being natives of tropical islands, require to be grown in the stove or hot-house, and cuttings of them will root readily in heat, under a hand-glass.

**X. FRAGARIA** (from *fragrans*, fragrant; the perfumed fruit of the strawberry is well known). Tourn. inst. 152. Nestl. pot. 17. Duchesn. mon. frais. 1 vol. 8vo. Ser. in D.C. prod. 2. p. 569.

**LIN. SYST.** *Icosandria, Monogynia*. Calyx with a concave tube; the limb 10-parted, the outer 5 segments accessory. Petals 5. Stamens numerous. Carpels numerous, at length falling from the fleshy and succulent polyphore. Styles lateral. Seeds appended.—Herbs, throwing out runners. Leaves trifoliate; leaflets coarsely toothed. Polyphore roundish, succulent, red, rarely white. In this genus what is called the fruit is a fleshy receptacle or polyphore, with carpels or seeds appended to it.

\* *Carpels very numerous on the outside of the fleshy receptacle. Stamens numerous. Flowers hermaphrodite.*

1 *F. vesca* (Lin. syst. 705.) stoloniferous; leaflets plicate, thin, pilose beneath; fruit pendulous; sepals at length reflexed; hairs on the peduncles adpressed. **Æ. H.** Native of Europe, in woods and on hills; north-west coast of America; plentiful in Britain. Smith, engl. bot. 1524.

*Var. α, sylvestris* (Lin. spec. ed. 1. p. 495.) Duch. in Lam. dict. 2. p. 531. no. 2.) stoloniferous; receptacles egg-shaped; calyx short. **Æ. H.** Native of Europe, in woods; plentiful in Britain. *F. vesca sylvestris*, Lin. spec. 709. *F. vulgaris*, Ehrh. Beitr. 7. p. 21.—Blackw. herb. 77. There are varieties of this plant with red and white fruit.

*Var. β, semperflorens* (Duchesn. l. c. 2. p. 531. no. 1.) stoloniferous; receptacle conical-oblong, shining. Native of the alps of Jura. Nois. jard. fr. t. 11. f. 2. There are varieties of this strawberry with red and white receptacles, viz.

1 *Red alpine strawberry, fr. des alpes à fruit rouge, fr. des alpes de tous les mois à fruit rouge, fr. des alpes de quatre saisons à fruit rouge, alpine rouge, scarlet alpine, prolific alpine.* Fruit conical, large for a wood strawberry, and of a first-rate quality, ripening from June to November.

2 *White alpine strawberry, fr. des alpes à fruit blanc, fr. des alpes de tous les mois à fruit blanc, fr. des alpes de deux saisons à fruit blanc, fr. des alpes de quatre saisons à fruit blanc, alpine blanc.* Fruit conical, large for an alpine strawberry. A first-rate kind, ripening from June to November.

3 *American alpine strawberry.* Fruit conical, large. A first-rate kind, like the red alpine strawberry.

4 *Danish alpine strawberry.*

*Var. γ, minor* (Duchesn. l. c. 2. p. 431. no. 3.) stoloniferous; stem and leaves short; receptacle spherical, shining, red or white. To this variety belong the following sorts of wood strawberry.

1 *Red wood strawberry, frasier d'Angleterre, fr. à chassis, fr. commun rouge, fr. commun à fruit rouge, fr. des bois à fruit rouge.* Fruit roundish, large for a wood strawberry. A first-rate kind, ripening from the end of June, through July.

2 *White wood strawberry, fr. commun blanc, fr. commun à fruit blanc, fr. des bois à fruit blanc.* Fruit roundish, size of the last, of a first-rate quality, ripening end of June and through July.

*Var. δ, hortensis* (Duchesn. l. c. 2. p. 532. no. 4.) stoloniferous; stem and peduncles longer; leaves pallid; receptacle elongated, rather compressed. There are varieties of this with

red, white, and black fruit. To this belong the following sorts of strawberry.

1 *Frasier de Montreuil à fruit blanc.* Fruit ovate, large, of a first-rate quality, ripening about the beginning of July.

2 *Frasier de Montreuil à fruit rouge, fr. de Montreuil à Marteau, fressant, dent de cheval, de ville de bois.* Differing from the last only in the colour of the fruit. They are both only fugitive varieties of the wood or alpine strawberries.

*Var. ε, cflagéllis* (Duchesn. in Lam. dict. 2. p. 532. no. 5.) stolons very short or wanting altogether; receptacle elongated, roundish-ovate; leaves longer than the stem. To this variety belong the following sorts of strawberry.

1 *Red alpine bush-strawberry, frasier buisson, fr. buisson à fruit rouge, fr. commun sans filets, fr. sans coulans ordinaire, fr. sans filets ordinaire, fr. buisson des alpes rouge, fr. des alpes sans coulans à fruit rouge, fr. des alpes sans filets à fruit rouge, fr. de gaillon à fruit rouge.* Fruit row dish, ovate, middle-sized. A second-rate sort, ripening in the beginning of July.

2 *White bush alpine strawberry, frasier buisson des alpes blanc, fr. buisson à fruit blanc.* Only differing from the foregoing in the colour of the fruit.

*Var. ζ, multipler* (Duchesn. l. c. 2. p. 532. no. 7.) stoloniferous, pale; receptacle small. Blackw. herb. t. 77. f. 3. *Double-blossomed strawberry, frasier à fleurs doubles, fr. à fleurs semidoubles.* This variety is worthless as to its fruit.

*Var. η, botryformis* (Duchesn. l. c. 2. p. 532. no. 7.) stoloniferous; stamens transformed into flowers. Commonly called in France *Frasier couronné*.

*Var. θ, muricata* (Duchesn. l. c. 2. p. 533. no. 8.) receptacle small; styles elongated, echinated; petals wanting; sepals foliaceous. Commonly called in France *Frasier arbrisseau à fleurs vertes*.

*Fertile, Wild, Wood, or Alpine Strawberry.* Fl. April, May. Pl.  $\frac{1}{2}$  to 1 foot.

2 *F. CALYCINA* (Lois. fl. gall. 1. p. 299.) leaves ternate, pilose; leaflets sessile, cuneated, roundish, coarsely toothed; flowers corymbose; peduncles longer than the scapes; calyx about equal in length to the corolla. **Æ. H.** Native of France, in woods. *F. grandiflora*, Thuil. fl. par. ed. 2. p. 264. *F. vesca grandiflora*, D. C. fl. fr. 1. p. 468. Flowers white. Fruit red.

*Large-calyx Strawberry.* Fl. Apr. May. Clt. ? Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  ft.

3 *F. COLLINA* (Ehrh. Beitr. 7. p. 26.) stoloniferous; leaflets plicate, thin, silky above and pilose beneath; fruit erect; sepals after flowering erect; hairs on peduncles erect. **Æ. H.** Native of Switzerland and Germany. Flowers white. Fruit green. Perhaps only a variety of *F. vesca*. To this species belong the strawberries called

1 *Green strawberry, green pine, pine apple, green alpine, green wood, pordered alpine, frasier vert d'Angleterre, frasier vert.* Fruit roundish or depressed, globular, large, solid; flesh greenish, very juicy, with a peculiar and somewhat pine apple flavour. A second-rate sort, ripening middle of July.

2 *Williams's green pine.* Fruit roundish, middle-sized. A second-rate sort, ripening end of June.

*Hill Strawberry.* Fl. April, May. Clt. 1798. Pl. 1 foot.

4 *F. PLATANOIDES* (Ser. in D. C. prod. 2. p. 570.) leaves palmately 5-lobed, pilose; lobes lanceolate, acute, obsolete toothed; sepals lanceolate, acute, pilose. **Æ. H.** Native of North America? Petals red.

*Platanus-like Strawberry.* Fl. April, June. Clt. ? Pl.  $\frac{3}{4}$  ft.

\* \* *Carpels few, immersed in little pits in the receptacle (f. 71. d.). Stamens few (f. 71. c.). Flowers usually dioecious from abortion.*

5 *F. MAJALFEA* (Duchesn. in Lam. dict. 2. p. 533.) stoloniferous; leaflets plicate, thin, pilose beneath; flowers herma-

phrodite; stamens long; receptacle middle-sized; carpels numerous; calyxes erectly adpressed after flowering. **2. H.** Native of France. To this species belong the following *strawberries*.

1 *Frasier de Bargemont, fr. en étoile, Majaufe*. Fruit roundish, ovate, reddish, small. A second-rate sort, ripening beginning and middle of July.

2 *Frasier vineux de champagne, fr. de champagne, fr. vineux, Majaufe de champagne*. Fruit conical, small, green. A second-rate sort, ripening in the beginning of July.

*Majaufe Strawberry*. Fl. Apr. Jun. Clt.? Pl.  $\frac{3}{4}$  foot.

6 *F. BRESLINGEA* (Duchesn. in Lam. dict. 2. p. 533.) leaflets plicate, rather coriaceous, green; pili long and firm; petals narrow, whitish, yellow; sepals erectly adpressed after flowering; receptacle adherent; carpels rather turgid.

*Var. a, abortiva* (Duchesn. l. c. p. 534. no. 11.) almost sterile; leaves thin, less pilose; branches elongated; receptacle depressed, greenish, red; carpels hardly adhering. Commonly called *Frasier coucou* and *fr. aveugle*.

*Var. β, nigra* (Duchesn. l. c. p. 535. no. 12.) very sweet-scented, usually sterile; branches short; leaves usually 5-lobed; stolons numerous. Commonly called *Breslinge d'Allemagne*.

*Var. γ, pendula* (Duchesn. l. c. no. 13.) receptacle pear-shaped, adpressed, red, without any carpels at the base. Native of France. Commonly called *Frasier marteau* and *Breslinge de Bourgogne*.

*Var. δ, hispida* (Duchesn. l. c. p. 14.) plant humble, robust; stolons numerous; branches rather prostrate; receptacles elongated, purple. This variety of *strawberry* is known in France under the names of *Breslinge de Longchamp* and *Frasier de Longchamp*.

*Var. ε, viridis* (Duchesn. l. c. p. 536. no. 15.) leaves late, greyish; petioles usually appendiculate; peduncles long; receptacle roundly turbinate, greyish green, hardly coloured. Nois. et jard. fr. t. 13. f. 2. There is a kind of this with yellowish and shorter petals. To this variety belong the following *strawberries*.

1 *Breslinge d'Angleterre, frasier de Pennsylvanie*. Fruit small, green, roundish, ovate. A worthless sort, ripening in the beginning of July.

2 *Caucasian strawberry*. Fruit roundish, middle-sized. A second-rate sort, ripening in the middle of July.

*Var. ζ, pratensis* (Duchesn. l. c. p. 536. no. 16.) plant humble; branches short; stolons short; leaves small; receptacle round, adhering to the calyx; pulp rather brittle, very tumid. *F. vesca pratensis*, Lin. spec. 709.? Flowers usually rising before the leaves. This *strawberry* is called in France *Frasier de Brugnon* and *Breslinge de Suède*.

*Breslinge Strawberry*. Fl. Apr. May. Clt.? Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

7 *F. ELATIOR* (Ehrh. Beitr. 7. p. 23.) leaflets plicate, rather coriaceous, green; flowers usually dioecious from abortion; sepals at length reflexed on the peduncle; petals snow white, roundish; entire; receptacle firm, adhering but little to the calyx. **2. H.** Native of North America; in the south of England, in groves, but rare. Smith, engl. bot. 2197. *Caperonniers*, Duchesn. in Lam. dict. 2. p. 534. The *hautbois* are the most variable of all *strawberries*, but they retain a general character from which they naturally do not

depart; the fruit sometimes changes from globular to ovate, and from ovate to globular, while fertile plantations will produce runners that may perhaps be sterile, and seedlings many of which will prove so. The latter ought to be extirpated. In all the sorts of *hautbois* there exist prolific and sterile plants, which last have long stamens, and are commonly called males; these ought in all cases to be destroyed. The varieties of *hautbois strawberries* are as follow:

1 *Black hautbois, new hautbois*. Fruit ovate, large. A first-rate sort, ripening end of June and beginning of July.

2 *Brown hautbois*. Fruit large. A second-rate sort, ripening the same time as the last.

3 *Caperon framboise, frasier framboise, frasier d'apricot*. *Fragaria elatior β*, dioica, Duchesn. in Lam. dict. 2. p. 536. no. 18. *F. magna*, Thuill. fl. par. p. 254. Flowers always dioecious from abortion. There is a variety of this with curled leaves.

4 *Common hautbois, hautbois, original hautbois, old hautbois, dioecious hautbois, hautbois or musky, frasier de Bruxelles*. *Fragaria elatior α*, moschata, Duchesn. in Lam. dict. 2. p. 536. no. 17. *Fragaria moschata*, West, bet. 2. p. 327. Nois. jard. fr. p. 10. t. 13. f. 1. Fruit roundish or ovate, middle-sized. A second-rate sort, ripening end of June and beginning of July.

5 *Globe, caperon ordinaire, Antwerp or musk, Danish*. Fruit roundish, middle-sized. A second-rate sort, ripening in the end of June and beginning of July.

6 *Large flat, white, Bath, Salter's, Formosa, Lowder's, Weymouth*. Fruit roundish, large. A first-rate sort, retains its character better than any of the other sorts of *hautbois*. It ripens in the end of June or beginning of July.

7 *Long-fruited muscatelle*. Fruit oblong, small. A second-rate sort, ripening about the beginning of July.

8 *Prolific or conical, double-bearing, hermaphrodite, Hudson's Bay, musk, Regent's, dwarf, sucombe, Sir Joseph Banks's, spring grove, caperon royal, caperon hermaphrodite, caperonnier royal*. Fruit large, conical. One of the best of the *hautbois*, ripening end of July or beginning of August. Flowers the largest of the class. Receptacle broad. Stamens long, permanent round the base of the fruit, even to the period of its maturity.

9 *Round-fruited muscatelle*. Fruit roundish-ovate, small. A first-rate sort, ripening beginning of July.

10 *Russian*. Fruit ovate, small. A worthless sort, ripening beginning of July.

11 *Swedish*. Fruit roundish, small. Habit dwarf. Unworthy of cultivation.

*Taller or Hautbois Strawberry*. Fl. Apr. May. Brit. Pl. 1 ft. 8 *F. VIRGINIANA* (Mill. dict. ed. 8. Ehrh. Beitr. 7. p. 25.) flowers late, dioecious from abortion, rather campanulate; petals ovate; leaflets coriaceous, not plicate; petioles short; peduncles and pedicels length of leaves; receptacle very tumid, pendulous; styles very long. **2. H.** Native of Virginia. Duchesn. in Lam. dict. 2. p. 539. no. 24. Nois. jard. fr. p. 16. t. 12. f. 2. Flowers white. Fruit deep red when ripe. To this species belong the following kinds of *strawberry*; they are commonly called *scarlet strawberries*.

1 *American scarlet, black American, new American scarlet, new roseberry, Thomson's roseberry*. Fruit conical, middle-sized. Requires plenty of room. Leaves tall. Fruit rich and sweet, coming in late.

2 *Autumn scarlet*. Fruit ovate, middle-sized. A second-rate sort, ripening beginning of July.

3 *Bishop's seedling*. Fruit round, middle-sized, ripening end of June or beginning of July. A great bearer and almost of first quality.

4 *Black cone*. Fruit conical, middle-sized. A worthless sort, ripening end of June.

FIG. 71.

5 *Black Hudson's Bay, black pine, Hoisie's seedling.* Fruit conical, middle-sized. A second-rate sort, ripening beginning of July.

6 *Black roseberry, black round-fruited roseberry.* Fruit roundish, large. A first-rate sort, of a fine dark shining colour, and a good bearer; ripens about the end of June or beginning of July.

7 *Carmine scarlet, carmine roseberry.* Fruit roundish-ovate, middle-sized. A second-rate sort and a bad bearer; ripens beginning of July.

8 *Charlotte, Princess Charlotte, Wilmott's early scarlet.* Fruit round, middle-sized. A first-rate sort but an indifferent bearer, ripening middle and end of June.

9 *Cinnamon scarlet.* Fruit roundish, middle-sized. A second-rate sort, but a good bearer, ripening end of June.

10 *Clustered scarlet, clustered wood pine.* Fruit small, roundish. A sort of no value. Ripens about the end of June.

11 *Cockscomb scarlet.* Fruit large, compressed. A second-rate sort, ripening end of July.

12 *Copper-leaved roseberry.* Fruit conical, middle-sized. A second-rate sort, ripening end of June.

13 *Coul late scarlet, Sir George Mackenzie's late scarlet.* Fruit ovate, large. An excellent late sort, and a good bearer. Ripens beginning and middle of July.

14 *Diack's seedling, new Aberdeen.* Fruit roundish, large. A second-rate sort but a great bearer. Ripens end of June and beginning of July.

15 *Dudson House scarlet.* Fruit roundish, large. A second-rate sort but an abundant bearer. Ripens end of June.

16 *Duke of Kent's scarlet, globe scarlet, prolific scarlet, early prolific scarlet, Nova Scotia scarlet, cluster scarlet, Austrian scarlet, Outlands scarlet, Duke of York's scarlet.* Fruit small, roundish. An early sort, but too small for general cultivation. It ripens about the middle of June.

17 *Early globe.* Fruit roundish, middle-sized. A second-rate sort, rather acid. Ripens end of June.

18 *Garnstone scarlet.* Fruit large, roundish. A first-rate sort, ripening in the end of June and beginning of July.

19 *Globular Hudson's Bay.* Fruit roundish, small. A worthless sort, ripening in the end of June.

20 *Golden lemon scarlet.* Fruit roundish, middle-sized. A second-rate sort, ripening in the end of June.

21 *Grange Hudson's Bay.* Fruit small, oblong. A worthless sort, ripening in the end of July.

22 *Grimstone scarlet.* Fruit small, conical. A second-rate sort, and a very bad bearer.

23 *Groce-end scarlet.* Fruit large, depressed, spherical. A first-rate sort, very handsome, and a most abundant bearer.

24 *Hudson's Bay, York river scarlet, American scarlet, late scarlet, Hudson's pine* (of Scotland), *Atkinson's scarlet, Hopwood's scarlet, velvet scarlet.* Fruit ovate, large. A second-rate sort, ripening in the end of June. Requires to remain till it assumes a dark colour, otherwise it is acid.

25 *Knight's large scarlet, Knight's scarlet, American scarlet, great American scarlet, hairy-leaved scarlet, large scarlet,* female parent of the *Downton.* Fruit roundish, large. A second-rate sort, and a moderate bearer. Ripens in the end of June.

26 *Lenisham scarlet, scarlet cluster.* Fruit roundish-ovate, small. A worthless sort, ripening about the end of June.

27 *Lynedock seedling.* Fruit ovate, middle-sized. A second-rate acid sort. Ripens in the beginning of July.

28 *McDon.* Fruit roundish, middle-sized. A first-rate sort, and a good bearer. Ripens in the end of June.

29 *Methren scarlet, Methren castle, Southampton scarlet.* Fruit large, roundish. A coarse sort, ripening in the end of June.

30 *Morrisania scarlet, Hudson's.* Fruit small, round. A worthless sort, ripening in the middle and end of June.

31 *Nairn's scarlet.* Fruit ovate, middle-sized. A second-rate sort, ripening in the end of June.

32 *Narrow-leaved scarlet, Knight's.* Fruit conical, middle-sized. A second-rate sort, ripening in the end of June.

33 *Oblong scarlet, long scarlet, long-fruited scarlet, Padley's early scarlet, Padley's large scarlet.* Fruit oblong, middle-sized. A second-rate sort, ripening in the middle and end of June.

34 *Old scarlet, scarlet, early scarlet, original scarlet, Virginian, scarlet Virginian, old Bath scarlet* of some, *orange* or *Irish* of the Dutch, *ecarlante, ecarlette de Virginie, de Virginie.* Fruit roundish, middle-sized. A first-rate sort, valuable for its earliness, but more especially for its excellence in preserving.

35 *Orange Hudson's Bay, Hamilton, Bishop's pine, orange pine.* Fruit conical, middle-sized. A rather acid second-rate sort, ripening in the end of June.

36 *Pine roseberry.* Fruit conical, middle-sized. A second-rate sort, inferior to the *roseberry.* Ripens in the end of June.

37 *Pitmaston black scarlet, early Pitmaston black.* Fruit oblong, small. A sort of no merit, ripening in the beginning of July.

38 *Red finger.* Fruit conical, large. A second-rate sort, ripening in the end of June.

39 *Roseberry, rose, Scotch scarlet, Aberdeen, Aberdeen seedling, prolific pine, Brickley scarlet.* Fruit conical, large. A first-rate sort, well known as a very abundant bearer, and continuing late in succession. Ripens in the end of June and beginning of July.

40 *Round-fruited scarlet, late round-fruited scarlet, Knight's* (no. 18. hort. trans.). Fruit round, middle-sized. A second-rate sort, but a good bearer. Ripens in the end of June and beginning of July.

41 *Scone scarlet.* Fruit round, middle-sized. A second-rate very acid sort, ripening in the end of June.

42 *Sir Joseph Banks's scarlet.* Fruit roundish, small. A worthless sort, ripening in the middle and end of June.

43 *Slough scarlet, Brown's scarlet.* Fruit roundish, small. A second-rate sort, resembling the *duke of Kent.* Ripens in the middle and end of June.

44 *Solid scarlet, solid fleshed.* Fruit roundish, middle-sized. A second-rate sort, ripening in the beginning of July. It is a hybrid between the *Hautbois* and *scarlet.*

45 *Southborough, Marshall's seedling.* Fruit roundish, large. A coarse sort, but a good bearer. Ripens in the beginning of July.

46 *Vernon's scarlet, White's scarlet.* Fruit round, middle-sized. A second-rate sort, ripening in the end of June.

47 *Wilmot's late scarlet, Wilmot's scarlet, Wilmot's new scarlet, Wilmot's seedling, Wilmot's imperial, large Virginian, late Virginian.* Fruit bluntly conical, large. A second-rate sort, ripening in the end of June.

#### *Black strawberries.*

1 *Downton, Knight's seedling, Knight's strawberry.* Fruit ovate, large, ripening beginning and middle of July. The best of the *black strawberry.*

2 *Elton seedling.* Fruit large, ovate. A first-rate sort, ripening middle of July. A great bearer, valuable as a very late sort.

3 *Gibb's black seedling.* Fruit conical, small. A second-rate sort, and a bad bearer, ripening beginning of July.

4 *Knight's scarlet fleshed.* Fruit conical, middle-sized, more red inside than out. A first-rate sort, ripening end of June.

5 *Pitmaston black, late Pitmaston black.* Fruit ovate, mid-

dle-sized, ripening in July. Although an excellent sort, it is so tender as almost entirely to die off in the winter, consequently it is unfit for general culture.

6 *Old black, black Canterbury, black pine, Turkey pine, black beacon, mulberry.* Fruit conical, middle-sized. A first-rate sort, ripening beginning of July.

7 *Sweet cone, Knight's sweet cone.* Fruit ovate, large, ripening end of June. Of excellent flavour, but not so prolific as the *Downton*.

*Virginian Strawberry.* Fl. April, May. Clt. 1620. Pl. 1 ft.

9 *T. GRANDIFLORA* (Ehrh. beitz. 7.) late; flowers always dioecious from abortion; leaflets glaucous, coriaceous, broadly crenated, glabrous above, and pilose beneath; peduncles thick; sepals reflexed; hairs on petioles and peduncles spreading. *Æ. H.* Native of Surinam. *F. magna*, Thuil. fl. par. p. 254? *F. calycina*, Mill. fig. 288. *F. Chilensis*  $\beta$  *ananassa*, Duchesne in Lam. dict. 2. p. 538. Flowers white. Fruit red. Called in English *pine strawberries*, and in French *frasier ananas*. The following are the varieties.

1 *Bath scarlet, Bath, new Bath scarlet, Liverpool, golden drop, Devonshire, North's seedling, Milne's seedling, imperial scarlet, Austin's, Carolina pine, Surinam* of some, *scarlet fleshed Carolina, Chili.* Fruit ovate, middle-sized. A second-rate sort, ripening beginning of July. *F. Caroliniensis*, Duchesne in Lam. dict. 2. p. 539.

2 *De Bath.* *Fragaria Chilensis*  $\gamma$  *calyculata*, Duchesne in Lam. dict. 2. p. 538. *Noisette*, jard. fr. t. 11. f. 1. and t. 14. f. 4.

3 *Black prince, Wilmol's black imperial.* Fruit roundish, middle-sized. A second-rate shy bearing kind, ripening end of June.

4 *Bostock, Rostock, Rostock seedling, Rostock pine, Rostock scarlet, Wellington, cone, Byram, Caledonian, Vernon's, Montague's, prolific Bath, new Bath, Whitley's pine, Beattie's seedling, English globe, red Chili, Devonshire, Devonshire Chili, red Bath, new scarlet.* Fruit large, roundish. A good bearer, but the fruit is rather coarse and hollow. Ripens end of June.

5 *Bullock's blood.* Fruit roundish, large. A worthless sort, ripening beginning of July.

6 *Chinese, North's seedling, red Chili, North's large scarlet, Bourbon* (of the Americans), *chapelized, Carolina* of some, *large Chili, pine apple, Frasier ananas.* Fruit large, roundish. This and the *Surinam* were formerly much cultivated on account of their bearing, but are now giving way to the superiority of *Keen's seedling*. It ripens end of June and beginning of July.

7 *Dutch.* Fruit roundish, large. A worthless sort, ripening beginning of July.

8 *Dwarf white Carolina.* Fruit roundish, ovate, large. A worthless sort, ripening end of June and beginning of July. The synonyms attached to the *round white Carolina* are also applicable to this, with the exception of the last.

9 *Glazed pine, Knott's pine, scarlet pine-apple, Chinese* of some, *Carolina* of some, *red Chili* of some. Fruit conical, large. A second-rate sort.

10 *Keen's imperial, imperial, black imperial, large imperial black, imperial pine, black Islworth, Keen's black, Keen's large fruited, Islworth pine, large black, Keen's black pine, nectarine.* Fruit roundish, large. A second-rate tender and shy bearing kind, ripening end of June.

11 *Keen's seedling, Keen's new seedling, Keen's new pine, Keen's black pine, Murphy's child.* Fruit large, roundish. A first-rate sort, ripening middle and end of June. It is very productive, and one of the best for forcing.

12 *Knevell's new pine.* Fruit large, roundish. A second-rate sort, ripening end of June. It is a shy bearer, and will not grow in many soils.

13 *Large black seedling.* Fruit roundish, large. A second-rate sort, ripening beginning of July.

14 *Mulberry, Mahone, King, Cherokee, Surinam* of Scotland. Fruit ovate, middle-sized. A worthless sort, ripening beginning of July.

15 *Old pine or Carolina pine, Carolina, scarlet pine, old scarlet pine, old Carolina, common Carolina, Carolina pine, large Carolina, blood pine, Pyne hill, grandiflora, black pine, Borsdorf, Surinam or scarlet fleshed, superior, Shew's scarlet.* Fruit ovate, large. A first-rate sort, ripening end of June and beginning of July. As a solid, juicy, and peculiarly rich fruit, this kind is exceeded by none. *Keen's seedling* is earlier, more productive, and profitable for the market, but its cultivation on these accounts ought not to supersede that of the *old pine strawberry*, the superior quality of which entitles it to be strongly recommended.

16 *Red cone.* Fruit ovate, middle-sized. A second-rate sort, ripening end of June.

17 *Round white Carolina, Carolina, white Carolina, white pine, large blush pine, white Bath, red and white Bath, large white, Chili, white Chili, large white Chili, large pale Chili, large flesh-coloured Chili, cone, globe, conical white Carolina.* Fruit roundish or irregularly ovate, large. A worthless sort, ripening end of June and beginning of July.

18 *Surinam, red pine, red pine apple, Sutton's large, Oldaker's new pine, red Chili, Chinese, Devonshire scarlet, North's seedling, ananas or apricot* of the Dutch, *De Carolina.* Fruit roundish, ovate, large. A worthless sort, ripening beginning of July. The cultivation of this sort is on the decrease, and is likely to be soon lost altogether.

19 *Taylor's new emperor.*

20 *Variegated pine, striped leaved scarlet.* Leaves variegated with white. A tender and worthless sort with regard to its fruit.

21 *Westbere.* Fruit ovate, middle-sized. A second-rate sort, ripening end of June and beginning of July.

*Great-flowered Strawberry.* Fl. April, May. Clt. 1759. Pl. 1 foot.

10 *F. CHIL'ENSIS* (Ehrh. beitz. 7. p. 26.) late; flowers always dioecious from abortion; leaflets obovate, obtuse, coarsely serrated, coriaceous, wrinkled, clothed with silky villi beneath; calyx and peduncles silky; peduncles thick; fruit pendulous; sepals erect. *Æ. H.* Native of South America, in Chili and Peru; and west coast of North America. Duchesne in Lam. dict. 2. p. 537.---Dill. hort. elth. t. 20. f. 140. *Nois. jard. fr. 51. t. 12. f. 1.* Hairs on peduncles and petioles spreading. Fruit rose-coloured; flesh white. Called *Chili strawberry*. The varieties are as follow.

1 *Black Chili.* Fruit large, of an irregular shape. A coarse kind, ripening beginning and middle of August.

2 *Large blush Chili.* Fruit large, ovate, of indifferent quality, ripening beginning and middle of July. It is hardly distinguishable from the true *Chili*.

3 *Pine Chili.* Fruit large, ovate. A worthless sort, ripening beginning and end of July.

4 *Scarlet Chili.* Fruit large, ovate. As a *Chili strawberry* one of the best. Ripens beginning of July.

5 *True Chili, Patagonian, Greenwell's, Greenwell's French, Greenwell's new giant, du Chili, Frutiller.* Fruit large, ovate, ripening beginning and middle of July. It may be said of the *Chilis* generally, that they are tender bad bearers, and of indifferent quality.

6 *Wilmot's superb.* Fruit large, roundish, hollow, and woolly. As a *Chili strawberry* one of the best. Ripens beginning of July.

7 *Yellow Chili.* Fruit large, of an irregular shape. One of the best of the *Chilis*. Ripens beginning of July.

8 *Quoimio de Canterberi, Canterbury.* Fruit ovate, with red flesh and juice. *Fragaria Chilensis* va.  $\delta$  *tincta*, Duchesne in Lam. dict. 2. p. 539.

4 A

*Chili Strawberry.* Fl. April, May. Clt. 1727. Pl. 1 foot.  
11 F. BONARIENSIS (Juss. herb. ex Pers. ench. 2. p. 53.) leaflets broadly ovate, oblique at the base, villous beneath; stem villous.  $\mathcal{U}$ . II. Native of Monte Video and Buenos Ayres. Calyx villous. Petals white, large. Perhaps referrible to *F. grandiflora*.

*Buenos Ayrean Strawberry.* Fl. April, June. Pl. 1 foot.

12 F. CANADENSIS (Mich. fl. bor. amer. 1. p. 299.) large; leaflets ample, oval, manifestly petiolate; pedicels long, recurved, pendulous; receptacle globose, scrobiculate, villous.  $\mathcal{U}$ . II. Native of North America, in woods and hilly places from Hudson's Bay to the United States. Flowers white.

*Canadian Strawberry.* Fl. April, May. Pl. 1 foot.

13 F. SUNDAICA (Blum. bijdr. 1106.) calycine segments spreading, entire; down on petioles and peduncles spreading; leaves ternate and quinate; leaflets simply and bluntly serrated, pubescent on the nerves beneath.  $\mathcal{U}$ . II. Native of Java, on Mount Gede. Flowers not described.

*Sunda Strawberry.* Pl.  $\frac{3}{4}$  foot.

\*\*\* *Leaves simple.*

14 F. MONOPHYLLA (Willd. spec. 1093. Uster. neue ann. fasc. 8. p. 40. t. 1. Curt. bot. mag. t. 63.) stoloniferous, weak; leaves simple, crenately toothed; fruit pendulous; receptacles elongated, red; sepals at length reflexed; hairs on peduncles adpressed.  $\mathcal{U}$ . II. Native of Europe. *F. vesca* var.  $\zeta$  *monophylla*, Duchesn. in Lam. dict. 2. p. 532. no. 6. *F. alnornis*, Tratt. ros. 3. p. 166. Flowers white, hermaphrodite. Fruit round, small, worthless. Called *one-leaved Alpine strawberry*, *Fraser de Versailles*, *Fraser à feuilles simples*.

*One-leaved Strawberry.* Fl. May. Clt. 1773. Pl.  $\frac{1}{2}$  foot.

The greater part of the varieties of strawberries are furnished with stolons or runners. By some botanists the species have been considered only varieties, but generally are distinguished as species. T. A. Knight (Hort. trans. 3. p. 207.) considers the *F. Chilensis* or *Chili*, the *F. grandiflora* or *pine*, and the *F. Virginiana* or *scarlet*, (the first supposed to be a native of Surinam, the second of Chili, and the third of Virginia,) to be varieties only of one species, as all may be made to breed together indiscriminately. The fruit has received its name from the ancient practice of laying straw between the rows, which keeps the ground moist and the fruit clean. They are natives of temperate or cold climates, as of Europe and America, and on the higher mountains of Asia. The fruit, though termed a berry, is in correct botanical language, a fleshy receptacle or polyphore studded with the carpella, commonly called seeds.

*Use.*—The fruit is fragrant, whence the generic name *Fragaria*, delicious, and universally esteemed. It consists almost entirely of matter soluble in the stomach, nor neither there nor when laid in heaps and left to rot, does it undergo the acetous fermentation. Hence it is very nourishing, and may be safely eaten in quantity. In addition to its grateful flavour, the sub-acid juice has a cooling quality, particularly acceptable in summer. Eaten either alone or with sugar and cream, there are few constitutions with which strawberries, even when taken in large quantities, are found to disagree. Further, they have properties which render them in most conditions of the animal frame positively salutary; and physicians concur in placing them in their small catalogue of pleasant remedies. They dissolve the tartarous incrustations of the teeth. They promote perspiration. Persons afflicted with the gout have found relief from using them very largely; so have patients afflicted with the stone; and Hoffmann states he has known consumptive people cured by them. The bark of the root is astringent.

*Of species and varieties.*—The classification of strawberries

by Mr. James Barnet, published by the Horticultural Society, has been adopted with some little variation in the foregoing enumeration of varieties. In regard to the size it will be necessary to state that the comparisons are made between the individual varieties of which each species is composed, and do not extend to those of other species. The general estimation of many of the sorts is not so high as had been formerly stated, owing to their having been found tender or indifferent bearers, compared with others which experience has proved to be superior.

*Modes of propagation.*—The plants multiply spontaneously every summer, as well by suckers from the parent stem as by numerous runners, all of which, rooting and forming a plant at every joint, require only to be removed to a bed where there is room for them to flourish. Each of these separately bears a few fruit the following season, and will bear in full perfection the second summer. A plantation of the *Alpine* yields fruit the same year that it is made. The *woods* and the *Alpines* come regularly from seed, and bring a finer fruit than from offsets, except the intention be to try for new varieties. Knight, in making experiments with a view of ascertaining whether most of the sorts would not breed together indiscriminately, raised about 400 varieties, "some very bad, but the greater part tolerably good, and a few very excellent." The fruit of above a dozen of the sorts were sent to the Horticultural Society in August, 1818, and found of various degrees of excellence. The seeds, if sown immediately after being gathered, will produce plants which will come into bearing the following year.

*Soil and site.*—Neill says, "Strawberries are generally placed in a quarter of the garden by themselves, and it should be one which is freely exposed to sun and air. They are sometimes, however, planted in single rows, as edgings to borders, and in this way they often produce great crops. In either case care must be taken to replant them every fourth or fifth year at the farthest. The *alpine* and *wood* varieties may be placed in situations rather cool and shady; perhaps as an edging in the shrubbery. In such places they produce their fruit perfectly well, and late in the season, which is desirable."

*General culture.*—The following excellent instructions for cultivating strawberries are given by Mr. Keen of Isleworth, one of the best growers of that fruit. He says, "I will commence with a general detail of my practice; this may be considered as applicable to all the varieties of the *strawberry*, and afterwards, in noticing each kind that I cultivate, I will specify such peculiarities of treatment as are exclusively applicable to each.

"In preparing the soil for strawberries, if it be new, and as is frequently the case, very stiff, it should be trenched, but if the bottom spit of the soil, as sometimes happens, be of inferior quality, I then recommend only a simple digging, placing dung at the bottom underneath the mould so dug; on the contrary, should the land have been kept in a high state of cultivation or be good to the full depth, it will be advisable for the bottom spit to be brought up to the top, placing the dung between the spits. The best way to obtain new plants is by planting out runners in a nursery for the express purpose in the previous season; for it is a very bad plan to supply a new plantation from old plants. With respect to the time of planting, I have always found the month of March better than any other. Sometimes when my crops have failed I have had runners planted in the autumn for the following year, but these have always disappointed my expectations. I plant them in beds containing 3 or 4 rows, and the plants in each row, at a certain distance from each other, leaving an alley between each bed, the distance of the rows and of the plants in the rows, as well as the width of the alleys, depending on the kind of *strawberry* planted. The width of the alleys, as it will afterwards be stated, may appear

considerable, but I am satisfied that allowing this space for the workmen to stand on when they water the plants or gather the fruit is beneficial, because I have observed in other persons' grounds, where less space is allotted for this purpose, that great damage is done to the plants and fruit by the trampling of the people.

"After the beds are planted I always keep them as clear of weeds as possible, and on no account allow any crop to be planted between the rows. Upon the growing of the runners, I have them cut when necessary; this is usually three times in each season. In the autumn I always have the rows dug between; for I find it refreshes the plants materially, and I recommend to those persons to whom it may be convenient to scatter in the spring very lightly some loose straw or long dung between the rows. It serves to keep the ground moist, enriches the strawberry, and forms a clean bed for the trusses of fruit to lie upon; and thus by a little extra trouble and cost a more abundant crop may be obtained. A short time before the fruit ripens I always cut off the runners to strengthen the root, and after the fruit is gathered I have what fresh runners have been made taken off with a reaping hook, together with the outside leaves around the main plant, after which I rake the beds, then hoe them, and rake them again. In the autumn, unless the plants appear very strong, I have some dung thrown in between the rows, but if they are very luxuriant the dung is not required, for in some rich soils it would cause the plants to turn nearly all to leaf. I also have to remark, that the dung used for manure should not be too far spent; fresh dung from the stable door is preferable to that dung, which many persons are so fond of. The duration of the beds must be determined by the produce of the plants, which varies much according to the different sorts; it always varies with the same sort in different soils, so that the precise time of the renewal of the beds must be regulated by the observation of the gardener in each particular case.

"I commence my observations on the different sorts with the *pine strawberry*. The best soil for it is a light loam, though no other kind of *strawberry* will bear a strong loam better than this. It is likewise to be noticed, that this is of all others the most difficult *strawberry* from which to procure a good crop. Particular care must be taken that they are planted in open ground; for in all gardens they grow very strong, but seldom bear fruit, in consequence of being so much shaded by standard trees; and I have observed the shade of the walnut tree to be much more injurious to these than to others, for under it they seldom bear at all, but run entirely to leaf. In planting the beds of *pine strawberries* I keep the rows two feet apart, and put the plants 18 inches from each other in the row, leaving alleys of three feet wide between each bed; these large distances I find necessary, for the trusses of fruit in my garden ground are frequently a foot long. The duration of this *strawberry* with me is three years; the first year it bears the best; the second year the crop is very good, and the third year it is less.

"The *imperial strawberry*, which was raised by myself from seed, may be treated in a similar way with respect to planting, distance, &c. as the *pine*; but I have to remark, that it requires rather a lighter and richer soil, and is not so liable to run to leaf when planted under trees.

"The *scarlet strawberry* must also be treated like the *pine*. With respect to distance for planting the beds of *scarlets*, I put each row 21 inches apart, and each plant 18 inches distant in the row, and make the alleys 2 feet 6 inches wide. The duration of this *strawberry* with me seldom exceeds three years.

"The *hautbois* I have always found to thrive best in a light soil, and it must be well supplied with dung, for excess of

manure does not drive it into leaf like the *pine strawberry*. In planting the beds each row must be 2 feet apart, and from plant to plant in the rows must be 18 inches, leaving the alleys between the beds 3 feet wide. There are many different sorts of *hautbois*; one has the male and female organs in the same blossom, and bears very freely; but that which I most approve is the one which contains the male organs in one blossom, and the female in another; this bears fruit of the finest colour, and of far superior flavour. In selecting these plants care must be taken that there are not too many of the male plants among them, for as these bear no fruit they are apt to make more runners than the females. I consider one male to ten females the proper proportion for an abundant crop. I learned the necessity of mixing the male plants with the others by experience in 1809; I had before that period selected female plants only for my beds, and was entirely disappointed in my hopes of a crop. In that year, suspecting my error, I obtained some male blossoms, which I placed in a bottle on the bed of female *hautbois*. In a few days I perceived the fruit near the bottle to swell; on this observation I procured more male blossoms, and in like manner placed them in bottles in different parts of the beds, removing the bottles to fresh places every morning, and by this means obtained a moderate crop where I had gathered no fruit the preceding year. The duration of the *hautbois* with me seldom exceeds three years.

"The *wood strawberry* is best raised from seed, which I obtain from fruit just gathered, sowing it immediately in a bed of rich earth. When the plants are of a proper size, I transplant them into other beds, where I let them continue till the March following. They are then planted in rather a moist soil in beds as the others, each row being 2 feet apart, and the plants in each row 18 inches distant, the alley between each bed being 3 feet wide; in this way I produce abundant crops of very fine fruit. I have propagated this *strawberry* from runners, but never with such good success as from seeds, particularly if the runners were taken from old roots. The duration of this *strawberry* with me seldom exceeds 2 years.

"The *alpine strawberry* must always be raised from seed, which should be sown in a bed of rich earth in spring. When the plants are of a proper size, which will be in July and August, I plant them in rows at the back of hedges, or walls, in a rich or in a very moist soil; the rows should be 2 feet apart, and the distance from plant to plant in the rows 12 inches. My alpine, thus managed, bear most abundantly, so much so that in gathering them there is not room for the women to set their feet without destroying many. The alpine differ from all other strawberries in quickness of bearing; for no other sort sown in the spring of the year will produce fruit under 2 years, whereas this yields a crop at the end of one year. Its duration with me seldom exceeds 2 years." —*Hort. trans.* 4. p. 2.

Mr. Atkinson (*Hort. trans.* 5. p. 189.) describes a method of making strawberry beds, which he saw in a garden at Chatham, and which he thought excellent. The beds were upon flat ground, each about 3 feet wide, and between them were trenches 9 inches wide, and 4 inch walls of brick on each side of the trenches to keep up the earth, these trenches were about the depth of 2 or 3 layers of bricks and were for the purpose of holding water, which was supplied from a pump, whenever the ground was dry while the plants were in fruit. By this means a much greater crop of fruit was obtained, and the plants continued bearing much longer than in beds where there were no trenches for water. According to this plan considerable extent of strawberry ground is watered with very little labour, and it has the advantage of letting the water to the roots of the plants,

so as to keep the ground moist without hardening the surface, as is the case when the tops of the beds are watered with watering pots.

Mr. Knight (Hort. trans. 6. p. 103.) considers half the distance allowed by Mr. Keen to be sufficient space for strawberry plants. His beds also are wholly expended at the end of 16 or 17 months after being formed, and the ground is then applied to other purposes. He has consequently the trouble of renewing his beds every year; but he finds his trouble much less than properly managing old beds, and he is quite certain that he obtains a much larger quantity of fruit, and of a very superior quality, than he ever did obtain by retaining the same beds in bearing during 3 successive years, from the same extent of ground. By employing heat to *strawberry* plants raised from seed in spring, he has obtained abundant crops from yearly plants of every species.

*Taking the crop.*—The fruit ripens from June to August and September, but the main crop is usually over in July. Gather when the weather is dry, and the same day that the fruit is to be sent to table, otherwise it will soon lose its flavour. Pinch off the calyx and a quarter of an inch of the pedicel, along with the fruit.

*Forcing the strawberry in hothouses, pits, and hot beds.*—This fruit is forced in every description of forcing house, and also in the pinery, though the heat of the latter often prevents the setting of the blossoms. Where they are forced in large quantities, it is a good method to apply a pit to their sole cultivation. M'Phail says, "They will occasionally do well in a hot-house for growing the pine, but a heat sufficient to force peaches and nectarines is more natural and likely to secure the obtaining of good crops of fine fruit. A good way of forcing the *strawberry*," he adds, "is to bring them forward in a gentle heat, in melon frames, till the fruit be nearly about half swelled, and then to give them a stronger heat to ripen them" (Gard. rememb. 29.). Nicol thinks "the climate of the cherry-house most suitable to the nature of the *strawberry*; they will do well in a hot-bed, but the best method is to force them in flued pits, such as those for raising pines."

*Soil.*—*Strawberries*, to be forced in pots, require a strong and very rich loamy earth. Nicol.

*Choice of sorts.*—Abercrombie and Nicol recommend the *alpine* and *scarlet Virginia*, to which Nicol adds the *wood strawberry*. William Morgan (Hort. trans. 2. p. 376.) begins with the *alpines*, next he takes the *Bath scarlets* and *common scarlets*, and after these the *pines*. But it is allowed by all that Keen's *seedling* and the *old pine* are the best for forcing.

*Potting and preparing the plants.*—Abercrombie says, "the plants selected should be 2 years old, having attained a full bearing state. It conduces to the perfection of the fruit to put as many plants as are intended to be forced, into pots, that they may be previously nursed for a longer or shorter time, according to the age of the stool.—1st New runners of the present summer may be potted in July and August, and nursed in pots for 2 seasons, having the blossoms pinched off in the second. This course of preparation is attended with most trouble, but the crop repays it. Three offsets may be planted in one large pot. 2d Runners made last year may be potted in April, and then plunged in the earth, to be nursed throughout the growing season, with a view to forcing, having such blossoms as appear pinched off, while the roots are carefully watered.—3d Stools of 2 years old standing, which have borne one crop, may be put into pots in August, September, or October. They may also be put into pots during any mild interval from the beginning of November till the end of the year; but they will not be so strong and well rooted. The method of potting established bearers is this:

the pots should be twenty-fours or thirty-twos; provide at the same time some fresh and good rich loam. Put some of the earth, well broken with the spade and free from grubs or hurtful worms, into each pot, to the depth of 3 or 4 inches. Then take up the plants, with a ball of earth to the root of each; pare the ball with a knife till it is pretty round, and having cleared the stem of the plant from any withered or rotten leaves, place it in a pot, which fill up to the surface of the ball with the prepared earth. Water the plants as they are potted, and remove them to a warm situation. On the approach of winter, all the potted plants, whether established bearers or runners, should be placed under a frame or other sufficient shelter, till the hot-bed or forcing house is ready to receive them."—Abercrombie. M'Phail says "*strawberry* plants, intended for forcing, should be planted in pots eight or ten months before they are set into the forcing house, or strong plants may be taken up with balls of earth about their roots, and be potted and set into the forcing house immediately." Nicol says, "some force old roots or stools, and others the runners only. Those who force the old roots generally lift and pot them about October or November, lifting a bulk from the bed, nearly sufficient to fill a 9 or 10 inch pot of plants 3 or more years old. Others plant runners of the former year in April, 3 or 4 in a large pot, or 2 in a middle-sized one, and plunge them in the earth all summer, giving them occasional waterings, and taking proper care of them. These succeed better than old roots, treated as above. But when I was in the practice of forcing *strawberries*, I used to prepare my plants in the following manner:—In July or August I planted runners of that season, 3 in a 9 or 10 inch pot, watered them and placed them in the shade for a few days; then plunged them to the brim in a freely exposed situation. In October their leaves were dressed off and the plants trimmed, and before winter they were covered with a little dry litter, in order to preserve the pots from the effects of the frost. The following spring any flowers that made their appearance were pinched off, and throughout the summer the plants were occasionally refreshed with water, and kept clear from weeds. In autumn the leaves were again dressed off as before; and when taken up for forcing, the pots were dressed and fresh earthed at top, previous to being placed in the forcing house. This method of preparing the plants is no doubt more troublesome than either of the above mentioned, but the plants, by being completely established and of a proper age, produce better crops. I have tried all the three ways repeatedly, and prefer the last."

Morgan raises his *alpines* from seed, sowing in January, in frames or boxes, to be placed in a gentle heat; he hardens them after they are come up by removal to a colder situation; pot in May, in pots 6 inches in diameter and 6 inches deep. In October they are in flower, when he puts them under shelter, and in the latter end of November he places them in the forcing house or pinery, where they bear fruit through the winter. The *scarlets* he pots 3 plants in a pot, of the same size as those used for the *alpines*; in May or early in June, taking the runners of the previous year, he picks off the blossoms as they appear, and keeps them in a shady place till January, when he places them in the forcing house on shelves, 18 inches from the glass, each pot in a pan. The *pine strawberry* he pots in the same manner, and takes them into the forcing house in February or March. T. A. Knight (Hort. trans. 5. p. 433.) prepares his *strawberry* plants for early forcing as follows:—he manures a small piece of ground very highly but very superficially, just covering the manure with mould. The ground being prepared, the strongest and best rooted runners of the preceding year are selected and planted in the beginning of March, in rows 1 foot apart and 8 inches between the plants in one half of the rows,

and 4 inches in the other half, the thickly and thinly planted rows occurring alternately. In July all the plants of the thickly planted rows are removed to ground that has produced an early crop of peas or potatoes; and these, having the roots well preserved, always afford an abundant crop of fruit in the following summer. The other plants remain unnoticed till the end of November, when the mould between the rows is removed with the spade, and the most widely extended lateral roots detached from it. The spade is also made to pass under each plant, and between it and the plant adjoining, so that each plant becomes capable of being removed at a subsequent period, without having any of the roots ruptured. As each plant becomes detached from the surrounding soil, the ground is closed around it, and it remains till it is wanted, but it should be placed in its pot as early as the middle of February, if it be not sooner removed. In potting *strawberry* plants, Mr. Knight always employs soil of the richest quality and very finely reduced, and a good deal of water, holding manure in solution, is employed to occasion the newly introduced soil to occupy all space previously vacant in the pots. The plants are then in a state to be subjected immediately to artificial heat.

*Time of beginning to force.*—If the fruit be wanted very early, the plants are put into hot-beds or pits in October, but the crops from *strawberries* so forced Nicol thinks hardly worth the trouble. Abercrombie says “begin to force *strawberries* about nine weeks before you want to gather fruit. Plants excited before the first of January seldom repay the trouble, and in proportion as the time of beginning to force approaches the vernal equinox the returns are more abundant. Have reserve sets of potted plants for removal into a house or frame every three weeks till the middle of March:” he adds, “*strawberries*, taken into the house in March, fruit in higher perfection than those forced earlier.” M’Phail and Nicol begin in January. The latter observes, “those who force *strawberries* to a considerable extent, perhaps 1000 pots, bring them in in different successions, perhaps 100 or 200 at a time; that is in places where there are several forcing houses. M’Phail says “when the weather begins to get cold in September, *strawberries* of the alpine kind in pots may be set in a forcing house or brick frame, and if they be in good health, they will produce fruit for a considerable time. They require only a gentle heat of from 50° to 60°; give them water occasionally, but as there is constantly blossom and fruit on them, they need not be watered all over broad-cast. Give them great plenty of air; they only require protection from heavy rains and cold weather.” Morgan, as has been already noticed, begins to force *alpinæ* in November, the *scarlets* in January, and the *pines* in February and March. Thus ensuring, as he says, a successional supply of fruit from October till June.

*Temperature.*—Abercrombie says, begin at 40° and raise the heat as in the cherry-house. When a pit is employed, Nicol directs the pots to be plunged in a mild bark-bed, and the temperature, by the aid of the flues, to be kept at 50°, and 55° or 66° in sunshine. Such treatment will make the plants thrive and the fruit set freely. Morgan prefers beginning with the heat of a frame on dung, or a pit, and then moves to the peach-house, and after the fruit is set removes his plants to ripen in the vinery or stove. *Scarlets* he finds bear more heat than the other sorts.

*Air and water.*—Air is to be freely admitted in good weather, and water plentifully supplied at all times, until the fruit begins to ripen off. Then it is to be withheld, lest the flavour become insipid. Morgan prefers supplying water from pans, in order not to rot the hearts of the plants. He gives as little water as possible when the plants are nearly ripe, this being essential to have good-flavoured fruit.

*Treatment of the plants after the fruit is gathered.*—The *strawberry*, it is generally considered, will not force the year after like fruit trees, but must be rested by plunging in the open ground for one or two years, pinching off all blossoms as they appear. Williams states that “the *scarlet strawberry*, after affording a crop of fruit in a hot-house early in the spring, if carefully removed out of the pots or boxes, and placed in the open ground, will yield another crop of fruit in September. This second crop is very abundant, the warm rains in July and August proving highly favourable to the growth of the fruit; and as there is no other *strawberry* to be had at this season of the year except the *alpine*, the addition of the *scarlet* makes a pleasing variety in the dessert.” (Hort. trans. 2. p. 93.) Morgan observes, without limiting his observations to any one sort, that “after the fruit has been gathered from the plants, the pots should be plunged in a shady border, giving them a good watering, and at the same time cutting off all the leaves; when thus treated, they will in the year following, produce as good crops in forcing as fresh potted plants. If not wanted for this purpose, they may be turned out into the natural ground, and will then bear a crop in the autumn of the same year, as described by Williams above.”

XI. DUCHESNEA (in honour of Ant. Nicholas Duchesne, author of *Manuel de Botanique, contenant les propriétés des plantes utiles*, 1 vol. 12mo. Paris, 1798, and *Histoire Naturelle des Frasiars*, 1 vol. 8vo. Paris, 1766.). Smith, in *Lin. trans.* 10. p. 373. D. Don, *prod. fl. nep.* p. 236.

*Lin. syst.* *Icosándria, Polygynia*. Calyx 10-parted, the outer 5 segments accessory, large, foliaceous, tridentate at the apex and spreading. Petals 5. Stamens numerous. Carpels numerous, adhering to an elevated fleshy receptacle. Styles lateral. Seed pendulous. A herb, with habit of the strawberry, furnished with stolons which extend widely. Leaves trifoliate; leaflets cuneate-ovate, deep green, shining, coarsely crenated towards the apex, and hairy beneath. Peduncles axillary, solitary, 1-flowered. Flowers golden yellow. Fruit like that of the strawberry, red, and insipid.

1 D. FRAGARIOIDES (Smith, l. c.). 2. H. Native of the mountains of Nipaul. D. fragiformis, D. Don, *prod. fl. nep.* p. 233. *Fragaria Indica*, Andr. bot. rep. 479. Ker. bot. reg. 61.

*Strawberry-like Duchesnea* or *Indian Strawberry*. Fl. May, Oct. Clt. 1805. Pl. creeping.

*Cult.* This plant will grow in any common soil, and is easily increased by the stolons or runners. It prefers a dry warm situation.

XII. POTENTILLA (from *potens*, powerful; supposed medical quality of some species). *Lin. spec. gen.* no. 865. *Nestl. pot. diss.* 4to. *Lehm. pot. diss.* 4to. D. C. *prod.* 2. p. 57.

*Lin. syst.* *Icosándria, Polygynia*. Calyx 10-parted, the 5 outer segments accessory (f. 72. a.). Petals 5 (f. 72. b.). Stamens numerous. Carpels numerous, with lateral styles, seated on a dry, permanent, elevated receptacle. Seeds pendulous.—Herbs or sub-shrubs, with compound leaves, and with the stipulas adnate to the petioles. Flowers white, yellow, rarely red.

§ 1. *Leaves ternate.*

\* *Flowers yellow.*

1 P. NIVEA (*Lin. spec.* 715.) stems ascending, few-flowered; leaves ternate; leaflets obovate-cuneiform, with flat, deeply serrated margins, rather hairy above, but clothed with white tomentum beneath; petals broad, obcordate, a little longer than the calyx. 2. H. Native of Switzerland, Lapland, and Siberia;

in America, Labrador, the mountains and alpine prairies from Carlton House to the Rocky Mountains, and to the shores of the Arctic sea. Vahl. fl. dan. 1035. Hook. in bot. mag. 2982. Lodd. bot. cab. 460. Flowers yellow.

*Var. β, macrophylla* (Ser. mss. in D. C. prod. 2. p. 571.) petioles elongated; leaflets larger; flowers larger. *P. nivea β, pallidior*, Swartz, ex Lehm. pot. 184. *P. leucophylla*, Pall. itin. 3. p. 194. ex Bieb. fl. taur. suppl. 359.—Gmel. sib. 3. t. 37. f. 1.

*Var. γ, cōncolor*; leaves the same colour and rather villous on both surfaces.

*Var. δ, prostrata* (Retz. prod. ed. 1. p. 97. ex Lehm. pot. 184.) flowers glomerate.

*White-leaved Cinquefoil.* Fl. Ju. Aug. Clt. 1816. Pl. asc.

2 *P. ANGUSTIFOLIA* (Schlecht. berl. mag. ann. 7. p. 296. and Lehm. pot. p. 186. t. 19. but not of D. C.) stems ascending, few-flowered; leaves ternate; leaflets oblong-lanceolate, smoothish above and densely clothed with white tomentum beneath, with pectinately-serrated, revolute edges; serratures piliferous at the apex; calyx white; the segments about equal in length to the petals. *γ. H.* Native of Eastern Siberia. *P. leucophylla*, Fisch. in litt. Flowers yellow.

*Narrow-leaved Cinquefoil.* Fl. May, June. Clt. 1820. Pl. ascending.

3 *P. MACRANTHA* (Led. in act. nov. soc. petr. 5. p. 541. no. 30. fl. alt. 2. p. 260.) stems oblique, few-flowered; leaves ternate; leaflets ovate-oblong, deeply serrated, beset with spreading pili above and on the flat margins, but clothed with white villi beneath; petals obcordate, twice the length of the calyx; stipulas green. *γ. H.* Native of Siberia, beyond the Baikal and in subalpine places at the river Tscharysch, and of Kamtschatka. *P. nivea γ, Kamtschatica*, Schlecht. et Cham. in Linnaea. 2. p. 21. Flowers yellow.

*Var. β, uniflora* (Led. l. c.) stem erect, 1-flowered; leaflets obovate, rather retuse. *γ. H.* Native of Dahuria.

*Large-flowered Cinquefoil.* Fl. April, May. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

4 *P. MINIMA* (Hall. fil. in Schlecht. cent. exsic. 1. no. 59.) stems diffuse, filiform, 1-flowered; leaves ternate, smoothish above but pilose beneath; leaflets obovate, short, crenated, and rather retuse; calycine segments obtuse, shorter than the corolla. *γ. H.* Native of the alps of Switzerland, and Salisburg. Ser. mus. helv. 1. p. 51. t. 8. Lodd. bot. cab. 480. *P. Brauniiana*, Nestl. in litt. but not in mon. pot. t. 10. f. 4. Hoppe in Sturm, deutschl. fl. with a figure. *P. verna γ, nana*, D. C. fl. fr. 5. p. 542.—*P. verna α, alpestris*, Wallr. sched. p. 228. *P. frigida β*, D. C. fl. fr. 4. p. 462. Flowers yellow. Perhaps only a small variety of *P. aurea*, Lin.

*Var. β, Brauniiana* (Ser. mss.) leaflets cuneated, toothed; flowers larger; calycine segments acute. *P. Brauniiana*, Nestl. pot. 70. t. 10. f. 4. but not of Hoppe, exclusive of nearly all the synonyms.

*Smallest Cinquefoil.* Fl. May, June. Clt. 1818. Pl.  $\frac{1}{4}$  foot.

5 *P. ELEGANS* (Cham. et Schlecht. Linnaea. vol. 2. p. 22.) stem erect, 1-flowered; leaves petiolate, smoothish, ternate; leaflets deeply lobed; lobes linear, obtuse, entire, and trifid; stipulas membranous, acute; petals obcordate, longer than the calyx. *γ. H.* Native of Kamtschatka. Flowers yellow.

*Elegant Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

6 *P. GELIDA* (Meyer, verz. pfl. 146.) plant rather pilose; radical leaves ternate; leaflets obovate-roundish, toothed; stipulas obovate, obtuse, almost quite entire; stems filiform, decumbent, usually 3-flowered; petals obcordate, twice the length of the calyx, outer segments of the calyx elliptic, obtuse, inner ones longer, lanceolate, acute. *γ. H.* Native of Caucasus. *P. grandiflora*, Bieb. fl. taur. 1. p. 409. Allied to *P. Brauniiana* and *P. glacialis*. Flowers yellow.

*Var. α, glabrior* (Meyer, l. c.) leaflets smoothish, bluntly toothed; stipulas very blunt.

*Var. β, pilosior* (Meyer, l. c.) leaflets more or less pilose, acutely toothed; stipulas bluntish or acutish. *γ. H.* Native on the alps of Kasbek, at the height of 2300 feet.

*Cold Cinquefoil.* Pl. decumbent.

7 *P. HELVETICA* (Schleich. cat. 1897. p. 20.) plant very pilose; root thick; stems tufted, rather diffuse, few-flowered; leaves ternate; leaflets ovate, pectinately toothed; the teeth rather imbricated; calycine segments bluntish, shorter than the corolla. *γ. H.* Native of Vallais and Switzerland, on the mountains. *P. frigida α*, D. C. fl. fr. 4. p. 3748. *P. Norvegica*, Sut. fl. helv. 1. p. 310. but not of Lin.

*Swiss Cinquefoil.* Fl. April, June. Clt. 1819. Pl.  $\frac{1}{4}$  foot.

8 *P. FRIGIDA* (Vill. dauph. 3. p. 563. ex Nestl. pot. 70. t. 10. f. 3. exclusive of the synonymes) plant very pilose; root thick; stems tufted, rather diffuse; leaves ternate; leaflets ovate, crenated; calycine segments lanceolate, longer, or equal in length to the petals, which are obcordate. *γ. H.* Native of the alps of Dauphiny. Flowers yellow.

*Frigid Cinquefoil.* Fl. April, June. Clt. 1819. Pl.  $\frac{1}{4}$  foot.

9 *P. GRANDIFLORA* (Lin. spec. 715.) stem ascending, few-flowered; leaves ternate; leaflets obovate, cuneated at the base, deeply serrated, pilose; stipulas large; petals obcordate, twice the length of the calyx; receptacle pilose. *γ. H.* Native of the alps of Europe and Siberia. Lehm. pot. 164. Curt. bot. mag. 75. Hall. hist. no. 1114. t. 20. f. 1.—Gmel. sib. 3. p. 183. no. 83. t. 36. f. 1. Flowers large, yellow.

*Var. β, Pyrenæica* (Ser. in D. C. prod. 2. p. 573.) leaflets 3 and 5. *γ. H.* Native of the Pyrenees. *P. Pyrenæica*, Ram. in D. C. fl. fr. 4. p. 459. and 5. p. 452.

*Var. γ, minor* (Venetz, in litt.) stem and leaves smaller. *γ. H.* Native of Vallais.

*Great-flowered Cinquefoil.* Fl. Ju. Jul. Clt. 1640. Pl. asc.

10 *P. FRAGIFORMIS* (Willd. in mag. der. gesell. nat. freunde, p. 294. Lehm. pot. p. 165. t. 15.) stem erect, few-flowered; leaves ternate; leaflets roundish-obovate, bluntly toothed, beset with spreading pili on both surfaces, and having the margins villous; petals obcordate, a little longer than the calyx. *γ. H.* Native of the Aleutian Islands. Flowers yellow.

*Strawberry-like Cinquefoil.* Fl. Ju. Jul. Clt. 1800. Pl. 1 ft.

11 *P. RETUSA* (Oed. fl. dan. 799.) hairy; stems erect, few-flowered; leaves ternate; leaflets cuneiform, tridentate at the apex, pilose; stipulas entire; petals obovate, longer than the calyx. *γ. H.* Native of Denmark. Flowers yellow.

*Retuse-leaved Cinquefoil.* Pl.  $\frac{1}{4}$  foot.

12 *P. VILLOSA* (Pallas, ex Pursh, fl. amer. sept. 1. p. 353.) stem ascending, few-flowered; leaves ternate; leaflets roundish-cuneiform, serrated, clothed with silky villi above, and with hoary tomentum beneath; petals obcordate, twice the length of the calyx. *γ. H.* Native of North America, on the west coast, Dundas Island, Unalashka and about Behring's Straits, Kotzebue's Sound, &c. Lehm. pot. p. 166. t. 16. *P. lucida*, Willd. in berl. mag. ann. 7. p. 296. Corolla large, golden yellow.

*Villous Cinquefoil.* Fl. June, July. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

13 *P. NORVÉGICA* (Lin. spec. 715.) stem erect, dichotomous at the apex; leaves ternate, petiolate; leaflets oblong, acutely serrated, beset with spreading pili; pedicels axillary; petals obovate, shorter than the calyx. *γ. H.* Native of Lapland, Norway, Siberia; North America, throughout Canada, Hudson's Bay, Labrador, shores of the Columbia, at Fort Vancouver, and towards the mouth of the river. Lehm. pot. 153. Oed. fl. dan. t. 171. *P. millegrana* and *P. grōssa*, Dougl. in herb. hort. soc. *P. dichotoma*, Mönch. Flowers small, pale yellow.

*Norwegian Cinquefoil.* Fl. Ju. Jul. Clt. 1764. Pl.  $\frac{1}{2}$  to 1 ft.

14 *P. NANA* (Schlecht. in berl. mag. ann. 7. p. 296. and

Lehm. pot. 181.) stem erect, usually 1-flowered; leaves ternate; leaflets roundish-obovate, bluntly toothed, pilose on both surfaces, canescent beneath; petals obcordate, 3-times the length of the calyx.  $\mathcal{U}$ . H. Native of the Aleutian islands, and of North America on the most elevated of the Rocky Mountains, Labrador, Kotzebue's Sound, &c. Outer calycine segments roundish and very obtuse. Corolla large, pale yellow.

*Dwarf Cinquefoil.* Pl. 2 inches.

15 *P. HIRSU'TA* (Michx. fl. bor. amer. 1. p. 303.) plant beset with loose hairs; stem erect, few-flowered; leaves ternate, petiolate; leaflets obovate, profoundly serrated; teeth blunt; petals shorter than the calyx.  $\mathcal{U}$ . H. Native of North Canada, from Quebec to St. Lawrence; plains of the Saskatchewan, &c. Nestl. pot. p. 67. t. 9. f. 1. *P. Morisoni*, D. C. cat. hort. monsp. p. 135. *P. Montpelienensis*, Lin. spec. 704. *Fragaria parviflora*, Lam. fl. fr. 3. p. 112. Corolla yellow.

*Hairy Cinquefoil.* Fl. July, Aug. Clt. 1680. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  ft.

16 *P. ELA'TIOR* (Schlecht. in berl. mag. ann. 7. p. 295. Lehm. pot. p. 157. t. 14.) stem erect, tall; leaves ternate, petiolate; leaflets oval, acutely serrated, veiny, almost glabrous on both surfaces; petals obovate, entire, a little longer than the calyx.  $\mathcal{U}$ . H. Native of Siberia. Flowers yellow.

*Taller Cinquefoil.* Fl. June, July. Clt. 1824. Pl.  $1\frac{1}{2}$  foot.

17 *P. VALLIA'NA* (Lehm. pot. p. 172.) stem erect, usually 1-flowered; leaves ternate; lateral leaflets cuneiform and trifid at the apex, middle one rhomboid, all very hairy, clothed with shining, yellowish, or white down beneath; petals reniform, twice the length of the calyx.  $\mathcal{U}$ . H. Native of Greenland and North America, on the dry and elevated ridges of the Rocky Mountains; shores and islands of the Arctic Sea. *P. hirsuta*, Vahl. in litt. Horn. fl. dan. t. 1390. but not of Michx. *P. Jamesoniæna*, Grev. in mem. soc. wern. 3. p. 417. t. 20. Flowers yellow.

*Vahl's Cinquefoil.* Pl. 2 to 3 inches.

18 *P. SUBACAULIS* (Lin. spec. 715.) stems prostrate, few-flowered; radical leaves as well as those of the runners ternate, but the cauline ones are simple; leaflets obovate-cuneate, serrated to the middle, densely clothed with hoary tomentum; petals round, obcordate, about twice the length of the calyx.  $\mathcal{U}$ . H. Native of Germany, Switzerland, Vallais, Piedmont, and of Siberia. Jacq. icon. rar. vol. 3. t. 491. *P. cinerea*, Poir. *P. glaucescens*, Willd. *P. verna*, Kunth, fl. berol. p. 142. *P. ovata*, Poir. *P. incana*, Moench. *P. arenaria*, Borek. *P. opaca*, Vill.—All. fl. pedem. t. 24. f. 2. Gmel. sib. 3. t. 36. f. 2. Flowers yellow.

*Var.  $\beta$ , latiloba* (Ser. in D. C. prod. 2. p. 573.) leaflets broader and shorter. Native of Siberia, about Barnaul.

*Almost stemless Cinquefoil.* Fl. Apr. May. Clt. 1820. Pl. pr.

19 *P. VELUTINA* (Lehm. pot. 170.) stem ascending, few-flowered; leaves ternate; leaflets cuneiform, truncate, bluntly toothed at the apex, canescent on both surfaces from fascicles or tufts of velvety hairs; petals roundish, quite entire, a little longer than the calyx.  $\mathcal{U}$ . H. Native of Provence, on the mountains. *P. subacaulis*, D. C. fl. fr. 4. p. 465. *P. grandiflora*, Scop. fl. carn. 1. no. 626. t. 22. but not of Lin. *P. incana*, Lam. fl. fr. 3. p. 112. Flowers yellow.

*Velvety Cinquefoil.* Fl. Apr. May. Clt. 1820. Pl. 2 to 3 inc.

20 *P. EMARGINATA* (Pursh, fl. amer. sept. 1. p. 353.) stems assurgent, few-flowered; leaves ternate; leaflets deeply toothed, hairy on both surfaces; pedicels terminal, elongated; petals oblong-cuneate, emarginate, twice the length of the calyx.  $\mathcal{U}$ . H. Native of Labrador. Flowers large, yellow.

*Emarginate-petalled Cinquefoil.* Pl. 2 inches.

21 *P. DENTICULOSA* (Ser. inss. in D. C. prod. 2. p. 573.) hairy; stems creeping, filiform; leaves ternate, petiolate; leaflets broadly obovate, of the same colour on both surfaces, doubly

toothed, petiolate; stipulas denticulated; flowers axillary, solitary; petals obovate, about equal in length to the calyx.  $\mathcal{U}$ . H. Native of Nipaul. Flowers yellow.

*Toothletted-stipuled Cinquefoil.* Pl. creeping.

22 *P. WALLICHIA'NA* (Ser. in D. C. prod. 2. p. 574.) hairy; stem creeping, filiform; leaves ternate; leaflets obovate, sessile, toothed; flowers axillary, solitary; petals obovate, longer than the calyx.  $\mathcal{U}$ . H. Native of Nipaul. Flowers yellow.

*Wallich's Cinquefoil.* Pl. creeping.

23 *P. MONANTHES* (Lindl. in Wall. cat. no. 1025. Lehm. pug. 3. p. 33.) stem erect, 1-2-flowered; leaves ternate, rather pilose on both surfaces, and somewhat ciliated; leaflets cuneiform, truncate, crenately toothed; teeth roundish, obtuse; stipulas short, entire; outer calycine segments the largest, roundish, and obtuse; petals nearly orbicular, quite entire, length of calyx.  $\mathcal{U}$ . H. Native of Sirmore. Flowers small, yellow.

*One-flowered Cinquefoil.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

24 *P. CUNEATA* (Wall. cat. no. 1015. Lehm. pug. 3. p. 34.) stem ascending, but erect and leafless at the apex; leaves ternate, on very long petioles, pilose; leaflets obovate, rounded at the base, truncate at the apex, deeply tridentate, acute; flowers terminal, crowded, sub-cymose.  $\mathcal{U}$ . H. Native of Gosains-than. Flowers yellow.

*Wedge-leaved Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

25 *P. ERIOCA'RPA* (Wall. cat. no. 1012. Lehm. pug. 3. p. 35.) plant glabrous; stem ascending, simple, few-flowered, almost leafless; leaves on long petioles, ternate; leaflets petiolate, obovate-rhomboid, deeply 5-toothed at the apex; outer calycine segments larger, ovate, nerved; petals obcordate, twice the length of the calyx.  $\mathcal{U}$ . H. Native of the mountains of Kamaon and Gosainsthan. Flowers large, yellow.

*Hairy-fruited Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

26 *P. ARGYROPHYLLA* (Wall. cat. no. 1020. Lehm. pug. 3. p. 36.) stem erect, nearly simple; leaves ternate, almost sessile, distant; leaflets oblong, serrate-toothed, densely clothed with white tomentum beneath; teeth apiculated; stipulas ovate-lanceolate, deeply serrated; petals broad, obcordate, longer than the calyx.  $\mathcal{U}$ . H. Native of Gosainsthan. Flowers large, yellow.

*Silver-leaved Cinquefoil.* Pl.  $1\frac{1}{2}$  foot.

\* \* *Flowers white or red.*

27 *P. CATHA'CLINES* (Lehm. pug. 3. p. 37.) stems prostrate, usually 1-flowered; leaves ternate, distant; leaflets roundish, deeply serrated, densely clothed with silky pili above, but with white tomentum beneath; stipulas ovate, almost entire; petals obcordate, longer than the calyx.  $\mathcal{U}$ . H. Native of Gosainsthan. Flowers blood-coloured.

*Reclining Cinquefoil.* Pl. prostrate.

28 *P. ATROSA'NGU'NEA* (Lodd. bot. cab. 786.) plant clothed with silky villi; stems decumbent; leaves ternate, petiolate; leaflets obovate, deeply serrated, clothed with white tomentum beneath; stipulas ovate-lanceolate, entire, or bifid; petals obcordate, longer than the calyx.  $\mathcal{U}$ . H. Native of Nipaul and Gosainsthan. Sims, bot. mag. 2689. Peduncles few, 1-flowered at the tops of the branches. Corolla dark blood-coloured.

*Dark-bloody-flowered Cinquefoil.* Fl. May, Sept. Clt. 1822. Pl. decumbent.

29 *P. MICRA'NTHA* (Ram. in D. C. fl. fr. 4. p. 3760.) stems prostrate, hairy, 1-flowered; leaves ternate; leaflets ovate, obtuse, serrated, unequal at the base, silky; outer calycine segments a little toothed; petals obcordate-cuneate or nearly entire, shorter than the calyx.  $\mathcal{U}$ . H. Native of the Pyrenees; of Italy, on Mount Generoso; in Calabria, on Mount Polleno. Lehm. pot. 158. Ser. mus. helv. 1. p. 60. t. 5. *P.*

*fragaria*  $\beta$ , micrantha, Nestl. pot. 158. *P. breviscapa*, Vest. in flora, 1821. p. 158. *Fràga stérilis*  $\beta$ , parviflora, Lapeyr. fl. pyr. 287. *P. parviflora* Clairville. Flowers small, white.

*Small-flowered Cinquefoil.* Fl. May, June. Clt. 1820. Pl. tr.

30 *P. FRAGARIA* (Poir. dict. 5. p. 599.) stems decumbent, 2-flowered; leaves ternate; leaflets roundish-obovate, acutely serrated, hairy, canescent beneath; petals obovate, about equal in length to the calyx.  $\alpha$ . H. Native of Europe, in woods; in Britain in dry pastures. Lehm. pot. 160. Ser. mus. helv. 1. p. 59. t. 4. f. 2. *Fragaria stérilis*, Lin. spec. 709. Smith, engl. bot. 1785. Curt. fl. lond. t. 30. *P. fragariastrum*, Ehrh. beitz. *Fragaria præcox*, Kit. *P. prostrata*, Walt. *P. fragarioides*, Vill. *Fràga stérilis*, Lapeyr. fl. pyr. p. 287. Habit of the strawberry. Flowers white, spreading.

*Strawberry Cinquefoil.* Fl. May, June. Britain. Pl. prost.

31 *P. HYBRIDA* (Wallr. sched. p. 247.) stems procumbent; leaves ternate; leaflets obovate-oblong, closely serrated beneath the apex, smoothish above, glaucescent beneath, and silky; calycine segments ovate, acuminate, about equal in length to the petals, which are obovate.  $\alpha$ . H. Native of Germany.

*Hybrid Cinquefoil.* Pl. pros.

32 *P. SPECIOSA* (Willd. spec. 2. p. 1110.) stems erect, subcorymbose at the apex; leaves ternate; leaflets elliptic, serrated at the apex, pubescent above, and clothed with white tomentum beneath; petals spatulate, entire, a little longer than the calyx.  $\alpha$ . H. Native of Crete, on the mountains. Nestl. pot. p. 74. t. 11. Smith, fl. græc. t. 484. Corolla white.

*Sherry Cinquefoil.* Fl. June, July. Pl.  $\frac{3}{4}$  foot.

33 *P. SILENENS* (Poir. suppl. 4. p. 541.) stems decumbent, rooting; leaves usually ternate; leaflets oval-oblong, retuse at the apex, closely serrated in front, silky, hoary beneath; petals obovate, twice the length of the calyx.  $\alpha$ . H. Native of France and the Pyrenees. *P. Vaillantii*, Nestl. pot. p. 75. *P. emarginata*, Desf. *P. nitida*, Thunb. *P. montana*, Schrad. Brot. *Fràga Vaillantii*, Lapeyr. fl. pyr. p. 287.—Vaill. par. t. 10. f. 1. Flowers white.

*Splendid Cinquefoil.* Fl. May, June. Pl. creeping.

34 *P. NITIDA* (Lin. spec. 714.) stems ascending, usually 1-flowered; leaves ternate; leaflets obovate-cuneiform, toothed at the apex, clothed on both surfaces with silvery silky down; petals oboval, emarginate, longer than the calyx.  $\alpha$ . H. Native of the mountains of Dauphiny and Savoy. Lehm. pot. 187. Ser. mus. helv. 1. p. 62. t. 5. f. a, b, c, d. Jacc. fl. austr. app. t. 25. Sturm, deutsch. fl. fasc. 12. with a figure. *P. Terglovensis*, Vitm. summ. 3. p. 270.—Boec. mus. t. 9. f. 4. Flowers white or peach blossom coloured. Plant tufted.

*Shining Cinquefoil.* Fl. May, June. Clt. 1815. Pl. 2 to 3 inches.

35 *P. APENNINA* (Tenor. cat. hort. neap. 1815. p. 50. fl. neap. 1. p. 30. t. 46.) plant shining; stems tufted, 1-4-flowered; leaves ternate; leaflets oval, obtuse, somewhat 2-3-toothed at the apex, teeth connivent; stipulas broad; petals obovate, longer than the calyx.  $\alpha$ . H. Native of the Apennines.—Boec. mus. t. 8. f. 4. Flowers white.

*Apennine Cinquefoil.* Fl. May, June. Clt. 1821. Pl. 1 to 3 inches.

36 *P. BOCCONI* (Nestl. pot. 73. t. 10. f. 2.) stems ascending, few-flowered; leaves ternate; leaflets elliptic, clothed with silky hoary down on both surfaces, retuse and closely tridentate at the apex.  $\alpha$ . H. Native of the Apennines.—Boec. mus. t. 8. Flowers white or red.

*Bocconi's Cinquefoil.* Fl. May, June. Clt. 1823. Pl.  $\frac{1}{2}$  ft.

37 *P. TRIDENTATA* (Sol. in Ait. hort. kew. ed. 1. vol. 2. p. 216. t. 9.) root creeping; stem ascending; leaves ternate; leaflets oblong-cuneiform, tridentate at the apex, smoothish above, but pubescent and glaucescent beneath.  $\alpha$ . H. Native of

Greenland, Labrador, Canada, and Newfoundland. In Scotland on Werron hill near Brechin. Smith, engl. bot. 2389. Flowers corymbose, white, tinged with red.

*Tridentate-leaved Cinquefoil.* Fl. June, July. Scot. Pl.  $\frac{1}{2}$  ft.

38 *P. BIFLORA* (Lehm. pot. p. 192. t. 20.) stem erect, 2-flowered at the apex; leaves ternate, finely pilose; lateral leaflets deeply tripartite, terminal one bipartite, with the segments linear, entire, and ciliated on the margins.  $\alpha$ . H. Native of Eastern Siberia and North America, in barren grounds from lat. 64° to the shores of the Arctic sea and Kotzebue's Sound. Richards in Frankl. first journ. ed. 2. app. p. 21. Flowers white or red.

*Two-flowered Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

§ 2. *Leaves digitate, with usually 5-7-9 leaflets.*

\* *Flowers yellow.*

39 *P. UMBROSA* (Stev. in Bess. cat. hort. crem. ann. 1816. p. 110. Bieb. fl. taur. suppl. 357.) stems erectish, naked from the base to the bifurcations; radical leaves with 5-6 obovate-oblong, bluntly serrated leaflets, cauline leaves ternate; stipulas falcate; petals obovate, rather longer than the calyx.  $\alpha$ . H. Native of the south of Tauria, in shady places. Allied to *P. reptans*, but abundantly distinct. Petals of a golden yellow inside, but brownish yellow on the outside.

*Shaded Cinquefoil.* Fl. June, July. Clt. 1818. Pl. 1 foot.

40 *P. REPTANS* (Lin. spec. 714.)

FIG. 72.

stem creeping; leaflets 5, obovate-cuneiform, sharply serrated, pilose; pedicels axillary, solitary, longer than the leaves; bractæas (f. 72. d.) 3-lobed; petals obovate, longer than the calyx.  $\alpha$ . H. Native of Europe; plentiful in Britain in hedges and by road sides, particularly near London. Smith, engl. bot. 862. Fl. dan. 1164. Curt. lond. 1. t. 37. Flowers yellow.

*Creeping Cinquefoil.* Fl. June, Sept. Britain. Pl. creeping.

41 *P. FLAGELLARIS* (Lehm. pot. p. 141. t. 12.) stems filiform, prostrate; leaflets 5, lanceolate, serrated, nearly glabrous; pedicels axillary, solitary, filiform, elongated; petals obovate, quite entire, a little longer than the calyx.  $\alpha$ . H. Native of Eastern Siberia. Corolla yellow.

*Rod Cinquefoil.* Fl. June, July. Clt. 1820. Pl. trailing.

42 *P. SIMPLEX* (Nestl. mon. p. 40. t. 9. f. 2. Lehm. pot. p. 142.) stems trailing; leaflets 5, oblong-oval, serrated, rather pilose beneath; pedicels axillary, solitary, length of leaves; petals roundish, hardly emarginate, a little longer than the calyx.  $\alpha$ . H. Native of fields and dry woods in Canada about Quebec, Pennsylvania, and Carolina. *P. sarmentosa*, Poir. suppl. 4. p. 543. *P. Caroliniæana*, Pers. ench. 2. p. 55. Flowers yellow.

*Simple-stemmed Cinquefoil.* Pl. trailing.

43 *P. NEUMAYERIANA* (Tratt. ros. 4. p. 75.) stems decumbent; radical leaves quinate, cauline ones ternate; leaflets roundish-cuneate, deeply toothed at the apex, pubescent on both surfaces; flowers solitary, supra-axillary, on long pedicels; petals 3 times the length of the calyx.  $\alpha$ . H. Native of Austria.

*Neumayer's Cinquefoil.* Pl. decumbent.

44 *P. CANADENSIS* (Lin. spec. 713.) stem ascending, weak; radical leaves quinate; leaflets sessile, obovate-cuneiform, acutely serrated above, clothed with silky white down; petals orbicular, almost entire, length of calyx.  $\alpha$ . H. Native of Canada and

**Carolina.** Nestl. pot. p. 58. t. 10. f. 1. *P. pumila*, Lam. *P. sarmentosa*, Muhl. Flowers yellow. Pedicels axillary, solitary, 1-flowered, filiform, elongated. Flowers yellow.

**Canadian Cinquefoil.** Fl. June, July. Clt. 1800. Pl.  $\frac{1}{2}$  ft.

45 *P. DISSECTA* (Pursh, fl. amer. sept. 1. p. 355.) plant erect, branched, smoothish; leaflets 5, pinnatifid, with the segments entire and acute; flowers terminal, subcorymbose.  $\mathcal{U}$ . H. Native near Hudson's Bay. Flowers yellow.

**Dissected Cinquefoil.** Pl. 1 foot.

46 *P. VERNA* (Lin. spec. 712.) stems decumbent; lower leaves quinate; leaflets obovate-cuneiform, deeply serrated at the apex, pilose on the nerves, with the teeth blunt; flowers subpanicled; petals obcordate, longer than the calyx.  $\mathcal{U}$ . H. Native of Europe and the north of Asia, in dry places. In Britain in elevated pastures and barren hilly ground, near Kippax, Yorkshire; about Bury, Suffolk; Cambridgeshire; on St. Vincent's Rocks, Bristol; and in the King's Park, Edinburgh. Smith, eng. bot. t. 37. Sturm, deutsch. fl. fasc. 17. with a figure. *P. debilis*, Schleich. cat. 1815. Flowers yellow. There are several slight varieties of this plant.

**Spring Cinquefoil.** Fl. April, May. Britain. Pl. decumbent.

47 *P. PATULA* (Waldst. et Kit. pl. hung. 2. p. 218. t. 199.) stems tufted, rather decumbent, beset with adpressed pili; radical leaves with 7-9 leaflets; leaflets cuneiform, deeply toothed at the apex, naked above, but pilose beneath; petals retuse, longer than the calyx.  $\mathcal{U}$ . H. Native of the Carpathian mountains. Nestl. pot. 56. Flowers yellow.

**Spreading Cinquefoil.** Fl. May, July. Clt. 1818. Pl. tufted.

48 *P. OPAEA* (Lin. spec. 713.) stems decumbent, filiform; leaflets 5-7 on the lower leaves, lanceolate-cuneiform, deeply serrated, pilose on both surfaces; petals obcordate, about equal in length to the calyx or a little longer; stipulas entire, bifid or trifid.  $\mathcal{U}$ . H. Native throughout Europe, Siberia, and of Labrador. In Scotland on the hills of Clova, Angusshire, as also in Perthshire. Jacq. icon. rar. t. 91. Smith, engl. bot. 2149. *P. dubia*, Sut. fl. helv. 1. p. 308. *P. Galiciana*, Pohl. et Bess. Flowers yellow, disposed in a leafy corymb; pedicels filiform; stems purplish.

**Opaque Cinquefoil.** Fl. May, June. Britain. Pl. ascending  $\frac{1}{2}$  foot.

49 *P. AU'REA* (Lin. spec. 712.) stems ascending; radical leaves quinate; leaflets oblong-cuneiform, middle one stalked, serrate-toothed at the apex, rather silky, with silky ciliated margins; petals obcordate, nearly twice the length of the calyx.  $\mathcal{U}$ . H. Native of the Alps of Europe. *P. Halleri*, Ser. mus. helv. 1. p. 75. *P. maculata*, Gilb.—Hall. enum. t. 6. f. 4. hist. no. 1122. t. 21. f. 6. Flowers yellow.

**Golden-flowered Cinquefoil.** Fl. May, June. Scotland. Pl. decumbent  $\frac{1}{2}$  foot.

50 *P. ALPESTRIS* (Hall. fl. in Ser. mys. helv. 1. p. 53. Smith, engl. fl. 2. p. 419.) stems ascending; radical leaves of 5, rarely of 7 wedge-shaped, rather hairy leaflets, deeply cut in their upper half; upper stipulas ovate; pedicels axillary and terminal, long; petals heart-shaped; calycine segments acute.  $\mathcal{U}$ . H. Native of Switzerland, Denmark, and Lapland. In England in the county of Durham, and on rough stony ground at Hafod, Cardiganshire. In Scotland on Ben Lawers, and other mountains of Breadalbane. *R. Salisburgensis*, Hænke in Jacq. coll. vol. 2. p. 68. icon. rar. t. 490. *P. aurca*, Smith, fl. brit. 549. engl. bot. 561. Fl. dan. 114. Ser. mus. helv. 1. p. 72. t. 8. *P. verna*  $\beta$ , Wahl. fl. lapp. 146. *P. verna*  $\gamma$ , Nestl. pot. 52. Corolla of an orange or tawny yellow-colour.

**Alp Cinquefoil.** Fl. July. Britain. Pl.  $\frac{1}{2}$  to 1 foot.

51 *P. CROCEA* (Hall. fl. in Schleich. cat. 1807. p. 20.) stems ascending; lower leaves quinate; leaflets oblong-cuneate, bluntly rounded at the apex, rather hairy, deeply serrated at the

top; the teeth obtuse; petals obcordate, twice the length of the calyx.  $\mathcal{U}$ . H. Native of the Alps of Switzerland and Salzburg. *P. filiformis*, D. C. fl. fr. 6. p. 542. *P. Pyrenæica*, Poir. suppl. 4. p. 539. *P. heterophylla*, Nestl. pot. 56. *P. verna*, Wahl. *P. adscendens*, Lapeyr. *P. rotundifolia*, Vill. *P. Sabauda*, D. C. fl. fr. 4 and 5. no. 3738. *P. rubens*, Horn. hort. hafn. 2. p. 447. Corolla large, copper-coloured.

**Copper-coloured-flowered Cinquefoil.** Fl. May, July. Clt. 1816. Pl. ascending  $\frac{1}{2}$  foot.

52 *P. GERANIODES* (Willd. spec. 1101.) stem decumbent; lower leaves with 5-7 leaflets; leaflets cuneiform, somewhat palmately pinnatifid, pilose, with the segments linear; petals obcordate, a little longer than the calyx.  $\mathcal{U}$ . H. Native of Armenia and Syria. Nest. pot. 47. t. 5. f. 1. Corolla yellow.

**Geranium-like Cinquefoil.** Fl. May, July. Clt. 1820. Pl. decumbent.

53 *P. LINDACKERI* (Tauch. ex Spreng. syst. 2. p. 538.) leaves quinate, silky beneath; leaflets cuneiform, deeply toothed, the teeth oblong and roundish; stems filiform, procumbent; petals exceeding the calyx.  $\mathcal{U}$ . H. Native of Bohemia.

**Lindacker's Cinquefoil.** Pl. proc.

54 *P. RANUNCULOIDES* (Humb. et Bonpl. in Nestl. pot. 56. t. 3. f. 1. H. B. et Kunth, nov. gen. amer. 6. p. 216.) stems erect, few-flowered; radical leaves with 5-7 obovate, roundish, bluntly toothed, nearly glabrous leaflets; petals obcordate, a little longer than the calyx.  $\mathcal{U}$ . F. Native of Mexico, at the bottoms of the mountains called Cerro de las Cruces. *P. macrorrhiza*, Schlecht. consp. pot. in berol. mag. 7. p. 292. Lehm. pot. 114. Flowers yellow.

**Ranunculus-like Cinquefoil.** Pl.  $\frac{1}{2}$  foot.

55 *P. HYEMALIS* (Schlecht. et Cham. in Linnæa. 5. p. 572.) root thick; radical leaves quinate; leaflets ovate, obtuse, crenate-toothed, green and pilose above, but clothed with white tomentum beneath; stems ascending, corymbose at the apex, 7-15-flowered, very hairy, as well as the calyxes; calycine segments lanceolate, acute; receptacle villous.  $\mathcal{U}$ . G. Native of Mexico, at Cruz Blanca. Flowers yellow, about the size of those of *P. alba*.

**Winter Cinquefoil.** Fl. Nov. Pl.  $\frac{1}{2}$  foot.

56 *P. THOMASII* (Tenore, prod. 2. suppl. 1. p. 61. fl. neap. 1. p. 285. t. 44.) stem erectish, corymbiferous; radical leaves with 5, rarely with 7 leaflets; leaflets obovate, coarsely toothed, clothed on both surfaces with silky villi, greenish above, but hoary beneath; petals obcordate.  $\mathcal{U}$ . H. Native of Italy. Flowers yellow.

**Thomas's Cinquefoil.** Pl. 1 foot.

57 *P. ARGENTEA* (Lin. spec. 712.) stems ascending; leaves quinate; leaflets cuneiform, deeply cut at the top, clothed with white tomentum beneath, the margins revolute; petals retuse, longer than the calyx.  $\mathcal{U}$ . H. Native of Europe; plentiful in Britain, and of Canada. Smith, engl. bot. t. 89. Fl. dan. t. 865. Flowers yellow.

*Var.  $\beta$ , dentata* (Wallr. sched. 237.) leaflets almost entire, only with 2 or 3 teeth at the apex, tomentose beneath.  $\mathcal{U}$ . H. Native of Germany and America. *P. cinerea*, Rafin. in litt.

*Var.  $\gamma$ , dissæcta* (Wallr. sched. 237.) leaflets more or less deeply divided into linear segments, tomentose beneath.  $\mathcal{U}$ . H. Native of Germany and France.

*Var.  $\delta$ , minuta* (Ser. mss. in D. C. prod. 2. p. 577.) stems few-flowered, and are, as well as the leaves, very small, tomentose beneath.  $\mathcal{U}$ . H. Native about Geneva.

**Silvery Cinquefoil.** Fl. June, Aug. Britain. Pl. 1 foot.

58 *P. GUNTHERI* (Pohl. tent. 2. p. 185. Lehm. pot. 97. t. 10.) stems weak, diffuse; lower leaves quinate, upper ones ternate; leaflets cuneate, acutely serrated at the top, canescent beneath, with flat margins; petals retuse, a little longer than the

calyx. 2. H. Native of Silesia and Bohemia, in arid places. P. Weimanniæna, Gunther. Flowers yellow.

*Gunther's Cinquefoil.* Fl. Ju. July. Clt. 1818. Pl.  $\frac{1}{2}$  to 1 foot.

59 P. CALABRA (Tenor. suppl. 2. p. 67. fl. neap. 1. p. 287. t. 45.) stems prostrate; leaves quinate, tomentose on both surfaces, very white beneath; leaflets cuneiform, multifid; petals longer than the calyx. 2. H. Native of Calabria, on the mountains. Flowers yellow.

*Var.  $\beta$ , impolita* (Wahl. fl. carp. p. 507.) stems ascending, firm; leaflets pectinately toothed, tomentose on both surfaces.

*Calabrian Cinquefoil.* Fl. June, July. Clt. 1820. Pl. pros.

60 P. DECLINATA (Horn. hort. hafn. p. 56.) stems prostrate; lower leaves quinate; leaflets lanceolate, deeply cut; cauline leaves ternate; petals shorter than the calyx. 2. H. Native country unknown. Flowers small, yellow.

*Declinate Cinquefoil.* Fl. June, July. Clt. 1817. Pl. pros.

61 P. PETRÆA (Schlecht. berol. mag. ann. 7. p. 292. Lehm. pot. 119. t. 11.) stems ascending; leaves quinate; leaflets cuneiform-rhomboid, deeply serrated at the apex, clothed with hoary silky down on both surfaces; corollas small; petals roundish-obcordate, exceeding the calyx. 2. H. Native of France, about Dijon, in rocky stony places.

*Rock Cinquefoil.* Fl. May, July. Clt. 1819. Pl.  $\frac{1}{2}$  to 1 ft.

62 P. COLLINA (Wibel. prim. fl. werth. 2. p. 267. ex Lehm. pot. 99.) stems ascending; lower leaves quinate, upper ones ternate; leaflets cuneiform, bluntly toothed at the apex, clothed with canescent tomentum beneath, with flat margins; petals rather retuse, longer than the calyx. 2. H. Native of Wertheim, in fields. Flowers yellow.

*Hill Cinquefoil.* Fl. June, July. Clt. 1816. Pl. 1 foot.

63 P. INTERMEDIA (Lin. mant. 76.) stems erect, dichotomous; lower leaves with 7 leaflets, cauline ones quinate or ternate; leaflets obovate-oblong, nearly glabrous; panicle leafy; petals obcordate, a little longer than the calyx. 2. H. Native of Switzerland, Dauphiny, and the Pyrenees, Nestl. pot. 49. t. 8. Ser. mus. helv. 1. p. 76. P. Nestleriæna, Tratt. ros. 4. p. 91. P. alchemilloides, Schlecht. P. varians, Moench. Flowers yellow.

*Var.  $\beta$ , macrostala* (Ser. in D. C. prod. 2. p. 577.) flowers large; leaves small; stipulas ovate. P. intermedia, Thom. cat. 1818. p. 24.

*Var.  $\gamma$ , elongata* (Ser. l. c.) leaflets smaller and narrower; stem elongated. P. elongata, Goldb. ex Fisch. gor. in litt.

*Intermediate Cinquefoil.* Fl. May, Sept. Clt. 1786. Pl. 1 to  $1\frac{1}{2}$  foot.

64 P. INCISA (Desf. cat. hort. par. ex Nestl. pot. 51. t. 4. f. 1. but not of Lag.) stems decumbent, dichotomous; lower leaves quinate, upper ones ternate; leaflets oblong-cuneiform, deeply cut at the apex, pilose; petals cuneate, retuse, a little longer than the calyx. 2. H. Native country unknown. Corolla pale yellow.

*Cut-leaved Cinquefoil.* Fl. June, July. Clt. 1818. Pl. dec.

65 P. GRACILIS (Dougl. mss. Hook. fl. bor. amer. 192.) stems erect, tall, beset with soft hairs, corymbosely panicked at the apex; leaves quinate, lower ones on long petioles, upper ones almost sessile; leaflets lanceolate, deeply and pinnatifidly serrated, clothed with white tomentum beneath; stipulas large, lanceolate, entire; petals obcordate, longer than the calyx, which is silky. 2. H. Native of North America, on the banks of the Columbia and the plains of the Mulnomak river. Hook. bot. mag. t. 2984. Flowers golden yellow.

*Slender Cinquefoil.* Clt. 1826. Pl. 1 to 2 feet.

66 P. LODDIGESII (Spreng. syst. app. 199.) stems erect, hoary, pilose; leaves with 5-7 leaflets; leaflets pinnatifidly serrated, hairy above, hoary and pilose beneath; flowers corymbose; petals retuse, exceeding the calyx. 2. H. Native of

Siberia. P. vinosa, Lodd. bot. cab. with a figure. Flowers yellow.

*Loddiges's Cinquefoil.* Fl. June, July. Pl. 1 foot.

67 P. NORMA'LIS (Bess. ex Spreng. syst. append. p. 199.) stem erect, densely woolly as well as the leaves; leaves quinate; leaflets pinnatifid, white beneath; stipulas oblong, cut; peduncles corymbose; petals exceeding the calyx. 2. H. Native of Podolia, at Tyra. Flowers yellow.

*Normal Cinquefoil.* Pl. 1 foot.

68 P. FLABELLIFORMIS (Lehm. pug. 2. p. 12.) stem erect, slender; leaves with 7-9 leaflets; leaflets deeply pinnatifid, beset with adpressed pili above, but with white hoary tomentum beneath, with the segments linear, distant, and revolute at the margins; flowers corymbose; petals obcordate, exceeding the calyx. 2. H. Native of North America, in the plains of the Saskatchewan. Hook. fl. bor. amer. p. 192. t. 64. Corolla golden yellow.

*Fan-formed-leaved Cinquefoil.* Pl.  $1\frac{1}{2}$  foot.

69 P. CHRYSANTHA (Trev. ind. sem. hort. wratisl. 1828.) stems ascending, beset with spreading pili; leaves with 5, rarely with 7 leaflets, upper ones ternate, pubescent; leaflets oblong-cuneate, deeply serrated; upper stipulas rather cut; petals obcordate, twice the length of the calyx. 2. H. Native of Siberia, in dry grassy places and on the sides of hills; of North America in moist prairies near the Rocky Mountains, and of Germany. Led. fl. ross. alt. illust. t. 338. P. Thuringiæa, Bernh. ex Link. enum. pl. hort. berol. 2. p. 64. Flowers golden yellow, loosely corymbose.

*Golden-flowered Cinquefoil.* Fl. Ju. July. Clt. 1827. Pl. 1 ft.

70 P. DESERTORUM (Bunge, in Led. fl. ross. alt. ill. t. 337. fl. alt. 2. p. 257.) stems erect, clothed with viscid glandular hairs, as well as the leaves; leaflets obovate, bluntly toothed; stipulas entire; panicle dichotomous; petals obcordate. 2. H. Native of Altaia, on the Arkat mountains in the Soongarian desert. Stems purplish at the base. Corolla yellow. Very like P. geoides.

*Desert Cinquefoil.* Fl. July. Pl. 1 foot.

71 P. DEALBATA (Bunge in Led. fl. ross. alt. ill. t. 326. fl. alt. 2. p. 250.) stems ascending, pubescent; leaves with 5 or 7, rarely with 9 leaflets, upper ones ternate, all smoothish above, but clothed with white tomentum beneath; leaflets oblong, cuneate at the base, pectinately pinnatifid, with revolute margins; stipulas nearly entire; petals obovate, hardly exceeding the calyx. 2. H. Native of Altaia, at the rivers Irtysh, Bekun, Kurtschum, in meadows, and near Loktewsk. Flowers yellow, panicked.

*Whitened-leaved Cinquefoil.* Fl. May, June. Pl. 1 foot.

72 P. CONCI'NNA (Richards in Frankl. first journ. ed. 2. app. p. 20.) stem short, few-flowered; radical leaves with 7 leaflets, and cauline ones ternate; leaflets obovate-cuneate, serrated at the apex, densely clothed with white tomentum beneath; petals obcordate, exceeding the calyx. 2. H. Native of North America, on the plains of the Saskatchewan about Carlton House. Hook. fl. bor. amer. p. 193. t. 67. Petioles and peduncles woolly. Flowers golden yellow.

*Neat Cinquefoil.* Pl. 2 to 3 inches.

73 P. LEPTOPETALA (Lehm. ind. sem. hort. hamb. 1830. p. 8. pug. 3. p. 32.) stems ascending, pilose, nearly leafless; leaves quinate; leaflets oval, serrated, densely clothed with white tomentum beneath; stipulas ovate, entire; petals obcordate, veiny, shorter than the calyx. 2. H. Native of mountains between the town of Mexico and Toluco. Root brown, woody. Corolla small, yellow.

*Slender-petalled Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

74 P. WALLICHIANA (Del. in Wall. cat. no. 1023. Lehm. pug. 3. p. 30.) stems erect, bluntly angled; leaves quinate,

pilose on both surfaces; leaflets stalked, obovate, bluntly serrated at the apex; flowers panicle, crowded; calycine segments lanceolate, outer ones usually bifid; petals emarginate, a little longer than the calyx.  $\mathcal{U}$ . II. Native of Nipaul. Corolla yellow.

*Wallich's Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

75 *P. VIRGATA* (Lehm. pot. 75. no. 27.) stem erect, twiggy; leaves with 7-9 leaflets; leaflets lanceolate, pinnatifid, glabrous above, and clothed with white tomentum beneath; stipulas lanceolate, entire; corolla small; petals obovate, quite entire, twice the length of the calyx.  $\mathcal{U}$ . H. Native country unknown. Flowers yellow, panicle at the tops of the branches.

*Twiggy Cinquefoil.* Fl. June, July. Clt. 1820. Pl.  $1\frac{1}{2}$  foot.

76 *P. CANESCENS* (Bess. fl. galic. no. 607. 1. p. 330.) stem erect, many-flowered; leaves quinate; leaflets oblong-cuneiform, deeply serrated, clothed with adpressed pili above, and canescent from tomentum beneath; stipulas ovate-lanceolate, entire or toothed; petals obcordate, length of calyx.  $\mathcal{U}$ . H. Native of Europe, Caucasus, and Siberia. *P. Hungarica*, Schlecht. *P. parviflora*, Gaud. *P. ornithopoda*, Tausch. hort. can. 1. fasc. 1. t. 10. ex Tratt. ros. 4. p. 54. ?—Jacq. fl. aust. 4. t. 383. Flowers yellow.

*Var.  $\beta$ , inclinata* (Ser. in D. C. prod. 2. p. 578.) stems inclinate, weak; leaves clothed with hoary tomentum beneath, smoothish above.  $\mathcal{U}$ . H. *P. inclinata*, Vill. dauph. 3. p. 567. t. 45. Horn. hort. hafn. 2. p. 477. *P. adscendens*, Waldst. et Kit. ex Lehm. pot. 92. *P. internodia*, Schult. obs. bot. p. 95. *P. recta*, Lapeyr. abr. 288. *P. assurgens*, Vill. fl. dauph. 3. p. 567. *P. hirta*, Henke.

*Canescent Cinquefoil.* Fl. June, July. Clt. 1817. Pl. 1 to  $1\frac{1}{2}$  foot.

77 *P. STIPULARIS* (Lin. spec. 712. but not of Lapeyr.) stems erect, weak; lower leaves with 7 leaflets, upper ones ternate; leaflets linear-oblong, tridentate, nearly glabrous; stipulas large, dilated; petals obovate, hardly emarginate, longer than the calyx; receptacle glabrous.  $\mathcal{U}$ . H. Native of Siberia.—Gmel. sib. 3. t. 37. f. 2. Flowers small, yellow, panicle.

*Large-stipuled Cinquefoil.* Fl. June, July. Clt. 1727. Pl.  $\frac{1}{2}$  to 1 foot.

78 *P. HIRTA* (Lin. spec. 712. Lehm. pot. t. 8.) stem pilose, erect, few-flowered; leaves with 5-7 leaflets; leaflets pilose, cuneiform, cut at the apex; stipulas lanceolate, entire; petals obcordate, longer than the calyx.  $\mathcal{U}$ . H. Native of the Pyrenees, south of France, Piedmont, Silesia, Siberia, &c. *P. crysoptala*, Bess. in litt. *P. angustifolia*, D. C. fl. fr. 5. p. 540. Flowers yellow.

*Var.  $\beta$ , rubens* (Ser. in D. C. prod. 2. p. 578.) stem red, decumbent, viscid.  $\mathcal{U}$ . H. *P. hirta  $\beta$  viscosa*, Pers. *P. pilosa*, Vill. dauph. 3. p. 570. Willd. spec. 2. p. 1100. *P. Sibirica*, Patrin.

*Hairy Cinquefoil.* Fl. May, Sept. Clt. 1725. Pl.  $\frac{1}{2}$  to 1 ft.

79 *P. PEDATA* (Poir. suppl. 4. p. 540. Nestl. pot. 447.) stem ascending, reddish; leaves pedate, with 5-7 leaflets; leaflets lanceolate, serrated, pilose on the margins and beneath.  $\mathcal{U}$ . H. Native of Liguria and Piedmont, on hills. Lodd. bot. cab. 579. *P. rubens*, All. fl. pedem. 2. no. 1486. but not of Vill. *P. pilosa*, D. C. fl. fr. 6. p. 540. exclusive of the synonymes, Willd. spec. 2. p. 1100. *P. hirta  $\alpha$ , rubens*, Ser. in D. C. prod. 2. p. 578. Flowers large, golden yellow.

*Pedate-leaved Cinquefoil.* Fl. June, July. Clt. 1819. Pl. ascending 1 foot.

80 *P. ASTRACANICA* (Jacq. icon. rar. 1. t. 92.) stem ascending, pilose, dichotomous; radical leaves quinate; leaflets oblong, bluntly serrated; cauline leaves toothless, tripartite, pubescently pilose; stipulas large; petals obcordate, longer than the calyx.  $\mathcal{U}$ . H. Native of Caucasus and about Constan-

tinople. *P. corymbosa*, Mönch. Flowers terminal and axillary.

*Astracan Cinquefoil.* Fl. Ju. July. Clt. 1787. Pl. 1 to  $1\frac{1}{2}$  ft.

81 *P. TAURICA* (Schlecht. in berol. mag. ann. 7. p. 291. Lehm. pot. 90. t. 9.) stem erect, pilose, many-flowered; leaves quinate; leaflets obovate, cuneate at the base, serrated in front, clothed with adpressed silky pili; stipulas lanceolate, entire; petals obcordate, a little longer than the calyx.  $\mathcal{U}$ . H. Native of Tauria, on the higher mountains, and at Sarcpta in arid places. Flowers large, pale yellow, sub-panicled.

*Taurian Cinquefoil.* Fl. June, July. Clt. 1820. Pl. 1 foot.

82 *P. RECTA* (Lin. spec. 711.) stem erect, pilose; leaves with 5-7 leaflets; leaflets oblong, deeply serrated, beset with spreading pili; lower stipulas lanceolate, entire, upper ones broader and jagged; petals obcordate, exceeding the calyx.  $\mathcal{U}$ . H. Native of Tauria, Caucasus, Austria, Germany, Italy, Switzerland, France, and the Pyrenees. Nestl. pot. 42. t. 6. All. fl. pedem. 71. f. 1. Sav. hort. rom. 5. t. 49. Flowers pale yellow, disposed in terminal corymbs.

*Upright Cinquefoil.* Fl. Ju. Aug. Clt. 1648. Pl. 1 to  $1\frac{1}{2}$  ft.

83 *P. OBSCURA* (Willd. spec. 2. p. 1100.) stem erect, pilose, reddish; leaves with 5-7 leaflets; leaflets oval-oblong, deeply toothed, beset with adpressed pili; stipulas ovate-lanceolate, for the most part cut; petals obcordate, hardly longer than the calyx.  $\mathcal{U}$ . H. Native of Siberia, Tauria, Caucasus, and Italy. NoCCA in Balb. fl. sic. 240. t. 10. *P. recta  $\beta$  obscura*, Poir. suppl. 5. p. 589. *P. recta*, Vill. dauph. 3. p. 569. Flowers golden yellow, corymbose.

*Obscure Cinquefoil.* Fl. Ju. July. Clt. 1800. Pl. 1 to 2 ft.

84 *P. LACINIOSA* (Waldst. et Kit. in litt. ex Nestl. pot. 45. Lehm. pot. 86. t. 9.) stem pilose, erect, reddish; leaves with 5-7 leaflets; leaflets oblong, laciniately pinnatifid, pilose; stipulas deeply jagged; petals obcordate, much longer than the calyx.  $\mathcal{U}$ . H. Native of Hungary. *P. cardiopetala*, Bess. in litt. Flowers yellow, disposed in corymbose panicles.

*Jagged-leaved Cinquefoil.* Fl. June, July. Clt. 1816. Pl. 1 to  $1\frac{1}{2}$  foot.

85 *P. DIVARICATA* (Poir. suppl. 4. p. 540.) stem erect; leaves with 5-7 leaflets; leaflets oblong, tapering a long way at the base, deeply serrated, smoothish; stipulas pinnatifid; petals obcordate, about equal in length to the calyx.  $\mathcal{U}$ . H. Native of Corsica. D. C. fl. fr. 6. p. 541. Stems dichotomously corymbose at the apex, with the branches divaricate. Corolla yellow.

*Divaricate-branched Cinquefoil.* Fl. Ju. July. Pl. 1 to  $1\frac{1}{2}$  ft.

86 *P. VALDERIA* (Lin. spec. 714.) stem erect, hoary as well as the whole plant; leaves with 5-7 leaflets; leaflets obovate, serrated, clothed with silky tomentum, hoary beneath; stipulas lanceolate, entire, rarely denticulated; petals obovate-oblong, hardly emarginate, shorter than the calyx.  $\mathcal{U}$ . H. Native of Piedmont, Valder, &c. in stony places. All. pedem. t. 21. f. 1. Flowers pale sulphur-coloured.

*Valder Cinquefoil.* Fl. May, June. Clt. 1825. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  ft.

\* \* *Flowers white or red.*

87 *P. LUPINOIDES* (Willd. spec. 2. p. 1107. Nestl. pot. 60. Lehm. pot. 126.) stem erect, pilose; leaves with 5-7 leaflets; leaflets obovate, roundish, obtuse, connivently serrated at the apex, densely clothed with silky villi; stipulas large, entire; petals obcordate, shorter than the calyx.  $\mathcal{U}$ . H. Native of the higher alps of Dauphiny and the Pyrenees. Lodd. bot. cab. 654. *P. nivālis*, Lapeyr. abr. p. 290. act. toul. 1. p. 210. t. 16. *P. lupinoides  $\beta$  nivālis*, Pers. ench. 2. p. 55. *P. Valdèria*, Vill. dauph. 3. p. 572. *P. lanata*, Lam. fl. fr. 3. p. 646. *P. integrifolia*, Lapeyr. abr. 291. Corolla white. Flowers 3-6, terminal.

*Lupine-like Cinquefoil.* Fl. July. Clt. 1739. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  ft.

88 *P. CLUSIANA* (Jacq. austr. 2. t. 116. Sims, bot. mag. 1327.) stems ascending, few-flowered, purplish, pubescent; radical leaves quinate, cauline ones ternate; leaflets oval-cuneiform, pubescent, tridentate at the apex, with the teeth connivent; stipulas ovate-lanceolate, entire; petals roundish, hardly longer than the calyx. *Æ. H.* Native of Austria, Styria, Carniola, Tyrol, and Salisburg, on rocks and among stones. *P. caulescens*  $\beta$  *Clusiæna*, Poir. suppl. 5. p. 595. *P. caulescens*, Scop. fl. carn. ed. 2. vol. 1. p. 361. Corymbs terminal. Corolla large, white.

*Clusius's Cinquefoil.* Fl. June, Aug. Clt. 1806. Pl.  $\frac{1}{2}$  foot.

89 *P. CAULESCENS* (Lin. spec. 713.) downy; stem erect, weak, many-flowered, pilose; radical leaves quinate, cauline ones ternate; leaflets obovate, connivently serrated at the apex, with pilose margins; stipulas entire; petals obovate-cuneiform, hardly emarginate, longer than the calyx. *Æ. H.* Native of the south of Europe, on the higher Alps. Jacq. austr. 3. p. 11. t. 220. Sturm, deutsch. fl. fasc. 1. with a figure. *P. alba* var. Lam. fl. fr. 3. p. 118. Peduncles crowded at the tops of the stems. Corolla white.

*Caulescant Cinquefoil.* Fl. May, July. Clt. 1759. Pl.  $\frac{1}{2}$  ft.

90 *P. GLAUCA* (Moris, clenck. sard. p. 18.) plant very clammy; stems ascending; radical leaves quinate, cauline ones ternate or simple; leaflets obovate-cuneiform, pubescent on both surfaces, bluntly and unequally many-toothed at the apex. *Æ. H.* Native of Sardinia. Habit of *P. caulescens*, Lin. but differs from it in the teeth of the leaflets being more close.

*Glaucous Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

91 *P. ALBA* (Lin. spec. 713.) stems procumbent, weak, few-flowered; lower leaves quinate, upper ones ternate; leaflets oblong, connivently serrated at the apex, smoothish above, but clothed with silky canescent down beneath; stipulas lanceolate, entire; petals obcordate, longer than the calyx. *Æ. H.* Native of middle and south Europe and Caucasus. In Wales in mountainous woods according to Mr. Haviland, but not observed by any other person. Smith, engl. bot. 1384. Jacq. austr. 2. t. 115. *P. nitida*, Scop. carn. ed. 2. vol. 1. p. 362. *P. Clusiæna*, Gesh. cat. scap. no. 272. *P. cordata*, Braune, fl. salisb. 2. p. 80. *Fragaria alba*, Crantz. Pedicels axillary and terminal. Flowers white.

*White-flowered Cinquefoil.* Fl. Feb. Aug. Wales. Pl. prostrate.

92 *P. ALCHEMILLOIDES* (Lapcyr. act. toul. 1. p. 212. t. 17.) stems erectish, many-flowered; leaves with 5 or 7 leaflets; leaflets oblong-lanceolate, tridentate at the apex, the teeth connivent, glabrous above, but with silky-silvery down beneath; stipulas of radical leaves subulate, of cauline ones ovate-lanceolate; outer calycine segments lanceolate; petals ovate-oblong, emarginate, a little longer than the calyx. *Æ. H.* Native of the Pyrenees, among rocks. *P. Pyrenæica*, Schlecht. Flowers white.

*Alchemilla-like Cinquefoil.* Fl. July, Aug. Clt. 1823. Pl. 1 ft.

93 *P. COMAROIDES* (Humb. et Bonpl. ex Nestl. pot. 62. t. 4. f. 3. and Kunth, nov. gen. amer. 6. p. 217.) stems firm, erectish; radical leaves quinate, cauline ones ternate; leaflets elliptic, usually 5-toothed at the apex, smoothish above, but clothed with silky hoary down beneath; stipulas entire; petals obcordate, much longer than the calyx. *Æ. H.* Native of Mexico, on mount Jorullo at the height of 1600 feet. *P. rubra*, Schlecht. in berl. mag. nat. 291. Corolla dark purple.

*Comarum-like Cinquefoil.* Fl. Sept. Pl.  $\frac{3}{4}$  foot.

94 *P. COLORATA* (Lehm. sem. hort. hamb. 1821. p. 8.) stems erect, purple; lower leaves quinate, with obovate-lanceolate leaflets; upper leaves ternate, with lanceolate leaflets; leaflets serrated, and beset with silky incumbent pili; stipulas ovate, quite entire, sheathing; petals obcordate, veiny, longer than the calyx.

*Æ. H.* Native of Nipaul. *P. Nepalensis*, Hook. exot. fl. t. 88. *P. formosa*, D. Don, prod. fl. nep. p. 232. Flowers beautiful purple.

*Coloured Cinquefoil.* Fl. Ju. July. Clt. 1822. Pl. 1 to  $1\frac{1}{2}$  ft.

95 *P. RUSSELLIANA* (Sweet, fl. gard. t. 279.) villous; stems branched, diffuse; radical leaves petiolate, ternate, quaternate or quinate; leaflets ovate or obovate, obtuse, deeply serrated, feather-nerved, rather silky beneath; stipulas adnate, ovate-lanceolate, acuminate; calycine segments lanceolate, acute; petals large, obcordate. *Æ. H.* A hybrid between *P. formosa* and *P. atropurpurea*. Petals bright scarlet, with a darker base.

*Russell's Cinquefoil.* Fl. June, Aug. Hybrid. Pl.  $1\frac{1}{2}$  foot.

96 *P. HOPWOODIANA* (Sweet, fl. gard. 2. ser. t. 61.) stems ascending, clothed with villi; lower leaves with 5-6 leaflets, upper ones ternate; leaflets oblong-cuneiform, coarsely toothed, hairy on both surfaces; calycine segments ovate, acuminate; petals obcordate, imbricated, longer than the calyx. *Æ. H.* A hybrid between *R. formosa*, impregnated by the pollen of *P. recta*. Petals beautifully variegated, marked with a spot of deep rose colour at the base, and from it to the centre of a pale straw colour, edged with bright rose colour. Lindl. bot. reg. t. 1383.

*Hopwood's Cinquefoil.* Fl. June, Jul. Hybrid. Pl.  $1\frac{1}{2}$  ft.

97 *P. MACKAYANA* (Sweet, fl. gard. 2. ser. t. 42.) villous; stems ascending, branched; leaves flaccid, radical ones quinate; leaflets oblong-cuneate, coarsely and bluntly toothed; cauline leaves ternate, few-toothed; stipulas ovate, acute, quite entire; petals obcordate, undulated, a little longer than the calyx. *Æ. H.* A hybrid, produced from *P. formosa* impregnated by the pollen of *P. opaca*. Petals pale yellow tinged with red, and light red at the base.

*Mackay's Cinquefoil.* Fl. June, Oct. Hybrid. Pl.  $1\frac{1}{2}$  ft.

### § 3. Leaves pinnately digitate.

98 *P. DIVERSIFOLIA* (Lehm. pug. 2. p. 9. Hook, fl. bor. amer. 190.) stems ascending; radical leaves pinnate, with usually 3 pairs of leaflets, and quinate; cauline leaves with 2 pairs of leaflets, digitate or ternate; leaflets cuneiform, coarsely and deeply toothed above, and clothed with silky pili at the apex; stipulas ovate-lanceolate, quite entire; petals obcordate, longer than the calyx. *Æ. H.* Native of North America, in the alpine prairies, as well as of the higher summits of the Rocky Mountains between lat. 52° and 56°. Corolla yellow.

*Diverse-leaved Cinquefoil.* Pl.  $\frac{1}{4}$  to 1 foot.

99 *P. PULCHERRIMA* (Lehm. pug. 2. p. 10. Hook, fl. bor. amer. p. 190.) stems ascending, villous; leaves impari-pinnate; leaflets crowded, elliptic, equally serrated, beset with adpressed pili above and clothed with white tomentum beneath; stipulas ovate, acute, quite entire, woolly; petals entire, longer than the calyx. *Æ. H.* Native of North America, in the prairies as well as on the dry banks of the Rocky Mountains, between lat. 52° and 56°. Corolla golden yellow.

*Very fair Cinquefoil.* Pl.  $\frac{1}{4}$  foot.

100 *P. RUBRICAU'LIS* (Lehm. pug. 2. p. 11. Hook, fl. bor. amer. p. 191.) stem ascending; radical leaves pinnate, with 2 pairs of leaflets, cauline ones ternate; leaflets approximate, oblong, pinnatifidly serrated, glabrous above and tomentose beneath; stipulas quite entire; petals obcordate, exceeding the calyx a little; receptacle smoothish. *Æ. H.* Native of North America, about Bear Lake, in lat. 66°. Flowers golden yellow, disposed in a dichotomous panicle.

*Red-stemmed Cinquefoil.* Pl. 1 foot.

101 *P. PULCHRELLA* (R. Br. chl. melv. p. 193.) stems procumbent; usually 1-flowered; leaves pinnate, with 2 pairs of leaflets, clothed with silky tomentum beneath; leaflets 2-3-lobed or linear, entire, with revolute edges, the terminal or odd one pinnatifid; stipulas ovate, sheathing; styles glandular and dilated at the base; petals obovate, emarginate, length of calyx. *Æ. H.*

Native of the islands of the Arctic sea; shores of the mainland between the Coppermine and Mackenzie rivers. Corolla yellow.

*Pretty Cinquefoil.* Pl. procumbent.

102 *P. RUTHÉNICA* (Willd. spec. 1079.) stem erect, diffuse, pilose; radical leaves quaternately-pinnate, cauline leaves ternate; leaflets hairy, obovate, unequally and deeply serrated; stipulas oblong-lanceolate, outer side toothed; petals shorter than the calyx.  $\mathcal{U}$ . H. Native of Siberia. Flowers small, yellow, paniced on the tops of the branches; pedicels hairy, primary ones solitary in the forks of the stem.

*Russian Cinquefoil.* Fl. May, June. Clt. 1799. Pl. 1 to 2 ft.

103 *P. DIFFUSA* (Willd. enum. 555.) stem diffuse, beset with spreading pili; radical leaves quaternately pinnate, cauline ones ternate; leaflets lanceolate, unequally and coarsely serrated, beset with spreading pili on both surfaces; primary pedicels solitary; petals retuse, shorter than the calyx.  $\mathcal{U}$ . H. Native country unknown. Flowers small, yellow, paniced at the tops of the branches.

*Diffuse Cinquefoil.* Fl. May, July. Clt. 1817. Pl. 1 foot.

104 *P. DOMBEYI* (Nestl. pot. p. 38. t. 5. f. 2.) stems decumbent, pilose; leaves quaternately pinnate, upper ones ternate; leaflets obovate, cuneiform, hardly pilose, serrated at the apex; stipulas lanceolate, acute, entire; petals a little longer than the calyx; receptacle hairy; carpels glabrous.  $\mathcal{U}$ . H. Native of Chili. Corolla yellow.

*Dombey's Cinquefoil.* Pl. decumbent.

§ 4. *Leaves pinnate. Flowers yellow.*

105 *P. BIFURCA* (Lin. spec. 711.) roots creeping; stems ascending; leaflets about equal in size, bifid or entire, outer ones confluent; stipulas oblong, entire, or a little cut; flowers sub-corymbose; pedicels pilose; petals obovate, entire, longer than the calyx.  $\mathcal{U}$ . H. Native of Iberia, Siberia, and Silesia.—Gmel. itin. 1. t. 37. f. 1. Corolla pale yellow.

*Var.  $\beta$ , subsericea* (Ser. mss. in D.C. prod. 2. p. 580.) stems, leaves, and calyxes smaller, and clothed with rather silky down.  $\mathcal{U}$ . H. Native about Astracan.

*Var.  $\gamma$ , monstrosa* (Fisch. gor. in litt. Led. fl. alt. 2. p. 246.) branches much crowded, short.  $\mathcal{U}$ . H. Native of Dahuria and Altaia, in sterile salt places.

*Forked-leaved Cinquefoil.* Fl. May, Ju. Clt. 1773. Pl.  $\frac{1}{2}$  ft.

106 *P. ASTRAGALIFOLIA* (Led. fl. ross. alt. ill. t. 328. fl. alt. 2. p. 246.) plant clothed with silky villi; stems prostrate, nearly leafless; radical leaves pinnate, usually with 6 pairs of leaflets; leaflets oblong, quite entire, or 2-3-parted, upper ones rather confluent, terminal or odd one trifid; cauline leaves small, simple, entire, or wanting; stipulas oblong, entire, or cut a little; petals nearly orbicular, twice the length of the calyx.  $\mathcal{U}$ . H. Native of Altaia, in sterile deserts on the right bank of the river Tschuja. Flowers pale yellow, 2-4, terminal.

*Milk-catch-leaved Cinquefoil.* Fl. June. Pl. prostrate.

107 *P. JAPONICA* (Blum. bijdr. 1105.) stolons decumbent; radical leaves pinnate, usually with 3 pairs of leaflets, beset with strigose villi; cauline leaves ternate; leaflets obovate, sharply serrated, outer ones largest and approximate; stipulas trifid at the apex.  $\mathcal{U}$ . H. Native of Japan.

*Japan Cinquefoil.* Pl. creeping.

108 *P. GEORDES* (Bieb. fl. taur. 1. p. 401.) plant hairy; stems erect; leaves pinnate; leaflets roundish, a little lobed, hairy, outer ones the largest; stipulas multifid; panicle somewhat dichotomous; calycine segments obtuse, denticulated at the apex; petals obovate, entire, about equal in length to the calyx.  $\mathcal{U}$ . H. Native of Tauria, among rocks towards the top of Mount Tschaturdag. Lehm. pot. t. 2. *P. fragarioides*, Habl. 147. but not of Lin. Corolla yellow, about the size of those of *Geum urbānum*.

*Geum-like Cinquefoil.* Fl. Ju. Jul. Clt. 1820. Pl. 1 to 1 $\frac{1}{2}$  ft.

109 *P. FRAGARIODES* (Lin. spec. 710.) stem erect, dichotomous, with creeping stolons issuing from the base; radical leaves pinnate, cauline ones ternate; leaflets oval, sharply serrated, silky-pilose, outer ones larger and more confluent; stipulas serrated; petals obovate-cuneiform, a little longer than the calyx.  $\mathcal{U}$ . H. Native of Siberia. Lehm. pot. t. 4. Gmel. fl. sib. 3. t. 34. f. 2. *P. poterioides*, Schlecht. berol. mag. ann. 7. p. 286. Plant pilose. Flowers yellow, in corymbose panicles.

*Strawberry-like Cinquefoil.* Fl. May, Ju. Clt. 1773. Pl.  $\frac{1}{2}$  ft.

110 *P. PIMPINELLOIDES* (Lin. spec. 711.) stem erect, pilose; leaves pinnate; leaflets about equal, roundish, dentately serrated, pilose; stipulas cut; petals obcordate, a little longer than the calyx.  $\mathcal{U}$ . H. Native of America, among stones. Nestl. pot. 32. t. 2. f. 1. Buxb. cent. 1. t. 48. Flowers yellow, disposed in dichotomous panicles.

*Pimpernel-like Cinquefoil.* Fl. Ju. Aug. Clt. 1758. Pl. 1 ft.

111 *P. CICUTARIFOLIA* (Willd. spec. 2. p. 1098.) stem erect, beset with adpressed pili; leaves pinnate; leaflets cuneiform, deeply toothed, with a few hairs on both surfaces; stipulas nearly entire; flowers in corymbose panicles; petals obovate, about equal in length to the calyx; receptacle glabrous.  $\mathcal{U}$ . H. Native of Galatia. Nestl. pot. t. 2. f. 2. Flowers yellow, about the size of those of *P. argentea*. Leaves resembling those of *Erodium cicutarium*.

*Cicutarium-leaved Cinquefoil.* Fl. June, Aug. Clt. 1818. Pl.  $\frac{1}{2}$  to 1 foot.

112 *P. SUPINA* (Lin. spec. 711.) stems decumbent, dichotomous; leaves pinnate; leaflets oblong, deeply serrated; stipulas ovate, entire; pedicels axillary, solitary; petals obovate, length of calyx.  $\mathcal{U}$ . H. Native of Europe and Siberia, also of North America, in the plains of the Saskatchewan. Jacq. fl. aust. 5. t. 406. Gmel. itin. vol. 1. t. 27. f. 1. *P. prostrata*, Haenke. Corolla small, yellow.

*Supine Cinquefoil.* Fl. June, Aug. Clt. 1696. Pl. prostr.

113 *P. EFFUSA* (Dougl. mss. Hook. fl. bor. amer. p. 187.) plant clothed with hoary tomentum; stems ascending, weak; leaves interruptedly pinnate; leaflets oblong, deeply serrated; flowers in dichotomous panicles; stipulas lanceolate, acuminate, entire; petals obcordate, equal in length to the sepals, which are acuminate.  $\mathcal{U}$ . H. Native of the north-west coast of America, on the elevated grounds of the Assinaboyné, and the higher parts of the Red river. Receptacle villous. Corolla golden yellow.

*Effuse Cinquefoil.* Pl. ascending.

114 *P. PENNSYLVANICA* (Lin. mant. 76.) stem erect, rather pilose; leaves interruptedly pinnate, clothed with hoary tomentum; larger leaflets oblong, truncate, deeply serrated, smaller ones quite entire, about the size of the segments of the larger ones; stipulas lanceolate, usually entire, but sometimes with a few teeth; petals obcordate, a little longer than the calyx.  $\mathcal{U}$ . H. Native of the south of Europe, North America, and Siberia, plentiful. Jacq. hort. vind. 2. t. 189. *P. hispida*, Poir. suppl. 4. p. 538. Willd. enum. 553. Panicle branched. Flowers yellow.

*Var.  $\beta$ , strigosa* (Lehm. pot. p. 55.) leaflets somewhat pectinately pinnatifid; segments with revolute margins; stipulas jagged.  $\mathcal{U}$ . H. Common in North America and Siberia. *P. pectinata*, Fisch. in litt. *P. absinthifolia*, Dougl.

*Pennsylvanian Cinquefoil.* Fl. June, Aug. Clt. 1725. Pl. 1 to 2 feet.

115 *P. MISSOURICA* (Horn. ex Lindl. bot. reg. 1412.) stem erect; leaves pinnate, with usually 3 pairs of leaflets, hoary and silky above, and clothed with white down beneath; leaflets oblong, pinnatifid, with the segments lanceolate-linear and acute;

stipulas foliaceous, cut; flowers corymbose; petals emarginate, longer than the woolly calyx. *2. H.* Native of North America, on the plains of the Missouri. *P. arguta*, Spreng. syst. 2. p. 534. but not of Pursh. Flowers yellow.

*Missouri Cinquefoil.* Fl. June, Aug. Clt. 1827. Pl.  $1\frac{1}{2}$  foot.

116 *P. ARGUTA* (Pursh, fl. amer. sept. 2. p. 736.) stem erect, pubescent, clammy at the apex; leaves pinnate; leaflets roundish-ovate, oblique at the base, doubly and deeply toothed; stipulas almost entire; calyxes acute, shorter than the petals, which are obovate and entire. *2. H.* Native of North America, in the woody country as far as lat.  $65^{\circ}$ . north, and westward to the Rocky Mountains, and at Fort Vancouver on the Columbia. Hook. fl. bor. amer. p. 186. t. 63. Lindl. in bot. reg. t. 1379. *P. confertiflora*, Torrey, fl. unit. st. 1. p. 199. *P. obliqua*, and *P. ferruginea*, Dougl. *P. sylvestris*, Bigel. fl. host. 2. p. 206. *Gœum agrimonoides*, Pursh, fl. amer. sept. 1. p. 351. Plant pubescent all over. Flowers pale yellow. Panicle crowded, dichotomous.

*Sharp-serrated-leaved Cinquefoil.* Fl. June, Jul. Clt. 1826. Pl. 1 to 3 feet.

117 *P. HIPPIA'NA* (Lehm. pug. 2. p. 7. Hook. fl. bor. amer. p. 188. t. 64.) stem erect; leaves pinnate, leaflets lanceolate, oblong, deeply and connivently serrated, silky above, and clothed with hoary shining tomentum beneath; stipulas lanceolate, acuminate, quite entire; panicle somewhat dichotomous, loose; petals obcordate, exceeding the calyx. *2. H.* Native of North America, on the plains of the Saskatchewan and prairies of the Rocky Mountains. *P. leucophylla*, Torrey, ann. lyc. 2. p. 197. but not of Pall. itin. 3. p. 194. *P. dealbata*, Dougl. mss. Flowers yellow.

*Hippio's Cinquefoil.* Fl. June, July. Pl. 1 to 2 feet.

118 *P. BIPINNATIFIDA* (Dougl. mss. Hook. fl. bor. amer. p. 188.) stem erect; leaves pinnate; leaflets obovate, pectinately pinnatifid, clothed with silky silvery down above, and with white tomentum beneath; stipulas rhomboid, cut; flowers corymbose, crowded; petals obovate, entire, longer than the calyx. *2. H.* Native of North America, in Louisiana and plains of the Saskatchewan and Red rivers. *P. arguta*, Lehm. pot. p. 62. but not of Pursh. Flowers yellow.

*Bipinnatifid-leaved Cinquefoil.* Fl. June, July. Clt. 1826. Pl. 1 to 2 feet.

119 *P. DRUMMONDI* (Lehm. pug. 2. p. 9. Hook. fl. bor. amer. p. 189. t. 65.) stem herbaceous; radical leaves irregularly and subverticillately pinnate, cauline ones with 2 pairs of leaflets; leaflets obovate, truncate, cuneate at the base, profoundly serrated, ciliated, smoothish; stipulas ovate, entire; petals obcordate, veiny, twice the length of the calyx. *2. H.* Native of North America, in alpine woods on the Rocky Mountains, north of the Smoking River, in lat.  $56^{\circ}$ . Panicle terminal. Petals golden yellow.

*Drummond's Cinquefoil.* Fl. Ju. Jul. Clt. 1826. Pl. 1 to 2 ft.

120 *P. VISCOSA* (Donn, hort. cantab. ed. 7. and Lehm. pot. p. 57.) stems erect, and are as well as the leaves clothed with clammy pubescence: leaves greenish on both surfaces, pinnate; leaflets oblong, sharply and deeply serrated, superior ones decurrent, lower ones small; stipulas almost entire; petals obovate, emarginate, hardly longer than the calyx; receptacle pilose. *2. H.* Native of Dahuria and Siberia, on rocks at the rivers Tscharysch and Buchtorn, and in fields at the river Irtysh. Led. fl. ross. alt. ill. t. 343. *P. hispida*, Nestl. pot. t. 36. but not of Willd. *P. longifolia* and *P. nudicaulis*, Schlecht. berl. mag. p. 287. *P. pennsylvanica*, Horn. hort. hafn. 2. p. 476. *P. pubescens*, Manch. meth. p. 658. *P. dentata*, Vitm. Flowers yellow, crowded at the tops of the branches into a few-flowered panicle.

*Clammy Cinquefoil.* Fl. Ju. Aug. Clt. 1797. Pl. 1 to  $1\frac{1}{2}$  ft.

121 *P. AGRIMONIOIDES* (Bieb. fl. taur. 1. p. 403.) stems ascending, beset with spreading villi; leaves interruptedly pinnate; leaflets numerous, obovate-oblong, obtuse, deeply and bluntly toothed or almost pinnatifid, pubescent above, and clothed with hoary villi beneath; stipulas nearly entire, ovate-lanceolate; petals longer than the calyx; receptacle villous. *2. H.* Native of Armenia, and Siberia in dry grassy places at the river Irtysh. Led. fl. ross. alt. ill. t. 327.—Gmel. sib. 3. t. 38. Flowers yellow, disposed in a terminal panicle.

*Agrimony-leaved Cinquefoil.* Fl. May, June. Clt. 1817. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

122 *P. STRICTOSA* (Pall. ex Tratt. no. 31. exclusive of the American plant. Led. fl. alt. 2. p. 237.) stem erect, straight, pubescent; leaves pinnate; leaflets oblong, cuneate at the base, deeply and pectinately toothed, with revolute margins, clothed with hoary pubescence above and with woolly tomentum beneath; stipulas half pinnate; flowers panicle; petals obovate, hardly exceeding the calyx. *2. H.* Native of Altaia, at the river Tscharysch and Tschuja.—Gmel. sib. 3. p. 181. no. 29. t. 34. f. 1. Flowers yellow.

*Strigose Cinquefoil.* Fl. June, July. Pl. 1 foot.

123 *P. FILIP'NDULA* (Schlecht. berol. mag. ann. 7. p. 286. ex Lehm. pot. 59.) stem erect, pilose; leaves interruptedly pinnate, beset with spreading pili, pale green on both surfaces; leaflets lanceolate, pinnatifidly serrated, smaller ones quite entire, outer ones confluent; stipulas toothed; panicle crowded, somewhat trichotomous; petals obcordate, exceeding the calyx; receptacle villous. *2. H.* Native of Dahuria. Corolla yellow.

*Dropwort-like Cinquefoil.* Fl. June, July. Clt. 1823. Pl. 1 to 2 feet.

124 *P. TANACETIFOLIA* (Schlecht. berol. mag. ann. 7. p. 286. ex Lehm. pot. p. 60.) stems ascending, pilose; leaves pinnate, very hairy; leaflets lanceolate, pinnatifidly serrated, upper ones opposite, with the terminal one stalked; stipulas jagged; panicle terminal, corymbose; petals obcordate, twice the length of the calyx; receptacle villous. *2. H.* Native of Siberia. Corolla pale yellow.

*Tansy-leaved Cinquefoil.* Pl.  $\frac{1}{2}$  to 1 foot.

125 *P. SANGUISORBA* (Schlecht. berol. mag. ann. 7. p. 286. ex Lehm. pot. 61. t. 5.) stem erect, 1-2-flowered, glabrous, purplish; leaves pinnate, quite glabrous; leaflets obovate, bluntly serrated; stipulas cut; petals obcordate, hardly the length of the calyx; receptacle glabrous. *2. H.* Native of Siberia. Corolla cream-coloured.

*Burnet-like Cinquefoil.* Fl. Ju. Jul. Clt. 1826. Pl.  $\frac{1}{2}$  to 1 ft.

126 *P. MICROPE'TALA* (D. Don, prod. fl. nep. 231.) stems almost simple, slender; lower leaves pinnate, upper ones ternate; leaflets 7-9, obovate-oblong, serrate-toothed, outer ones much the largest, all clothed with white tomentum beneath; stipulas oblong, obtuse, scarious, quite entire; pedicels opposite the leaves, usually solitary; petals oval, quite entire, one half shorter than the calyx. *2. H.* Native of Gosaingsthan. Corolla small, yellow. Outer calycine segments bifid or bipartite. *Cómarum flávum*, Hamilt. Roxb. hort. beng. p. 36. *P. albiflorum*, Wall. cat. no. 1018.

*Small-petalled Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

127 *P. LESCHENAULTIA'NA* (D. C. prod. 2. p. 584.) plant thickly beset with yellow hairs; stems ascending, few-flowered; radical leaves pinnate, cauline ones ternate, on short petioles; leaflets obovate-roundish, obtuse, crenate-toothed, outer ones the largest, silky above and clothed with white tomentum beneath; stipulas dilated, almost quite entire; petals obcordate, longer than the calyx. *2. H.* Native of the East Indies, on the Neelgherry Mountains, where it is called *Guhè-gueda*, according to Leschenault. Corolla yellow.

*Leschenault's Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

128 *P. LEUCONOTA* (D. Don, prod. fl. nep. p. 230.) stems erect, almost simple; leaves pinnate, with many pairs of leaflets; leaflets oblong, deeply serrated, green above, but clothed with silvery white down beneath; stipulas ovate, deeply serrated; flowers small, sub-umbellate, involucred; calycine segments nearly equal; petals obovate, quite entire, exceeding the calyx.  $\mathcal{U}$ . H. Native of Gosaingsthan. Corolla yellow.

*White-backed-leaved Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

129 *P. POLYPHYLLA* (Wall. cat. no. 1026. Lehm. pug. 2. p. 14.) stem erect; leaves interruptedly pinnate, with many pairs of leaflets; leaflets quite glabrous, lined with veins, the large ones oblong and bluntly crenate-toothed; stipulas sheathing, oval, crenate-toothed; outer calycine segments large, 3-lobed, with the lateral lobes small; petals obovate-orbicular, longer than the calyx.  $\mathcal{U}$ . H. Native of Gosaingsthan. Panicle terminal, corymbose. Corolla golden yellow.

*Var.  $\beta$ , barbata* (Wall. cat. 1030.) stem very pilose; calyxes more foliaceous.

*Many-leafletted Cinquefoil.* Pl. 1 to  $1\frac{1}{2}$  foot.

130 *P. PEDUNCULARIS* (D. Don, prod. fl. nep. p. 230.) stem slender, erect, simple, few-flowered, leafless at the apex; leaves radical, pinnate, length of stem; leaflets oblong, contiguous, sharply and deeply serrated, rather silky above and silvery beneath; outer calycine segments longest, usually 2-3-cleft; petals nearly orbicular, entire, twice the length of the calyx.  $\mathcal{U}$ . H. Native of Gosaingsthan. *P. velutina*, Wall. cat. 1016. but not of Lehm. Corolla yellow. Habit of *P. anserina*.

*Peduncular Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

131 *P. COMMUTATA* (Lehm. pug. 2. p. 16.) stems ascending, 1-2-flowered, almost leafless; leaves pinnate, with many pairs of leaflets, green above, but clothed with silky villi beneath; leaflets oblong, deeply serrated or somewhat pinnatifid; flowers small, outer calycine segments oblong, obtuse, the rest ovate, acute.  $\mathcal{U}$ . H. Native of Kamaon. *P. microphylla*  $\hat{c}$ , latifolia, Wall. cat. no. 1010. Corolla small, yellow.

*Changed Cinquefoil.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

132 *P. MICROPHYLLA* (D. Don, prod. fl. nep. p. 231. Wall. cat. no. 1010. Lehm. pug. 2. p. 17.) plant humble, tufted, clothed with silky villi; stems erect, 1-flowered, almost leafless, peduncle-formed, length of leaves; leaves pinnate, with many pairs of leaflets; leaflets crowded, deeply and digitately pinnatifid; segments linear, bluntish; petals obovate, quite entire, twice the length of the calyx.  $\mathcal{U}$ . H. Native of Gosaingsthan. Flowers golden yellow.

*Var.  $\beta$ , glabriuscula* (Wall. l. c.) plant a little larger, and less silky, villous.

*Var.  $\gamma$ , depressa* (Wall. l. c.) plant more densely tufted; stems shorter.

*Small-leaved Cinquefoil.* Pl. 2 to 3 inches.

133 *P. CHINENSIS* (Ser. in D. C. prod. 2. p. 581.) canescent; stem erect, paniculately corymbose at the apex, many-flowered; leaves interruptedly pinnate, larger leaflets oblong, pectinately-pinnatifid, glabrous above, and clothed with hoary tomentum beneath, with the nerves rather prominent; segments parallel, spreading, linear, with revolute edges; stipulas ovate, upper ones cut; flowers small; outer calycine segments minute.  $\mathcal{U}$ . H. Native of China, in the province of Pichiley. Corolla yellow.

*China Cinquefoil.* Pl.  $1\frac{1}{2}$  foot.

134 *P. GERARDIANA* (Lindl. in Wall. cat. no. 1023. Lehm. pug. 2. p. 23.) plant woolly; stem erect, slender; leaves pinnate; leaflets 5-7, green above, and densely clothed with villi beneath, outer ones much the largest, obovate, bluntly serrate-toothed; stipulas broad, lanceolate, quite entire; flowers terminal, sub-corymbose; petals obovate-cuneiform, somewhat 2-lobed, longer than the calyx.  $\mathcal{U}$ . H. Native of Sirmore. Corolla yellow.

*Gerard's Cinquefoil.* Pl.  $\frac{1}{2}$  to 1 foot.

135 *P. NIVALIS* (Torrey, ann. lyc. 2. p. 32. t. 3. f. 1.) plant nearly glabrous; stems erect, leafless, 1-flowered; leaves pinnate, with numerous, contiguous, somewhat imbricated, ovate, rather ciliated 2-3-lobed leaflets, upper ones confluent; lobes acute, spreading; petals nearly orbicular, quite entire, a little longer than the calyx.  $\mathcal{U}$ . H. Native of North America, among the Rocky Mountains. Corolla yellow.

*Snow Cinquefoil.* Pl.  $\frac{1}{4}$  foot.

136 *P. MOORCROFTII* (Wall. cat. 1014. Lehm. pug. 3. p. 29.) stem erect, simple, few-flowered; leaves pinnate, with 3-4 pairs of leaflets, pilose above, and glabrous beneath; leaflets obovate-oblong, almost quite entire, terminal one trifid; stipulas ovate-lanceolate, quite entire, ciliated; inner calycine segments ovate-roundish, obtuse; petals obovate, quite entire, longer than the calyx.  $\mathcal{U}$ . H. Native of Ladak. Corolla yellow.

*Moorcroft's Cinquefoil.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

137 *P. ANSERINA* (Lin. spec. 710.) roots and stems creeping; leaves interruptedly pinnate; leaflets oval, sharply serrated, silky; pedicels axillary, solitary, length of leaves; stipulas multifid; petals obovate, longer than the calyx.  $\mathcal{U}$ . H. Native of Europe, Siberia, and America, in meadows and by road sides; plentiful in Britain. Smith, engl. bot. 861. Sturm, deutsch. fl. with a figure. Fl. dan. t. 544. Curt. lond. t. 31. Corolla large, yellow. The roots are astringent, with a sweetish taste, and were formerly used for tanning leather.

*Var.  $\beta$ , geminiflora* (Ser. in D. C. prod. 2. p. 582.) flowers twin.—Moris. hist. sect. 2. t. 20. f. 4. *P. anserina*  $\beta$ , Nestl. pot. 35. Lehm. pot. 72.

*Var.  $\gamma$ , cóncolor* (Ser. l. c.) leaves silky on both surfaces.

*Var.  $\delta$ , Grœnlândica* (Tratt. ros. 4. p. 13.) leaves smaller, with fewer pairs of leaflets; leaflets ovate-roundish, pinnatifidly serrated, glabrous above; stolons very long.  $\mathcal{U}$ . H. Native of Greenland.

*Goose Cinquefoil, Silver-weed, or Goose Tansey.* Fl. May, Sept. Britain. Pl. creeping.

138 *P. SIEMERSIANA* (Lehm. sem. hort. hamb. 1821. p. 8. pug. 2. p. 31.) stems erect; leaves interruptedly pinnate, with many pairs of silky-silvery leaflets; larger leaflets obovate, sharply serrated, lined above, and nerved beneath; stipulas deeply toothed; petals obovate, a little longer than the calyx.  $\mathcal{U}$ . H. Native of Nipaul. *P. splendens*, Wall. mss. D. Don, prod. fl. nep. p. 230. Sweet, fl. gard. t. 191. *P. fulgens*, Wall. mss. *P. lineata*, Trev. Reichb. hort. bot. l. p. 7. t. 8. *P. nas-pata*, Hamilt. mss. Flowers yellow, disposed in dichotomous corymbs.

*Siemers's Cinquefoil.* Fl. May, July. Clt. 1822. Pl. 1 foot.

139 *P. CANDICANS* (Humb. et Bonpl. ex Nestl. pot. p. 34. t. 3. f. 2. and H. B. et Kunth, nov. gen. amer. 6. p. 216.) stems ascending, few-flowered; leaves interruptedly pinnate; leaflets unequal, profoundly pinnatifid, clothed with white silky down on both surfaces; stipulas cut and entire; petals spatulate, obcordate, a little longer than the calyx.  $\mathcal{U}$ . H. Native of Mexico, on the mountains. Flowers yellow, 2-4 at the tops of the stems, and lateral near the tops of the stems, on long pedicels. Receptacle villous.

*Var.  $\beta$ , nana* (Humb. et Bonpl. ex Nestl. pot. t. 34. f. 2.) *P. Humboldtiana*, Tratt. ros. 4. p. 41. Stem and leaves smaller. Lehm. pot. 67.

*White-leaved Cinquefoil.* Fl. May, July. Clt. 1820. Pl.  $\frac{1}{2}$  to 1 foot.

140 *P. VERTICILLATA* (Steph. in Willd. spec. 2. p. 1096.) stems ascending; leaves pinnate; leaflets narrow-linear, clothed with white tomentum beneath, with revolute margins; lateral ones distant, opposite, twin, subverticillate, terminal one trifid; stipulas cut; petals obovate, entire, a little longer than the

calyx.  $\mathcal{U}$ . H. Native of Siberia. Flowers yellow, crowded at the tops of the branches.

*Verticillate-leaved Cinquefoil.* Pl.  $\frac{1}{4}$  foot.

141 *P. LINEARILOBA* (Moc. et Sesse, fl. mex. icon. t. 298. D. C. prod. 2. p. 582.) root thick, turnip-formed; stems prostrate, 1-2-flowered; leaves silky; radical ones bipinnate, cauline ones 1-lobed; leaflets linear-obovate; stipulas lanceolate, narrow; calycine segments ovate; petals obovate, length of the calyx.  $\mathcal{U}$ . H. Native of Mexico. Flowers yellow. Allied to *P. anserina*.

*Linear-lobed-leaved Cinquefoil.* Pl. prostrate.

142 *P. APPROXIMATA* (Bunge in Led. fl. ross. alt. ill. t. 325. fl. alt. 2. p. 241.) stems erect or ascending at the base, and are, as well as the petioles, clothed with white villi; radical and lower cauline leaves with 7 leaflets, upper ones with 5 leaflets or ternate, all pubescent and green above, but clothed with hoary tomentum beneath, pectinately pinnatifid; stipulas ovate-lanceolate, entire, rarely furnished with a large tooth at the base; petals emarginate, longer than the calyx; receptacle villous.  $\mathcal{U}$ . H. Native of Altaia, in dry grassy places at the river Irtysh. Panicle dichotomous, with the pedicels solitary in the forks. Corolla yellow.

*Approximate Cinquefoil.* Fl. June, July. Pl.  $\frac{1}{2}$  foot.

143 *P. CONFERTA* (Bunge in Led. fl. ross. alt. ill. t. 333.) root many-stemmed; stems ascending, and are, as well as the petioles, beset with long spreading villi; leaves pinnate; leaflets 7-11, oblong-lanceolate, distant, pectinately pinnatifid, with revolute margins, green and pubescent above, and clothed with hoary villi beneath; stipulas broad-ovate, a little cut; panicle terminal, crowded; petals obovate, rather retuse, about equal in length to the calyx; receptacle villous.  $\mathcal{U}$ . H. Native of Altaia, at the river Kerlyk. Corolla yellow.

*Crowded Cinquefoil.* Fl. June, July. Pl.  $\frac{1}{2}$  foot.

144 *P. SOONGARICA* (Bunge in Led. fl. ross. alt. ill. t. 332. fl. alt. 2. p. 244.) stem loose, ascending at the base, puberulous; petioles clothed with white villi; leaves pinnate; radical ones with 3-4 pairs of leaflets, those under the flower lanceolate and entire, the rest of the cauline ones with 2 pairs of leaflets; leaflets cinereous beneath, superior ones deeply pinnate-parted, lower ones smaller, lowest ones almost entire; lower stipulas pinnately jagged; flowers in loose dichotomous panicles; petals obovate, somewhat emarginate, exceeding the calyx; receptacle villous.  $\mathcal{U}$ . H. Native of Altaia, on the mountains of Arkul and Dolen Kara in the Soongarian desert. Corolla yellow.

*Soongarian Cinquefoil.* Fl. May. Pl.  $\frac{1}{2}$  to 1 foot.

145 *P. EGEDII* (Wormsk. in fl. dan. 9. p. 5. t. 1578.) stem short, rather branched; leaves pinnate, quite glabrous; leaflets oval, pinnatifid; segments lanceolate, acute; pedicels axillary, solitary, longer than the leaves; stipulas quite entire; petals obovate, longer than the calyx.  $\mathcal{U}$ . H. Native of Greenland, near Holsteinborg. Corolla large, yellow.

*Eged's Cinquefoil.* Pl. 1 to 2 inches.

146 *P. SERICEA* (Lin. spec. 70.) stems hoary, pubescent; leaves pinnate; leaflets ovate or obovate-oblong, deeply pinnate parted, clothed with silky tomentum on both surfaces; segments linear, obtuse, with revolute margins; stipulas lanceolate, entire or a little cut; flowers in dichotomous panicles; petals obovate, twice the length of the calyx; receptacle villous.  $\mathcal{U}$ . H. Native of Siberia, on rocks at the rivers Tschuja, Koksun, and Tscharysch. Lehm. pot. t. 6. Led. fl. ross. alt. ill. t. 334. Corolla yellow.

*Var.  $\beta$ , glabrata* (Hook. fl. bor. amer. p. 189.) leaves hardly silky at the apex.  $\mathcal{U}$ . H. Native of North America, on the Rocky Mountains between lat.  $52^{\circ}$  and  $56^{\circ}$ .

*Silky Cinquefoil.* Fl. May, Ju. Clt. 1780. Pl.  $\frac{1}{4}$  to  $\frac{3}{4}$  foot.

147 *P. DASYPHYLLA* (Bunge in Led. fl. ross. alt. ill. t. 331.

fl. alt. 2. p. 243.) stems ascending, rather villous; leaves pinnate; leaflets oblong, pinnate-parted; segments oblong-linear, bluntish, green and pubescent above, but clothed with hoary-silky villi beneath; stipulas ovate-lanceolate, entire; panicle terminal, few-flowered; petals obovate, entire, longer than the calyx; receptacle rather villous.  $\mathcal{U}$ . H. Native of Altaia, on rocks at the rivers Korgon, Tscharysch, Koksun, and Tschuja, in the Soongarian desert. Corolla yellow.

*Thick-leaved Cinquefoil.* Fl. May. Pl.  $\frac{1}{2}$  foot.

148 *P. MULTIFIDA* (Lin. spec. 710.) stems ascending, pubescent; leaves pinnate, with few pairs of leaflets; leaflets pinnate-parted; segments linear, green and pubescent above, and clothed with hoary tomentum beneath; stipulas linear-lanceolate, acuminate, entire; flowers corymbose; petals emarginate, about equal in length to the calyx; receptacle pilose.  $\mathcal{U}$ . H. Native of Switzerland, Siberia, Altaia, and Dahuria, in subalpine places, and in rather humid meadows. Ser. mus. 1. p. 56 and 79. t. 8. *P. verticillaris*, Willd.?—Ann. ruth. p. 88. t. 113. f. 13. Flowers yellow.

*Var.  $\beta$ , angustifolia* (Lehm. pot. p. 64.) leaflets more profoundly pinnate-parted, the segments much longer, and more distant.

*Multifid-leaved Cinquefoil.* Fl. May, June. Clt. 1759. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

149 *P. CORIANDRIFOLIA* (D. Don, prod. fl. nep. p. 232.) plant tufted, nearly glabrous; stems simple, few-flowered, nearly leafless; radical leaves very numerous, pinnate; leaflets profoundly pinnate-parted; segments linear, ending each in a tuft of long white hairs, tipped with obtuse glands; stipulas lanceolate, acute, and entire; petals 2-lobed, twice the length of the calyx.  $\mathcal{U}$ . F. Native of Gosaingsthan. *P. meifolia*, Wall. cat. no. 1011. Corolla yellow.

*Coriander-leaved Cinquefoil.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

150 *P. DISSECTA* (Pursh, fl. sept. 1. p. 355.) plant nearly glabrous; stems erect, loose; radical leaves pinnate; lower leaflets lanceolate, quite entire, upper ones cuneiform, pinnatifid; cauline leaves digitately-pinnate, the lateral leaflets the smallest; stipulas large, entire or denticulated; flowers pedunculate at the tops of the stems; petals obovate, hardly longer than the calyx.  $\mathcal{U}$ . H. Native of Hudson's Bay. Flowers pale yellow, corymbose.

*Dissected-leaved Cinquefoil.* Pl.  $\frac{1}{2}$  foot.

#### § 5. *Leaves pinnate. Flowers white.*

151 *P. RUPESTRIS* (Lin. spec. 711.) stems erect, dichotomous, reddish brown; radical leaves pinnate, cauline ones ternate; leaflets roundish, cuneate at the base, serrate-toothed; stipulas undivided; petals obovate, longer than the calyx.  $\mathcal{U}$ . H. Native of Europe and Siberia, in mountainous regions. In Wales on the sides of a hill called Craig Wreiddin or rather Breiddin, Montgomeryshire, but a doubtful native. Jacq. austr. 2. p. 91. t. 114. Ser. mus. helv. 1. p. 65. t. 6. f. 2. Smith, engl. bot. 2058. Krok. fl. sil. 2. t. 9. *P. rubens*, Moench. meth. p. 657. *P. fragarioides*, Poir. suppl. 5. p. 586. Outer calycine segments usually bifid according to Ledebour, but linear and shorter than the inner ones according to Lehman. According to Smith the petals are obovate in the British plant, if so it is a distinct species. Corolla white.

*Rock Cinquefoil.* Fl. May, Sept. England. Pl. 1 to  $1\frac{1}{2}$  foot.

#### § 6. *Shrubby species.*

152 *P. FRUTICOSA* (Lin. spec. 709.) shrubby; leaves pinnate; leaflets oblong-lanceolate, quite entire, hairy; flowers subcorymbose; stipulas lanceolate, scarious, pilose above; petals obovate-roundish, longer than the calyx.  $\mathcal{U}$ . H. Native of Poland, Germany, Dahuria, Piedmont, and the Pyrenees. In

England in mountainous thickets, but rare; about Greta-Bridge, Mickleforce, Egglestone Abbey, and several other places in Teesdale. Smith, engl. bot. t. 88. Nestl. pot. 30. t. 1. *P. prostrata*, Lapeyr. abr. p. 67. Upper leaves sessile, ternate. Leaves glabrous above, but when young beset with incumbent pili beneath, and canescent. Flowers yellow.

*Shrubby Cinquefoil.* Fl. Ju. Aug. England. Sh. 2 to 4 feet.

153 *P. FLORIBUNDA* (Poir. suppl. 4. p. 54. Pursh, fl. amer. sept. 1. p. 355.) shrubby; leaves pinnate, pilose, grey; leaflets lanceolate, quite entire; flowers corymbose; stipulas lanceolate, scarious; petals obovate-roundish, longer than the calyx.  $\frac{1}{2}$ . H. Native of North America, throughout Canada from Lake Huron to the plains of the Saskatchewan and Bear Lake rivers under the Arctic circle, and from Newfoundland to the valleys of the Rocky Mountains on both sides, Kotzebue's Sound, and Behring's Straits. Wats. dend. brit. 70. *P. fruticosa*  $\beta$ , Nestl. pot. p. 30. *P. tenuifolia*, Schlecht. in berol. mag. ann. 7. p. 285. Upper leaves ternate, sessile? Flowers yellow.

*Bundle-flowered Cinquefoil.* Fl. June, Oct. Clt. 1811. Sh. 2 to 4 feet.

154 *P. PARVIFOLIA* (Fisch. in litt. Lehm. pug. 3. p. 6.) shrubby, branched; leaves ternate, pilose on both surfaces; lateral leaflets deeply bipartite, rarely bifid or entire, terminal one tripartite, with the segments divaricate, linear, with revolute margins; stipulas lanceolate, acuminate, membranous, scarious, pilose above, purplish; flowers 2-3, terminal; petals obovate-cuneiform, entire, much longer than the calyx.  $\frac{1}{2}$ . H. Native of the Soongarian desert. Flowers yellow. Receptacle woolly.

*Small-leaved Cinquefoil.* Shrub 2 to 4 feet.

155 *P. DAHURICA* (Nestl. pot. 31. t. 1.) shrubby, nearly glabrous; lower branches horizontal, upper ones erect; leaves impari-pinnate, with 5 leaflets; leaflets oblong, quite entire, with revolute margins, superior ones confluent; flowers in terminal corymbose panicles; stipulas connate in one, pilose, scarious; outer calycine segments oval, inner ones the largest, ovate, and coloured; petals obovate, entire, longer than the calyx.  $\frac{1}{2}$ . H. Native of Dahuria, near Nertschinsk. *P. fruticosa*  $\beta$ , Lehm. pot. 32. *P. glabra*, Lodd. bot. cab. t. 914. Led. fl. ross. alt. ill. t. 173. Flowers white.

*Dahurian Cinquefoil.* Fl. June, Aug. Clt. 1818. Shrub 2 to 4 feet.

156 *P. SALESOVII* (Poir. suppl. 4. p. 538. Lehm. pot. p. 35. t. 1.) shrubby; leaves pinnate, with 3-4 pairs of oblong sharply serrated leaflets, clothed with white tomentum beneath; stipulas ovate, acuminate, entire; flowers crowded at the tops of the branches; petals obovate, entire, longer than the calyx; outer calycine segments narrow.  $\frac{1}{2}$ . H. Native of Siberia. Corolla white.

*Salesov's Cinquefoil.* Fl. June, Jul. Clt. 1823. Sh. 1 to 2 ft.

157 *P. ARBUSTULA* (D. Don, prod. fl. nep. p. 256. Wall. pl. asiat. rar. 3. t. 228.) shrubby, much branched; leaves pinnate; leaflets 5, oval, obtuse, villous above, and naked beneath, when young silky on both surfaces; peduncles elongated, 1-flowered, terminal, solitary, villous; stipulas brown, lanceolate, obtuse, membranous; calycine segments dissimilar, outer ones roundish, obtuse, deeply bipartite; petals orbicular, entire, longer than the calyx.  $\frac{1}{2}$ . H. Native of Gosaingsthan. *P. Nepalensis*, D. Don, prod. fl. nep. p. 229. but not of Hook. Stems rooting. Flowers yellow.

*Little-tree Cinquefoil.* Shrub creeping.

158 *P. REPTANS* (Wall. cat. 1009. Lehm. pug. 3. p. 3.) shrubby, much branched; leaves ternate; leaflets oblong, entire, silky above, and glabrous beneath, with revolute margins; flowers terminal, usually solitary; stipulas broad, lanceolate, entire, membranous, sheathing; outer calycine segments usually deeply bipartite; petals orbicular, deeply emarginate, twice the length

of the calyx.  $\frac{1}{2}$ . H. Native of Gosaingsthan and Kamaon. Flowers yellow.

*Stiff Cinquefoil.* Shrub 2 to 3 feet.

159 *P. LIGNOSA* (Willd. herb. ex Spreng. syst. append. p. 314.) shrubby; branches twisted, compressed; leaves quinate digitate; leaflets cuneate, truncate, 3-toothed at the apex; peduncles solitary.  $\frac{1}{2}$ . H. Native of Hyrcania.

*Woody Cinquefoil.* Shrub.

† *Species not sufficiently known.*

160 *P. LAGASCA'NA* (Ser. in D. C. prod. 2. p. 586.) tomentose; leaves quinate pinnate; leaflets cuneiform, cut; floral ones ternate, with the leaflets sessile and trifid; petals equal in length to the calyx; receptacle hairy.  $\frac{1}{2}$ . H. Native country unknown. *P. incisa*, Lag. gen. et spec. p. 16. but not of Desf.

*Lagasca's Cinquefoil.* Pl.  $\frac{3}{4}$  foot.

161 *P. CORYMBOSA* (Poir. act. toul. 3. p. 325.) stem shrubby, ascending; leaves quinate and ternate, villous.  $\frac{1}{2}$ . H. Native country unknown.

*Corymbose-flowered Cinquefoil.* Shrub.

162 *P. BITHYNICA* (Horn. hort. bafn. suppl. 55.) stem much branched; radical leaves quinate; leaflets roundish-obovate; cauline leaves ternate; petals shorter than the calyx.  $\frac{1}{2}$ . H. Native of Bithynia.

*Bithynian Cinquefoil.* Pl.  $\frac{3}{4}$  foot.

*Cult.* All the species of *Potentilla* are of easy cultivation, and some of them are handsome when in flower. They will grow in any common garden soil, and are easily increased by dividing the plants, or by seed. The shrubby kinds are very proper for the front of shrubberies, and they propagate freely by cuttings planted in the autumn in a sheltered situation.

XIII. TORMENTILLA (from *tormentum*, pain; in reference to its supposed efficacy in tooth ache, as well as from being supposed to cure diseases of the bowels). Lin. gen. no. 256. Smith, engl. fl. 2. p. 423.

LIN. SYST. *Tcosindria*, *Polygynia*. Calyx 8-parted, the 4 outer segments accessory and parrowest. Petals 4, inversely heart-shaped. Stamens 16 or more, not half so long as the corolla. Styles lateral, deciduous. Carpels or akenia seated on a small depressed hairy receptacle.—Herbaceous plants, with weak terete stems, digitate leaves, and solitary lateral pedicels, bearing small yellow flowers.

1 *T. ERÉCTA* (Lin. spec. 716.) stem ascending, branched, dichotomous; leaves ternate; cauline ones sessile; leaflets oblong, acute, deeply serrated; stipulas cut; pedicels solitary in the forks of the stem, and lateral; petals obcordate.  $\frac{1}{2}$ . H. Native of Europe, in barren pastures, heaths, and bushy places; plentiful in Britain. Oed. fl. dan. 589. *T. officinalis*, Smith, fl. brit. 552. engl. bot. t. 863. Curt. lond. fasc. 5. t. 35. *Potentilla Tormentilla*, Sibth. 162. Nestl. pot. 65. *Potentilla tetrapétala*, Hall. jun. in Ser. mus. 1. p. 57. The flowers are sometimes to be met with having 5 petals, and a double blossomed variety was found by the late Miss Jones, of Hafod, in Cardiganshire. The roots are so astringent as to be used in the Western Isles of Scotland and in the Orkneys for tanning leather; for which purpose they are superior even to oak bark. They are at first boiled in water, and the leather is then steeped in the cold liquor. They are also used for dyeing a red colour. The root has an austere styptic taste, with a slight kind of aromatic flavour, and it is one of the most agreeable and efficacious of our indigenous aromatic astringents, and may be employed with good effect in all cases where medicines of this class are proper. It is sometimes given in powder, but usually in decoction.

*Erect Tormentil.* Fl. June, July. Britain. Pl.  $\frac{1}{2}$  foot or pr.

2 *T. REPTANS* (Lin. spec. 716.) stems procumbent, hardly

branched; leaflets 3-5, obovate, deeply toothed, hairy, as well as the petioles; stipulas lanceolate, entire; pedicels lateral, 1-flowered; long, and slender; petals obcordate.  $\mathcal{U}$ . H. Native of Europe, about hedges and the borders of fields. In Britain in several parts of Oxfordshire, and at Braintree, Essex; at Lakenham, near Norwich; in Hertfordshire and Surrey; at Bright House, near Halifax, Yorkshire; in barren grounds of Scotland. Smith, engl. bot. 864. *Potentilla procumbens*, Sibth. *Potentilla nemoralis*, Nestl. pot. 65. Plot's tormentil, Pet. herb. brit. t. 41. f. 10. Flowers sometimes with 5 petals.

*Creeping Tormentil*. Fl. June, July. Britain. Pl. pros.

3 *T. HUMIFUSA*; floriferous stems short and filiform, procumbent; leaflets 5, cuneate-oblong, obtuse, deeply toothed, clothed with white tomentum beneath.  $\mathcal{U}$ . H. Native of North America, in the plains of the Missouri. *Potentilla humifusa*, Nutt. gen. amer. 1. p. 130.

*Trailing Tormentil*. Pl. trailing.

*Cult.* Plants of the easiest culture and propagation; however they are not worth growing except in botanical gardens, to fill up the arrangements.

XIV. *COMARUM* (from *κομῆρος*, *comaros*, the arbutus; similar in fruit). Lin. gen. no. 638. Smith, engl. fl. 2. p. 433.

LIN. GEN. *Icosándria*, *Monogýnia*. Calyx 10-parted, the 5 outer segments accessory and small. Petals 5, lanceolate, shorter than the calyx, attached to the rim of the calyx along with the stamens. Styles lateral. Carpels or akenia numerous, seated on a large, dry, spongy, hairy, hemispherical receptacle.—An herbaceous creeping plant, with broad pinnate and ternate leaves, and terminal panicles of purple flowers.

1 *C. PALÚSTRE* (Lin. spec. 718.)  $\mathcal{U}$ . H. Native of Europe, Siberia, and North America, in marshes; plentiful in Britain. Smith, engl. bot. 173. Schkuhr, handb. t. 138. f. 1. Fl. dan. 637. *Potentilla Comarum*, Scop. fl. carn. ed. 2. vol. 1. p. 359. *Potentilla palustris*, Lehm. pot. 32. *Potentilla rubra*, Hall. fil. in Ser. mus. helv. 1. p. 5, 6. Root creeping. Stems ascending. Leaves pinnate. Leaflets broad, acutely serrated, green above, but glaucescent beneath. Flowers pedicellate, axillary, and terminal, dark purple; petals lanceolate, acuminate, much shorter than the calyx. The roots dye wool of a dirty red-colour, and have astringency enough with other plants of the same class to tan leather. In Scotland the fruit are called *cow-berries*.

*Marsh Cinquefoil*. Fl. June, July. Britain. Pl. 1 to 1½ foot.

*Cult.* This plant will grow in any kind of moist soil, and is increased by dividing at the root.

XV. *HORKELIA* (in honour of John Horkel, professor of physiology at Berlin). Cham. et Schlecht. in Linnæa. vol. 2. p. 27. Hook. fl. bor. amer. p. 196.

LIN. SYST. *Decándria*, *Polygýnia*. Calyx campanulate, semi-10-cleft, outer segments accessory. Petals 5, small. Stamens 10, inserted by 2 series in the sides of the calyx. Ovaries numerous, seated on a dry, conical, villous, receptacle. Styles simple, articulated with the ovaries, almost terminal. Akenia inclosed in the calyx.—Erect herbs, with pinnate leaves, and crowded terminal insignificant flowers.

1 *H. CONGESTA* (Dougl. mss. Hook. bot. mag. 2880.) radical leaves pinnate; leaflets cuneate-oblong, cut at the apex; outer calycine segments quite entire; petals longer than the calyx.  $\mathcal{U}$ . H. Native of California, at Cape Mendocino, and on the low hills of the Umpqua river in lat. 41° to 42°. Corolla white.

*Crowded-flowered Horkelia*. Fl. Aug. Clt. 1826. Pl. 1 to 2 ft.

2 *H. CALIFÓRNICA* (Cham. et Schlecht. in Linnæa. 2. p. 27.) erect, clothed with viscid pili; leaves pinnate and pinnatifid; flowers paniced; petals shorter than the calyx.  $\mathcal{U}$ . H. Native of California. *Sibbaldia Californica*, Spreng. syst. app. p. 341. Corolla white.

*Californian Horkelia*. Pl. 1 to 2 feet.

*Cult.* The species of *Horkelia* will grow in any common garden soil, and are readily increased by dividing at the root.

XVI. *SIBBALDIA* (in honour of Robert Sibbald, professor of physic at Edinburgh, author of *Scotia Illustrata*, 1684, &c.) Lin. gen. 393. Lam. ill. t. 221. D. C. prod. 2. p. 586.

LIN. SYST. *Penta-Decándria*, *Penta-Decagýnia*. Calyx flat-tish, 10-cleft, the 5 outer segments accessory. Petals 5, linear-spatulate. Stamens 5-10. Styles 5-10, lateral. Carpels or akenia 5-10, seated on an almost naked receptacle.—Evergreen, dwarf, glandless herbs, with trifoliate leaves, and glomerate or corymbose heads of yellow or white flowers.

1 *S. PROCUMBENS* (Lin. spec. 406.) leaves trifoliate; leaflets equal, cuneate, and coarsely toothed at the apex, rather pilose; flowers corymbose; petals shorter than the calyx.  $\mathcal{U}$ . H. Native of Europe, Siberia, and North America, on high mountains. Plentiful on the summits of the highland mountains of Scotland, in micaceous soil. Smith, engl. bot. t. 897. Fl. dan. 32. Petals small, yellow.

*Procumbent Sibbaldia*. Fl. July. Scotland. Pl. 1 to 3 inches.

2 *S. ADPRESSA* (Bunge in Led. fl. ross. alt. ill. t. 276. fl. alt. 1. p. 429.) leaves ternate; lateral leaflets oblong-lanceolate, quite entire, intermediate one cuneate, tripartite, with the lateral segments entire, and the middle one tridentate at the apex, silky beneath; flowers with 10 stamens and 10 styles; petals equal in length to the calyx.  $\mathcal{U}$ . H. Native of Altaia, on high dry fields at the rivers Kan and Tschuja. Petals white.

*Adpressed Sibbaldia*. Pl. ¼ foot.

3 *S. PARVIFLÓRA* (Willd. act. soc. berol. vol. 2.) leaves trifoliate; leaflets beset with strigose pili on both surfaces; flowers in glomerate heads; petals obovate, one-half shorter than the calyx.  $\mathcal{U}$ . H. Native of Cappadocia. *Fragaria orientalis flore luteo*, Tourn. cor. 21. Petals yellow.

*Small-flowered Sibbaldia*. Fl. July, Aug. Pl. ¼ foot.

*Cult.* *Sibbaldia* is a genus of small alpine plants. They do best in small pots in a mixture of peat, loam, and sand, and are increased by dividing.

XVII. *CHAMÆRHODOS* (from *χαμαί*, *chamai*, on the ground, and *ῥόδος*, *rhodos*, a rose, dwarf-rose). Bunge in Led. fl. ross. alt. ill. t. 257. fl. alt. 1. p. 429. Hook. fl. bor. amer. p. 196. —*Sibbaldia* species of Lin. D. C. and others.

LIN. SYST. *Pentándria*, *Penta-Decagýnia*. Calyx campanulate, 5-cleft. Petals 5, obovate. Stamens 5. Styles lateral, rarely 5, usually 10 or more. Carpels 5-10 or more, seated on a villous receptacle.—Small plants, with dissected leaves, beset with glandular pili. Corolla white or purple.

1 *C. ERÉCTA* (Bunge in Led. fl. alt. 1. p. 431.) herbaceous, pubescent; stems elongated, racemosely paniced; radical leaves biternately multifid, upper cauline ones 3-5-cleft; segments linear-filiform; flowers pentandrous; styles 5-20; petals exceeding the calyx.  $\mathcal{G}$ . F. Native of Siberia, and Altaia, in pine woods, and of North America about Carlton House, on the Saskatchewan, as also among the Rocky Mountains.—Amm. ruth. p. 58. t. 25. Lam. ill. t. 221. f. 2. *Sibbaldia erecta*, Lin. spec. p. 406. Corolla purple.

*Erect Chamærhodos*. Fl. June, Aug. Clt. 1806. Pl. 1 ft.

2 *C. GRANDIFLÓRA* (Bunge, fl. alt. 1. p. 431.) stems numerous, erect, leafy; leaves divided into numerous linear segments, pubescent; petals twice the length of the calyx.  $\mathcal{U}$ . H. Native of Dahuria, on granite rocks near Ouda, and at the river Selenga. *Sibbaldia grandiflora*, Pall. in Willd. rel. ex Schultes, syst. 6. p. 770. Corolla red, larger than that of *C. erecta*.

*Great-flowered Chamærhodos*. Pl. 1 foot.

3 *C. SARULÓSA* (Led. fl. ross. alt. ill. t. 257. fl. alt. 1. p. 432.) plant suffruticose, clothed with clammy villi, tufted; stems as-

ceding, dichotomously and corymbosely paniced at the apex; leaves triternate; segments obovate-oblong, obtuse; flowers with 5 stamens, and usually with 10 styles; petals equal in length to the calyx.  $\mathcal{U}$ . H. Native of Siberia, in sandy islands in the river Tschuja. Petals white.

*Sand Chamærhodos*. Fl. June. Pl. procumbent.

4 *C. POLYGYNA*; stem straight, beset with glandular hairs, paniced; leaves multifid; segments linear; flowers polygynous, disposed in glomerate heads; petals about equal in length to the calyx.  $\mathcal{U}$ . H. Native of Siberia. *Sibbaldia polygyna*, Willd. rel. ex Schultes, syst. 6. p. 770. Petals rose-coloured.

*Polygynous Chamærhodos*. Fl. Jul. Aug. Clt. 1824. Pl.  $\frac{1}{2}$  ft.

5 *C. ALTAICA* (Bunge, fl. alt. 1. p. 429.) plant suffruticose, tufted, prostrate; leaves palmate or 3-parted, middle segment trifid, lateral ones bifid or trifurcate; sepals linear; flowers usually solitary, with 5 stamens and 10 styles; petals more than twice the length of the calyx.  $\odot$ . H. Native of Altaia, at the rivers Kan and Kelyk, in schistous saltish soil. *Sibbaldia Altaica*, Lin. suppl. 191. Flowers large, red.

*Altaian Chamærhodos*. Fl. June, July. Pl. prostrate.

*Cult.* The species of *Chamærhodos* are very difficult to preserve through the winter, as they are very liable to be carried off by the damp. They should be grown in pots in a mixture of sand, peat, and loam, and should be placed on a dry shelf in a cold frame in winter, at which time they should be but sparingly watered, if at all. They are only to be increased by seed.

XVIII. AGRIMONIA (a corruption of *Argemone*, a name given by the Greeks to a plant which was supposed to cure cataract of the eye, from *apycos*, *argos*, white, the cataract of the eye being white). Tourn. inst. t. 155. Nestl. pot. 16. D. C. prod. 2 p. 587.

*LAN. SYST.* *Dodecandria, Digynia*. Calyx tubular, foveolate on the sides, with 5 small acute marginal segments (f. 73. d.), the tube subsequently hardened, and closed over the seeds, furnished on the outside by a circle of hooked bristles, forming an involucre. Petals 5 (f. 73. b.). Stamens 7-20, from the rim of the calyx along with the petals. Carpels 2, in the bottom of the calyx. Styles 2, lateral (f. 73. c.). Seeds pendulous.—Astringent aromatic herbs, with interruptedly pinnate leaves, each accompanied by a pair of stipulas united to the petioles. Flowers small, numerous, spiked, yellow. Bractees trifid (f. 73. a.).

1 *A. EUPATORIA* (Lin. spec. 643.) hairy or smoothish; leaves interruptedly pinnate; leaflets elliptic-oblong, coarsely serrated, odd one stalked; petals twice the length of the calyx; fruit distant; tube of calyx campanulate, encircled by a whorl of hooked prickles above; spikes of flowers elongated.  $\mathcal{U}$ . H. Native of Europe, in bushy places by road sides, and about the borders of fields; plentiful in some parts of Britain. Smith, engl. bot. 1335. Curt. lond. fasc. 5. t. 32. Woody. med. bot. suppl. 258. Fl. dan. t. 588. The herb is slightly bitter, aromatic, astringent, evincing a tonic property, for which it has always been noted, and which has procured it a place in several British herb teas. In decoction it was formerly used as an astringent for a gargle, and in diarrhoea and leucorrhœa. Kalm informs us, that the Canadians use the infusion of the root with great success in burning fevers, and Dr. Hill says it is an effectual cure for jaundice, sweetened

with honey, in the quantity of half a pint three times a day. The plant will dye wool of a nankeen colour. It is also recommended for dressing leather.

*Eupator's Agrimony*. Fl. June, July. Britain. Pl. 1 to 2 ft.

2 *A. NEPALENSIS* (D. Don, prod. fl. nep. p. 229.) leaves interruptedly pinnate; leaflets ovate, serrated, odd one stalked, very villous on both surfaces, as well as the stems; racemes erect, slender; bractees trifid, shorter than the calyx; calycine segments lanceolate, acute, keeled.  $\mathcal{U}$ . H. Native of Gossainsthan.

*Nipaul Agrimony*. Fl. June, July. Clt. 1820. Pl. 1 to 2 ft.

3 *A. DAHURICA* (Willd. herb. ex Stev. in litt. D. C. prod. 2. p. 587.) glabrous; leaves interruptedly pinnate; the rest unknown.  $\mathcal{U}$ . H. Native of Dahuria. Very like *A. Eupatoria*, but differs in the leaves being narrower and more acute, and in the flowers being more remote.

*Dahurian Agrimony*. Fl. June, July. Clt. 1811. Pl. 1 to 2 ft.

4 *A. ODORATA* (Cam. epit. 7. D. C. prod. 2. p. 587.) hairy; leaves interruptedly pinnate; leaflets oblong, lanceolate, deeply crenate-toothed; petals twice the length of the calyx; fruit distant; tube of calyx campanulate, pilose, with the foveolæ obovate, and drawn out even to the base, and with the bristles ascending and short.  $\mathcal{U}$ . H. Native of Italy. *A. Eupatoria*, Desf. cat. 176. ex D. C. fl. fr. 4. p. 451.—Mill. fig. t. 15. Spikes several.

*Sweet-scented Agrimony*. Fl. July, Aug. Clt. 1640. Pl. 2 to 3 feet.

5 *A. PILOSA* (Led. ind. hort. dorp. suppl. 1823. p. 1. fl. alt. 2. p. 205.) pilose; leaves interruptedly pinnate; leaflets cuneate-rhomboid, smoothish above, but pilose at the nerves beneath, serrated, the smaller ones almost quite entire; bristles of fruit erectly connivent; the foveolæ drawn out beyond the middle.  $\mathcal{U}$ . H. Native of Altaia, frequent in meadows and by way sides. Rehb. icon. pl. rar. 3. p. 49. t. 252. f. 414. Stems usually simple, bearing only one spike, rarely branched.

*Pilose Agrimony*. Fl. June, July. Clt. 1819. Pl. 1 to 2 ft.

6 *A. PARVIFLORA* (Ait. hort. kew. ed. 1. vol. 2. p. 130.) smoothish; leaves interruptedly pinnate; leaflets numerous, lanceolate, deeply serrated; spikes slender; petals one-half longer than the calyx; fruit distant; tube of calyx turbinate; foveolæ drawn out even to the base; bristles ascending.  $\mathcal{U}$ . H. Native of North America, from Pennsylvania to Carolina, and throughout Canada. Fibres of the root tubercous, as in *Spiræa filipendula*.

*Small-flowered Agrimony*. Fl. June, July. Clt. 1766. Pl. 1 to 2 feet.

7 *A. SUAVEOLENS* (Pursh, fl. amer. sept. 1. p. 336.) plant very hairy; leaves interruptedly pinnate; leaflets lanceolate, sharply serrated; spikes of flowers twiggy and clammy; flowers almost sessile; petals twice the length of the calyx; fruit obconical, with divaricate bristles.  $\mathcal{U}$ . H. Native from Virginia to Carolina.

*Sweet-scented Agrimony*. Fl. July, Aug. Clt. 1810. Pl. 1 to 2 feet.

8 *A. BLUMI*; leaves interruptedly pinnate, velvety, pubescent; the terminal leaflet sessile; racemes elongated, spicately racemose, clothed with clammy pubescence.  $\mathcal{U}$ . H. Native of Java and Japan, on the mountains. *A. suaveolens*, Blum. bijdr. 1113. but not of Pursh.

*Blume's Agrimony*. Pl. 1 to 2 feet.

9 *A. STRIATA* (Michx. fl. bor. amer. 1. p. 887.) leaves interruptedly pinnate; spikes twiggy; fruit reflexed, turbinate, sulcately striated.  $\mathcal{U}$ . H. Native of Canada. Flowers white. This species is hardly known.

*Striated-calycex Agrimony*. Fl. July, Aug. Clt. 1812. Pl. 1 to 2 feet.

10 *A. REPENS* (Lin. spec. 875.) hairy; leaves pinnate; leaflets oblong, terminal one sessile; spikes nearly sessile; petals 3 times the length of the calyx; bractæas length of flowers; stipulas length of the internodes of the stem, and almost covering it; roots creeping; fruit hispid. *Æ. H.* Native of Armenia. Like *A. Eupatoria*, but the stems are thicker, the spikes more dense, the flowers sessile, and the fruit larger.

*Creeping-rooted Agrimony.* Fl. Jul. Aug. Clt. 1737. Pl. 2 ft.

*Cult.* Plants of easy culture. They will grow in any common soil, and are easily increased by dividing at the root.

**XIX. AREMONIA** (altered from *Agrimonia*). Neck. elem. no. 768. *Agrimonioides*, Tourn. inst. t. 155. *Amônia*, Nestl. pot. 17. *Spallanzania*, Poll. giorn. fis. pav. 1816. p. 187. with a figure.

*Lin. syst.* *Peta-Decándria, Digýnia*. Involucrum calyciform, 10-12-cleft. Tube of calyx oblong, with a 5-cleft bractless limb. Petals 5. Stamens 5-10. Carpels 2. Styles terminal. Akenia usually solitary from abortion, inclosed in the globose tube of the calyx, thin, membranous. Seed pendulous.—An evergreen herb, with interruptedly impari-pinnate leaves; leaflets dentately serrated, lower ones small, outer ones large. Flowers small, yellow, in fascicles or few-flowered corymbs.

1 *A. AGRIMONIODES* (D. C. prod. 2. p. 588.) *Æ. H.* Native of Italy and Carniola, in humid places. *Agrimonia agrimonioides*, Lin. spec. 643. Col. cephr. t. 144. Mor. oxon. sect. 5. t. 34. f. 9. Stem leaves ternate.

*Agrimonia-like Aremonia.* Fl. June, July. Clt. 1739. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

*Cult.* See *Agrimonia* for culture and propagation.

**XX. BRAYERA** (in honour of Dr. Brayer, the discoverer of the plant). Kunth, in Brayer, not. 8vo. 1824. Paris, dict. class. hist. nat. 2. p. 501. with a figure, D. C. prod. 2. p. 588.

*Lin. syst.* *Dodecándria, Digýnia*. Calyx permanent, with a turbinate tube, which is silky on the outside; limb 10-parted, outer segments accessory, large, and oblong; the 5 inner ones spatulate and shorter; throat pervious. Petals 5, scale-formed, small, linear, deciduous. Stamens 15-20, nearly equal, shorter than the petals. Carpels 2, free, in the bottom of the calyx, 1-2-ovulate. Styles exerted, crowned by subpeltate crenately lobed stigmas. Seed solitary, pendulous.—A tree. Peduncles branched, and clothed with soft hairs, flexuous, and bracteate; flowers 4 together; bractæas roundish-elliptic. Leaves unknown.

1 *B. ANTHELMINTICA* (Kunth, l. c.) *h. F.* Native of Abyssinia, where it is called *cotz* or *cabotz*. The flowers of this tree are the most powerful anthelmintic known. Upon the authority of Dr. Brayer 2 or 3 doses of the infusion are sufficient to cure the most obstinate case of tænia.

*Anthelmintic Brayera.* Tree.

*Cult.* The tree will possibly thrive well in a mixture of loam and peat, and cuttings will most probably root in sand under a hand-glass.

#### Tribe II.

**NEURA'DEÆ.** Calyx 5-cleft (f. 74. *a.*), with a short tube, adhering to the ovaries; lobes cut, valvate in æstivation. Petals 5 (f. 74. *b.*), inserted in the bottom of the calycine lobes. Stamens 10. Styles 10. Carpels 10, connected into a 10-celled capsule (f. 74. *c.*), which is depressed at the apex, and girded by the eelinated calyx. Seeds solitary in the cells, bony, obliquely pendulous. Embryo curved, with an oblique radicle and oblong cotyledons.—Decumbent, fruticose, tomentose herbs, with sinuately pinnatifid leaves, and small solitary axillary flowers. Seeds germinating in the capsule.

**XXI. NEURA'DA** (*νευρον*, *neuron*, a nerve; in reference to the plaited nerved leaves). Juss. in Lin. gen. 587. Gaertn. fruct. 1. p. 162. t. 32. D. C. prod. 2. p. 548.

*Lin. syst.* *Decándria, Polygýnia*. Character the same as that of the tribe.

1 *N. PROCUMBENS* (Lin. spec. 631.) *Ö. H.* Native of Egypt, Arabia, and Numidia. Forst. descrip. p. 90. Lam. ill. t. 393. (f. 74.)

*Procumbent Neurada.* Pl. tr.

*Cult.* The seeds of this plant only require to be sown in a warm dry sheltered situation in the open ground.

#### Tribe III.

**ROSEÆ** (so named in consequence of the section comprising roses). D. C. prod. 2. p. 596.—*Rosæ*, Juss. gen. p. 353. Calyx with the tube contracted at the mouth (f. 75. *g.*), and with a 5-parted limb (f. 75. *b.* f. 76. *d.*); the segments somewhat spirally imbricated at the apex in æstivation, and usually pinnately divided (f. 75. *b. c.* f. 76. *d.*). Petals 5 (f. 75. *e.* f. 76. *e.*). Stamens numerous. Carpels numerous, bony, inserted on the inside of the tube of the calyx, which at length becomes baccate (f. 75. *f.* f. 76. *b.*), and incloses them; they are dry and indehiscent, bearing each a style on the inner side. Styles exerted from the constricted part of the calycine tube (f. 75. *g.*), sometimes distinct, sometimes connected into a columnar style. Seeds solitary, exalbuminous, inverted. Embryo straight, with flattish cotyledons.—Shrubs, usually with impari-pinnate leaves, serrated leaflets, and with the stipulas adnate to the petiole (f. 75. *a.*).

**XXII. ROSA** (from *rhos*, red, Celtic; in reference to the colour of the flowers of most of the species of the rose). Tourn. inst. 1. p. 636. t. 408. Lin. gen. 631. Lam. ill. t. 440. Lindl. mon. 8vo. 1820. Pronv. nom. ros. 1818. mon. ross. 1824.—*Rhodophora*, Neck. elem. 784.

*Lin. syst.* *Icosándria, Polygýnia*. The character the same as that of the tribe.

**SECT. I. SIMPLICIFOLIA** (Lindl.). Leaves simple, exstipulate. Fruit bristly.

1 *R. BERBERIFOLIA* (Pall. nov. act. petr. 10. p. 379. t. 10. f. 5.) leaves simple, serrated; prickles decurrent; sepals entire.

*h. H.* Native of Persia, near Amadan, and in fields at the bottom of Mount Elwend, and in the desert of Soongaria. *R. simplicifolia*, Salisb. hort. allert. 359. par. lond. 101. with a figure. Led. fl. ross. atl. ill. 370. *Lówea conspicua*, Lindl. bot. reg. 1261. Petals yellow, marked with purple at the base.

*Var. a, glabra* (Ser. in D. C. prod. 2. p. 602.) stipulas connate, leaf-formed, glabrous; prickles substipular, twin. *h. H.* Native of the Soongarian desert, in salt places beyond the river Irtysh.—Red. et Thor. ros. 1. p. 27.

*Var. β, velutina* (Ser. mss. in D. C. prod. 2. p. 602.) stem, prickles, and leaves velvety; leaflets spatulate-lanceolate; prickles substipular, twin. *h. H.* Native of Persia.

*Barberry-leaved Rose.* Fl. Ju. Jul. Clt. 1790. Sh. 1 to 2 ft.

**SECT. II. FEROCES** (from *ferox*, fierce, in reference to the branches being thickly beset with prickles). Lindl. mon. p. 3. Branches clothed with permanent tomentum. Fruit naked. The plants contained in this section are a strictly natural group. They are low shrubs, losing their leaves early in autumn, and

FIG. 74.

are then remarkable for their hoary branches, bristles and numerous prickles. Their fruit is perfectly smooth, which character separates them from the next section, in which the fruit is downy. Sepals usually toothed.

2 *R. FERROX* (Lawr. ros. t. 42.) prickles of the same shape, and much crowded.  $\frac{1}{2}$ . H. Native of Caucasus. Lindl. in bot. reg. t. 440. *R. Kamtschatica*, Red. ros. 1. p. 47. t. 12. *R. Kamtschatica*  $\beta$ , *ferox*, Ser. in D. C. prod. 2. p. 607. *R. echinata*, Dupont. Flowers large, red. Fruit globose, scarlet.

*Var.  $\beta$ , nitens* (Lindl. bot. reg. 824.) leaves shining, pale green, glabrous on both surfaces; flowers pale crimson. *R. Kamtschatica*  $\gamma$ , *nitens*, Ser. in D. C. prod. 2. p. 607.

*Fierce Rose*. Fl. July, Aug. Clt. 1796. Shrub 3 to 4 ft.

3 *R. RUGOSA* (Thunb. fl. jap. 213.) arms crowded, nearly equal; peduncles beset with curved prickles.  $\frac{1}{2}$ . H. Native of Japan. *Ramanas* of the Japanese. Lindl. ros. p. 5. t. 19.

*Wrinkled Rose*. Shrub 3 to 4 feet.

4 *R. KAMTSCHATKA* (Vent. cels. t. 67.) prickles infra-stipular, falcate, large; leaves opaque.  $\frac{1}{2}$ . H. Native of Kamtschatka, in dry rocky places. Lindl. in bot. reg. t. 419. Flowers solitary, deep red. Fruit spherical, scarlet, less than that of *R. ferox*.

*Kamtschatka Rose*. Fl. June, Jul. Clt. 1791. Sh. 3 to 4 ft.

SECT. III. BRACTEATÆ (from *bracteatus*, propped or covered with plates; flowers furnished with bracteas). Branches and fruit clothed with permanent tomentum. This section is readily distinguished from the last by the woolliness of the fruit. Leaves dense, usually shining, and prickles are placed under the stipulas in pairs. Sepals simple or nearly so.

5 *R. INVOLUCRATA* (Roxb. Lindl. ros. p. 8.) leaflets elliptic-lanceolate, tomentose beneath; bracteas contiguous, pectinate.  $\frac{1}{2}$ . H. Native of Nipaul and China. Lindl. bot. reg. 709. *R. palustris*, Hamilt. mss. *R. Lindleyana*, Tratt. ros. 2. p. 190. Flowers white, nearly solitary, surrounded by 3 or 4 approximate leaves.

*Involucrated Rose*. Fl. Ju. Jul. Clt. 1818. Sh. 3 to 4 ft.

6 *R. MICROPHYLLA* (Roxb. Lindl. ros. p. 9.) leaflets ovate, small; bracteas appressed, pectinate; fruit prickly.  $\frac{1}{2}$ . H. Native of China. *Hsi-tong-hong* of the Chinese. Flowers small, double, of a delicate blush colour.

*Small-leaved Rose*. Fl. Aug. Oct. Shrub 2 to 3 feet.

7 *R. BRACTEATA* (Wendl. obs. p. 50.) leaflets oblong, obtuse, quite glabrous; bracteas appressed, pectinate.  $\frac{1}{2}$ . H. Native of China. Red. ros. p. 35. t. 6. Vent. cels. t. 28. *Rosa lucida*, Lawr. ros. t. 84. *Rosa Macartnea*, Dum. Cour. bot. cult. Flowers showy, pure white, solitary, nearly sessile. Fruit spherical, orange red.

*Var.  $\beta$ , scabriuscula* (Lindl. ros. 10.) branches setigerous; prickles smaller, straightish.  $\frac{1}{2}$ . H. Native of China. *R. bracteata*, Moench, meth. suppl. 290. Jacq. fragm. 30. t. 34. f. 2. Sims, in bot. mag. 1377.

*Bracteated or Macartney's Rose*. Fl. June, Oct. Clt. 1795. Shrub 2 to 3 feet.

8 *R. LYEALLII* (Lindl. ros. p. 12. t. 1.) leaflets oblong-lanceolate, glabrous; bracteas distant, entire; flowers cymose.  $\frac{1}{2}$ . H. Native of Nipaul. Plant densely villous. Flowers probably white.

*Lyell's Rose*. Shrub 3 to 4 feet.

SECT. IV. CINNAMOMÆ (plants agreeing in character with *R. cinnamomea*). Lindl. ros. 13. Plants setigerous or unarmed, bracteate. Leaflets lanceolate, glandless. Disk thin, never thickened. This section is distinguished by its long, lanceolate leaflets, without glands, upright shoots, and compact habit; red flowers never solitary except by abortion, and always

supported by bracteas; an inconspicuous disk but little thickened; round, small, red fruit, losing their long narrow sepals, and small, smooth, shining pericarps. The shoots are usually setigerous next the ground, but rarely so towards the apex, except in one or two instances. *R. alpina* and *R. acicularis* of the following division sometimes have bracteas, but their sepals never fall off till the fruit is decayed. Sepals simple, entire, or nearly so, unless when mentioned otherwise.

9 *R. NITIDA* (Willd. enum. 544.) dwarf; prickles crowded, very slender; leaflets shining, narrow-lanceolate, flat.  $\frac{1}{2}$ . H. Native of Newfoundland. Lindl. ros. 13. t. 2. *R. rubripina*, Bosc. dict. d. agr. 246. ? *R. blanda*, Pursh, fl. amer. sept. 1. p. 344. *R. Redùtea rubescens*, Red. ros. 1. p. 103. t. 36. Shrub beset with straight red spines. Flowers deep red. Fruit depressed, spherical, bright scarlet.

*Shining-leaved Rose*. Fl. June, Aug. Clt. 1807. Sh. 2 ft.

10 *R. RA'PA* (Bosc. dict. d'agr. ex. Desf. cat. hort. par. 273.) taller, diffuse; branches unarmed; leaflets oblong, undulated, shining; fruit hemispherical.  $\frac{1}{2}$ . H. Native of North America, in the warmer states. Red. ros. 1. p. 7. t. 2. *R. túrgida*, Pers. ench. 2. p. 49. *R. fraxinifolia*, Dum. Cours. bot. cult. Petals always multiplied, smaller than those of *R. lucida*, bright red. Fruit deep red. Sepals compound.

*Turnip Rose*. Fl. June, Aug. Shrub 3 to 4 feet.

11 *R. LU'IDA* (Ehrh. Beitr. 4. p. 22.) compact; prickles of the branches stipular; leaflets oblong, imbricated, flat, shining; fruit globose, depressed.  $\frac{1}{2}$ . H. Native of North America, from New York to Carolina; near Boston, in bogs, and on the edges of marshes, and of Newfoundland. *R. rubra lucida*, Ross. ros. t. 7. and t. 25. f. 1. *R. lucida*, Jacq. fragm. 71. t. 107. f. 3. Red. ros. 1. p. 15. t. 11.—Dill. elth. 325. t. 245. f. 316. Flowers red, overtopped by the leaves and young branches. Fruit bright red.

*Lucid Rose*. Fl. June, Aug. Clt. 1724. Sh. 4 to 6 feet.

12 *R. LINDLEYI* (Spreng. syst. 2. p. 647.) diffuse; branches twiggy, almost unarmed; leaflets oblong, undulated, opaque, glaucescent.  $\frac{1}{2}$ . H. Native of North America. *R. laxa*, Lindl. ros. 18. t. 3. *R. Carolina*, Ait. hort. kew. ed. 2. vol. 3. p. 260. *R. Carolina*, *pimpinellifolia*, Andrews. ros. with a figure. A spreading shrub, with reddish brown branches. Flowers rose-coloured, growing usually in pairs.

*Lindley's Carolina Rose*. Fl. July, Aug. Ch. ? Sh. 3 to 4 ft.

13 *R. LA'XA* (Retz. ex Spreng. syst. 2. p. 548.) cauline prickles recurved; flowers corymbose; bracteas glandularly serrated; petioles unarmed, villous; leaflets oblong, equally serrated, pubescent beneath.  $\frac{1}{2}$ . H. Native of Siberia. Flowers red. Fruit oblong, glabrous.

*Loose Rose*. Shrub 3 to 4 feet.

14 *R. KOSINGIANA* (Bess. ex Spreng. syst. append. 2. p. 518.) prickles almost stipular, recurved; leaflets with cuspidate serratures, glabrous on both surfaces, pale beneath; peduncles and calyxes hispid; fruit oblong, glabrous.  $\frac{1}{2}$ . H. Native of Podolia, at Tyra.

*Kosington Rose*. Shrub 4 to 6 feet.

15 *R. FRUTICORUM* (Bess. ex Spreng. syst. 2. p. 548.) prickles almost stipular, strong, reflexed; petioles unarmed, and are as well as the under surface of the leaves villous; leaflets elliptic; peduncles very short, glabrous; fruit globose, glabrous.  $\frac{1}{2}$ . H. Native of Volhynia.

*Bush Rose*. Fl. June, July. Clt. 1818. Shrub 5 to 6 feet.

16 *R. PARVIFLORA* (Ehrh. Beitr. 4. p. 21.) dwarf; stipulas linear; prickles acicular; leaflets lanceolate, smoothish, sharply serrated; calyxes clammy.  $\frac{1}{2}$ . H. Native of North America, on the declivities of hills in the state of New York and Carolina. Du Roi, herb. 2. p. 354. Smith, insect. georg. 1. p. 49. t. 25. ? *R. humilis*, Marsh. arb. 136. *R. Caroliniana*, Michx. fl. bor.

amer. 1. p. 295. *R. Carolina*  $\gamma$  and  $\delta$ , Ait. hort. kew. ed. 2. vol. 3. p. 260. Pennsylvanian Rose, Lawr. ros. t. 3. and t. 66. A very low weak plant. Flowers pale blush, usually growing by pairs.

*Var.  $\beta$ , flore-pleno*; flowers double, pale blush, unexpanded. A neat little rose. Red. ros. 2. p. 78. with a figure.

*Small-flowered Pennsylvanian Rose*. Fl. June, Aug. Clt. 1724. Shrub 2 feet.

17 *R. Woodsii* (Lindl. ros. p. 21.) stipulas and sepals connivent; leaflets oblong, obtuse, glabrous.  $\gamma$ . H. Native of North America, near the Missouri and north of the Saskatchewan and as far as the Bear Lake. Lindl. bot. reg. t. 976. *R. lutea nigra*, Pronv. nom. p. 24. A low shrub, with dull dark branches. Flowers pink. Fruit ovate, naked. There is a plant which was gathered about Cumberland House Fort, which Mr. Borrer takes to be a variety of the present species, having the leaves downy beneath.

*Woods's Rose*. Fl. Mar. June. Clt.? Shrub 2 to 3 feet.

18 *R. CAROLINA* (Lin. spec. 703.) stipulas convolute; leaflets lanceolate; sepals spreading.  $\gamma$ . H. Native of New England, Virginia, and Canada as far as the Saskatchewan. Red. ros. 1. p. 81. t. 28. Lindl. ros. p. 23. t. 4. *R. Virginiana*, Du Roi, harbk. 2. p. 353. Rössig, ros. t. 13. *R. palustris*, Marsh. arbr. 135. *R. corymbosa*, Ehrh. Beitr. 4. p. 21. *R. Pennsylvanica*, Michx. fl. bor. amer. 1. p. 296. *R. Caroliniana*, Bigel, fl. bost. 121. *R. Hudsoniana*, Red. ros. 1. p. 95. t. 35. Branches green or reddish brown. Cymes one or many-flowered. Flowers crimson. Petals concave or flat, crumpled. Fruit round, scarlet, hispid. Sometimes the ends of the shoots have no prickles.

*Var.  $\beta$ , Florida* (Lindl. ros. t. 23.) leaves without pubescence, thinner. *R. Florida*, Donn, cant. ed. 8. p. 169. *R. cneaphylla*, Rafin.

*Carolina Rose*. Fl. June, Jul. Clt. 1726. Shrub 2 to 8 ft.

19 *R. BLANDA* (Ait. hort. kew. 2. p. 202.) taller; prickles deciduous; leaflets oblong, flat; petioles pilose.  $\gamma$ . H. Native of North America, on the west coast, Hudson's Bay, Canada as far north as Bear Lake. *R. fraxinifolia*  $\alpha$ , blanda, Ser. in D. C. prod. 2. p. 606. Flowers solitary, large, pale red.

*Bland Rose*. Shrub 2 to 6 feet.

20 *R. FRAXINFOLIA* (Börk. Holz. 301. Ker. bot. reg. 458.) taller, unarmed; branches straight, glaucescent; leaflets opaque, undulated, glabrous.  $\gamma$ . H. Native of Newfoundland, and on the north-west coast of America. *R. Virginiana*, Mill. dict. no. 10. *R. blanda*  $\alpha$ , Sol. mss. Jacq. fragm. 70. t. 105. *R. corymbosa*, Bosc. dict. d'agr. ex Desf. cat. hort. par. p. 272. ? *R. alpina*  $\beta$ , Ait. hort. kew. ed. 2. vol. 3. p. 265. *R. alpina lævis*, Red. ros. 1. p. 57. t. 19. Lawr. ros. t. 75. Branches dark purple, with a pale blue bloom. Flowers small, red, in few-flowered cymes. Fruit naked, small, round, or ovate, of a dull pale red colour.

*Var.  $\beta$ , variegata* (Ser. in D. C. prod. 2. p. 607.) flowers rose-coloured, variegated with purple. *R. alpina flore variegata*, Red. ros. p. 55. with a figure.

*Var.  $\gamma$ , L'Heritieriana* (Ser. l. c.) flowers corymbose, semi-double; prickles scattered, recurved. *R. L'Heritieriana*, Red. ros. 3. p. 21. with a figure.

*Ash-leaved Rose*. Fl. May, June. Clt.? Shrub 4 to 6 ft.

21 *R. CINNAMOMEA* (Besl. hort. cyst. vern. ord. 6. p. 5. Lin. spec. 703.) tall, cinereous; branches straight; prickles stipular, straightish; stipulas dilated, undulated; leaflets oblong, obtuse, wrinkled, tomentose beneath.  $\gamma$ . H. Native of Denmark, Belgium, Portugal, Germany, Switzerland, France, Bohemia, and Caucasus. Lindl. ros. p. 28. t. 5. Red. ros. 1. p. 105. t. 37. and p. 133. t. 51. *R. fecundissima*, Munch. hausv. 5. p. 279. Fl. dan. t. 1214. *R. majalis*, Herm. diss. 8. Flowers solitary or 2-3 together, pale or bright red. Fruit round, naked,

crimson. The double-flowering variety is much more common than the single.

*Var.  $\beta$ , fluvialis* (Lindl. ros. p. 28.) leaflets ovate, acute.  $\gamma$ . H. Native of Denmark and Switzerland.

*Cinnamon Rose*. Fl. May, June. Clt.? Shrub 5 to 6 feet.

22 *R. DICKSONIANA* (Lindl. hort. trans. 7. p. 224. syn. brit. fl. p. 99.) branches flexuous, setigerous, armed with a few slender, scattered prickles; leaflets folded together, unequal, with coarse double serratures; stipulas, petioles, and sepals glandular, the latter unequal; fruit naked.  $\gamma$ . H. Native of Ireland. Flowers white.

*Dickson's Rose*. Fl. June, July. Ireland. Sh. 5 to 6 feet.

23 *R. TAURICA* (Bieb. fl. taur. 1. p. 394.) taller, cinereous; prickles scattered, weak; branches straight, unarmed towards the apex; leaflets oblong, wrinkled, villous beneath; sepals compound; styles stretched out, glabrous.  $\gamma$ . H. Native of Tauria, in bushy places. Habit of *R. cinnamomea*. Flowers red.

*Taurian Rose*. Fl. June, Jul. Clt. 1817. Shrub 5 to 6 ft.

24 *R. DAHURICA* (Pall. fl. ross. 61. Lindl. ros. p. 32.) tall, much branched; branches slender, coloured; prickles stipular, spreading, a little recurved; stipulas linear; leaflets oblong, wrinkled, tomentose beneath, deeply serrated.  $\gamma$ . H. Native of Dahuria and Mongol Tartary, in birch woods. Flowers red. Fruit ovate, red.

*Dahurian Rose*. Fl. May, June. Clt. 1824. Sh. 4 to 6 ft.

25 *R. SOONGARICA* (Bunge in Led. fl. alt. 2. p. 226.) tall; branches brown; prickles stipular, strong, reflexed; stipulas ovate, lanceolate, glandularly serrated; leaflets glabrous, oval-oblong, simply serrated; fruit globose, glabrous.  $\gamma$ . H. Native of the Soongarian desert, on the mountains of Arkaul and Dolenkara, at the river Irtysh. Peduncles corymbose, beset with glandular bristles. Petioles prickly. Flowers white; petals length of calyx. Prickles of the sterile branches straight.

*Soongarian Rose*. Fl. May. Shrub 5 to 6 feet.

26 *R. GMELINI* (Bunge in Led. fl. alt. 2. p. 228.) branches dark brown, sterile branches very prickly, floriferous ones almost unarmed; prickles setaceous, unequal; sepals ovate, acuminate, undivided, beset with glandular bristles; petioles clothed with glandular down; leaflets 5-7, obovate-oblong, simply serrated, pubescent, and glandless beneath; peduncles hispid; fruit ovate, glabrous.  $\gamma$ . H. Native of Siberia, common. *R. canina*, Sievers in Pall. nord. beytr. 7. *Rosa non spinosa*, fructu turbinato, Gmel. fl. sib. 3. p. 177. no. 15. Petals deep red, shorter than the sepals.

*Gmelin's Rose*. Shrub 3 to 4 feet.

27 *R. ARISTATA* (Lapeyr. fl. pyr. t. 105.) upper leaves usually with 2 pairs of leaflets, and with the petiole ending in a spine.  $\gamma$ . H. Native of the Pyrenees. Stem with a few prickles. Flowers solitary, purple. Perhaps a monstrosity of *R. cinnamomea*.

*Armed-petioled Rose*. Shrub 4 to 6 feet.

28 *R. MAJALIS* (Retz, obs. bot. 3. p. 33.) dwarf, grey; branches straight, coloured; prickles scattered, nearly equal; stipulas linear; leaflets oblong, flat, glaucous, and tomentose beneath.  $\gamma$ . H. Native of Sweden, Lapland, and Britain, near Pontefract, Yorkshire. *R. mítica*, Fl. dan. 688. *R. spinosissima*, Gorter. ingr. 78. *R. collincola*, Ehrh. Beitr. 2. p. 70. *R. cinnamomea*, Smith, engl. bot. 2388. Flowers usually solitary, pale red. Fruit orange red, spherical, naked.

*Var.  $\beta$ , canescens* (Lindl. ros. p. 34.) leaves white from tomentum.  $\gamma$ . H. Native of Sweden.

*Hog Rose*. Fl. May, June. Britain. Shrub 3 to 4 feet.

29 *R. MACROPHYLLA* (Lindl. ros. p. 35. t. 6.) unarmed; leaves very long; leaflets 5-11, lanceolate; petioles with a few glands, and are, as well as the leaflets, woolly beneath; sepals narrow, longer than the petals, which are apiculated.  $\gamma$ . H.

Native of Gosaingsthan. Flowers red. Peduncles villous, and furnished with a few unequal setæ, as well as the fruit.

*Long-leaved Rose.* Shrub 5 to 6 feet.

SECT. V. PIMPINELLIFOLIÆ (from *pimpinella*, pimpinel, and *folium*, a leaf; resemblance in leaves to those of *pimpinella*). Lindl. ros. p. 36. Plants bearing crowded, nearly equal prickles, or unarmed. Bractless, rarely bracteate. Leaflets ovate or oblong. Sepals connivent, permanent. Disk almost wanting. This section is essentially different from the last in habit, but in artificial characters they approach very nearly. It, however, may be distinguished by the greater number of leaflets, which vary from 7 to 13, and even to 15, instead of from 5 to 7. The flowers are also universally without bracteas, except in the *R. alpina*, *R. Sabini*, *R. Doniana*, and perhaps *R. marginata*. These having connivent permanent sepals, cannot be confounded with the preceding division, nor on account of their disk with the following. There is no instance of stipular prickles in the present tribe. The sepals are entire or nearly so, unless when mentioned otherwise.

30 *R. ALPINA* (Lin. spec. 703.) unarmed; fruit elongated, pendulous; peduncles hispid. *h. H.* Native of the alps of Austria, hills in the south of France, Silesia, Bohemia, Dauphiny, Switzerland, &c. Jacq. fl. austr. 3. p. 43. t. 279. Lindl. bot. reg. 424. *R. rupëstris*, Crantz, austr. 85. *R. Monspeliciæ*, Gouan. monsp. 255. *R. inermis*, Mill. dict. no. 6. *R. hybrida*, Vill. dauph. 3. p. 554. *R. lagenaria*, Vill. l. c. p. 563. *R. biflora*, Krok. fl. sil. 2. p. 157. Flowers erect, blush-coloured, solitary. Fruit orange red, oblong or obovate, with a long neck, generally pendulous.

*Var. β, Pyrenæica* (Lindl. ros. p. 37.) tube of calyx and peduncles hispid. *R. Pyrenæica*, Gouan. ill. 31. t. 19. *R. alpina*, Jacq. hort. schœnbr. 4. p. 416. *R. hispida*, Krok. siles. 2. p. 152. *R. turbinata*, Vill. dauph. 3. p. 550. *R. alpina c.*, D. C. fl. fr. 6. p. 536. *R. hispida* and *R. alpina coronata*, Desv. journ. bot. 1813. p. 119?

*Var. γ, pendulina* (Lindl. ros. p. 37.) leaflets numerous, and are as well as the stems coloured. *h. H.* *R. pendulina*, Lin. herb. Ait. hort. kew. ed. 1. vol. 2. p. 208. Lawr. ros. t. 91. *R. alpina pendulina*, Red. ros. 1. p. 57. t. 17. *R. alpina c.*, latifolia, Ser. in D. C. prod. 2. p. 612.

*Var. δ, pimpinellifolia* (Lindl. ros. p. 37.) smaller in every part than the other varieties. *h. H.* *R. pimpinellifolia*, Vill. dauph. 3. p. 553. *R. glandulosa*, Bell. in act. taur. 1790. p. 230. *R. pygmaea*, Bieb. fl. taur. 1. p. 397. *R. Pyrenæica β*, Smith in Rees' cycl.

*Var. ε, lagenaria* (Ser. in D. C. prod. 2. p. 611.) stem and branches glabrous; peduncles hispid; neck of calyx tapering; leaflets lanceolate or oblong, doubly and sharply serrated. *h. H.* Native of the Alps and Pyrenees.

*Var. ζ, sorbinella* (Ser. in D. C. prod. 2. p. 611.) peduncles short, hispid; calyx smooth; leaflets oblong-lanceolate, distant, acutely and doubly serrated. *h. H.* Native of the Alps of Bern.

*Var. κ, hispidella* (Ser. l. c.) branches armed with slender, more or less numerous, recurved prickles; peduncles and calyxes smoothish; leaflets elliptic. *R. alpina β*, D. C. fl. fr. 4. p. 440. *R. alpina coronata*, Desv. journ. bot. 1813. p. 119.

*Var. θ, lævis* (Ser. mel. 1. p. 52. ros. exsic. no. 49. but not of Desv. nor Red.) stem, peduncles, and calyxes quite glabrous; fruit oblong. *h. H.* Native of the Alps of Switzerland and Jura. *R. sanguisorba majoris*, &c. Dill. hort. elth. p. 325. t. 245. f. 317. *R. alpina glabra*, Desv. journ. bot. 1813. p. 119. *R. alpina lævis*, Desv. l. c. *R. alpina vulgaris*, Red. ros. 2. p. 111. with a figure.

*Var. ι, pyriformis* (Ser. l. c.) stem, peduncles, and calyxes glabrous; fruit short, pear-shaped. *h. H.* Native on mount Belpberg, about Bern.

*Var. κ, setosa* (Ser. l. c.) stem smooth; peduncles and calyxes beset with numerous, yellow, long bristles; leaflets distant, elliptic or obovate, sharply and doubly serrated; fruit pear-shaped. *h. H.* Native of Switzerland about Bern, and of the Pyrenees. *R. alpina hircina*, Desv. journ. bot. 1813. p. 119.

*Var. λ, globosa* (Desv. journ. bot. 1813. p. 119.) stem and branches smooth; peduncles and calyxes hispid; fruit nearly globose. *R. alpina ξ*, D. C. fl. fr. 5. p. 536. *R. canina ambigua*, Desv. journ. bot. 1813. p. 119. There is a variety of this with dark purple petioles and branches.

*Var. μ, helleborina* (Ser. l. c.) leaflets large, approximate, sharply and broadly toothed, the 3 terminal ones resembling those of *Helleborus lividus*; germens and pedicels smooth. *h. H.* Native of Russia.

*Var. ν, pilosula* (Ser. l. c.) leaflets obovate, obtuse; petioles hispid; peduncles pilose. *h. H.* Native about Basle.

*Var. ζ, turbinata* (Desv. journ. bot. 1818. t. 119.) stem and branches almost unarmed; leaflets ovate, glaucescent beneath; peduncles hispid; sepals dilated at the apex; flowers double red. *R. inermis*, Delaun. bon. jard. 1808. p. 717. Red. ros. 2. p. 93. with a figure. *R. alpina flore pleno*, Godefroy, cat. 1819. no. 58. *R. turbinata*, Vill. dauph. 3. p. 550. but not of Ait. *R. alpina multiplex*, Ser. mel. 1. p. 13. in a note. *R. mixta*, Tratt. ros. 1. p. 136.

*Alpine Rose.* Fl. June, July. Clt. 1683. Shrub 5 to 8 ft.

31 *R. CANDOLLEANA*; prickles crowded, equal; fruit elongated, pendulous. *h. H.* Native of Germany and Siberia. *R. rubella*, Lindl. ros. p. 40. *R. pendula*, Roth. fl. germ. 2. p. 561. *R. alpina*, Pall. fl. ros. 61. *R. polyphylla*, Willd. enum. suppl. 37. *R. alpina θ*, rubella, Ser. in D. C. prod. 2. p. 612. *R. Candolleana pendula*, Red. ros. 2. p. 45. with a figure. *R. Candolleana elegans*, Thor. ros. cand. p. 7. Flowers solitary, deep red. Fruit elongated, scarlet.

*Var. β, melanocarpa* (Lindl. ros. p. 40.) fruit shorter, blackish-brown.

*De Candolle's Rose.* Shrub 3 to 4 feet.

32 *R. RUBELLA* (Smith, engl. bot. 2521.) prickles slender, straight, crowded; fruit globose; leaflets glabrous; peduncles bristly. *h. H.* Native of England, in Northumberland, on the sandy sea-coast. Flowers either blush coloured or white, blotched with pink. Fruit bright scarlet.

*Reddish Rose.* Fl. July. England. Shrub 2 to 3 feet.

33 *R. STRICTA* (Muhl. cat. 50. Lindl. ros. p. 42. t. 7.) much branched; branches unarmed; fruit elongated, pendulous. *h. H.* Native of North America, in New England and Pennsylvania. *R. Virginiana*, Herm. diss. 19. *R. pendulina*, Lin. spec. 705. *R. Carolina ζ*, Ait. hort. kew. ed. 2. vol. 3. p. 260. Lawr. ros. t. 36.—Dill. hort. elth. 325. t. 215. f. 317. Flowers bright red. Fruit speckled with little pale spots before maturity. Leaves glaucous.

*Var. β, pubescens*; leaves pubescent beneath. *h. H.* Native of North America, on the Saskatchewan.

*Straight Rose.* Fl. June. Clt. ? Shrub 3 to 4 feet.

34 *R. SUAVIS* (Willd. enum. suppl. p. 37. Link. enum. 2. p. 57.) stem hispid; leaves glabrous, glaucescent beneath; peduncles and petioles clothed with glandular bristles. *h. H.* Native country unknown. Petals deep purple, deeply 2-lobed. Fruit oblong, glabrous.

*Sweet Rose.* Fl. June, July. Clt. 1818. Shrub 3 to 4 feet.

35 *R. ACICULARIS* (Lindl. ros. p. 44. t. 8.) tall; prickles acicular, unequal; leaflets glaucous, wrinkled, rather convex; fruit sub-ampullaceous, drooping. *h. H.* Native of Siberia. Flowers solitary, pale blush, fragrant. Fruit obovate, naked, of a yellowish orange colour. *R. alpina ε*, aculeata, Ser. in D. C. prod. 2. p. 611.

*Acicular-prickled Rose.* Fl. May, Ju. Clt. 1805. Sh. 6 to 8 ft.

36 *R. LUTE'SCENS* (Pursh, fl. amer. sept. vol. 2. p. 735. Lindl. ros. p. 47. t. 9.) prickles of branches crowded, unequal, slender, reflexed; of the branchlets small and nearly equal; leaflets flat, glabrous, simply serrated.  $\frac{1}{2}$ . H. Native of North America and Siberia. *R. hispida*, Curt. bot. mag. 1570. Flowers pale yellow. Fruit large, ovate, black.

*Yellow American Rose.* Fl. May, Ju. Clt. 1780. Sh. 4 to 6 ft.

37 *R. SULPHUREA* (Ait. hort. kew. 2. p. 201. Lindl. ros. t. 77.) stipulas linear, divaricate, dilatèd at the apex; leaflets glaucous, flattish; tube hemispherical.  $\frac{1}{2}$ . H. Native of the Levant. Ker. bot. reg. t. 46. Red. ros. 1. p. 29. t. 3. *R. hemisphærica*, Herm. diss. 18. *R. glaucophylla*, Ehrh. Beitr. 2. p. 69. *Rosa lutea flore pleno*. Rai. hist. 1475. no. 31. *R. lutea*, Brot. fl. lus. 1. p. 337. Stem prickles unequal, scattered. Flowers large, of a fine transparent yellow, always double.

*Sulphur-coloured-flowered Rose.* Fl. July. Clt. 1629. Sh. 4 to 6 feet.

38 *R. FLA'VA* (Wicks ex Spreng. syst. 2. p. 550.) fruit globose, and is as well as the peduncles hispid; prickles of the branches much crowded, somewhat setaceous; petioles prickly; leaflets pubescent beneath.  $\frac{1}{2}$ . H. Native of Siberia. Flowers yellow.

*Yellow Siberian Rose.* Shrub 4 to 6 feet.

39 *R. VIMI'NEA* (Lindl. ros. p. 49.) branches twiggy; prickles setaceous, much crowded, straight, spreading, unequal; leaflets membranous, flat, glabrous, simply serrated.  $\frac{1}{2}$ . H. Native of Siberia? *R. horrida*, Lindl. ex Spreng. syst. 2. p. 549. Flowers very large.

*Twiggy Rose.* Shrub 3 to 4 feet.

40 *R. SPINOSISSIMA* (Lin. fl. succ. 442. spec. 491.) prickles unequal; leaflets flat, glabrous, simply serrated.  $\frac{1}{2}$ . H. Native of Europe; plentiful in Britain. A dwarf, compact bush, with creeping roots. Flowers small, solitary, white or blush coloured. Fruit ovate, or nearly round, black or dark purple.

*Var. c, pumila* (Lindl. ros. p. 50.) prickles horizontal; fruit ovate; \* peduncles glandular or bristly.  $\frac{1}{2}$ . H. Native throughout Europe and of Caucasus, on hills near the sea. *R. spinosissima*, Lin. *R. cinnamomea*, Herm. diss. 7. *R. chamaerhodon*, Vill. dauph. 3. p. 555. *R. pimpinellifolia*  $\frac{1}{2}$ , Red. ros. 1. p. 119. t. 44. \* \* Peduncles naked. *R. spinosissima*, Fl. dan. t. 398. Bull. par. t. 277. Lawr. ros. t. 18. and t. 48. Smith, engl. bot. t. 187. *R. pimpinellifolia*, Lin. syst. ed. 10. p. 1062. spec. 703. Rossig. ros. t. 9. and t. 25. f. 2. Jacq. fragm. 71. t. 107. f. 1. Red. ros. 1. p. 83. t. 29. and p. 85. t. 30. *R. Scôtica*, Mill. dict. no. 5. *R. collina*, Schrank. fl. no. 774. *R. pimpinellifolia*, var. *a*, vulgaris, Ser. in D. C. prod. 2. p. 608. *R. spinosissima*, var. *pusilla*, Woodv. in Lin. trans. 12. p. 179.

† The following are the names of the Garden varieties of the Scotch Rose.

\* *Double Scotch Roses.*

<i>Anderson's double lady's blush.</i>	* <i>small double light purple.</i>
<i>double lady's blush.</i>	* <i>double dark red.</i>
<i>double pink blush.</i>	* <i>double light red.</i>
<i>double Proven's blush.</i>	* <i>true double red.</i>
<i>double rose blush.</i>	* <i>large double two-coloured.</i>
<i>Dutch double blush.</i>	* <i>small double two-coloured.</i>
<i>princess double blush.</i>	* <i>large double white.</i>
<i>double crimson.</i>	* <i>large semi-double white.</i>
<i>double crimson marbled.</i>	* <i>Whitley's double white.</i>
<i>double dark marbled.</i>	* <i>globe double yellow.</i>
<i>double light marbled.</i>	* <i>large double yellow.</i>
<i>double purple.</i>	* <i>pale double yellow.</i>
	* <i>small double yellow.</i>

\* \* *Single-flowered Scotch Roses.*

variegata.  
venulosa glabra.  
venulosa hispida.

*Var. β, reversa* (Lindl. ros. p. 51.) dwarf; prickles slender; lower ones deflexed; fruit ovate. *h. H.* *R. spinosissima*, Jacq. fragm. 79. t. 124. *R. nana*, Andrews, ros. *R. reversa*, Lindl. bot. reg. t. 431. Flowers of a whitish yellow colour.

*Var. γ, R. polycarpa* (Lindl. l. c.) dwarf; fruit depressed, and are as well as the peduncles bristly. *h. H.* Native of Ireland.

*Var. δ, pilosa* (Lindl. l. c.) leaflets acute, pilose beneath. *h. H.* Native of Ireland.

*Var. ε, turbinata* (Lindl. l. c.) dwarf; fruit turbinate. *h. H.* Native of Ireland.

*Var. ζ, Pallasi* (Lindl. l. c.) taller; prickles nearly equal, much crowded. *h. H.* *R. pimpinellifolia*, Pall. fl. ross. 62. t. 75. Red. ros. 1. p. 84. *R. Altaica*, Willd. enum. 543. *R. Sibirica*, Tratt. ros. 2. p. 230. *R. pimpinellifolia* 0, Altaica, Red. ros. 1. p. 84. Flowers white. Grows in elevated plains and exposed precipices, from the northern part of the Altaian mountains, extending through Siberia. Its more robust habit, and its approach to equal size in its prickles are its principal characters.

*Var. η, Rossica* (Lindl. l. c.) taller; prickles long and very slender. *h. H.* Native of Russia.

*Var. θ, argentea* (Ser. in D. C. prod. 2. p. 608.) branches and stems hispid from prickles, intermixed with minute bristles; peduncles and calyxes purple, hispid; leaflets ovate, clothed with white tomentum beneath; flowers white, semi-double. *h. H.* *R. hispida argentea*, Red. ros. 3. p. 81. Curt. bot. mag. 1570.

*Var. ι, echinella* (Ser. l. c.) teeth of leaflets very numerous; peduncles and calyxes hispid.

*Var. κ, flavescens* (Ser. l. c.) peduncles and fruit smooth; flowers pale yellow. *R. Candolleana flavescens*, Red. ros. 2. p. 46.

*Var. λ, microcarpa* (Ser. l. c.) flowers and leaves smaller; fruit smaller, and are as well as the peduncles hispid or smooth; stem prickly. *h. H.* Native of Podolia. *R. melanocarpa*, Bess. enum. pl. Vohl. 18. 61 and 62.

*Var. μ, inermis* (Ser. l. c. D. C. fl. fr. 4. p. 438.) stems and branches unarmed. var. 1. Flowers white. Red. ros. 1. p. 84. var. 2. Flowers pale red. Red. ros. 3. p. 23.

*Var. ν, marmorata* (Ser. l. c.) flowers small, more or less variegated or blotched; leaflets small, roundish; stems and branches more or less prickly. *h. H.* Lois. in Duham. ed. nov. ex Red. ros. 1. p. 84. *R. pimpinellifolia* 0, Red. ros. 1. p. 84.

*Var. ο, Isländica* (Lindl. ros. p. 57.) taller; prickles large, falcate. *h. H.* Common in Ireland. *R. Hibernica*, Hook. mss.

*Very-spiny* or Scotch Rose. Fl. May, June. Britain. Sh. 1 to 2 feet.

41 *R. HIBERNICA* (Smith, engl. bot. 2196.) prickles unequal, slightly hooked, smaller ones bristle-formed; leaflets ovate, acute, simply serrated, with the ribs hairy beneath; sepals pinnate; fruit nearly globular, smooth as well as the peduncles. *h. H.* Native of Ireland, in the counties of Derry and Down, in thickets. Flowers rather small, light blush coloured. Fruit orange-coloured.

*Irish Rose.* Fl. June, Nov. Ireland. Shrub 4 to 6 feet.

42 *R. OXYACANTHA* (Bieb. fl. taur. 3. p. 338.) stem very

prickly; prickles setaceous, reversed; petioles prickly and glandular; leaflets sharply and simply serrated, glabrous; sepals undivided; peduncles clothed with glandular bristles, when in fruit reflexed; fruit nearly globose, glabrous. *h. H.* Native of Siberia. Flowers red.

*Sharp-spined Rose.* Fl. Ju. Jul. Clt. 1820. Sh. 2 to 4 ft.

43 *R. SANGUISORBIFOLIA* (Donn, hort. cant. ed. 8. p. 169.) tall; prickles nearly equal; leaflets 9-11, oblong, glabrous, simply serrated; fruit globose, depressed, dark. *h. H.* Native country unknown. *R. spinosissima*, var. *ι, sanguisorbifolia*, Lindl. ros. t. 51. *R. spinos. ι, macrophylla*, Ser. in D. C. prod. 2. p. 609. Flowers white. This plant is easily distinguished from the last in the greater number of leaflets, and in the globose depressed fruit.

*Burnet-leaved Rose.* Fl. May, June. Clt. ? Sh. 3 to 5 feet.

44 *R. GRANDIFLORA* (Lindl. ros. p. 55. and bot. reg. 888.) branches without bristles; prickles nearly equal, distant; leaflets flat, glabrous, simply serrated. *h. H.* Native of Siberia. *R. pimpinellifolia*, Bieb. fl. taur. 2. p. 394. Flowers white. Fruit dark.

*Great-flowered Rose.* Fl. May, Ju. Clt. 1818. Sh. 4 to 6 ft.

45 *R. CALIFORNICA* (Schlecht. et Cham. in Linnea. 2. p. 35.) branches glabrous; prickles stipular, twin, a little recurved, the rest of the shrub unarmed; leaflets 5-7, ovate, obtuse, sharply serrated, pubescent above and tomentose beneath; stipules with a few glands on the margins; corymbs terminal; peduncles pilose; sepals ovate, acuminate, dilated, and spatulate at the apex, pubescent outside and tomentose inside, white, and densely ciliated on the edges. *h. H.* Native of California. Petals rose-coloured, size of those of *R. pimpinellifolia*.

*California Rose.* Shrub.

46 *R. NANKINENSIS* (Lour. coch. 324.) dwarf, much branched; prickles crowded; leaflets acuminate, ciliate serrated; sepals prickly; petals apiculate. *h. G.* Native of China, about Canton and Nankin. Flowers pale red, small, double.

*Nankin Rose.* Shrub 1 foot.

47 *R. MYRIACANTHA* (D. C. fl. fr. 4. p. 439. Lindl. ros. p. 55. t. 10.) prickles unequal, largest ones dagger-formed; leaflets glandular, glabrous, orbicular. *h. H.* Native of Dauphny and near Montpellier. *P. parvifolia*, Pall. ross. 62. *R. provincialis*, Bieb. fl. taur. 1. p. 396. *R. spinosissima*, var. *η, myriacantha*, Ser. in D. C. prod. 2. p. 608. Flowers white.

*Myriad-spined Rose.* Fl. May, Ju. Clt. 1820. Sh. 1 to 2 ft.

48 *R. INVOLUTA* (Smith, engl. bot. 2068.) prickles very unequal, and very much crowded; leaflets doubly serrated, pubescent; petals convolute; fruit prickly. *h. H.* Native of the western parts of Scotland; in several parts of the Hebrides; in the Isle of Arran (G. Don); and in Glen Lyon. *R. nivālis*, Donn, hort. cant. ed. 8. p. 170. Petals pale red, concave.

*Involute-petalled Rose.* Fl. June. Scotland. Sh. 2 to 3 ft.

49 *R. REVERSA* (Waldst. et Kit. hung. 3. p. 293. t. 264.) prickles setaceous, nearly equal, reflexed; leaves doubly serrated, pubescent; fruit hispid. *h. H.* Native of Hungary, on the mountains of Matra, in stony places. Flowers solitary, white, tinged with pink. Fruit ovate, dark purple.

*Reversed Rose.* Fl. June, July. Clt. 1816. Sh. 2 to 5 ft.

50 *R. MARGINATA* (Wallr. ann. bot. 68. Lindl. ros. p. 58.) dwarf; branches twisted, when young pruinose; leaflets ovate-cordate, triply serrated, quite glabrous; sepals mucronate. *h. H.* Native of Germany, in fields about Bemmstadt. Petals blush-coloured, with yellow claws. Fruit ovate-globose, purplish. Prickles numerous, straight. Peduncles and calyxes bristly, with glands.

*Marginate Rose.* Shrub 1 to 2 feet.

51 *R. SABINI* (Woods. in Lin. trans. 12. p. 188.) peduncles, branches, fruit, and calyx bristly; prickles scattered, straightish; leaflets doubly serrated, nearly smooth, with hairy ribs; sepals

pinnate. *h. H.* Native of Scotland, near Dunkeld; in England in Cumberland, Northumberland, and Yorkshire. Borr. in engl. bot. suppl. 2594. Flower-stalks rather aggregate. Petals fine red. Fruit ovate, bright scarlet.

*Sabine's Rose.* Fl. July. Britain. Shrub 5 to 8 feet.

52 *R. DONIA'NA* (Woods. in Lin. trans. 12. p. 185.) peduncles bractless, bristly as well as the globular fruit and calyx; stem bristly and prickly, like the downy petioles; leaflets elliptical, doubly and sharply serrated, hairy on both sides; petals spreading. *h. H.* Native of the Highlands of Scotland, particularly on the mountains of Clova, Angusshire. Borr. in engl. bot. suppl. 2601. *R. Sabini*  $\beta$ , Lindl. ros. p. 59. Flowers pink, expanded. Segments of the calyx simple.

*Don's Rose.* Fl. June, July. Scotland. Shrub 2 to 4 feet.

53 *R. WILSONI* (Borr. in Hook. brit. fl. p. 228. engl. bot. suppl. 2722.) prickles crowded, unequal, straight, intermixed with setæ; leaflets simply serrated, hairy, their disks glandless; sepals simple; fruit nearly globular. *h. H.* Native of England, near Bangor Ferry. Flowers beautiful dark pink.

*Wilson's Rose.* Fl. June, July. Shrub 2 to 4 feet.

54 *R. GRA'CILIS* (Woods. in Lin. trans. 12. p. 186.) peduncles usually in pairs, bristly, often bracteate; branches, fruit, and calyx bristly; larger prickles curved, usually twin; leaflets doubly serrated, hairy on both sides. *h. H.* Native of the north of England, in thickets. *R. villosa*, Smith, engl. bot. 583. excluding the synonym and the fruit. Petals slightly concave, of a pale pink. Fruit globular. Segments of the calyx simple.

*Slender Rose.* Fl. July. Britain. Shrub 8 to 10 feet.

55 *R. RECLINATA* (Red. ros. 3. p. 79. with a figure) stem nearly unarmed, but very prickly in the single-flowered variety; leaflets 3-7, lanceolate-oblong; flower bud reclinate before expansion; sepals nearly entire; fruit nearly globose, and are as well as the peduncles glabrous. *h. H.* Native of? Perhaps a hybrid between *R. alpina* and *R. Indica*, ex Red. l. c. Flowers lurid purple.

*Var.  $\beta$ , multiplex* (Red. l. c. p. 79. with a figure,) flowers nearly double, inclinate, somewhat panicled; leaflets 3-5, ovate, rather cordate; stem rather prickly. *h. H.*

*Reclinate-flowered Rose.* Shrub.

† *Species belonging to section Pimpinellifoliae, but are not sufficiently known.*

56 *R. LIVESCENS* (Bess. suppl. cat. hort. crem. et enum. p. 20. 61. and 67.) prickles stipular, spreading; leaflets oblong, serrated, of a livid glaucous colour, partly coloured beneath, and are glabrous as well as the petioles; sepals glandular, exceeding the petals; peduncles twin, glabrous; fruit oblong, smooth. *h. H.* Native of Volhynia. *R. Guttenseingensis*, Jacq. f. 110. *R. Damascena*, var. *livescens*, Ser. in D. C. prod. 2. p. 604.

*Livescent-leaved Rose.* Shrub 4 to 5 feet.

57 *R. PALLENS* (Retz, ex Spreng. syst. append. p. 200.) prickles of branches twin, horizontal; leaflets oval, quite glabrous; sepals nearly equal; fruit hemispherical, and are smooth as well as the peduncles. *h. H.* Native of Sweden.

*Pale Rose.* Shrub 4 to 5 feet.

58 *R. HEMISPHERICA* (Spreng. syst. append. p. 200.) prickles of branches twin, horizontal; leaflets small, roundish, and are as well as the petioles quite glabrous; peduncles bristly; fruit hemispherical, short, glabrous. *h. H.* Native country unknown.

*Hemispheric-fruited Rose.* Shrub.

59 *R. MOSQUE'NSIS* (Spreng. syst. append. 200.) prickles stipular, straight; leaflets oblong, serrated, pubescent as well as the petioles, which are unarmed; fruit globose, glabrous, as well as the peduncles. *h. H.* Native about Moscow, in fields.

*Moscow Rose.* Shrub 4 to 5 feet.

60 *R. GORINK'ENSIS* (Fisch. ex Spreng. syst. append. p. 200.) branches shining, nearly unarmed; petioles and leaves pubescent beneath; fruit nearly globose, and are as well as the peduncles quite glabrous. *h. H.* Native about Moscow, in fields.

*Gorinki Rose.* Shrub 4 to 6 feet.

61 *R. OCHROLEUCA* (Swartz, ex Spreng. syst. append. p. 200.) This species differs from *R. spinosissima* in the prickles being straight, and in the petioles being nearly unarmed. *h. H.* Native country unknown. Flowers cream-coloured.

*Cream-coloured-flowered Rose.* Shrub 2 to 4 feet.

62 *R. CORUSCANS* (Waitz. ex Link. enum. 3. p. 57.) stem bristly and very prickly; petioles pubescent; leaflets oblong-lanceolate, acuminate, serrated, glabrous; peduncles naked; tube of calyx globose and naked, the segments with tomentose edges. *h. H.* Native country unknown. Flowers pink.

*Glittering Rose.* Fl. June, July. Clt.? Shrub 4 to 5 feet.

63 *R. KENTUCK'ENSIS* (Rafin. ros. amer. in ann. sc. phys. 5. p. 213.) stems weak, and are as well as the petioles glabrous; prickles recurved; branches flexuous; leaflets ovate-elliptic, attenuated at the base and apex, serrated, pale and pubescent beneath; calyx hispid and villous; fruit globose, glabrous. *h. H.* Native of North America, in Kentucky. Leaflets 3-5. Fruit dark purple. Prickles bay-coloured.

*Kentucky Rose.* Shrub 2 to 3 feet.

64 *R. TRIFOLIATA* (Rafin. l. c. p. 213.) quite glabrous; prickles recurved; leaflets 3, acute, serrated, glabrous; flowers subcorymbose; fruit globose, glabrous. *h. H.* Native of North America, in Kentucky. Flowers large, rose-coloured. Anthers copper-coloured.

*Trifoliate Rose.* Shrub 4 to 5 feet.

65 *R. ELEGANS* (Rafin. l. c. p. 214.) branches and petioles prickly; leaflets 5-7, elliptic, subcordate, serrated, glabrous, the same colour on both surfaces; flowers 1-3, terminal; fruit globose, hispid. *h. H.* Native of North America, on the banks of Hudson's river. Flowers large, rose-coloured, fragrant. Stipulas hispid.

*Elegant Rose.* Shrub 4 to 5 feet.

66 *R. GLOBOSA* (Rafin. l. c. p. 215.) branches glabrous; prickles twin, straight, short; petioles pubescent, prickly; leaflets 3-5, ovate, serrated, villous beneath; flowers panicled; fruit globose, large, glabrous. *h. H.* Native of North America.

*Globose-fruited Rose.* Shrub.

67 *R. CURSOR* (Rafin. l. c. p. 215.) branches flagelliform, glabrous; prickles recurved; petioles, nerves, peduncles, and calyxes glandular; leaflets 3-5, oblong, acuminate, serrated, pale and villous beneath; flowers numerous, corymbose; peduncles jointed, bracteolate; fruit globose, glabrous, small. *h. H.* Native of North America, in Kentucky. Stems running even to the tops of trees. Stipulas narrow. Flowers large, scentless. Fruit pear-shaped.

*Runner Rose.* Shrub cl.

68 *R. OBOVATA* (Rafin. l. c. 5. p. 217.) stem glabrous; prickles stipular, straight; petioles prickly, pubescent; leaflets 7, obovate, acute, entire, pubescent beneath; flowers solitary; fruit globose, depressed; peduncles glabrous. *h. H.* Native of New York. Flowers large, rose purple, very fragrant. Branches beset with glandular dots.

*Obovate-leafletted Rose.* Shrub.

69 *R. SERRULATA* (Rafin. l. c. p. 218.) stem and petioles prickly and hispid; stipular prickles straight; stipulas ciliated; leaflets 5-7, obovate, doubly serrated, pale; flowers usually solitary: sepals serrulated; fruit globose, hispid. *h. H.* Native of North America. Flowers middle-sized, rose-coloured, sweet-scented. Petals almost entire.

*Var.  $\beta$ , rotundifolia* (Rafin. l. c.) prickles slender, straight, numerous; leaflets oval-roundish. Native of Kentucky.

*Serrulated-calyxed Rose.* Shrub 3 to 6 feet.

70 *R. RAFFINESQUII* (Ser. in D. C. prod. 2. p. 611.) plant almost unarmed and glabrous; petioles hispid; leaflets 3-7, oval-oblong, acuminate, serrated, glabrous; flowers usually solitary; fruit turbinate, glabrous; sepals undivided.  $\frac{1}{2}$  H. Native of North America. *R. nivea*, Rafin. l. c. p. 218. but not of D. C. Flowers white, rather sweet scented.

*Rafinesque's Rose.* Shrub 3 to 6 feet.

71 *R. PUSILLA* (Rafin. l. c. p. 218.) stems procumbent, glabrous, twisted; prickles stipular, straight; petioles pubescent; leaflets 3-5, obovate-oblong, serrated, shining, paler beneath and pubescent; flowers solitary; peduncles hispid; stigmas tomentose, umbilicate; fruit globose, depressed, smooth, scarlet.  $\frac{1}{2}$  H. Native of North America, in Kentucky.

*Small Rose.* Shrub procumbent.

SECT. VI. CENTIFOLIÆ (from *centum*, a hundred, and *folium*, a leaf; because of the species contained in this section agreeing in character with the *hundred-leaved rose*). Lindl. ros. p. 60. Shrubs bearing bristles and prickles of two forms. Peduncles bracteate. Leaflets oblong or ovate, wrinkled. Disk thickened, closing the throat. Sepals compound. This division comprises the portion which has most particularly interested the lovers of flowers. It is probable that the earliest of which there are any records as being cultivated belonged to some portion of it; but to which particular species those of Cyrene or Mount Pangæus are to be referred, is now too late to enquire. The attar of roses, which is an important article of commerce, is either obtained from them indiscriminately, as in the manufactory at Florence, conducted by a convent of friars, or from some particular kind, as in India. It appears, from specimens brought from Chizapore by Colonel Hardwicke, that *R. Damascēna* is there exclusively used for obtaining the essential oil. The Persians also make use of a sort which Kæmpfer calls *R. Shirazensis*, from its growing about Schiraz, in preference to others; this may be either *R. Damascēna* or *R. centifolia*. It is, however, well known that attar of roses from different countries is of various degrees of goodness, that from Turkey being usually the best. It is therefore probable that *R. moschata* may be sometimes used either alone or mixed with other kinds, especially at Mogodor, where considerable quantities are procured, but of inferior quality. To the three or four first species of the section nearly all the fine double roses of the gardens are referrible. The species contained in the present section are all setigerous, by which they are distinguished from the following divisions; their thickened disk and divided sepals separate them from the preceding. To the section of *Rubiginosæ* the glanduliferous sorts approach; but the difference of their glands, the size of their flowers, and their dissimilar habit, prevent their being confounded.

72 *R. DAMASCĒNA* (Mill. dict. no. 15.) prickles unequal, larger ones falcate; sepals reflexed; fruit elongated.  $\frac{1}{2}$  H. Native of Syria. Redout. ros. 1. p. 137. t. 53. *R. Belgica*, Mill. dict. no. 17. *R. Calendarium*, Mœnch. hausv. ex Bork. holz. 330. Rossig. ros. t. 8. and t. 33. *R. bifera*, Poir. suppl. 6. p. 276. Red. ros. 1. p. 107. t. 38. and p. 121. t. 45. Flowers large, white, or red, single or double. The present species may be distinguished from *R. centifolia* in the greater size of the prickles, green bark, elongated fruit, and long reflexed sepals. The petals of this species, and all the varieties of *R. centifolia*, as well as those of other species, are employed indiscriminately for the purpose of making rose water. The following are the garden varieties of the *Damask rose*.

*Agathe, rouge.* *Aurora.*  
*argentea.* *Belgic, blush.*  
*Auguste, belle.* *Belgique carnée.*

*Belgique violette.*

*bifera carnea.*

*bifera de Naples.*

*bifera grandiflora.*

*blush, early.*

*blush, imperial.*

*blush, monthly.*

*blush, Watson's.*

*Brunswick.*

*cluster, pale.*

*couronnée, belle.*

*couronnée, petite.*

*damas argenté.*

*damas pourpré.*

*damask, blush.*

*damask, red.*

*damask, white.*

*Egyptian.*

*emperor.*

*félicité.*

*Goliath.*

*gracieuse.*

*hundred-leaved, petite.*

*incomparable.*

*Damascus or Damask Rose.* Fl. June, July. Clt. 1573. Shrub 2 to 4 feet.

73 *R. CENTIFOLIA* (Lin. spec. 704.) prickles unequal, larger ones falcate; leaflets ciliated with glands; flowers drooping; calyxes clammy; fruit oblong.  $\frac{1}{2}$  H. Native of Eastern Caucasus, in groves. Bull. par. 275. Rossig. ros. t. 1. Red. ros. 1. p. 25. t. 1. p. 37. t. 7. p. 77. t. 26. p. 79. t. 27. p. 111. t. 40. *R. provincialis*, Mill. dict. no. 18. *R. polyanthos*, Rossig. ros. t. 35. *R. caryophyllæa*, Poir. suppl. 6. p. 276. *R. unguiculata*, Desf. cat. 175. *R. varians*, Pohl, boh. 2. p. 171. Flowers white or red, single, but most commonly double. This species is distinguished from *R. Damascēna* in the sepals not being reflexed, the flowers full, double, and the petals very large, whence the name of *Cabbage-rose*. Its fruit is either oblong or roundish, but never elongated. From *R. Gallia* it is distinguished by the flowers being drooping and by the larger size of the prickles, with a more robust habit. The following are the garden varieties of the *hundred-leaved or cabbage-rose*.

*Var. β, muscosa* (Lindl. ros. p. 64.) calyx and peduncles mossy. *h. II.* *R. muscosa*, Mill. dict. no. 22. Lawr. ros. t. 14. Rossig. ros. t. 6. Ker. bot. reg. t. 53. and t. 102. Red. ros. 1. p. 39. t. 8. p. 41. t. 9. p. 87. t. 31.—Mill. fig. t. 221. f. 1. *R. provinciâlis β*, Smith, in Rees' cycl. The Moss rose is either white or red and always very double. The following are the names of the varieties:

<i>moss, blush.</i>	<i>moss, single.</i>
<i>moss, common.</i>	<i>moss, striped.</i>
<i>moss, dark.</i>	<i>moss, white.</i>
<i>moss, prolific.</i>	

*Var. γ, Pomponia* (Lindl. ros. p. 64.) smaller in every part than the other varieties. *h. II.* *R. centifolia minor*, Rossig. ros. t. 20. and t. 37. *R. Divioniensis*, Rossig. ros. t. 24. *R. Pomponia*, D. C. fl. fr. 4. p. 443. Red. ros. 1. p. 65. t. 21. *R. Burgundiaca*, Pers. ench. 2. p. 48. *R. provinciâlis γ*, Smith, in Rees' cycl. *R. centifolia γ*, Red. ros. 1. p. 113. t. 41. Flowers double, white, or red. The following are the names of the garden varieties of the *Pomponie rose*.

<i>De Meaux.</i>	<i>pomponie, prolific.</i>
<i>dwarf Bagshot.</i>	<i>provins, dwarf.</i>
<i>mossy de Meaux.</i>	<i>provins, small.</i>
<i>mignonne charmante.</i>	<i>Rheims, de.</i>
<i>pomponie.</i>	<i>St. Francis.</i>

*Var. δ, bipinnata* (Lindl. ros. p. 65.) leaves bipinnate. *h. II.* *R. centifolia bipinnata*, Pers. ench. 1. p. 48. Red. ros. 2. p. 11. t. 4. Celery-leaved rose of the French.

*Hundred-leaved*, Cabbage, Pomponie, Provins, and Moss Roses. Fl. June, July. Clt. 1596. Shrub 3 to 6 feet.

74 *R. GALICA* (Lin. spec. 704.) prickles nearly equal, the same shape, weak; leaflets stiff, elliptic; flowers erect; sepals ovate; fruit nearly globose. *h. II.* Native of middle Europe and Caucasus, in hedges. Mill. fig. t. 221. f. 2. Rossig. ros. tt. 17. 22. 25. figures 6. 26. 28. 31. 36. 38. 39. Red. ros. vol. 1. p. 73. t. 25. p. 135. t. 52. vol. 2. p. 17. t. 7. p. 19. t. 8. and 10. *R. centifolia*, Mill. dict. no. 41. *R. sylvatica*, Gater. mont. p. 94. *R. rubra*, Lam. fl. fr. 3. p. 130. *R. holosericea*, Rossig. ros. t. 16. *R. Damascena*, rubra-purpurea, Rossig. ros. t. 18. *R. Belgica*, Brot. fl. lus. 1. p. 338. *R. blanda*, Brot. l. c. Flowers from red to crimson, double or semidouble. The flowers of the *officinal rose* have not the fragrance of the *Dutch hundred-leaved rose*, but the beautiful colour of the petals, and their pleasant astringency, have rendered them officinal. It must, however, be remarked, that their odour is increased by drying, while that of the *damask rose* is almost destroyed. They are kept dried for making gargles. The following are the names of the garden varieties of the French or officinal rose.

*Var. β, pumila* (Lindl. ros. p. 68.) flowers single; roots creeping. *h. H.* Native of Austria, Piedmont, Tauria, Caucasus, Iberia, and about Geneva. *R. pumila*, Lin. suppl. 262. Jacq. austr. 2. p. 59. t. 198. *R. repens*, Munch. hausv. 5. p. 281. *R. hispida*, Munch. l. c. *R. Austriaca*, Crantz. austr. 86. *R. Olympica*, Donn. hort. cant. ed. 8. p. 170. Flowers single, red.

*Var. γ, arvina* (Lindl. ros. p. 69.) leaves naked on both surfaces. *h. H.* Native of Silesia. *R. arvina*, Krok. siles. 2. p. 150.

*Var. δ, inaperta* (Ser. mel. 1. p. 86.) branches and peduncles hispid from prickles; calyx campanulate, glandular; flowers double from abortion, white and red. Called *vilmorin rose*.

*Var. ε, Agatha* (Red. et Thor. ros. 3. p. 35. with a figure.) leaflets small or large; sepals more or less pinnate; flowers small, very double, outer petals spreading, but the inner ones are concave. Called *Agatha rose*.

*Var. ζ, inermis* (Ser. in D. C. prod. 2. p. 604.) glabrous; branches smooth; peduncles hardly glandular; tube of calyx bell-shaped; flowers double, purple; sepals shortly and simply pinnate.

*French or Official Rose.* Fl. June, July. Sh. 2 to 3 feet.

75 *R. PYGMÆA* (Bieb. fl. taur. 1. p. 397. suppl. p. 342. cent. pl. ross. 1. t. 2.) stems unarmed; branches and petioles hispid from prickles; leaflets ovate, acute, glandularly biserrated, smoothish above, and glaucescent beneath; sepals entire; fruit rather obovate. *h. H.* Native of Tauria. Flowers red. Perhaps a variety of *R. Gállica*.

*Pygmy Rose.* Fl. June, July. Shrub 2 feet.

76 *R. PARVIFOLIA* (Ehrlh. Beitr. 6. p. 97.) dwarf; prickles nearly equal; leaflets stiff, ovate, acute, sharply serrated; sepals ovate, nearly simple. *h. H.* Native on mountains in the neighbourhood of Dijon. Ker. bot. reg. t. 452. *R. Burgundica*, Rossig, ros. t. 4. *R. Remensis*, Desf. cat. 175. *R. Gállica* var. *κ parvifolia*, Ser. in D. C. prod. 2. p. 664. Shrub compact, bluish grey. Flowers solitary, overtopped by the young shoots, purple, very double. Red. ros. 3. p. 107. with figures.

*Small-leaved or Burgundy Rose.* Fl. June, July. Shrub 1 to 2 feet.

77 *R. PULCHELLA* (Willd. enum. p. 545.) ovaries roundish-obovate; peduncles and calyxes beset with glandular bristles; petioles clothed with glandular pubescence, unarmed; cauline

prickles scattered. *h. H.* Native country unknown. Allied to *R. turbinata*, but the stems are much smaller; flowers also smaller, and the form of the ovaries is different. Perhaps this is the *rose de Meaux* of the gardens, or some variety of *R. Gállica*.

*Neat Rose.* Fl. June, July. Clt. 1824. Shrub 2 feet.

78 *R. ADENOPHYLLA* (Willd. enum. 546.) ovaries ovate, and are, as well as the calyxes and peduncles, clothed with glandular bristles; petioles beset with glandular pubescence, unarmed; leaves simply serrated, glaucous beneath, with glandular margins; prickles of the branches scattered. *h. H.* Native country unknown. Flowers large, single, red; petals emarginate. Allied to *R. turbinata* and *R. pulchella*.

*Gland-leaved Rose.* Fl. June, July. Shrub 2 feet.

79 *R. ORPESSE'NEA* (Red. ros. 2. p. 21. with a figure.) This appears to be some garden production, and possibly a variety of *R. Gállica*, but its fruit is that of *R. turbinata*. Flowers red, double. *h. H.* Native country unknown.

*Orbessan Rose.* Fl. June, July. Shrub 2 to 4 feet.

80 *R. VERECUNDA* (Waitz in Tratt. ros. vol. 1.) prickles crowded, straight; petioles villous, prickly; leaflets sweet-scented, ovate-oblong, acute, simply serrated, hoary-green, hairy above, and villous beneath, and on the margins; stipulas quite entire; branches setigerous and prickly; fruit oblong, and is, as well as the peduncles, clothed with glandular villi; flowers sub-cymose; styles exserted. *h. H.* Native country unknown. Perhaps a variety of *R. Damascena*.

*Reddish Rose.* Shrub 3 to 6 feet.

81 *R. LEPIDA* (Waitz in Tratt. ros. vol. 1.) prickles straight, crowded, unequal; branches prickly, glanduliferous, as well as the petioles, peduncles, and base of fruit; leaflets ovate, acute, simply serrated, hairy on both surfaces, with ciliated margins. *h. H.* Native country unknown. *R. Francisca*, Hortul. Perhaps a variety of *R. Damascena*.

*Lepid Rose.* Fl. June, July. Shrub.

vent, permanent. Disk thickened, closing the throat. This division borders equally close upon those of *Caninae* and *Rubiginosæ*. From both it is distinguished by its root shoots being erect and stout. The most absolute marks of difference, however, between this and Sect. *Caninae*, exist in the prickles of the present section being straight, and the serratures of the leaves diverging. If, as is sometimes the case, the prickles of this tribe are falcate, the serratures become more diverging. The permanent sepals are another character by which this tribe may be known from Sect. *Caninae*. The section *Rubiginosæ* cannot be confounded with the present section on account of their unequal, hooked prickles, and glandular leaves. Roughness of fruit and permanence of sepals are common to both.

82 *R. TURBINATA* (Ait. hort. kew. 2. p. 206.) tube of calyx turbinate; sepals undivided; leaves villous beneath.  $\frac{1}{2}$ . II. Native of Germany, probably spontaneous. Lawr. ros. 63. Jacq. schœnbr. 4. t. 415. Jacq. fragm. 71. t. 107. f. 2. Red. ros. 1. p. 127. t. 48. *R. campanulata*, Ehrh. Beitr. 6. p. 97. *R. Francofortiana*, Moench. hausv. 5. p. 24. *R. Francofurtensis*, Rossig. ros. t. 11. Habit of *R. Damascena*. Flowers large, red, very double.

*Turbinate-calyx* or *Franckfort Rose*. Fl. June, July. Clt. 1629. Shrub 4 to 6 feet.

83 *R. VILLOSA* (Lin. spec. 704.) leaflets rounded, bluntish, downy all over; fruit globose, rather depressed, partly bristly; sepals slightly compound.  $\frac{1}{2}$ . II. Native of Europe, in hedges; in Britain, in bushy rather mountainous situations, in Wales, Scotland, and the north of England. *R. mollis*, Smith, engl. bot. t. 2459. *R. tomentosa*  $\beta$ , Lindl. ros. p. 77. *R. heterophylla*, Woods. in Lin. trans. 12. p. 195. *R. pulchella*, Woods. l. c. p. 196. *R. pomifera*, Herm. diss. 16. Flowers red or pink. This is a very variable plant. Branches without bristles.

*Var.  $\beta$ , resinosa* (Lindl. ros. p. 77.) dwarf, grey; leaflets narrow; flowers very red.  $\frac{1}{2}$ . II. Native of Ireland.

*Villous Rose*. Fl. July. Britain. Shrub 5 to 6 feet.

84 *R. SYLVESTRIS* (Lindl. syn. brit. fl. p. 101.) stem erect, coloured, flexuous; prickles hooked; leaflets oblong, acute, hoary on both sides; sepals diverging, deciduous before the fruit is ripe; fruit elliptic, bristly.  $\frac{1}{2}$ . II. Native of Oxfordshire, in hedges. *R. tomentosa sylvestris*, Woods.

*Wild Rose*. Fl. June, July. England. Shrub 6 to 8 feet.

85 *R. BOREYKIANA* (Bess. ex Spreng. syst. 2. p. 652.) prickles of branches scattered, recurved; petioles prickly; leaflets doubly serrated, pubescent beneath, glandular on the margins, but not beneath; peduncles corymbose, covered with glandular bristles; fruit oblong, glabrous.  $\frac{1}{2}$ . H. Native of the north of Podolia.

*Boreykian Rose*. Shrub 6 to 8 feet.

86 *R. TOMENTOSA* (Smith, fl. brit. 539. engl. bot. 990.) leaflets ovate, acute, more or less downy; fruit elliptical, hispid; sepals pinnate; prickles slightly curved.  $\frac{1}{2}$ . H. Native of Europe, in hedges and thickets; plentiful in Britain. Red. ros. 2. p. 39. t. 17. *R. villosa*, Ehrh. arb. 45. Du Roi, harbk. 2. p. 341. Fl. dan. 1458. *R. mollissima*, Börk.holz. p. 307. *R. dubia*, Wibel. wirth. p. 263. *R. villosa*  $\beta$ , Huds. 219. Petals red, white at the base.

*Var.  $\beta$ , scabriuscula* (Smith, engl. bot. 1896.) leaves greener, nearly smooth except the ribs, which are hairy.  $\frac{1}{2}$ . H. Native near Newcastle. *R. foetida*, Batard, appl. 29. Red. ros. 1. p. 131. t. 150.

*Tomentose Rose*. Fl. June, July. Britain. Shrub 6 feet.

87 *R. SHERARDI* (Davies, Welsh. bot. 49.) prickles conical, hooked, compressed; leaflets elliptical, acute, downy on both surfaces; sepals pinnate; fruit globular, abrupt, rather bristly.  $\frac{1}{2}$ . H. Native near Kingston-upon-Thames, near Tonbridge Wells, and Down in Kent; in Cambridgeshire and Anglesea.

SECT. VII. *VILLOSAE* (from *villosus*, villous; shrubs villous).  
 Lindl. ros. p. 72. Surculi straight. Prickles straightish. Leaflets ovate or oblong, with diverging serratures. Sepals conni-

*R. subglobosa*, Smith, engl. fl. 2. p. 384. *R. tomentosa*, var.  $\epsilon$  and  $\eta$ , Woods, in Lin. trans. 12. p. 201. Peduncles from 1-8, the more numerous the shorter, beset with glandular bristles. Fruit large, globular.

*Sherard's Rose*. Fl. June, July. Britain. Shrub 6 feet.

88 *R. hispida* (Poir. encyc. bot. no. 15.) ovaries globose, and are as well as the peduncles hispid from prickles; leaflets ovate, white from tomentum beneath; stem prickles scattered; flowers solitary.  $\zeta$ . H. Native of Europe. *R. villosa*  $\beta$ , pomifera, Desv. journ. bot. 1813. p. 117.

*Hispid Rose*. Shrub 5 to 6 feet.

89 *R. alba* (Lin. spec. 705.) leaflets oblong, glaucous, nakedish above, simply serrated; prickles straightish or falcate, slender or strong, without setae; sepals pinnate, reflexed; fruit unarmed.  $\zeta$ . H. Native of Piedmont, Cochinchina, Denmark, France, and Saxony. Lawr. ross. tt. 23. 25. 32. 37. Oed. fl. dan. 1215. Red. ros. 1. p. 97. t. 34. and p. 117. t. 43. *R. usitatissima*, Gat. montaub. 94. Flowers large, either white or of the most delicate blush colour, with a grateful fragrance. Fruit oblong, scarlet, or blood-coloured. The following garden varieties belong to this species:

<i>agate.</i>	<i>maiden's blush, great.</i>
<i>belle Aurore.</i>	<i>maiden's blush, small.</i>
<i>blanche à cœur vert.</i>	<i>Moraga la favorite.</i>
<i>blanche de Belgique.</i>	<i>muscat rouge.</i>
<i>blush, double white.</i>	<i>noëa célestis.</i>
<i>bouquet blanc.</i>	<i>noëa plena.</i>
<i>celestial.</i>	<i>petite cuisse de nymphe.</i>
<i>Duc d'York.</i>	<i>rosa.</i>
<i>Eliza.</i>	<i>Simonville.</i>
<i>feuille fermée.</i>	<i>spineless virgin.</i>
<i>grande cuisse de nymphe.</i>	<i>thornless, double.</i>
<i>Henriette, belle.</i>	<i>triangularis.</i>
<i>Joanne d'Arc.</i>	<i>white, double.</i>
<i>maiden's blush, cluster.</i>	<i>white, semidouble.</i>

*White Rose*. Fl. June, July. Clt. 1597. Shrub 4 to 7 feet.

90 *R. mollis* (Led. ex Spreng. syst. 2. p. 551.) ovaries ovate, glaucous, and are prickly as well as the peduncles; branches glabrous, unarmed, pubescent as well as the petioles; leaflets obtuse, doubly serrated, villous on both surfaces.  $\zeta$ . H. Native of Caucasus. *R. Ledebourii*, Spreng. syst. 2. p. 551.

*Soft Rose*. Fl. June, July. Clt. 1818. Shrub 4 to 6 feet.

91 *R. teretifolia* (Bess. ex Spreng. syst. 2. p. 551.) prickles of the branches straight and compressed; petioles pubescent; leaflets tomentose beneath; peduncles corymbose, bristly; sepals lanceolate, emarginate; fruit oblong, tapering to both ends, bristly.  $\zeta$ . H. Native of Podolia, at Tyra.

*Turpentine Rose*. Shrub 4 to 6 feet.

SECT. VIII. RUBIGINOSÆ (from *rubiginosus*, rusted; the leaves of the species are usually clothed with rust-coloured glands beneath). Lindl. ros. p. 84. Prickles unequal, sometimes bristle-formed, rarely wanting. Leaflets ovate or oblong, glandular, with diverging serratures. Sepals permanent (f. 75. d.). Disk thickened. Sirculi arched. The numerous glands on the lower surface of the leaves will be sufficient to prevent any thing else being referred to this section. But *R. tomentosa* has sometimes glandular leaves, but in such cases the inequality of the prickles of *Rubiginosæ*, and their red fruit, will alone distinguish them.

92 *R. lutea* (Dodon. pempt. 187. Mhl. dict. no. 11.) prickles straight; leaflets deep green; sepals nearly entire, setigerous; petals flat, concave.  $\zeta$ . H. Native of Germany and south of France. Lawr. ros. t. 12. Curt. bot. mag. 363. *R. eglantaria*, Lin. spec. 703. Red. ros. 1. p. 69. t. 23. *R. foetida*, Herm. diss. 18. *R. chlorophylla*, Ehrh. Beitr. 2. p. 69. *R.*

*cærea*, Rossig. ros. t. 2. Flowers deep yellow, large, cup-shaped, solitary. Fruit unknown.

*Var.  $\beta$ , subrubra* (Red. ros. 3. p. 73. with a figure) peduncles rather hispid and glandular; leaves and petioles glabrous; stem prickly at the base; prickles unequal, scattered; petals of a lurid red above and yellowish beneath; stigmas yellow.

*Var.  $\gamma$ , punicea* (Lindl. ros. p. 84.) petals scarlet above and yellow beneath.  $\zeta$ . H. Native of Austria. *R. punicea*, Mill. dict. no. 12. Rossig. ros. t. 5. *R. cinnamomea*, Roth. fl. germ. 1. p. 217. *R. lutea bicolor*, Jacq. vind. 1. t. 1. Lawr. ros. t. 6. Sims, bot. mag. t. 1077. *R. eglantaria punicea*, Red. ros. 1. p. 71. t. 24. *R. eglantaria bicolor*, D. C. fl. fr. 4. p. 437.

*Yellow Eglantine Rose*. Fl. June. Clt. 1596. Sh. 3 to 4 ft.

93 *R. rubiginosa* (Lin. mant. 2. p. 564.) prickles hooked, compressed, with smaller straighter ones interspersed; leaflets elliptical, doubly serrated, hairy, clothed beneath with rust-coloured glands; sepals pinnate, and are bristly as well as the peduncles; fruit obovate, bristly towards the base.  $\zeta$ . H. Native throughout Europe, and of Caucasus. In Britain, in bushy places, on a dry, gravelly, or chalky soil. Smith, engl. bot. t. 991. Curt. fl. lond. t. 116. Jacq. austr. t. 50. Lawr. ros. tt. 41. 61. 65. 72. and 74. Schkuhr, handb. t. 134. *R. suavifolia*, Lightf. scot. 1. p. 261. Fl. dan. 870. *R. eglantaria*, Mill. dict. no. 4. Lin. spec. ed. 1. p. 491. *R. agrestis*, Savi. fl. pis. p. 475. *R. rubiginosa parviflora*, Rau, enum. 135. Leaves sweet-scented when bruised. Flowers pink. Fruit scarlet, obovate, or elliptic.

*Var.  $\beta$ , Vaillantiana* (Red. ros. 3. p. 95. with a figure,) fruit ovate and hispid as well as the peduncles; prickles of the branches somewhat horizontal; leaflets nearly glabrous above; flowers white.

*Var.  $\gamma$ , rotundifolia* (Lindl. ros. 88.) branches flagelliform; prickles straightish, slender; leaflets roundish, small, tube of calyx nearly globose, glabrous.  $\zeta$ . H. Native of Germany. *R. rubiginosa rotundifolia*, Rau, enum. p. 136. Flowers solitary.

*Var.  $\epsilon$ , aculeatissima* (Dup. gym. ros. p. 13. ex Red. et Thor. ros. 2. p. 97.) flowers usually solitary; fruit ovate, and are as well as the peduncles beset with glandular bristles; leaflets ovate-roundish; prickles straightish, very numerous. Cultivated in gardens.

*Var.  $\epsilon$ , nemoralis* (Red. et Thor. ros. 2. p. 23. with a figure) flowers usually solitary, small; fruit ovate, and is as well as the peduncles beset with glandular bristles; leaflets large, thin; prickles straightish, few.  $\zeta$ . H. Native of France. *R. nemorosa*, Lebert et Lejeune, fl. spa. 2. p. 511.

*Var.  $\zeta$ , umbellata* (Lindl. ros. 87.) flowers several, in a fascicle; fruit globose, almost smooth; peduncles hispid; branches very prickly; leaflets ovate-roundish, glabrous, glandular beneath; prickles hooked.  $\zeta$ . H. *R. umbellata*, Leers. fl. herb. 119. add. p. 286. Gmel. fl. bad. 2. p. 425. D. C. fl. fr. 5. p. 532. Rau, enum. 134. *R. tenuiglandulosa*, Mer. fl. par. 189. *R. rubiginosa eglantaria cymosa*, Woods, in Lin. trans. *R. sempervirens*, Roth, fl. germ. 1. p. 218.

*Var.  $\eta$ , pubera* (Ser. in D. C. prod. 2. p. 616.) flowers usually solitary; fruit ovate, smooth; peduncles beset with glandular bristles; leaflets roundish, glandular beneath, and are as well as the petioles puberulous.  $\zeta$ . H. Native of Switzerland, about Aarberg.

*Var.  $\theta$ , grandiflora* (Lindl. ros. 88.) leaflets nearly naked; petioles villous; flowers large; fruit purple, and are as well as the peduncles glabrous.  $\zeta$ . H. Native of Germany. *R. grandiflora*, Wallr. ann. bot. 66.

*Var.  $\iota$ , major* (Ser. exsic. no. 4. m. l. 1. p. 45.) stems erect; flowers solitary or corymbose, numerous; fruit ovate, and are as well as the peduncle clothed with glandular bristles; leaflets

broad, sparingly glandular beneath; petiole and middle nerve villous; flowers semidouble.

*Var. r, spinulifolia* (Ser. in D. C. prod. 2. p. 616.) prickles large, straight, or somewhat deflexed; leaflets oval, spinulose beneath; tube of calyx ovate, and is as well as the peduncles more or less hispid.  $\frac{1}{2}$ . H. Native about Fribourg and Verviers. *R. spinulifolia*, Dem. ess. p. 8. *R. spinulifolia*, Dematratiana, Thor. ros. t. 1. Red. et Thor. ros. 3. p. 8.

*Var. λ, flexuosa* (Lindl. ros. 88.) branches very flexuous; leaflets nearly orbicular; bractes deciduous; flowers usually solitary; styles smooth.  $\frac{1}{2}$ . H. Native of Germany and Switzerland. *R. Reynieri*, Hall. fil. in Roem. arch. 6. 1. st. 2. p. 7. *R. flexuosa*, Rau, enum. p. 127. *R. montana*, D. C. suppl. 532.?

*Var. μ, parvifolia* (Lindl. ros. 145.) dwarf; branches setigerous; leaflets roundish.  $\frac{1}{2}$ . H. Native of Tauria, and France. Willd. enum. 546. *R. micrantha*, D. C. fl. fr. 5. p. 539. but not of Smith. Flowers pale rose-coloured.

*Garden varieties of the Sweet Briar.*

<i>American, single.</i>	<i>monstrous.</i>
<i>blush.</i>	<i>mossy.</i>
<i>Clementine.</i>	<i>petite Hessoise.</i>
<i>cluster.</i>	<i>royal.</i>
<i>double.</i>	<i>scarlet.</i>
<i>dwarf, semidouble.</i>	<i>tree, double.</i>
<i>maiden.</i>	<i>white, semidouble.</i>
<i>Mannings.</i>	<i>Zabeth.</i>

*Rusty Rose, Sweet Briar, or Eglantine.* Fl. June, July. Britain. Shrub 4 to 6 feet.

91 *R. SUAVEOLENS* (Pursh. fl. amer. sept. vol. 1. p. 346.) prickles scattered, straight; petioles beset with glandular bristles; leaflets ovate, serrated, sparingly glandular beneath; flowers usually solitary; peduncles bracteate; fruit ovate.  $\frac{1}{2}$ . H. Native of North America. *R. rubiginosa* and *eglantaria* of the Americans. Rafin. ros. amer. in ann. phys. 5. p. 518. Leaves sweet-scented when bruised. Flowers pink. Sepals entire.

*American Sweet Briar or Eglantine.* Fl. June, July. Clt. 1100. Shrub 5 to 6 feet.

95 *R. MONTANA* (Vill. dauph. 3. p. 547.) prickles solitary, hooked; leaflets roundish, abrupt, doubly serrated, smooth, hardly glandular; peduncles and petioles bristly and glandular; sepals partly pinnate, bristly and glandular on the back; stems strong, reddish.  $\frac{1}{2}$ . H. Native of Dauphiny and other parts of the south of Europe. Smith in Rees' cycl. Flowers small, generally white.

*Mountain Sweet Briar.* Fl. June, July. Shrub 2 to 3 feet.

96 *R. MICRANTHA* (Smith, engl. bot. 2490.) prickles hooked, scattered, nearly uniform; leaflets ovate, doubly serrated, hairy, glandular beneath; sepals pinnate; fruit elliptic, rather bristly, contracted at the summit; stems straggling.  $\frac{1}{2}$ . H. Native of Britain, in hedges and thickets, chiefly in the south of England. *R. rubiginosa* β, *micrantha*, Lindl. ros. p. 87. with erroneous synonyms. Leaves sweet-scented. Flowers small, pale red.

*Small-flowered Sweet Briar.* Fl. June, July. Britain. Sh. 4 to 5 ft.

97 *R. SEPIUM* (Thunb. fl. par. 252. Borr. in engl. bot. suppl. t. 2653.) prickles slender; branches flexuous; leaflets shining, acute at both ends; flowers usually solitary;

fruit polished; sepals pinnate, with very narrow segments.  $\frac{1}{2}$ . H. Native of Europe, in hedges; in England near Bridport, Warwickshire. Flowers small, pink. *R. Helvética* and *R. myrtifolia*, Hall. *R. canina* β, D. C. fl. fr. ed. 3. no. 3617. *R. agræstis*, Savi. fl. pis. 1. p. 474. *R. biserrata*. *R. macrocarpa* and *R. stipularis*, Mer. fl. par. 190. ex Desv. (f. 75.)

*Hedge Briar.* Fl. June, July. Britain. Shrub 4 to 6 feet.

98 *R. PULVERULENTA* (Bieb. fl. taur. 1. p. 399.) branches glandular; leaflets pruinose on both surfaces; prickles recurved, dilated at the base; fruit ovate, and are as well as the peduncles hispid.  $\frac{1}{2}$ . H. Native of Caucasus, on hills about Narza. Flowers solitary, pale red, almost sessile. Leaves grey, with glands on both surfaces.

*Var. β, eriocarpa* (Ser. in D. C. prod. 2. p. 617.) leaflets oval, doubly serrated; fruit smooth. *R. pulverulenta*, Lyell. in Lindl. ros. p. 93.

*Powdery Briar.* Fl. June, July. Clt. 1817. Shrub 5 to 6 feet.

99 *R. UNCINELLA* (Bess. ex Spreng. syst. 2. p. 552.) prickles of the branches scattered, recurved; petioles rather prickly; leaflets pubescent beneath, doubly serrated, glandular on both surfaces; fruit oblong, and are as well as the peduncles glabrous.  $\frac{1}{2}$ . H. Native of Volhynia and Tauria.

*Small-hooked Briar.* Shrub 5 to 6 feet.

100 *R. CARYOPHYLLACEA* (Bess. enum. p. 19.) prickles of branches equal, recurved, scattered; petioles nearly unarmed; leaflets doubly serrated, glandular on both surfaces, and hoary beneath; fruit oblong, glabrous as well as the peduncles.  $\frac{1}{2}$ . H. Native of Podolia, Volhynia, and Iberia. *R. rubiginosa* var.  $\mu$  *caryophyllacea*, Ser. in D. C. prod. 2. p. 617.

*Clove-scented Briar.* Shrub 5 to 6 feet.

101 *R. IBERICA* (Stev. in Bieb. fl. taur. suppl. 343.) cauline prickles scattered, hooked, dilated at the base; petioles glandular and prickly; leaflets broad ovate, glandularly biserrated, and beset with glands on both surfaces; fruit ovate, smooth, or with a few bristles as well as the peduncles.  $\frac{1}{2}$ . H. Native of Eastern Iberia, about the town of Krzchinal. Very nearly allied to *R. pulverulenta* according to Bieberstein.

*Iberian Rose.* Fl. June, July. Clt. 1820. Shrub 4 to 6 ft.

102 *R. INODORA* (Fries. nov. fl. succ. 9.) stem very prickly; leaflets oblong, clammy and glandular beneath; fruit oblong, and are as well as the peduncles glabrous.  $\frac{1}{2}$ . H. Native of the north of Holland. Leaves scentless. Sepals reflexed, pinnate. Fruit oblong-ovate, purple. Said to be the same as *R. Borreri*, no. 122.

*Scentless Briar.* Shrub 4 to 5 feet.

103 *R. CUSPIDATA* (Bieb. fl. taur. 1. p. 396.) prickles strong, hooked, dilated at the base, scattered; leaflets ovate-lanceolate, acute, villous on both surfaces, glandular beneath; flowers corymbose; sepals pinnate, ending in a narrow serrated point; fruit ovate, and are as well as the peduncles hispid.  $\frac{1}{2}$ . H. Native of Tauria, about Kisljar. Flowers white. Fruit dark purple.

*Cuspidate-sepalled Briar.* Shrub 5 to 6 feet.

104 *R. GLUTINOSA* (Smith, fl. græc. prod. 1. p. 348. fl. græc. t. 482.) branches pilose; prickles numerous, falcate; leaflets roundish, coarsely serrated, hoary, glandular and viscid on both surfaces; fruit and peduncles beset with stiff bristles.  $\frac{1}{2}$ . H. Native of Mount Parnassus; of Sicily, and Candia, on the mountains. *R. rubiginosa* Crética, Red. ros. 1. p. 93. and p. 125. t. 47. *R. rubiginosa sphaerocarpa*, Desv. journ. bot. 1813. t. 118. Cupan. pamph. ed. 1. t. 61. Flowers pale blush. Sepals sub-pinnate. Fruit scarlet.

*Clammy Briar.* Fl. June, July. Clt. 1821. Shrub 2 to 3 ft.

105 *R. AGRESTIS* (Swartz ex Spreng. syst. 2. p. 553.) prickles of branches scattered, recurved; petioles unarmed, villous, and

FIG. 75.

glandular; leaflets equally serrated, villous and glandular beneath; germens oblong, and are, as well as the peduncles, quite glabrous.  $\frac{1}{2}$ . H. Native of Sweden.

*Field Briar.* Shrub 6 feet.

106 *R. PSEUDO-RUBIGINOSA* (Lejeune, fl. spa. 1. p. 229.) stem and petioles armed with recurved prickles; leaflets ovate-oblong, beset with glandular pili, covered with rusty glands beneath and on the margins; fruit roundish, hispid.  $\frac{1}{2}$ . H. Native of France near Malmedy. Sepals pinnate. Petals red.

*False-rusty Rose or False Sweet Briar.* Shrub 2 to 3 feet.

107 *R. WOLFGANGIANA* (Bess. enum. p. 61. and p. 67.) leaflets hardly glandular; styles very long, pubescent above; peduncles hispid from glandular bristles; fruit elongated, contracted at the neck, nearly naked, pear-shaped, with hardly any glandular bristles at the base.  $\frac{1}{2}$ . H. Native of Podolia, in a wood near Wichlor.

*Wolfgange's Briar.* Shrub 4 to 5 feet.

108 *R. DIMORPHA* (Bess. ex Spreng. syst. append. p. 200.) prickles of branches scattered and recurved; petioles prickly and pubescent; leaflets pubescent on both surfaces; peduncles short, crowded, thickly beset with glandular bristles, as well as the germens, which are ovate and contracted at both ends; calyx thickly beset with glands.  $\frac{1}{2}$ . H. Native of Podolia.

*Two-formed Briar.* Shrub 5 to 6 feet.

109 *R. WILDENOVII* (Spreng. syst. 2. p. 547.) prickles on the branches opposite, a little recurved; petioles villous, unarmed; leaflets oblong, narrow, equally serrated, villous beneath, and full of resinous dots; bractæ adpressed; peduncles short, solitary, glabrous, as well as the ovate fruit.  $\frac{1}{2}$ . H. Native of Siberia. *R. microphylla*, Willd. herb. *R. arenaria*, Bieb. et Stev. in Willd. herb. ex Spreng. l. c.

*Willdenow's Briar.* Shrub 4 to 6 feet.

110 *R. KLUKII* (Bess. cat. hort. crem. 1816. suppl. 4. p. 19. Bieb. fl. taur. suppl. 343.) cauline prickles strong, compressed, dilated at the base, recurved; petioles villous and prickly; leaflets small, elliptic, acute, sharply biserrated, with the serratures glandular, villous above, but rusty and glandular beneath; peduncles and fruit beset with glandular bristles.  $\frac{1}{2}$ . H. Native of Tauria. *R. rubiginosa*, Bieb. fl. taur. no. 979. exclusive of the synonyms. *R. floribunda*, Stev. and *R. balsamea*, Bess. Flowers pink. Allied to *R. rubiginosa*, according to Bieberstein, but according to Besser to *R. álba*.

*Kluk's Sweet-briar.* Fl. June, Jul. Clt. 1819. Sh. 5 to 6 ft.

111 *R. FLORIBUNDA* (Bess. hort. crem. ex Spreng. syst. append. but not of Steven.) prickles of branches strong, recurved; petioles prickly and villous; leaflets doubly serrated, wrinkled, glandular beneath and on the margins, as well as pubescent; peduncles aggregate, clothed with glandular pili, as well as the elliptic-oblong fruit.  $\frac{1}{2}$ . H. Native of Podolia.

*Bundle-flowered Briar.* Shrub 5 to 6 feet.

112 *R. MONTEZUMÆ* (Humb. et Bonpl. in Red. ros. 1. p. 55. t. 16.) petioles armed with little hooked prickles; branches unarmed; leaflets ovate, sharply serrated, glabrous; flowers solitary, terminal; tube of calyx elliptic, and is as well as the peduncles glabrous.  $\frac{1}{2}$ . H. Native of Mexico, on the chain of Porphyry mountains, which bound the valley of Mexico on the north, at the elevation of 1416 toises, on the top of Cerro Ventosa, near the mine of San Pedro. Flowers pale red. Sepals compound, dilated at the end.

*Montezuma's Briar.* Fl. June, Jul. Clt. 1825. Sh. 4 to 6 ft.

SECT. IX. *CANINÆ* (from *canis*, a dog; because *R. canina* is commonly called *Dog-rose*. The name is applied to this section because all the species contained in it agree in character with *R. canina*). Lindl. ros. 97. Prickles equal, hooked. Leaflets ovate, glandless or glandular, with the serratures con-

niving. Sepals deciduous (f. 76. g.). Disk thickened, closing the throat. Larger surculi arched.

113 *R. CAUCASIA* (Pall. ross. t. 11.) prickles strong, recurved; leaflets soft, ovate; calyx and peduncles hispid; sepals simple; fruit smooth?  $\frac{1}{2}$ . H. Native of Iberia. Lindl. ros. p. 97. t. 11. *R. leucantha*, Bieb. fl. taur. suppl. 351. Flowers large, growing in bunches, white or pale red.

*Caucasian Dog-rose.* Fl. Ju. Jul. Clt. 1798. Sh. 10 to 12 ft.

114 *R. CILIA TO-PÉ-TALA* (Bess. enum. 66.) leaflets lanceolate; petals ciliated.  $\frac{1}{2}$ . H. Native of Lithuania. This plant differs from *R. villosa* in the lower stipulas being blunt, and in the ribs being prickly; from *R. caucasia* in the leaflets being rounder, in the sepals being more dilated, in the flowers being redder, and the petals being ciliated.

*Ciliated-stalked Rose.* Shrub.

115 *R. CANINA* (Lin. spec. 704.) prickles strong, hooked; leaflets simply serrated, pointed, quite smooth; sepals pinnate; fruit ovate, smooth, or rather bristly, like the aggregate flower stalks.  $\frac{1}{2}$ . H. Native throughout Europe and the north of Africa; plentiful in Britain, in hedges, woods, and thickets. Smith, engl. bot. 992. Fl. dan. 555. Curt. lond. 299. Lawr. ros. t. 21. 29. *R. dumalis*, Bechst. forsth. 241. et 939. ex Rau. *R. Andegavensis*, Bat. fl. main. et loir. 189. Red. ros. 2. p. 9. t. 3. *R. glauca*, Lois. in Desv. journ. *R. arvensis*, Schrank, fl. mon. *R. glaucescens*, Mer. par. *R. nitens*, Mer. l. c. *R. Teneriffensis*, Donn. hort. cant. ed. 8. p. 169. *R. senticosa*, Achar. acad. handl. 34. p. 91. t. 3. Flowers rather large, pale red, seldom white. Fruit ovate, bright scarlet, of a peculiar and very grateful flavour, especially if made into a conserve with sugar. The pulp of the fruit, besides saccharine matter, contains citric acid, which gives it an acid taste. The pulp before it is used should be carefully cleared from the seeds.

*Var. β, surculosa* (Woods. in Lin. trans. 12. p. 228.) differs from the species in having remarkably strong shoots, bearing sometimes great plenty of flowers.

*Var. γ, nuda* (Woods. l. c. p. 205.) is more doubtful than the last, having the calyx tube globose and the prickles nearly straight. Gathered by Mr. Woods at Ambleside.

*Var. δ, aciphylla* (Lindl. ros. p. 99.) dwarf; leaves smooth on both surfaces; flowers smaller than those of the species.  $\frac{1}{2}$ . H. Native of Germany, about Wirebourg. *R. aciphylla*, Rau, 69. with a figure. Red. ros. 2. p. 31. t. 13.

*Var. ε, Egyptiaca* (Lindl. ros. p. 99.) leaflets broad ovate, coarsely serrated, glabrous on both surfaces; receptacle elongated.  $\frac{1}{2}$ . H. Native of Egypt. *R. Indica*, Forsk. ægypt. descr. 113.

*Var. ζ, Burboniana* (Desv. journ. bot. 1813.) leaflets ovate, rather cordate, simply toothed; flowers purple, semidouble; petals rather concave; sepals undivided. *R. Gállica Burbónica*, Red. ros. 1. p. 74.

*Var. η, nitens* (Desv. journ. bot. 1813. p. 114.) petioles smoothish; leaflets ovate, acute, same colour on both surfaces, smooth and shining; fruit ovate, and are as well as the peduncles smooth.  $\frac{1}{2}$ . H. Native of France and Switzerland. Ser. mel. 1. p. 43. *R. nitens*, Desv. in Mer. fl. par. p. 192.

*Var. θ, obtusifolia* (Desv. journ. bot. 1813. p. 15.) petioles puberulous, usually glandular; leaflets ovate-roundish, acuminate, the same colour on both surfaces, and rather pilose beneath; fruit ovate, and are as well as the peduncles glabrous. *R. obtusifolia*, Desv. journ. bot. 2. p. 1809. p. 317. *R. leucantha*, Lois. bot. 1802. Bas. suppl. 32. D. C. fl. fr. 5. p. 535. but not of Bieb.

*Var. ι, glaucescens* (Desv. journ. bot. 1813. p. 114.) prickles slender; petioles glabrous; leaflets ovate, smooth on both surfaces, glaucous beneath; fruit ovate-globose, and are as well as the peduncles glabrous.  $\frac{1}{2}$ . H. Native of France. *R. glau-*

cæscens, Desv. in Mer. fl. par. 192. *R. canina* glauca, Desv. *journal. bot.* 1813. p. 116.

*Var. γ, Schottiana* (Ser. in D. C. prod. 2. p. 116.) branches rugged, unarmed; stipulas and petioles glabrous and hispid; leaflets ovate, acuminate, glabrous, glaucescent beneath; fruit ovate, smooth; peduncles hispid. *h. H.* Native of Podolia. *R. glauca*, Schott, ex. Besser. enum. 64.

*Var. λ, pilosiuscula* (Desv. *journal. bot.* 1813. p. 115.) branches prickly; petioles tomentose and hispid; leaflets ovate, acute, puberulous beneath and smoothish above; fruit ovate, smoothish; peduncles hispid. *R. humilis*, Bess. suppl. cat. crem. 4. *R. nitidula*, Bess. enum. p. 20. and 61. *R. Friedlanderiana*, Besser. enum. 46. 60. 63. *R. collina*, Rau, enum. no. 163.

*Var. μ, fastigiata* (Desv. *journal. bot.* 1813. p. 114.) prickles strong; petioles puberulous; leaflets ovate, acute, puberulous beneath; fruit ovate, smooth; peduncles hispid. *h. H.* Native of France. *R. fastigiata*, Bast. suppl. 30. D. C. fl. fr. 5. p. 535. Red. ros. 2. p. 3. with a figure. *R. stylösa β*, Desv. *journal. bot.* 2. p. 317. Styles approximate, but not joined.

*Var. ν, hispida* (Desv. *journal. bot.* 1813. p. 114.) branches prickly; petioles smoothish; leaflets ovate, acute, about the same colour on both surfaces, glabrous; fruit ovate, and are as well as the peduncles hispid. *R. canina*, var. *lanceolata grandidentata* and *ovoidalis*, Desv. l. c. p. 114. and p. 115. *R. Andegavensis*, Bast. ess. 189. suppl. 29. D. C. fl. fr. 5. p. 539. Red. ros. 2. p. 9. with a figure. *R. sempervirens*, Bast. ess. p. 188. Rau, enum. 120. Lindl. ros. p. 142. but not of Lin.

*Var. ξ, microcarpa* (Desv. *journal. bot.* 1813. p. 115.) leaflets oblong-lanceolate, velvety beneath; fruit smaller, ovate, glabrous. *h. H.* Native of France.

*Var. ο, Meratiiana* (Ser. in D. C. prod. 2. p. 614.) prickles strongly arched, and are as well as the petioles glabrous; leaflets broad, biserrated, glabrous; flowers usually solitary; fruit large. *h. H.* Native about Paris. *R. biserrata*, Mer. fl. par. 190. Red. ros. 3. p. 27. with a figure. Perhaps the same as *R. canina vulgaris*.

*Var. π, ambigua* (Desv. *journal. bot.* 1813. p. 114.) prickles straight; leaflets ovate-roundish, and are as well as the petioles glabrous; flowers solitary or tern; fruit ovate-globose, and is as well as the peduncles smooth. *h. H.* Native about Malmédy, in France. *R. Malmundiariensis*, Lejeune, fl. spa. 1. p. 231. Red. ros. p. 34. with a figure.

*Var. ρ, squarrosa* (Rau, enum. 77.) petioles and primary nerves of leaves glandular; prickles straightish, strong, and much crowded; leaflets doubly serrated. *h. H.* Native of Germany. *R. canina β*, Bieb. fl. taur. 1. p. 400. ex Rau, l. c.

*Var. σ, rubiflora* (Ser. in D. C. prod. 2. p. 614.) prickles strong, and arc, as well as the petioles, rather puberulous, rarely hispid; leaflets large, the same colour on both surfaces, smooth, and simply serrated; flowers usually solitary, about the size of those of *Rubus Idaeus*; peduncles and fruit smooth. *h. H.* Native about Geneva.

Common Dog Rose. Fl. June, July. Britain. Sh. 6 to 8 ft.

116 *R. Forsteri* (Smith, engl. fl. 2. p. 392.) prickles scattered, conical, hooked; leaflets simply serrated, smooth above, but hairy on the ribs beneath; sepals doubly pinnate; fruit elliptical, smooth, like the aggregate flower stalks. *h. H.* Native of Europe, in hedges; plentiful in England. Borr. in engl. bot. suppl. 2611. *R. collina β* and *γ*, Woodv. in Lin. trans. 12. p. 392. Flowers pale red.

*Forster's Dog-rose.* Fl. June, July. Britain. Sh. 6 to 8 ft.

117 *R. Gmelini* (Bunge in Led. fl. alt. 2. p. 229.) fruit ovate, glabrous; peduncles hispid; sepals ovate, acuminate, undivided, glandular, and prickly; flower-bearing branches almost unarmed, young sterile ones very prickly; prickles setaceous, unequal; petioles clothed with glandular down; leaflets 5-7, ob-

ovate-oblong, simply serrated, pubescent, and glandless beneath. *h. H.* Native of Siberia. *R. canina*, Sievers in Pall. nord. beytr. 7. Petals deep rose-coloured, shorter than the sepals, emarginate.

*Gmelin's Dog-rose.* Fl. June, July. Shrub 3 to 4 feet.

118 *R. dumetorum* (Thuill. fl. par. 250. Woods in Lin. trans. 12. p. 217.) prickles numerous, scattered, hooked; leaflets simply serrated, hairy on both surfaces; sepals pinnate, deciduous; peduncles aggregate, slightly hairy; fruit elliptical, smooth, as tall as the bracteas. *h. H.* Native of Europe, in hedges. In England in the southern counties, seldom in any abundance. Borr. in engl. bot. suppl. 2610. *R. leucantha β acutifolia*, Bast. in D. C. fl. fr. 5. p. 535. *R. sepium*, Borkh. ex Rau, enum. 79. *R. solstitialis*, Bess. prim. fl. gall. 324. *R. corymbifera*, Gmel. fl. bad. als. 2. p. 427. Synonymes from Lindl. and Ser. Flowers reddish.

*Thicket Dog-rose.* Fl. Ju. July. Britain. Sh. 4 to 6 feet.

119 *R. bracteescens* (Woods. in Lin. trans. 12. p. 216.) prickles aggregate, hooked; leaflets ovate, almost simply serrated, downy beneath; bracteas rising much above the fruit; sepals pinnate, deciduous? peduncles aggregate, occasionally rather hairy; fruit globose, smooth. *h. H.* Native of England, in hedges, about Ulverton, Lancashire, and Ambleton, Westmoreland. Flowers flesh-coloured.

*Bractescent Dog-rose.* Fl. Ju. July. England. Sh. 6 to 7 ft.

120 *R. sarmentacea* (Swartz, mss. Woods, in Lin. trans. 12. p. 213.) prickles hooked; leaflets ovate, doubly serrated, smooth, glandular; peduncles aggregate, smooth or minutely bristly; sepals pinnate, deciduous; fruit broadly elliptic, naked. *h. H.* Native of Europe, in hedges and bushy places common; plentiful in Britain. Borr. in engl. bot. suppl. 2595. *R. glaucophylla*, Winch, geogr. distri. 45. *R. canina*, Roth. fl. germ. 2. p. 560. Curt. lond. fasc. 5. t. 34. Flowers pink, fragrant. Fruit scarlet, as grateful to the palate probably as that of *R. canina*, with which this equally common plant is generally confounded.

*Sarmentaceous Dog-rose.* Fl. Ju. Jul. Britain. Sh. 8 to 10 ft.

121 *R. cæsia* (Smith, engl. bot. t. 2367.) prickles hooked, uniform; leaflets elliptical, somewhat doubly serrated, glaucous, hairy beneath, without glands; sepals distantly pinnate, deciduous; flower-stalks smooth, solitary; fruit elliptical, smooth. *h. H.* Native of Scotland, in the highland valleys, but rare; at Taymilt, in Mid-Lorn, Argyleshire; and in Strath Tay between Dunkeld and Aberfeldie, and by the side of Loch Tay. *R. canina pubescens*, Afz. ros. succ. tent. 1. p. 2. *R. canina ζ cæsia*, Lindl. ros. p. 99. Flowers of an uniform carnation hue, occasionally white.

*Grey Dog-rose.* Fl. July. Scotland. Shrub 4 to 5 feet.

122 *R. borreæri* (Woods. Lin. trans. 12. p. 210.) prickles hooked; leaflets ovate, doubly serrated, hairy, without glands; sepals pinnate, often doubly pinnate, deciduous; flower-stalks aggregate, hairy; fruit elliptical, smooth. *h. H.* Native of Britain, in hedges and thickets. *R. dumetorum*, Smith, engl. bot. 2579. *R. rubiginosa ♀*, Lindl. ros. 88. *R. rubiginosa inodora*, Hook. lond. t. 117. *R. sepium*, Borkh. ex Rau, enum. 90? but not of Thuill. *R. affinis*, Rau, enum. 79. *R. uncinella β*, Besser. enum. 64.? Flowers pale red. Fruit deep scarlet.

FIG. 76.

*Borrer's Dog-rose.* Fl. June, July. Britain. Sh. 6 to 10 ft.

123 *R. COLLINA* (Jacq. fl. austr. t. 197.) prickles hooked; leaflets roundish, simply serrated, smooth above, but clothed with hoary pubescence beneath; flower-stalks aggregate, bristly; fruit smooth. *h. H.* Native of Austria and other parts of Europe. Red. ros. 2. p. 13. t. 5. *R. frutetorum*, Bess. enum. 1860. *R. umbellata*, Leys. pal. 435. *R. fastigiata*, Bat. fl. main. et loir. suppl. 30. *R. platyphylla*, Rau, enum. 82. *R. psilophylla*, Rau, l. c. p. 191. Sepals pinnate, deciduous, bristly. Flowers pink. Peduncles beset with glandular bristles.

*Hill Dog-rose.* Fl. June, July. Shrub 4 to 5 feet.

124 *R. BALTICA* (Roth, nov. spec. pl. 234.) leaflets oblong-ovate, obtuse, simply serrated; petioles nearly unarmed, pilose; tube of calyx globose, with its base and peduncles beset with glandular bristles; sepals nearly simple, covered with rusty glandular bristles on the outside; bractes coloured. *h. H.* Native near Rostock by the sea side. Flowers pale red.

*Baltic Dog-rose.* Fl. June, July. Shrub 5 to 6 feet.

125 *R. JUNDZILLII* (Bess. Cat. hort. crem. 1810.) prickles of branches few, recurved; petioles prickly, and covered with glandular villi; leaflets glandularly biserrated, glaucescent beneath, and rather villous; fruit ovate, hispid at the base; peduncles hispid. *h. H.* Native of Volhynia, Tauria, and Caucasus. *R. Jundzilliana*, Bess. enum. p. 46, 61, and 67. *R. glandulosa* and *R. nitidula*, Bess.

*Jundzill's Dog-rose.* Shrub 5 to 6 feet.

126 *R. TURBINELLA* (Swartz, ex Spreng. syst. 2. p. 554.) prickles of branches few, and a little recurved; petioles unarmed, villous; leaflets equally toothed, clothed with hoary villi beneath; sepals entire, villous, elongated; germens globose, depressed, and are, as well as the aggregate peduncles, glabrous. *h. H.* Native of Sweden.

*Small-turban-fruited Dog-rose.* Shrub 5 to 6 feet.

127 *R. VENOSA* (Swartz ex Spreng. syst. 2. p. 554.) prickles of branches scattered, strong, and recurved; petioles unarmed, glabrous; leaflets doubly serrated, veiny, quite glabrous, glaucescent beneath; sepals elongated, a little cut, with the margins tomentose; germens ovate, and are, as well as the peduncles, glabrous. *h. H.* Native of Sweden.

*Fciny-leaved Dog-rose.* Shrub 5 to 6 feet.

128 *R. CORIIFOLIA* (Fries, ex Spreng. syst. 2. p. 554.) prickles of branches scattered, recurved; petioles unarmed, villous; leaflets coriaceous, opaque, unequally serrated, villous beneath; peduncles solitary, short, glabrous; germens globose, glabrous. *h. H.* Native of Denmark. *R. crassifolia*, Liljebl.

*Hide-leaved Dog-rose.* Shrub 5 to 6 feet.

129 *R. SWARTZII* (Fries, in Billberg Svensk, bot. ex Schrad. neue entd. 3. p. 219.) germens ovate, and peduncles smooth; branches and petioles beset with recurved scattered prickles; leaflets glabrous on both surfaces, shining, unequally and glandularly serrated; styles exserted. *h. H.* Native of the south of Sweden. Allied to *R. canina*.

*Swartz's Dog-rose.* Fl. June, July. Shrub 4 to 6 feet.

130 *R. SAXATILIS* (Stev. in Bieb. fl. taur. p. 349.) germens ovate, and are, as well as the peduncles, hispid; cauline prickles scattered, strong, compressed, recurved; petioles clothed with glandular villi, prickly; leaflets largish, unequally and sharply serrated, smoothish on both surfaces, paler beneath; the serratures somewhat duplicate; flowers corymbose. *h. H.* Native of Tauria. Allied to *R. canina*.

*Rock Dog-rose.* Fl. June, July. Shrub 4 to 6 feet.

131 *R. RUBRIFOLIA* (Vill. dauph. 3. p. 549.) prickles small, distant; leaflets ovate, and are, as well as the branches, glabrous, opaque, discoloured; sepals narrow, entire; fruit ovate-globose, smooth; flowers corymbose; peduncles smooth. *h. H.* Native of Dauphiny, Austria, Savoy, Pyrenees, and Au-

vergne, in woods. Bell. in act. taur. 1790. p. 229. t. 9. Jacq. fragm. 70. t. 106. Red. ros. 1. p. 35. t. 4. Lindl. in bot. reg. t. 430. *R. multiflora*, Reyn. act. laus. 1. p. 70. t. 6. *R. rubicunda*, Hall. fil. in Rœm. arch. 1. fasc. 2. p. 6. *R. canina*  $\beta$ , Sut. helv. 1. p. 302. *R. glauca*, Desf. cat. p. 175. *R. glaucescens*, Wulf. in Rœm. arch. 3. p. 376. *R. lûrida*, Andr. ros. *R. cinnamomea*  $\gamma$ , rubrifolia, Red. ros. 1. p. 134. Stems red. Leaves red at the edges. Flowers small, deep red. Sepals narrow, longer than the petals.

*Var.  $\beta$ , hispidula* (Ser. mus. helv. 1. p. 8 and 12. t. 1.) leaflets ovate; flowers red; fruit corymbose, smooth; peduncles hispid; sepals entire. *R. cinnamomea glauca*, Desv. journ. bot. 1813. p. 120. Red. ros. 1. p. 134.

*Var.  $\gamma$ , Redoutea* (Ser. in D. C. prod. 2. p. 609.) stems and branches reddish; prickles slender, hardly curved; petioles spinulose; corymbs few-flowered; leaflets ovate; petals very pale red, with rose-coloured and dotted margins. *R. Redoutea*, Red. ros. p. 3. and Mill. in ann. encycl. 1818. p. 35. *R. Redoutea glauca*, Red. ros. 1. t. 38. p. 101. Lindl. ros. 137. This appears to be a hybrid production between *R. rubrifolia* and *R. spinosissima*.

*Var.  $\delta$ , inermis* (Ser. in D. C. prod. 2. p. 610.) stem and branches unarmed; petioles prickly; leaflets ovate; peduncles and calyxes smooth; stipulas broad. *h. H.* Native of Switzerland. *R. rubrifolia*, Thomas.

*Var.  $\epsilon$ , pinnatifida* (Ser. in mus. helv. 1. p. 11. t. 2. f. 11.) leaflets ovate; flowers solitary, terminal; sepals pinnatifid; fruit globose, and are, as well as the peduncles, smooth. *h. H.* Native of Switzerland. *R. rubrifolia germinibus ovatis*, and *R. montana germinibus glabris*, Schleich. cat. 1815. pp. 24. 46. *R. canina globosa*, Desv. journ. bot. 1813. p. 114.

*Red-leaved Dog-rose.* Fl. June, July. Clt. 1814. Sh. 5 to 6 ft.

132 *R. SERICEA* (Lindl. ros. p. 105. t. 12.) prickles stipular, compressed; leaflets 7-11, oblong, obtuse, serrated at the apex, silky beneath; flowers solitary, bractless; sepals entire, ending in long points. *h. H.* Native of Gosaingsthan. Flowers pale red? Fruit and peduncles naked.

*Silky Rose.* Fl. June, July. Shrub 4 to 6 feet.

133 *R. MICROPHYLLA* (Roxb. Lindl. ros. p. 146.) prickles under the stipulas straight; stipulas very narrow, spreading at the tip; leaflets 5-9, shining, sharply serrated, glabrous; flowers solitary; calyx beset with straight prickles; sepals short, broadly ovate, apiculated, downy at the edge. *h. H.* Native of China. A charming little shrub, resembling the *Macartney Rose*. Flowers very double, pale red.

*Small-leaved Rose.* Fl. June, July. Shrub 2 to 3 feet.

134 *R. INDICA* (Lin. spec. 705.) branches glaucous-green, armed with equal hooked prickles; leaflets elliptic, acuminate, glabrous, crenate-serrated, glaucous beneath; stipulas ciliate serrulated; sepals ovate, entire; flowers numerous; fruit turbinate. *h. H.* Native of China, near Canton. Lawr. ros. t. 26. Red. ros. 1. p. 51. t. 142. p. 35. t. 15. *R. Sinica*, Lin. syst. veg. ed. 13. p. 398. *R. semperflorens carnea*, Rossig. ros. t. 19. *R. Indica Chinensis simplena*, Ser. mel. 1. p. 31. *R. reclinata flore submultiplici*, Red. ros. p. 79. with a figure. Flowers red, usually semidouble. Petioles setigerous and prickly. Petals obcordate.

*Var.  $\beta$ , Noisettiana* (Ser. in D. C. prod. 2. p. 600.) stem firm, and is, as well as the branches, prickly; stipulas nearly entire; flowers paniced, very numerous, semidouble, pale red; styles exserted. *R. Noisettiana*, R. d. ros. 2. p. 77. with a figure, Noisette rose.

*Var.  $\gamma$ , Ternauxiana* (Ser. in D. C. prod. 2. p. 600.) stem rather firm, and is, as well as the branches, prickly; leaflets lanceolate, smaller; flowers paniced, red, size of the *Pomponc rose*. *R. Noisettiana purpurea*, Red. ros. p. 103. with a figure.

*Var. δ, odoratissima* (Lindl. ros. p. 106. bot. reg. 864.) stem firm; prickles strong; stipulas fringed or entire; flowers rose-coloured, sweet-scented; peduncles thickened; fruit ovate. *h*. H. Native of China. *R. odoratissima*, Sweet. hort. suburb. lond. *R. Indica frâgrans*, Red. ros. 1. p. 6. t. 19. Flowers semidouble. Called *sweet-scented Chinese-rose* and *Rose à odeur de thé*.

*Var. ε, longifolia* (Lindl. ros. p. 106.) stems firm, nearly unarmed; leaflets 3-5, long, lanceolate; stipulas nearly entire; flowers rose-coloured, almost single; peduncles roughish. *R. longifolia*, Willd. spec. 2. p. 1079. Red. ros. 2. p. 27. t. 12.

*Var. ζ, pumila* (Lindl. ros. p. 106.) smaller in every part than the other varieties; flowers purplish; petals ovate. *h*. H. Native of China. *R. Indica pumila*, Red. ros. 1. p. 115. t. 42. *R. Indica ζ humilis*, Ser. mel. 1. p. 44.

*Var. η, caryophyllea* (Red. ros. 3. p. 69. with a figure,) leaflets large, thin; flowers subpanicked; petals cucullately inflexed.

*Var. θ, pannosa* (Red. ros. 2. p. 37. and p. 38. with a good figure,) stem and branches firm and prickly; leaflets ovate, red beneath; stipulas finely denticulated; flowers drooping a little, purple on the outside; petals oblong, concave, outer ones purple, inner ones somewhat cucullate, rose-coloured.

*Var. ι, cruenta* (Red. ros. 1. p. 128. with a figure, and 2. p. 38.) large; stems and branches almost unarmed, firm; leaflets large, red beneath; stipulas almost entire; flowers purplish, drooping, size of those of *var. odoratissima*; petals concave, broad.

*Var. κ, Fraseriana* (Hortul. Loud. hort. brit. p. 211.) a hybrid with double pink flowers.

*Var. λ, ruga* (Lindl. bot. reg. t. 1389.) flowers double blush, changing to white, sweet-scented. The *ruga-rose* is a hybrid, raised between the *sweet-scented Chinese-rose* and *R. arrénsis*.

*Var. ω, ochroleuca*; flowers double, large, cream-coloured, without any scent. This variety was introduced from China in 1824 by Mr. Parks, and is figured in the thirteenth volume of the Botanical Register. It is commonly called the *yellow Chinese rose*.

† Garden varieties referrible either to *R. Indica* or *R. semperflôrens*.

*Indian Rose*, *Monthly Rose*, *Blush* or *Common China Rose*. Fl. year. Clt. 1789. Shrub 4 to 20 feet.

135 *R. SEMPERFLÔRENS* (Curt. bot. mag. 284.) branches dark green, armed with scattered compressed hooked prickles, and a very few glands; leaflets 3-5, ovate-lanceolate, crenate-serrated, shining above, glaucous and slightly pubescent beneath, deeply stained with purple; petioles glandular, and slightly setigerous; sepals compound, narrow; fruit spherical. *h*. H. Native of China. Lawr. ros. t. 23. Smith, exot. bot. 2. p. 91. Jacq. schœnbr. 3. p. 281. *R. diversifolia*, Vent. cels. t. 35.

*R. Bengalensis*, Pers. ench. 2. p. 50. *R. Indica*, Red. ros. 1. p. 49. t. 13. p. 123. t. 46. and 2. p. 37. t. 16. Flowers solitary, single or semidouble, deep crimson. There are some very splendid varieties of this species with semidouble crimson flowers in our gardens, and the French appear to have some others still more beautiful, which have not yet been imported.

*Ever-flowering China-rose*. Fl. year. Clt. 1789. Shrub 3 to 10 feet.

136 *R. LAWRENCIANA* (Sweet, hort. suburb. Lindl. ros. p. 110.) dwarf; prickles large, stout, nearly straight; leaflets ovate, acute, finely serrated; petals acuminate. *h*. H. Native of China. *R. semperflôrens minima*, Sims, bot. mag. 1762. *R. Indica var. i acuminata*, Red. ros. 1. p. 53. with a figure. *R. Indica Lawrenciana*, Red. ros. 2. p. 38. Flowers small, single or semidouble, pale blush.

*Miss Lawrence's China-rose*. Fl. year. Clt. 1810. Sh. 1 ft. 137 *R. ATROPURPUREA* (Brot. fl. lus. 2. p. 488.) stem and petioles prickly; leaflets 5, lanceolate, serrated, glabrous, permanent; flowers terminal, solitary or few; germens nearly oval, and are, as well as the peduncles, hispid. *h*. II. Collected in the gardens of Lisbon, where it flowers all the year. Flowers semidouble, about the size of those of *R. moschata*. Perhaps *R. semperflôrens*.

*Dark-purple China-rose*. Fl. year. Shrub.

138 *R. PSEUDO-INDICA* (Lindl. ros. 132.) prickles nearly equal; stipulas very hairy; peduncles covered with little short prickles; calycine tube and sepals very hairy; flowers double, deep yellow; leaves more finely serrated and coriaceous than those of *R. Indica*. *h*. G. Native of China. Habit of *R. Indica*.

*False-Indian Rose*. Shrub.

SECT. X. SYSTYLA (from *συν*, *syn*, together, and *στυλος*, *stylus*, a column; in reference to the styles being connected). Lindl. ros. p. 111. Styles cohering together into an elongated column. Stipulas adnate. The habit of this section is nearly the same as that of the last division. The leaves are frequently permanent.

139 *R. SYSTYLA* (Bat. fl. main. et loir. suppl. 31.) sureuli assurgent; prickles strong, hooked; peduncles glandular; sepals pinnate, deciduous; styles smooth; floral receptacle conical. *h*. H. Native of France and England, in hedges and thickets; common in Sussex; at Walthamstow, Quendon, and Clapton, near London; at Dunnington Castle, Berkshire; near Penhurst, Kent, and Hornsey, Middlesex. Hills in the south of Scotland. *R. collina*, Smith, engl. bot. t. 1895. *R. stylôsa*, Desv. journ. bot. 2. p. 317. *R. brevistyla*, D. C. fl. fr. suppl. p. 537. *R. dibracteata*, D. C. l. c. *R. systyla a ovata*, Lindl. ros. p. 111. Shrub slender. Flowers fragrant, pink or almost white. Fruit ovate-oblong.

*Var. β, lanceolata* (Lindl. ros. 111.) leaflets ovate-lanceolate; fruit spherical. *h*. II. Native of Ireland.

*Var. γ, Monsônia* (Lindl. ros. 111.) stem more humble, erect, many-flowered; branches usually setigerous. *h*. H. Native of England, near Watford. *R. collina Monsônia*, Red. ros. 3. p. 67.

*Var. δ, leucochrôa* (Ser. in D. C. prod. 2. p. 599.) leaves glabrous, not glandular; peduncles hispid; calyxes glabrous. *h*. H. Native of Andegavany. *R. leucochrôa*, Desv. journ. bot. 1809. vol. 2. p. 316. and 1813. p. 113. t. 15. *R. brevistyla a*, D. C. fl. fr. 5. p. 537. *R. brevistyla leucochrôa*, Red. et Thor. ros. 1. p. 91. with a figure. *R. systyla*, Bast. fl. suppl. 31. D. C. fl. fr. 5. p. 537. var. *γ*.

*Var. ε, glandulôsa* (Ser. l. c.) leaflets 5-7, obovate-elliptic, somewhat biserrulated, glabrous above, but covered with rusty glands beneath; petals tomentose and glandular; column of styles short.

**Close-styled Rose.** Fl. May, July. Britain. Sh. 8 to 12 ft. 140 *R. ARVENSIS* (Huds. ang. ed. 1. p. 192.) surculi flagelliform; prickles unequal, falcate, scattered; leaflets simply serrated, glaucous beneath; peduncles glandular; sepals pinnate, deciduous; styles smooth; floral receptacle slightly convex; fruit globose or elliptical, smooth.  $\frac{1}{2}$ . II. Native of many parts of middle Europe. In England in hedges and thickets, and the borders of fields, chiefly in the midland counties. Smith, engl. bot. t. 188. Lawr. ros. t. 86. Red. ros. 1. p. 89. t. 32. Sims, bot. mag. 2054. *R. sylvestris*, Herm. diss. 10. *R. scândens*, Moench. weiss. pfl. 118. *R. herperhodon*, Ehrh. Beitr. 2. p. 69. *R. Halleri*, Krok. siles. 2. p. 150. *R. fúscá*, Moench. meth. 688. *R. sérpens*, Ehrh. arbr. 35. *R. sempervirens*, Rossig. ros. t. 32. *R. repens*, Gmel. fl. bad. als. 2. p. 418. Jacq. fragm. 69. t. 104. *R. rámpans*, Reyn. mem. laus. 1. p. 69. t. 5. Flowers usually white, slightly scented, generally several together, rarely solitary. Fruit of a dark blood-colour. Shrub sending out many arched trailing shoots.

*Var.  $\beta$ , híbrida* (Lindl. ros. 113.) surculi thicker and shorter; floriferous stems erect, many-flowered; branches bearing a few bristles; styles free.  $\frac{1}{2}$ . H. Native of Switzerland. *R. híbrida*, Schleich. cat. *R. geminata*, Rau, enum. 39. *R. gállica*, híbrida, Gaud. in Ser. mel. bot. 1. p. 39. The branches have a few setæ mixed among the prickles. The flowers are semidouble, of a most delicate flesh-colour. Called in the nurseries *double-hip rose*.

*Var.  $\gamma$ , Andersónii* (Smith, engl. fl. 2. p. 398.) habit stout; flowers large, pale flesh-coloured. Found wild in a hedge in Somersetshire.

*Var.  $\epsilon$ , Ayrshirea* (Ser. in D. C. prod. 2. p. 597.) prickles slenderer, very sharp; leaflets sharply serrated, thin; peduncles beset with glandular bristles.  $\frac{1}{2}$ . II. Cultivated in the gardens under the name of *Ayrshire rose*. *R. capreolata*, Neill, edinb. phil. journ. no. 3. p. 102. Flowers white, in clusters, fragrant.

*Var.  $\zeta$ , obtusata* (Ser. l. c.) leaflets roundish, blunt.  $\frac{1}{2}$ . II. Native of Switzerland, about Bern.

**Field Rose or White Trailing Dog-rose.** Fl. July. Britain. Shrub rambling.

141 *R. ABYSSINICA* (Brown in Salt's abyss. append. 64.) surculi climbing; prickles much crowded, falcate; leaflets ovate, evergreen; peduncles and calyxes tomentose; sepals entire; petioles very rough, with unequal glands and setæ.  $\frac{1}{2}$ . H. Native of Abyssinia. Lindl. ros. p. 116. t. 13.

*Abyssinian Rose.* Shrub cl.

142 *R. SEMPERVIRENS* (Lin. spec. 704.) surculi climbing; prickles nearly equal, falcate; peduncles numerous, glandular; leaves evergreen; leaflets ovate-lanceolate, simply serrated, smooth on both surfaces, paler beneath; sepals nearly simple; petioles armed with little hooked prickles; styles hairy.  $\frac{1}{2}$ . II. Native of France, Portugal, Italy, Greece, and the Balearic Islands. Lawr. ros. t. 45. Ker. bot. reg. 459. *R. scândens*, Mill. dict. no. 8. *R. Balearica*, Desf. cat. Pers. ench. 2. p. 49. *R. atrovirens*, Viv. fl. ital. 4. t. 6. *R. sempervirens globosa*, Red. ros. 2. with a figure. *R. sempervirens* var.  $\alpha$ , scândens, D. C. fl. fr. 5. p. 533. Flowers very numerous, white, and fragrant. Receptacle of flower conical, very thick. Fruit orange-colour, small.—There are varieties of this plant with semidouble and pale rose-coloured flowers. It is a very ornamental plant, rapidly forming a compact covering to old pales or buildings against which it is planted: and the Ayrshire rose is equally good for that purpose.—Smith, græc. t. 483.

*Var.  $\beta$ , microphylla* (Desf. atl. 1. p. 401.) leaflets nearly orbicular.  $\frac{1}{2}$ . H. Found about Tunis.

*Var.  $\lambda$ , latifolia* (Red. ros. 2. p. 16. and p. 49. with a figure,) leaflets broader; peduncles and fruit hispid; stems green.

*Var.  $\delta$ , Leschenaultiana* (Red. et Thor. ros. 3. p. 87. with a figure,) germens ovate, and are, as well as the peduncles, beset with glandular bristles; stems and petioles prickly, pruinose, and violaceous; leaflets ovate-lanceolate.  $\frac{1}{2}$ . II. Native of the Nelligery mountains, in Asia. Stems climbing to the height of 60 or 70 feet. Perhaps a proper species.

*Var.  $\epsilon$ , microphylla* (D. C. cat. hort. monsp. 138. fl. fr. 5. p. 533.) leaflets smaller; peduncles and fruit hispid.  $\frac{1}{2}$ . H. Red. ros. 2. p. 16.

*Var.  $\zeta$ , pilosula* (Ser. in D. C. prod. 2. p. 598.) peduncles and petioles usually pilose and hispid.  $\frac{1}{2}$ . II. Native of the Eastern Pyrenees.

*Var.  $\eta$ , Russelliana* (Hort.) flowers pale red. *Russell's rose*.

*Var.  $\xi$ , rose Clare* (Lindl. bot. reg. 1438.) an elegant rose, with spreading corymbs of deep red flowers. It is perhaps a hybrid between the present species and *R. Indica*.

**Evergreen Dog-rose.** Fl. June, Aug. Clt. 1629. Sh. cl.

143 *R. PROSTRATA* (D. C. hort. monsp. 138. fl. fr. 5. p. 536.) surculi prostrate; prickles nearly equal, falcate; leaves evergreen; styles glabrous; flowers usually solitary.  $\frac{1}{2}$ . II. Native of the south of France. Red. ros. 1. p. 90. *R. arvensis* var.  $\gamma$  prostrata, Ser. in D. C. prod. 2. p. 597.

*Var.  $\beta$ , bibracteata*; peduncles furnished with 2 or many bracteas; flowers very numerous; leaflets broadish.  $\frac{1}{2}$ . II. Native of France. *R. arvensis  $\beta$  bibracteata*, Red. ros. 1. p. 90. Ser. in D. C. prod. 2. p. 597. *R. bibracteata*, Bast. ann. litt. and in D. C. fl. fr. 5. p. 537. Flowers white or pale red.

**Prostrate Evergreen Dog-rose.** Fl. July. Shrub prostrate.

144 *R. MULTIFLORA* (Thumb. jap. 214.) branches, peduncles, and calyxes tomentose; leaflets soft, lanceolate, wrinkled; stipulas pectinated; styles downy; sepals ovate, entire; fruit turbinate, smooth.  $\frac{1}{2}$ . H. Native of Japan and China. Sims, bot. mag. 1059. Ker. bot. reg. 425. *R. flava*, Donn, hort. cant. ed. 4. p. 121. *R. florida*, Poir. suppl. *R. diffusa*, Roxb. Flowers single, red, clustered. Fruit bright red, not crowned by the calyx. Red. ros. 2. p. 70.

*Var.  $\beta$ , Thunbergiana* (Red. ros. 2. p. 70.) flowers white; petioles prickly.  $\frac{1}{2}$ . II. Native of Japan. Flowers small, double, clustered.

*Var.  $\gamma$ , canna* (Red. ros. 2. p. 69. with a figure,) flowers of a beautiful pink, small, double clustered.  $\frac{1}{2}$ . II. Native of China. Lindl. bot. reg. 425. Sims, bot. mag. 1059.

*Var.  $\epsilon$ , platiphylla* (Red. ros. 2. p. 69. with a figure,) leaflets broader; flowers large, double, purple, clustered, changing colour as they fade.  $\frac{1}{2}$ . H. Lindl. bot. reg. 1372. *R. Thoryi*, Tratt. ros. 2. p. 85. *R. Grevillei* and *R. Roxburghii*, Hort.

*Var.  $\zeta$ , Boursoitii* (Hort.) flowers small, double, pink, clustered. The garden roses known under the names of *R. Fraseriana*, *R. purpurea*, and *R. hyacinthina* are slight varieties of this.

**Many-flowered Rose.** Fl. June, July. Clt. 1804. Sh. cl.

145 *R. BRANONII* (Lindl. ros. p. 120. t. 14.) branches, lanceolate leaflets, and calyxes tomentose and glandular; stipulas serrated; prickles strong, scattered, hooked; sepals entire; styles hairy.  $\frac{1}{2}$ . II. Native of Nipaul. *R. Brônii*, Spreng. syst. 2. p. 556. Leaves simply serrated. Flowers in terminal bunches white or pale red.

*Var.  $\beta$ , nudiuscula* (Lindl. in bot. reg. 829.) leaflets oblong, acute, glabrous; petioles, pedicels, and calyxes glandular.

*Var.  $\gamma$ , Nipalensis* (Lindl. l. c.) leaflets ovate-lanceolate, distant; petals acute; pedicels and calyxes glandular.

*Var.  $\epsilon$ , arborea* (Lindl. l. c.) stem arborescent; leaves firmer, pubescent beneath.  $\frac{1}{2}$ . H. Native of Persia. *R. arborea*, Pers. ench. 2. p. 50. Shrub upright.

**Brown's Rose.** Fl. June, July. Clt. 1822. Shrub rambling.

146 *R. MOSCHATTA* (Mill. dict. no. 13.) branches very sparingly glandular, almost naked; prickles strong, hooked, scattered;

leaflets elliptic, acuminate, glaucous beneath, with the serratures connivent; stipulas entire; sepals compound, acuminate; styles hairy; pedicels glandular, downy, like the ovate tube, and reflexed sepals; fruit small, red. *h. H.* Native of the north of Africa, extending across the continent from Egypt to Mogodor, and thence to Madeira. Jacq. schœnbr. 3. t. 280. Lawr. ros. tt. 53 and 64. Jacq. fragm. 31. t. 34. f. 3. Red. ros. 1. p. 33. t. 5. p. 99. t. 35. *R. opsostémna*, Ehrh. Beitr. 2. p. 72. *R. glandulifera*, Roxb. Cymes very numerous, many-flowered, corymbose, with hairy ramifications. Flowers pure white, with a slight scent of musk. The Persian attar of roses is obtained from this species.

*Var. β, multiplex*; flowers double, white, sweet-scented, with the claws of the petals yellow.

*Var. γ, nudiuscula* (Lindl. ros. p. 122.) leaflets oblong, acute, glabrous; petioles, pedicels, and calyxes glandular.

*Var. δ, nivea* (Lindl. bot. reg. 861.) leaflets 3-5, large, ovate-cordate; flowers corymbose; peduncles and calyxes hispid; petals white, with a tinge of blush, large, obovate. *h. H.* *R. nivea*, Dupont, but not of D. C. *R. moschata β, rosea*, Ser. in D. C. prod. 2. p. 598.

*Musk Rose.* Fl. July, Oct. Clt. 1596. Shrub rambling.

147 *R. EVRATINA* (Bosc. dict. Poir. suppl. 714.) branches and petioles almost unarmed; leaflets 3-5, oval, obtuse, nearly equally toothed, green above, paler and rather glaucous beneath; stipulas with 2 sharp teeth; flowers in bunches, terminal, almost umbellate; peduncles bristly and glandular; sepals entire, acute; germens ovate, hispid. *h. H.* Native of Carolina. Flowers large, pale red.

*Ecratine Rose.* Fl. June, July. Clt.? Shrub.

148 *R. RUBIFOLIA* (Brown, in Ait. hort. kew. ed. 2. vol. 3. p. 260.) branches glabrous, armed with scattered, falcate prickles; leaflets ovate-lanceolate, serrated, green and shining above, but paler and downy beneath, with the serratures divaricate; petioles glabrous, with a few prickles; stipulas entire, fringed with glands; styles downy. *h. H.* Native of North America. Peduncles and calyxes glabrous, the former glandular. Flowers small, pale red, about 3 together. Fruit about the size of a pea, round and naked.

*Var. β, macrophylla* (Ser. in D. C. prod. 2. p. 599.) flowers twin or in fascicles, large, rose-coloured, approximate. *R. rubifolia*, Red. ros. 3. p. 71. with a figure.

*Var. γ, fenestralis* (Lindl. ros. p. 125. t. 15.) flowers solitary; leaflets smaller, smooth on both surfaces. *h. H.* *R. fenestrata*, Donn, hort. cant. ed. 8. p. 170.

*Bramble-leaved Rose.* Fl. Aug. Sept. Clt. 1800. Shrub 3 to 4 feet.

SECT. XI. *BANKSIANÆ* (so called in consequence of all the species contained in this section agreeing in character with *R. Banksiæ*). Lindl. ros. p. 125. Stipulas nearly free, subulate, or very narrow, usually deciduous. Leaves usually ternate, shining. Stems climbing. The species of this section are remarkable for their long, graceful, often climbing shoots, drooping white flowers, and ternate shining leaves. They are particularly distinguished by their deciduous, subulate, or very narrow stipulas. Their fruit is very variable. *R. hystrix* has setigerous branches and *R. setigera* has united styles.

149 *R. LEVIGATA* (Michx. fl. bor. amer. 1. p. 295.) stipulas linear-lanceolate, half adnate; leaflets shining, glabrous; prickles scattered, falcate; petioles unarmed; fruit muricated; sepals entire, permanent. *h. H.* Native of Georgia, in shady woods. Peduncles and tube of calyx beset with dense, weak, unequal bristles, also the back of the sepals. Flowers solitary, large, white.

*Smooth Rose.* Shrub cl.

150 *R. SINICA* (Ait. hort. kew. ed. 2. vol. 3. p. 261. Lindl. ros. p. 126. t. 16.) stipulas setaceous, deciduous; cauline prickles equal, falcate; petioles and ribs of leaves prickly; peduncles and fruit beset with straight bristles; sepals entire, permanent. *h. H.* Native of China. Hook. bot. mag. 2847. *R. trifoliata*, Bosc. dict. ex Poir. *R. ternata*, Poir. suppl. 6. p. 284. *R. Cherokeeensis*, Donn, hort. cant. ed. 8. p. 170. *R. nivea*, D. C. hort. monsp. 137. Red. ros. 2. p. 81. with a figure. Flowers white, solitary. Fruit elliptic, orange red. Disk conical.

Three-leaved *China Rose.* Fl. May, July. Clt. 1759. Sh. rambling.

151 *R. RECURVA* (Roxb. fl. ind. ined. Lindl. ros. p. 127.) stipulas subulate; leaflets 5-9, ovate-lanceolate, acutely serrated, smooth; petioles prickly; fruit muricated. *h. H.* G. Native of Nipaul. Flowers white? Branches armed with strong recurved prickles.

*Recurved-prickled Rose.* Shrub climbing.

152 *R. SETIGERA* (Michx. fl. bor. amer. 1. p. 295.) stipulas subulate; petioles rough from little setæ and little recurved prickles; leaflets 3, rarely 5, acutely serrated, smooth; peduncles setigerous; sepals pinnatifid and setigerous; fruit muricated; stem with 1-3 recurved prickles beneath the stipulas. *h. H.* Native of North America. Flowers numerous, sometimes solitary, rose-coloured. The united styles distinguish it from all the other species of this section.

*Setigerous Rose.* Shrub.

153 *R. HYSTRIX* (Lindl. ros. p. 129. t. 17.) prickles on branches unequal, crowded, larger ones falcate, small ones straight; stipulas very narrow, united half way, the free part deciduous; leaflets 3, smooth, ovate, shining, simply serrated, with a few prickles on the middle nerve; sepals nearly entire, permanent; fruit bristly. *h. H.* Native of China, in the province of Kiangsi, and of Japan. Branches flagelliform. Flowers large, solitary. Fruit large, oblong, purple.

*Porcupine Rose.* Shrub rambling.

154 *R. MICROCARPA* (Lindl. ros. 130. t. 18.) cauline prickles hooked, scattered; stipulas subulate; petioles downy or naked; leaflets 3-5, ovate-lanceolate, naked, crenate-serrated; flowers corymbose, with smooth peduncles; fruit pea-formed, unarmed. *h. H.* Native of China, in the province of Canton. Flowers very numerous, small, white.

*Small-fruited Rose.* Fl. May, Sept. Clt. 1822. Sh. rambl.

155 *R. TRIPHYLLA* (Roxb. fl. ind. ex Lindl. ros. p. 138.) shrub climbing and armed; leaves ternate; leaflets lanceolate. *h. H.* F. Native of China. Perhaps the same as *R. microcarpa*, or a variety of *R. Sinica*.

*Three-leaved Rose.* Shrub cl.

156 *R. BANKSIÆ* (Brown, in Ait. hort. kew. ed. 2. vol. 3. p. 258.) branches unarmed; stipulas subulate, rather hairy; leaflets 3-5, glabrous, except at the base of the middle nerve, oblong-lanceolate, simply serrated; sepals ovate, entire; fruit unarmed. *h. H.* Native of China. Sims, bot. mag. 1954. Red. ros. 2. p. 43. with a figure. Lindl. in bot. reg. 397. *R. Banksiana*, Abel. chin. 160. *R. inermis*, Roxb.? Flowers drooping, numerous, small, white and very double, with a weak but very pleasant scent.

*Var. β, lutea* (Lindl. bot. reg. 1105.) flowers double yellow. An elegant shrub when in flower.

*Lady Banks's Rose.* Fl. June, July. Clt. 1807. Sh. cl.

157 *R. FRAGARIÆFLORA* (Ser. in D. C. prod. 2. p. 601.) stem prickly; leaflets petiolulate, ovate, acuminate, entire; flowers corymbose, white; peduncles and calyxes smooth; sepals entire; stipulas solitary? basilar. *h. H.* G. Native of China.—Braan. icon. chin. 1821. t. 28. Flowers the size and colour of those of *Fragaria vesca*.

*Strawberry-flowered Rose.* Shrub cl.

158 *R. AMYGDALIFOLIA* (Ser. in D. C. prod. 2. p. 601.) branches prickly; leaves trifoliate, exstipulate?; leaflets oblong-lanceolate, entire, acute; flowers lateral, solitary; peduncles and calyxes hispid; petals longer than the calyx, white; styles combined into a long, filiform column. *h. G.* Native of China. — Braan. icon. chin. t. 19. Sepals broad, acute. Fruit ovate, large.

*Almond-leaved Rose.* Shrub cl.

† *Species not sufficiently known.*

159 *R. HISPA'NICA* (Mill. dict. no. 7.) leaves villous on both surfaces; sepals acutely serrated; fruit glabrous. *h. H.* Native of Spain. Mill. Prickles strong. Flowers bright red.

*Spanish Rose.* Fl. May. Clt. ? Shrub 4 feet.

160 *R. XANTHINA* (Lindl. ros. p. 132.) very like *R. spinosissima*, except in having no setæ, and double flowers the colour of those of *R. sulphurea*. *h. F.* Native of China.

*Yellowish-flowered Rose.* Shrub 2 to 3 feet.

161 *R. AGRÆTIS* (Gmel. fl. bad. als. 2. p. 416.) germens almost globose, and are as well as the peduncles hispid; leaflets round, obtuse, clothed with white tomentum beneath; stem prickly; prickles unequal, straight; flowers solitary. *h. H.* Native of Alsatia, in calcareous soil, in fields. Flowers large, white. Fruit roundish, smooth, red. Perhaps allied to *R. tomentosa*.

*Field Rose.* Shrub 1 to 2 feet.

162 *R. LYONII* (Pursh, fl. amer. sept. 1. p. 345.) germens subglobose, glabrous; peduncles hispid; petioles rather prickly; stem glabrous; prickles scattered, straight; leaflets 3-5, ovate-oblong, acute, serrated, smoothish above, tomentose beneath; uppermost leaves simple; flowers usually tern; stipulas linear; sepals tomentose, linear, hardly jagged. *h. H.* Native of Tennessee. Flowers pale red. Leaves small, with coloured veins. Evidently related to *R. Carolina*.

*Lyon's Rose.* Fl. June, July. Clt. ? Shrub 3 to 4 feet.

163 *R. POLLINIA'NA* (Spreng. pl. min. cogn. pug. 2. p. 66.) tube of calyx ovate, and is, as well as the peduncles and petioles, beset with glandular bristles; leaflets ovate-roundish, serrated, glabrous on both surfaces, having the teeth glandularly serrated; stem prickly. *h. H.* Grows in hedges, at the foot of Mount Baldo. Flowers large, purple. This species is evidently related to *R. rubiginosa*.

*Pollin's Rose.* Shrub 4 to 6 feet.

164 *R. HISPIDA* (Poir. encycl. no. 15.) germens globose, and are as well as the peduncles hispid and prickly; leaflets ovate, clothed with white tomentum beneath; stem prickly; prickles scattered; flowers solitary. *h. H.* Native country unknown. Evidently nearly allied to *R. tomentosa*.

*Hispid Rose.* Shrub 6 to 8 feet.

165 *R. LOUREIRIANA*; stem shrubby, tufted, branched, prickly; petioles prickly; tube of calyx round; peduncles unarmed. *h. H.* Cultivated in China and Cochin-china every where, and in the latter country it is called *Hoa-kôé*, and in the former *Múi-hôa*. *R. cinnamomea*, Lour. coch. 323. Leaves with hardly any scent. Flowers single, very red.

*Loureiro's Rose.* Shrub 3 feet.

166 *R. COCHINCHINENSIS*; stem climbing a little, very prickly; tube of calyx roundish, smooth; petioles and peduncles prickly. *h. H.* Native of Cochin-china, where it is called *Hoa hâng tau*. *R. spinosissima*, Lour. coch. p. 323. Flowers bluish-coloured, scentless. Perhaps *R. Sinica*. \*

*Cochin-china Rose.* Shrub 6 feet.

167 *R. ADENOPHYLLA* (Willd. enum. p. 546.) germens ovate, clothed with glandular bristles; petioles beset with glandular

down, unarmed; leaflets simply serrated, glaucous beneath, with glandular margins; prickles of branches scattered. *h. H.* Native country unknown. Flowers single, large, red; petals emarginate. This plant is perhaps allied to *R. parvifolia*.

*Gland-leaved Rose.* Shrub 4 to 6 feet.

168 *R. TIGURIORUM* (Willd. enum. p. 544.) germens roundish, glabrous; calyxes pilose; peduncles hispid; petioles villous, prickly; prickles on stem scattered. *h. H.* Native country unknown. Called in Germany *Tapeten Rose*. Perhaps nearly allied to *R. arvensis*.

*Cottage Rose.* Shrub.

169 *R. VELUTINA* (Clairv. man. d'herb. 163.) fruit round; leaves cottony beneath, edges glandular. *h. H.* Native of Switzerland, about Winterthur. Perhaps this is a variety of *R. pimpinellifolia*.

*Velvety Rose.* Shrub.

170 *R. MURICATA* (Waitz, in Link. enum. 2. p. 56.) stem muricated above; petioles almost naked; leaflets oval, obtuse, serrated, glabrous; peduncles glandular; tube of calyx oblong, naked; sepals with tomentose edges. *h. H.* Native country unknown.

*Muricated-branched Rose.* Shrub.

171 *R. RUFICANULIS* (Ehrh. beit. 7. p. 138.) prickles very slender, reflexed, covered with bluish bloom; branches unarmed; leaflets lanceolate, acutely serrated, glaucous beneath; tube of calyx globose; sepals undivided, length of corolla; styles shorter than the stamens. *h. H.* Native of America. *R. Portlandica*, Gord. cat. p. 28. *R. Portlandica*, Ludw. baumz. 15.

*Brown-stemmed Rose.* Shrub.

172 *R. VERTICILLACANTHA* (Mer. fl. par. 190.) prickles minute, rather verticillate, reflexed; leaflets oval, glandless; petioles rather glandular; fruit globose, clothed with glandular bristles; sepals undivided. *h. H.* Native about Paris. Perhaps a variety of *R. alpina*.

*Whorled-spined Rose.* Shrub 3 to 4 feet.

173 *R. MACROCARPA* (Mer. fl. par. 190.) prickles nearly straight; leaflets oval, toothed, glandless; petioles hardly glandular; fruit globose, and are, as well as the peduncles, smooth; sepals undivided, glandless. *h. H.* Native of France.

*Long-fruited Rose.* Shrub.

174 *R. STIPULARIS* (Mer. fl. par. 192.) prickles recurved; leaflets doubly serrated, glabrous, glandless; petioles glandular and prickly; stipulas large, entire, glandular; fruit oval, and are as well as the peduncles glabrous; sepals undivided, glandless. *h. H.* Native about Paris. Flowers rose-coloured.

*Stipular Rose.* Shrub.

175 *R. FLEXUOSA* (Rafin. prec. 37. but not of Rau.) stems twisted; prickles solitary, recurved; petioles glabrous and nearly unarmed; leaflets ovate, unequally serrated; flowers solitary; germens oblong, or globose, glabrous. *h. H.* Native of North America. *R. Rafflesiana*, Tratt. ros. 2. p. 231. Peduncles short. Flowers large, rose-coloured.

*Flexuous-stemmed Rose.* Shrub.

176 *R. ACUMINATA* (Rafin. ros. amer. in ann. sc. phys. 5. p. 216.) stem and petioles prickly; leaflets 3-5, oval, acuminate, serrated, pubescent beneath; flowers subumbellate; fruit obovate, and are as well as the peduncles beset with glandular bristles. *h. H.* Native of North America, on the banks of the Wabash river.

*Acuminate-leaved Rose.* Shrub.

177 *R. PRATENSIS* (Rafin. l. c. 5. p. 215.) stem flexuous; prickles stipular, straight; petioles pubescent; leaflets 5-7, oblong, attenuated at both ends, serrated, glabrous; flowers solitary; fruit ovate, hispid. *h. H.* Native of North America, in the meadows of Kentucky. Flowers white.

*Var. β, geminata* (Rafin. l. c.) leaflets obovate; flowers twin, rose-coloured.

*Meadow Rose.* Shrub.

178 *R. RIPARIA* (Rafin. l. c. 5. p. 216.) hispid and prickly; prickles straight; leaflets 5, unarmed, ovate, doubly serrated, ciliated, clothed with glaucous pubescence beneath; flowers solitary; peduncles angular; fruit turbinate, oblong, nearly smooth.  $\frac{1}{2}$ . H. Native of Maryland, on the banks of the Potowmack river. Flowers purple, fragrant.

*Var. β, amœna* (Rafin. l. c.) flowers double.

*River-bank Rose.* Shrub.

179 *R. DASYSTEMA* (Rafin. l. c. 5. p. 219.) stems nearly unarmed, villous; leaflets 5-7, oval or obovate, serrated, velvety beneath; flowers solitary; sepals simple; fruit oblong, hispid.  $\frac{1}{2}$ . H. Native of North America.

*Thick-stemmed Rose.* Shrub.

180 *R. WAITZIANA* (Tratt. ros. 1. p. 57.) fruit ovate, glabrous, scarlet; sepals appendiculate, bristly on the back; peduncles hispid; leaflets roundish-ovate, simply serrated; scentless, glabrous; floriferous branches glandular and prickly; prickles hooked.  $\frac{1}{2}$ . H. Native of Saxony, near Altenburgh.

*Waitz's Rose.* Shrub.

181 *R. RUBRISPINA* (Bosc. dict. ex Poir. suppl. 4. p. 615. and Tratt. ros. 2. p. 179.) fruit prickly, nearly globose; leaflets 5-7, elliptic, obtuse, glabrous, serrated; branches and peduncles furnished with small straight prickles; flowers usually solitary; sepals beset with glandular hairs on the edges.  $\frac{1}{2}$ . H. Native of North America.

*Red-spined Rose.* Shrub.

182 *R. SICULA* (Tratt. ros. 2. p. 68.) fruit globose, and are as well as the peduncles glabrous and unarmed; leaflets orbicular, sharply and doubly serrated, with the teeth all glandular at the apex; petioles clothed with glandular villi; stems prickly; prickles subverticillate.  $\frac{1}{2}$ . H. Native of Sicily, on the tops of the Nebrodes.

*Sicilian Rose.* Shrub.

183 *R. FRAXINIFOLIA* (Andr. ros. fasc. 33. ex Tratt. ros. 2. p. 100.) stem glabrous, nearly unarmed; germens oblong; peduncles glabrous; petioles prickly; leaflets rough, oblong, narrow, acute, serrated; flowers white, sweet-scented; inner petals small and flexuous.  $\frac{1}{2}$ . H. Native country unknown. Perhaps a variety of *R. sempervirens*.

*Ash-leaved Rose.* Shrub.

184 *R. HECKELIANA* (Tratt. ros. 2. p. 85.) fruit globose, glabrous, muricated; peduncles very short, tomentose; leaflets orbicular, doubly toothed, clothed with hoary tomentum on both sides as well as the stipulas, and ciliated with glands; very blunt at the apex; stems prickly; prickles somewhat verticillate.  $\frac{1}{2}$ . H. Native of Sicily, on the Nebrodes.

*Heckel's Rose.* Shrub.

185 *R. ERUBESCENS* (Andr. ros. fasc. 30. ex Tratt. ros. 1. p. 119.) fruit ovate, and are as well as the peduncles clothed with glandular bristles; sepals oblong, entire, glabrous; petioles rather prickly; leaflets ovate, acute, unequally serrated, discoloured; cauline prickles scattered and solitary, some straight and setaceous, and others large, recurved, and dilated at the base, dark purple.  $\frac{1}{2}$ . H. Native country unknown.

*Reddish Rose.* Shrub.

186 *R. INCA'NA* (Kit. ex Tratt. ros. 1. p. 135.) fruit and peduncles glabrous; cauline prickles recurved; petioles almost unarmed, and are, as well as the leaves, villously tomentose.  $\frac{1}{2}$ . H. Native of Hungary.

*Hoary Rose.* Shrub.

187 *R. CLUSIANA* (Waitz, ex Tratt. ros. 1. p. 119.) fruit nearly globose, glabrous; sepals appendiculate, and are, as well

as the peduncles, hispid; petioles villous, glandular, rather prickly; leaflets sweet-scented, ovate-lanceolate, simply serrated, pubescent beneath; stipulas quite entire; stem and branches unarmed.  $\frac{1}{2}$ . H. Native country unknown. *Rosa sine spinis*, Clus. hist. 1. p. 115. f. 1. Perhaps a variety of *R. Gállica*.

*Clusius's Rose.* Shrub 2 to 3 feet.

188 *R. GLABRA* (Andr. ros. fasc. 21.) fruit ovate; petioles and peduncles hispid; flowers of many equal petals; leaflets oblong, acuminate, serrated, glabrous; stem glabrous, nearly unarmed.  $\frac{1}{2}$ . H. Native country unknown. Size and form of *R. centifolia pomponia*. Leaves like those of *R. moschata*, but the plant altogether is more nearly allied to *R. cinnamomea* ex Tratt. ros.

*Glabrous Rose.* Shrub 4 to 6 feet.

189 *R. SPRENGELIANA* (Tratt. ros. 2. p. 163.) nearly unarmed; fruit globose, hispid; peduncles smoothish; petioles villous; leaflets oblong, serrated at the apex, pubescent beneath; branches nearly unarmed; prickles very few and straight; flowers sessile, aggregate.  $\frac{1}{2}$ . H. Native country unknown. *R. Virgínica*, Curt. ex Spreng. nov. prov. p. 36. no. 80.

*Sprengel's Rose.* Shrub.

190 *R. PORTENSCHLAGIANA* (Tratt. ros. 2. p. 203.) germens ovate, glabrous, coloured; peduncles very short, and are, as well as the petioles, prickly and glandular; sepals coloured, subulate, pinnatifid, one-half shorter than the petals; flowers alternate, solitary, large; stem unarmed.  $\frac{1}{2}$ . H. Native country unknown. Flowers rose-coloured.

*Portenschlag's Rose.* Shrub.

191 *R. WULFENI* (Tratt. ros. 1. p. 200.) fruit nearly globose, coloured, glabrous; peduncles solitary, short, clothed with glandular bristles; leaflets elliptic, somewhat doubly serrated; stipulas biauriculate; branches and petioles very prickly.  $\frac{1}{2}$ . H. Native of Germany.

*Var. β, rubra* (Tratt. ros. 1. p. 201.) leaves smaller; leaflets ciliated with glands; fruit ovate-oblong; petals deep rose-coloured.  $\frac{1}{2}$ . H. Native of Carinthia, on mount Nanus. Leaves, branches, and calyxes red.

*Wulfen's Rose.* Shrub.

192 *R. TRICHOCARPA* (Waitz, ex Tratt. ros. 2. p. 15.) fruit oblong; sepals appendiculate, and are, as well as the peduncles, hispid; petioles glandular and prickly; leaflets sweet-scented, ovate-lanceolate, simply serrated, glabrous on both surfaces; stem and branches very glabrous and prickly; prickles hooked, equal; stigmas sessile.  $\frac{1}{2}$ . H. Native country unknown. Perhaps a variety of *R. álba*.

*Hairy-fruited Rose.* Shrub 4 to 6 feet.

193 *R. CONCAVIFOLIA* (Waitz, ex Tratt. ros. 2. p. 66.) fruit ovate, glabrous; sepals appendiculate, hairy, glandless; peduncles hispid; petioles glandular, prickly; leaves sweet-scented, ovate, doubly serrated, pubescent on both surfaces; stipulas with glandular edges; flowers subcorymbose.  $\frac{1}{2}$ . H. Native country unknown.

*Concave-leaved Rose.* Shrub.

194 *R. ELLIPTICA* (Tausch, ex Tratt. ros. 2. p. 69.) fruit ovate, and are, as well as the peduncles, glabrous; leaflets elliptic, unequally and glandularly serrated, quite entire at the base, glaucescent, and beset with glandular pili; prickles reflexed, stipular.  $\frac{1}{2}$ . H. Native of Bohemia. *R. rubiginosa*, Guimpel, deutsch. Holzart. 1. p. 121. t. 91. Fruit blood-coloured.

*Elliptic-leaved Rose.* Shrub.

195 *R. MAUSCHII* (Schultes in œstr. fl. ed. 2. vol. 2. p. 69. ex Tratt. ros. 2. p. 218.) fruit nearly globose, and are, as well as the peduncles, glabrous; petioles beset with glandular bristles; stem prickles scattered, a little recurved; leaflets almost

glabrous.  $\frac{1}{2}$ . H. Native country unknown. Nearly allied to *R. rubiginosa* ex Tratt. l. c.

*Mauksch's Rose.* Shrub.

196 *R. ANDRÉWSII* (Tratt. ros. 2. p. 205.) fruit elliptic, glabrous; sepals oblong, quite entire, glabrous; peduncles and petioles hispid; stem unarmed; leaflets somewhat doubly serrated, glabrous, glaucescent beneath; flowers lateral, solitary, deep purple, drooping; fruit pendulous.  $\frac{1}{2}$ . H. Native country unknown. *R. inermis*, Andr. ros. fasc. 2. Very nearly allied to *R. alpina*.

*Var.  $\beta$ , débilis* (Tratt. l. c. p. 206.) stems weak, decumbent; leaflets small, nearly like those of *R. spinosissima*; flowers large, twin, very beautiful, between scarlet and blood-coloured.

*Andrews's Rose.* Shrub 2 to 3 feet.

197 *R. SERAFINII* (Viviani, add. fl. ital. fragm. and fl. libye. p. 67. fl. cors. spec. nov. 8.) germens oblong, and are, as well as the peduncles, glabrous; stem and petioles prickly; prickles recurved, falcate; stipulas ovate; leaflets roundish, doubly serrated, with the teeth glandular.  $\frac{1}{2}$ . H. Native of Corsica, on mount Coscione.

*Serafin's Rose.* Shrub 4 to 6 feet.

198 *R. GLABRATA* (Vest, ex Tratt. ros. 2. p. 220.) fruit large, solitary, nearly globose; peduncles very short; leaflets roundish-elliptic, decurrent at the base, doubly serrated, quite glabrous on both surfaces, with glandular margins; prickles scattered, usually twin.  $\frac{1}{2}$ . H. Native of Styria. Allied to *R. pimpinellifolia*.

*Smoothish Rose.* Shrub 3 to 4 feet.

199 *R. SIMPLEX* (Scop. fl. carn. ed. 2. vol. 1. p. 353. ex Tratt. ros. p. 229.) fruit ovate, glabrous; leaflets glabrous beneath; sepals beset with glandular bristles.  $\frac{1}{2}$ . H. Native country unknown. *R. Scopoliæna*, Tratt. l. c. Allied to *R. alpina* or *cinnamomea*.

*Simple Rose.* Shrub 4 to 6 feet.

200 *R. ORIENTALIS* (Dupont in litt. D. C. prod. 2. p. 607.) dwarf; stem prickly, glabrous; prickles conical, slender; young branches puberulous; leaflets roundish, tomentose, serrate-crenated; fruit globose, hispid; peduncles tomentose and hispid; sepals nearly entire.  $\frac{1}{2}$ . H. Native of Persia.

*Var.  $\alpha$ , Oliveriæna* (Ser. in D. C. prod. 2. p. 607.) leaflets very veiny and smoothish beneath; peduncles puberulous, but not glandular; fruit glabrous, hispid.  $\frac{1}{2}$ . H. Native of Persia.

*Var.  $\beta$ , Balbisiæna* (Ser. l. c.) leaflets hardly veiny, puberulous beneath; peduncles tomentose and hispid; tube of calyx very hispid and glandular.  $\frac{1}{2}$ . H.

*Oriental Rose.* Fl. June, July. Shrub 2 to 3 feet.

201 *R. VENTENATIANA* (Red. ros. 3. p. 83. with a figure,) cauline prickles unequal, crowded, straight; germ finger-shaped, beset with glandular bristles at the base, as well as the peduncles; flowers nearly sessile.  $\frac{1}{2}$ . H. Native country unknown.

*Ventenat's Rose.* Fl. June, July. Shrub.

202 *R. CANESCENS* (Krok. fl. siles. 2. p. 153. no. 784. ex Tratt. ros. 2. p. 226.) fruit nearly globose, and are hispid, as well as the peduncles; leaflets lanceolate, glabrous on both surfaces, discoloured, simply serrated; principal stem nearly unarmed, caescent; branches prickly and very hispid; stipulas adnate, very long.  $\frac{1}{2}$ . H. Native of Silesia.

*Canescent Rose.* Shrub 4 to 6 feet.

203 *R. KROKÆRI* (Tratt. ros. 2. p. 231.) fruit globose, and are, as well as the peduncles, glabrous and unarmed; leaflets usually 3, elliptic, obtuse, serrated at the apex, clothed with hoary tomentum beneath; petioles short, involucreted, stipulate; stem 1-flowered.  $\frac{1}{2}$ . H. Native of Silesia. *R. pygmæa*, Krok. fl. siles. 2. p. 154. in a note.

*Kroker's Rose.* Shrub 1 to 2 feet.

204 *R. AMBIGUA* (Lejeune. rev. fl. spa. p. 98.) fruit egg-shaped, glabrous, furnished with a few stalked glands; peduncles glabrous, rarely glandular; leaflets glabrous on both surfaces, doubly serrated, acuminate; bractæas and petioles glandularly ciliated.  $\frac{1}{2}$ . H. Native about Verviers. Perhaps a variety of *R. canina*.

*Ambiguous Rose.* Shrub 5 to 6 feet.

205 *R. SYLVATICA* (Tausch, in fl. vol. 2. p. 161. ex Tratt. ros. 1. p. 58.) fruit ovate, and are, as well as the peduncles, hispid; flowers cymose; petioles beset with glandular pili and prickles; leaflets ovate, acute, unequally and deeply glandularly serrated, pilose beneath; stems bristly or prickly.  $\frac{1}{2}$ . H. Native of Bohemia, in shady places.

*Wood Rose.* Shrub 4 to 6 feet.

*History.*—The rose is known by every body at first sight, and has been a favourite flower from time immemorial among the civilized nations of Europe and Asia. The shrub varies in size in different species and varieties, and the colours are red, white, purple, yellow, black, striped, or in almost numberless shades and mixtures, from single to semidouble and double. Roses are cultivated in every garden, from the most humble cottage upwards. Some species, as *R. centifolia*, *R. damascena*, &c. are also cultivated on a large scale by commercial gardeners for distilling rose-water, and for making attar or essential oil of roses. Six pounds of rose petals will impregnate by distillation a gallon of water strongly with its odour; but a hundred pounds afford hardly half an ounce of attar. The rose is also used in medicine. Botanists are not agreed as to the number of original species of this genus, and notwithstanding the labours of many scientific men the genus still remains a chaos, from which it can never be extricated. We have endeavoured in the foregoing pages to render the species as clear as it is practicable from the present knowledge of the genus. The most scientific work which has appeared upon the subject in England is the "*Rosarum Monographia*," of John Lindley, 1819; and Miss Lawrence has published about ninety plates of "*A Collection of Roses from Nature*," 1810. In France Guillemeau has published "*Histoire Naturelle de la Rose*," 1800, and P. J. Redoute and C. A. Thory have published a splendid work in folio, entitled "*Les Roses*," containing plates of both species and varieties. C. A. Thory has published a separate tract on the culture of roses, entitled "*Prodrome de la Monographie du genre Rosier*," &c. 1820. M. A. Pronville a "*Nomenclature Raisonnée*," in 1818. J. Sabine has given an account of Scotch roses in Hort. trans. 4. p. 231. Many varieties of the rose are yearly raised from seeds in the nurseries.

*Varieties* are raised from seed on the continent, where the seed ripens better than in this country. A number of varieties have also been raised in this country, especially of the *R. spinosissima* or *Scotch-rose*. New varieties are raised in France and Italy annually. L. Villaresi, royal gardener at Monza, has raised upwards of 50 varieties of *R. Indica*, some of them are quite black, others shaped like a ranunculus, and many of them highly odoriferous. Ample lists of the varieties are given under their proper species.

*Propagation.*—By seed for new varieties, and chiefly by layers for continuing approved sorts. They are also increased by budding, cuttings, and suckers.

*By seed.*—The hips containing the seeds are obtained from semidouble and single flowers, and to increase the chance of new varieties, these should be taken from plants that have been planted among or near to the kinds of which a cross is desired. Extracting the stamens from one flower, and dusting the stigmas with the pollen of another kind, might answer in most

instances. In France and Italy the usual mode is to form a plantation of double and semidouble sorts, mixed indiscriminately, and take the result of promiscuous impregnation; it is also done in some of the nurseries of this country. The hips generally ripen in October or November. The seeds do not vegetate till the second season after sowing. The first year, instead of sowing them, they may be preserved among sand, or the hips entire may be so preserved a full year, when the husks will be perfectly rotten, and the seed being separated and sown in February will come up in May or June following. The seeds should be sown in soft soil, and in a shady situation, or they may be covered with earth from a  $\frac{1}{4}$  to  $\frac{1}{2}$  an inch, according to the size of the seeds. Early in the second spring they may be planted in rows a foot or 2 feet apart every way, according to the size of the sorts. Here they may remain till they flower, which varies in the different sorts from the third to the fifth year, but most commonly they flower the fourth summer.

*By layers.*—The common mode is to lay down the young shoots of the preceding summer late in autumn or early in the succeeding spring, and then, with the exception of the *moss-rose*, and one or two others, they form rooted plants by the next autumn. But it is now found, that if the same shoots are laid down when the plant is beginning to flower in July, they will, with a few exceptions, produce roots, and be fit to remove the same autumn, by which a whole year is gained. Such sorts as do not root in one year must be left on the stools till the second autumn; but layers made when the shoot is in a growing state, and furnished with healthy leaves, root much more freely than shoots of ripe wood. After the plants are removed from the stools they are planted in nursery rows, and in a year the blossom buds, having been carefully pinched off from the first laying down, they will be fit for removal to their final destination. The stools are then to be pruned, and the soil stirred and enriched.

*By suckers.*—Many of the commoner sorts admit of being rapidly multiplied in this way, and the plants obtained may be planted in their final destination at once.

*By cuttings.*—Most sorts might be propagated in this way from cuttings of young wood, cut at a joint where it is beginning to ripen, and planted in sand and vegetable mould under a hand-glass. But this mode is only adopted with such sorts as strike easily, as the Indian and Chinese kinds.

*By budding.*—This mode of propagating roses is adopted only with the rarer kinds, and such as are difficult to propagate by layers; for it is found that plants so originated, even though on stocks of the hardier sorts, are less durable than such as are raised by any of the other modes. But the chief use of budding in the culture of the *rose* is to produce standard-roses, or to produce several sorts from the same tree or bush. Standard-roses are a modern invention, it is generally supposed of the Dutch, first carried to Paris, and about 30 years ago to England. They are highly artificial objects of great beauty, and form magnificent ornaments to parterres and borders. The stocks are either of the tree rose, *Rosa villosa*, or of any sorts of wild roses, which grow to a large size. They are budded at different heights, from 3 to 7 feet, but commonly between 5 and 6 from the ground. A stock in the Paris garden, which carries several sorts, has a naked stem of nearly 15 feet high, and there are others at Malmaison and at Grand Trianon of equal height. The stocks are procured from woods and copses, and after being planted in nursery lines are often budded the same summer, sometimes in summer by the scalope mode of budding, *l'œil puissant* of the French; and never later than the succeeding spring or summer by the common mode. Generally two buds are inserted on opposite sides of the stock, but often 3-4 or a dozen in

alternate positions on the upper 6 or 12 inches of the stem. Every stock is supported by a rod, which should reach a foot or eighteen inches higher than the situation of the bud; to this rod the stock is tied, and afterwards the shoots from the buds, which are otherwise liable to be blown out by high winds. The Paris nurserymen being supplied with stronger stocks than can readily be procured in England, and having a better climate and more experience in the culture of roses, excel us in this department of *rose* propagation, and their standards afford an article of commerce with other countries. Their common plants raised by layers are also in extensive demand, but in these we equal if not surpass them. Fine collections of standard roses may be seen in Lee's nursery at Hammersmith, in the Count de Vande's garden at Bayswater, in the duchess of Dorset's at Knowle, and in various other places.

*Final situation.*—No species of *rose*, wild or cultivated, thrives well in or near large towns, on account of the smoke or confined air. The yellow and Austrian roses, *R. lutea* and *R. bicolor* are difficult to flower in any situation. Roses are generally planted in the front of shrubberies and in borders; they are also planted by themselves in rose gardens or rosaries, in groups on lawn or gravel, either with common box or other edgings, or with edgings of wire, in imitation of basket-work; these last are called baskets of roses; the ground inclosed in the basket margin is made convex, so as to present a greater surface to the eye, and increase the illusion; the shoots of the stronger sorts are layered or kept down by pegs till they strike root, so that the points of the shoots furnished with buds appear only above the soil, which is sometimes covered with moss or small shells; under this treatment the whole surface of the basket becomes in two or three years covered with rose-buds and leaves, of one or of various sorts. Where one of the larger free growing sorts is employed, as the *moss rose*, or any of the Provins' varieties, one plant may be trained so as to cover a surface of many square yards. Where different sorts are introduced in the same basket, they should be as much as possible assimilated in size of leaves and flowers and habits of growth, and as different as possible in the colours of their flowers. By mixing small-flowered with large-flowered sorts, the beauty of the former is lost without adding to the effect of the latter. In rosaries commonly but one plant of a sort is introduced, and the varieties which most resemble each other are placed together, by which their distinctive differences are better seen. Particular compartments are often devoted to one species, as the *Scotch*, *Chinese*, *yellow*, *burnet-leaved*, &c. which has an excellent effect, sometimes a piece of rock-work in the centre is covered with creeping roses, and on other occasions they are trained to trellis-work, which forms a fence or hedge of roses round the whole. In this hedge standard roses are sometimes introduced at regular distances; a grove of standards is also frequently formed in the centre of the rosary, and sometimes they are introduced here and there in the beds. Standard roses, however, have certainly the best effect in flower borders, or when completely detached on a lawn; their sameness of form, and that form very compact and bushy, prevents them from grouping well, either among themselves or with other objects. Their beauty consists in their singularity, as *rose* plants, and in their flowers; and therefore to display these beauties to the best advantage, they require to be seen singly, or in succession. This is the case where they occur as single objects on a lawn, or in the centre, or here and there among groups of flowers, or in lines or avenues along flower-walks.

*Soil.*—Most species of the *rose*, in their wild state, grow in sandy and rather poor soil, excepting such as are natives of woods, where the soil is richer and comparatively moist. But

all the cultivated roses, and especially the double flowering kinds, require a rich loamy soil, inclining to clay rather than sand, and they require also, like most double flowers, plenty of moisture when in a growing state.

*General culture.*—To produce strong flowering roses requires some attention in pruning; old wood should be yearly cut out, and the young shoots thinned and shortened, according to their strength, and whether number or magnitude of flowers be wanted. Those sorts which throw out numerous suckers, should be taken up every three or four years, reduced, and replanted, and most sorts, excepting the standards, will be improved by the practice, provided attention be paid to remove a part of the old soil and replace it by new. The points of the shoots of the more delicate sorts of roses are very apt to die when pruning is performed in winter or spring; to avoid the consequences of this evil, many give a second pruning in June, or do not prune the tender sorts at all till the beginning of that month. A very good time for performing the operation is immediately after the bloom is over, cutting out old exhausted wood, shortening shoots which have flowered, to a good bud, accompanied with a healthy leaf, but leaving such shoots as are still in a growing state till October. Where very large roses are wanted, all the buds, except on that of the extreme point of each shoot, should be pinched off as soon as they make their appearance, and the plant liberally supplied with water. To lessen evaporation, and keep up a constant moisture at the roots of their roses, the Paris gardeners generally mulch them with half rotten stable dung or partially rotten leaves.

*Forwarding and retarding roses.*—The earliest flowering rose is the *monthly*, which in mild seasons and planted against a wall, will sometimes flower in the beginning of April; the roses next in succession are the *cinnamon*, which flowers in May, the *damask*, in the end of May or beginning of June; the *blush*, *York*, and *Laurel*, *Provins*, and *Dutch hundred-leaved*, in June, July, and August. The *Virginia* and *musk roses* are the latest European sorts; they flower in September, and in shaded situations will sometimes continue in bloom till the middle of October; but the earliest rose (the *monthly*), is also the latest, and generally continues flowering till interrupted by frost. The earliest sorts may be materially forwarded by being planted against a south wall, and if portable sashes be placed before them, and the wall is either flued or heated by fires, or a lining of dung placed behind, the plants may be brought to flower in February or March. The *monthly rose*, being protected by glass in autumn, or aided by artificial heat, may be continued in bloom till Christmas. A very common mode of obtaining late roses, and one of the greatest antiquity, is by cutting all the flower shoots off when the buds begin to appear, or by rubbing off all the rudiments of shoots of every kind early in the spring; a second crop is in consequence produced, which will not be in a state to bloom before the autumn.

*Forcing the rose.*—The best sorts for this purpose are the common and *moss Provence*. The Indian sorts force well, or rather in stoves continue in bloom all the year; but the commoner varieties not being fragrant, they are in less repute than the European roses. Rose plants should be a year in pots previously to the autumn when it is intended to force them; they should be planted in pots 6 or 8 inches in diameter, in rich loam, and plunged in an open airy situation, their flower-buds pinched off as they appear, and the plants put into a state of rest, by excluding the sun and rain, but not a free circulation of air. Abercrombie says, "There is no certainty of obtaining a fine blow of roses in the depth of winter by the most expensive artifices of forcing; and yet fine flowers may be produced early in the spring by any ordinary stove, put in operation in December. When the plants are first introduced, keep the air of the

house about 55°, never letting it fluctuate to more than 2 or 3 degrees below the above. In the second week, aim at 60° as the standard; in the third week 65°. When a month has nearly elapsed, begin to increase the heat gradually to 70°, having brought it to this standard, let it afterwards exceed it from 3 to 5 degrees rather than sink below. A succession may be kept up by introducing some pots every 8 or 10 days.

*Insects.*—All the species of *Rosa* are very liable to the attacks of insects, especially of the aphides; some, particularly the briar and Scotch rose, are attacked by the cynips *rosæ*, which by puncturing the bark, occasions the production of rose-galls, and of those massy tufts often seen on wild roses, which were formerly known under the name of *bedequer*, and used in medicine. A great number of insects seem fond of the flowers of roses, from the earwig to the seemingly harmless lady-bird, which deposits its larvæ in the leaves of various species, both wild and cultivated. There seems no remedy for insects on plants in the open air so simple and effectual as gathering them by hand, or removing the leaf or that part of the shoot which is infected by them. Under cover tobacco smoke will prove an effectual remedy for the aphides; but the larvæ of many others, and especially of the tipula, and the tenthredinidæ, which occasion the wrapping up and shrivelling of the leaves, can only be removed by hand.

† A genus allied to *Rosaceæ*.

XXIII. AMOREUXIA (this genus is dedicated by Sesse and Mocino to P. J. Amoreux, a botanist of Montpellier). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 638. Genus nova, Ruiz. et Pav. in herb. Lamb.

*Lin. syst.* *Icosándria*, *Monogýnia*. Calyx 5-parted, with a short tube, and oblong, acute lobes. Petals 5, obtuse and emarginate at the apex, larger than the calyx, and inserted in its base. Stamens about 20, disposed in one series, shorter than the petals. Ovary ovate, free, 3-celled, many-ovulate. Style filiform, acute. Capsule ovate.—A herb, with alternate, bistipulate, palmatifid leaves on long petioles, having the lobes serrated at the apex, and joined together at the base by a foliaceous membrane. Peduncles solitary, opposite the leaves, or nearly terminal, 1-flowered, inflexed at the apex. Flowers large, red.—Habit of *Neuráda* or *Drýas*, but the characters are not sufficiently known to determine which of the genera it comes nearest.

1 A. PALMATÍFIDA (Moc. et Sesse, fl. mex. icon. ined.). 2. ? G. Native of Mexico.

*Palmatifid-leaved Amoreuxia.* Pl. trailing.

*Cult.* A mixture of loam, sand, and peat, will probably suit this plant, and cuttings will perhaps root if planted in sand or mould, with a hand-glass placed over them.

ORDER LXXXIV. SANGUISORBEÆ (plants agreeing with *Sanguisorba* in important characters). Lindl. introd. nat. ord. p. 80. Rosaceæ, Tribe VI. Sanguisorbeæ, Juss. gen. p. 336. exclusive of some genera. D. C. prod. 2. p. 588.

Flowers usually unisexual from abortion. Calyx with a thickened tube (f. 78. a.) and a 3 (f. 80. a.) -4 (f. 79. b. f. 77. b.) -5-lobed limb, its tube lined with the disk. Petals none. Stamens definite, sometimes fewer than the segments of the calyx, with which they are alternate, arising from the orifice of the calyx; anthers 2-celled, innate, bursting longitudinally, occasionally 1-celled, and bursting transversely. Ovary solitary, simple, with the style proceeding from the apex at the base. Ovulum solitary, always attached to that part of the ovaries which is next the base of the style. Stigma compound or

simple. Nut solitary, inclosed in the often-indurated tube of the calyx. Seeds solitary, suspended, or ascending, exalbuminous. Embryo with a superior radicle, and large plano-convex cotyledons.—Herbaceous plants or under shrubs, occasionally spiny. Leaves simple, lobed, or pinnate, alternate, furnished with stipulas. Flowers small, usually capitate. This order differs from *Rosaceæ* in the apetalous flowers and indurated calyx, and the reduction of the carpella to one only. Their general character is astringency. A decoction of *Alchemilla vulgaris* is slightly tonic. *Sanguisorba* is useful as fodder.

*Synopsis of the genera.*

1 CERCOARPUS. Calyx coloured, with a cylindrical permanent tube, and a sinuately 5-lobed, deciduous limb. Stamens 20, inserted in the limb of the calyx. Carpel ending in a plumose style.

2 ALCHEMILLA. Calyx tubular, contracted at the throat, with an 8-parted limb (f. 77. b.). Stamens 1-4. Carpella 1-2. Style filiform, capitate at the apex.

3 CEPHALOTUS. Calyx coloured, 6-cleft (f. 78. b.). Stamens 12 (f. 78. c.). Anthers didymous (f. 78. c.), glandular on the back. Ovaries 6 (f. 78. d. h.), distinct. Styles terminal (f. 78. i.). Akenia 1-seeded.

4 MARGYRICARPUS. Calyx with the tube contracted at the mouth, the limb 4-5-parted, each segment furnished with a tooth-formed spinula on the outside at the base. Stigma feathery. Carpel 1, drupaceous.

5 POLYLEPIS. Calyx with a turbinate angular tube, and a 3-4-cleft limb, furnished with spine-formed teeth above. Stamens 5-20. Stigma pencilled. Carpel drupaceous.

6 ACÆSA. Calyx tubular, armed with glochidate prickles, and furnished with 2 scales at the base. Stamens 2-10. Carpels 1-2, dry. Stigma plumose.

7 SANGUISORBA. Flowers hermaphrodite. Calyx 4-cleft, propped by 2 scales at the base. Stamens 4. Carpels 2. Stigma pencil-formed. Akenia dry.

8 POTERICUM. Flowers monoecious or polygamous. Calyx furnished with 3 scales at the base (f. 79. a.); the limb 4-parted (f. 79. b.). Stamens 20-30. Stigma pencil-formed. Akenia 2, dry.

9 CLIFFORTIA. Flowers dioecious. Calyx with an urceolate tube and a 3-parted (f. 80. a.) limb. Stamens about 30. Stigma plumose. Akenia 1-2.

I. CERCOARPUS (from *κερκος*, *kerkos*, a shuttlecock, and *καρπος*, *karp s*, a fruit; in reference to the shape of the fruit). H. B. et Kunth, nov. gen. amer. 6. p. 232.—Bertolonia, Moc. et Sesse, fl. mex. icon. ined.

LIN. SYST. *Icosandria, Monogynia*. Calyx coloured, with a cylindrical permanent tube, and a sinuately 5-lobed deciduous limb, with the throat open. Petals wanting. Stamens 20, inserted in the limb of the calyx. Carpel 1, free. Fruit membranous, tailed by the plumose permanent style, 1-seeded, involved by the calyx.—A tree, with alternate, entire leaves, furnished with 2 petiolar stipulas; and axillary umbellate fascicles of flowers.

1 C. FOTHERGILLOIDES (H. B. et Kunth, l. c. t. 559.) h. G. Native near the town of Mexico. Bertolonia guieroides, Moc. et Sesse, fl. mex. icon. ined. Leaves nearly elliptic, coriaceous, glabrous. Calyx clothed with silky down.

*Fothergilla-like Cercocarpus*. Tree 12 feet.

*Cult.* A mixture of peat and loam will suit this tree, and cuttings will root if planted in a pot of sand, with a hand-glass placed over them.

II. ALCHEMILLA (*Alkemelych* the Arabic name of one of the species). Tourn. inst. t. 289. D. C. prod. 2. p. 589.—Alchemilla and Aphanes, Lin. gen. no. 165. and 166. Lam. ill. t. 86. and 87.

LIN. SYST. *Di-Tetrándria, Mono-Digýnia*. Calyx tubular (f. 77. c.), with the tube rather contracted at the apex; and with an 8-parted (f. 77. b.) limb, the alternate lobes or bracteoles the smallest (f. 77. b.), sometimes very small and tooth-formed. Petals wanting. Stamens 1-4. Styles lateral, filiform, capitate at the apex. Carpels 1-2, 1-seeded, at length becoming dry and indurated. Seed inverted. Herbs with palmate or lobed leaves. Flowers small, corymbose.

SECT. I. ALCHEMILLA (see genus for derivation). Lin. gen. no. 165. Calyx 8-cleft (f. 77. b.), alternate lobes smallest (f. 77. b.). Stamens 2-4. Perennial plants.

\* *Leaves palmately 7-9-cleft.*

1 A. CAPE'NSIS (Thunb. fl. cap. 1. p. 558.) leaves reniform, somewhat lobed, repandly crenated, and are as well as the stems hairy; racemes axillary and terminal. h. G. Native of the Cape of Good Hope, on the sides of hills and mountains. Lam. ill. t. 86. f. 2.

*Cape Lady's-mantle*. Pl.  $\frac{1}{2}$  foot.

2 A. VULGARIS (Lin. spec. 178.) leaves roundish, reniform, plicate, concave, 9-lobed, serrated; stem and petioles smoothish; flowers disposed in dichotomous corymbs.  $\mathcal{A}$ . II. Native of Europe and Siberia, in woods and pastures frequent; plentiful in some parts of Britain. Oed. fl. dan. 963. Smith, engl. bot. t. 597. Mill. fig. t. 18. f. 2. This plant varies much in hairiness and smoothness, as well as in size and stature. Stipulas cut. The whole plant is astringent and slightly tonic. The leaves were formerly used in medicine, and were esteemed to be vulnerary.

*Var.  $\beta$ , glabra* (D. C. fl. fr. 4. p. 451.) leaves and flowers glabrous; teeth of leaves furnished with a tuft of hairs at the apex.  $\mathcal{A}$ . II. Native of the Alps and the higher Pyrenees, in humid places. A. Pyrenæica, ex Dufour, ann. gen. sc. phys. 8. p. 228. A. lobata, Pall. itin. 2. p. 569.

*Common Lady's-mantle*. Fl. Ju. Aug. Brit. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  ft.

3 A. HYBRIDA (Hoffm. germ. 1. p. 79.) leaves roundish-reniform, 9-lobed, serrated, clothed with pubescence; stem and petioles downy; flowers fastigiate-glomerate.  $\mathcal{A}$ . H. Native of Europe, in mountain pastures; in Scotland, on the Seedlaw hills, Angusshire. A. alpina hybrida, Lin. spec. 179. A. vulgaris hybrida, Willd. spec. 1. p. 698. Mill. fig. t. 18. f. 1. A. pubescens, Lam. ill. no. 1403. but not of Bieb. A. montana, Willd. enumer. 1. p. 190. Wallr. ann. bot. p. 26.—Pluk. phyt. 240. f. 2. Stipulas serrated.

*Hybrid Lady's-mantle*. Fl. June, Aug. Scotl. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  ft.

4 A. PUBESCENS (Bieb. fl. taur. 1. p. 114.) leaves roundish-reniform, 7-lobed, toothed, silky beneath; corymbs terminal, crowded, clothed with silky villi.  $\mathcal{A}$ . II. Native among rocks on the higher Caucasus. Willd. hort. berl. 2. t. 79.

*Pubescent Lady's-mantle*. Fl. June, Jul. Clt. 1813. Pl.  $\frac{1}{4}$  ft.

**\*\* Leaves palmate; leaflets 5-7, serrated at the apex.**

5 *A. ALPINA* (Lin. spec. 179. var.  $\alpha$ .) leaves digitate; leaflets 5-7, lanceolate-cuneate, obtuse, serrated at the apex, with the serratures adpressed, clothed with white satiny down beneath.  $\mathcal{U}$ . II. Native of Europe and North America, in mountain pastures; in the mountainous parts of the north of England and Scotland, common among rocks on the banks of mountain rivulets. Smith, engl. bot. t. 244. Oed. fl. dan. 49. *A. argentea*, Lam, fl. fr. 3. p. 303. The satiny under side of the leaves of this and the following species has given rise to the generic English name of *Lady's-mantle*.

FIG. 77.

*Alpine Lady's-mantle*. Fl. Jul. Britain. Pl.  $\frac{1}{4}$  foot.

6 *A. SERICEA* (Willd. enum. p. 171.) leaves digitate; leaflets 7, lanceolate-obovate, obtuse, connected at the base, serrated at the apex, clothed with satiny down beneath.  $\mathcal{U}$ . II. Native of Caucasus. *A. alpina*, Bieb. fl. taur. 1. p. 114. exclusive of the synonyms. Much larger in every part than *A. alpina*.

*Silky Lady's-mantle*. Fl. June, Jul. Clt. 1813. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  ft.

**\*\*\* Leaves digitate; leaflets 3-5, multifid, or serrated all round.**

7 *A. PENTAPHYLLA* (Lin. spec. 179.) leaflets 3-5, multifid, glabrous, and rather ciliated; stipulas foliaceous, bi or tridentate at the apex.  $\mathcal{U}$ . II. Native of Europe, on the alps.—Boeckl. mus. p. 18. t. 1. Stems creeping.

*Fine-leafletted Lady's-mantle*. Fl. July. Clt. 1784. Pl. cr.

8 *A. SIBBALDIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 226. t. 561.) leaves deeply 3-parted, clothed with adpressed pubescence beneath; segments deeply serrated, lateral ones bifid; stipulas 2-4-cleft; stems corymbosely many-flowered at the apex; flowers conglomerate, diandrous, and usually digynous.  $\mathcal{U}$ . G. Native between Mexico and Toluco, near Tianguillo, and on Mount Orizaba.

*Sibbaldia-leaved Lady's-mantle*. Fl. July. Clt. 1823. Pl.  $\frac{1}{2}$  ft.

9 *A. APHANODES* (Mutis. in Lin. fil. suppl. 122.) plant smoothish; leaves profoundly 3-parted; segments ciliated, intermediate one trifid, lateral ones bifid; stipulas 2-3-cleft; stems branched, creeping; flowers axillary and terminal, diandrous or tetrandrous and digynous.  $\mathcal{U}$ . G. Native of New Granada. H. B. et Kunth, nov. gen. amer. 6. p. 225.

*Aphanes-like Lady's-mantle*. Pl. creeping.

10 *A. VULCANICA* (Schlecht. et Cham. in Linnaea. 5. p. 573.) pilose; stems flagelliform, trailing; cauline leaves ternate; leaflets cuneate, deeply 5-7-toothed at the apex; stipulas bifid on both sides; flowers axillary, forming small, leafy racemes at the tops of the branches; stamens 2; styles 3.  $\mathcal{U}$ . G. Native of Mexico, on Mount Orizaba.

*Volcanic Lady's-mantle*. Pl. trailing.

11 *A. HIRSUTA* (H. B. et Kunth, l. c.) leaves deeply tripartite, pilose; segments divided in a fan-like manner; stipulas 2-3-cleft; stems racemose, erect, hairy; flowers diandrous and digynous, disposed in glomerate heads.  $\mathcal{U}$ . G. Native of South America.

*Var.  $\alpha$ , campestris* (Schlecht. et Cham. in Linnaea. 5. p. 572.) stems elongated; leaves canescent beneath.  $\mathcal{U}$ . G. Native of Mexico, in grassy places near Jalapa.

*Var.  $\beta$ , alpestris* (Schlecht. et Cham. l. c.) leaves the same colour on both surfaces; stem short.  $\mathcal{U}$ . G. Native of Mexico, on Mount Orizaba.

*Hairy Lady's-mantle*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

12 *A. RUPESTRIS* (H. B. et Kunth, nov. gen. amer. 6. p. 224.) leaves profoundly 3-parted, clothed with silky pili beneath; segments deeply serrated; stipulas entire; stems branched, creeping; flowers somewhat corymbose, diandrous and trigynous.  $\mathcal{U}$ . G. Native of South America, on the burning mountain Ruca-Pichincha, near Quito. Habit of *A. aphanes*.

*Rock Lady's-mantle*. Pl. creeping.

13 *A. NIVALIS* (H. B. et Kunth, l. c. t. 560.) leaves multifid, sheathing, stem-clasping, and imbricating, clothed with silky hairs on the outside; stems tufted; flowers terminal, usually tern, diandrous, and usually tetragynous.  $\mathcal{U}$ . F. Native of the province of Popayan, on the snowy top of Mount Paramo de Puraca.

*Snow Lady's Mantle*. Pl. tufted.

14 *A. TRIPARTITA* (Ruiz. et Pav. fl. per. 1. p. 68.) hairy; stems creeping, filiform, dichotomously branched, leafy above; leaves deeply 3-parted; segments cuneiform, 3-5-cleft; stipulas unequally bifid; petioles sheathing; peduncles dichotomously corymbose; flowers diandrous and digynous.  $\mathcal{U}$ . F. Native of Peru, on the cold tops of mountains, in springs.

*Tripartite-leaved Lady's-mantle*. Pl.  $\frac{1}{4}$  foot.

15 *A. ORBICULATA* (Ruiz et Pav. l. c.) leaves orbicularly reniform, lobed, deeply serrated, glabrous above, and clothed with silvery villi beneath; petioles terete, hairy; peduncles dichotomously corymbose; flowers 8-cleft, diandrous, digynous.  $\mathcal{U}$ . F. Native of Peru, on cold mountains in humid places. *Aphanes orbiculata*, Pers. ench.

*Orbicular-leaved Lady's-mantle*. Pl.  $\frac{1}{4}$  foot.

16 *A. PECTINATA* (H. B. et Kunth, nov. gen. amer. 6. p. 226.) leaves roundish-reniform, 9-11-lobed, pectinately serrated, clothed with silvery silky down beneath; radical leaves many-lobed, on long petioles; stipulas 3-5-cleft; stems dichotomous; flowers 8-10-cleft, diandrous, usually pentagynous.  $\mathcal{U}$ . F. Native of Mexico, near Jalapa, San Andres, and Cruz Blanca.

*Pectinate-leaved Lady's-mantle*. Pl.  $\frac{1}{4}$  foot.

17 *A. PINNATA* (Ruiz et Pav. fl. per. 1. p. 69.) leaves pinnate; leaflets bifid or trifid; radical ones petiolate, cauline ones clasping the stem; stems branched, sarmentose, creeping; flowers diandrous, digynous.  $\mathcal{U}$ . F. Native of Peru, on the high cold humid mountains of Tarma and Panatuhnara. *Aphanes pinnata*, Pers.

*Pinnate-leaved Lady's-mantle*. Pl.  $\frac{1}{4}$  foot.

SECT. II. *A'PHANES* (from *a priv.* and *phaino*, *phaino*, to appear; that is to say, a plant of no appearance, being small, and lying flat on the ground). Lin. gen. no. 166. Calyx 4-cleft, rarely 5-cleft, with small teeth between the lobes. Stamens 1-2, fertile, the rest sterile. Annual plants.

18 *A. ARVENSIS* (Scop. carn. 1. p. 115.) leaves small, hairy, petiolate, 3-parted; segments 2-3-cleft; flowers axillary, glomerate.  $\odot$ . II. Native throughout Europe, in cultivated fields; plentiful in Britain, also of Iberia and Jamaica. Smith, engl. bot. 1011. *Aphanes arvensis*, Lin. spec. 179. Oed. fl. dan. t. 973. *A. aphanes*, Leers. herb. no. 122.

*Corn Parsley-piert*. Fl. April, June. Britain. Pl. prostrate.

19 *A. CORNUCOPIOIDES* (Roem. et Schult. syst. 3. p. 471.) leaves hairy, cut, stem-clasping, almost sessile, 3-parted, with the petiole dilated; segments 2-3-cleft; flowers axillary, glomerate; stipulas cut.  $\odot$ . II. Native about Madrid, in corn-fields. *Aphanes cornucopioides*, Lag. gen. et spec. nov. p. 99. no. 7.

*Cornucopia-like Parsley-Piert*. Pl. prostrate.

*Cult.* The hardy species will grow in any common soil, and are increased by dividing the plants at the root. Those species natives of South America should be grown in small pots, well

drained with sherds, and filled with a mixture of peat and loam, and placed among other alpine plants. They are also to be increased by dividing the plants. The annual species are only weeds, and will grow under any circumstance.

III. CEPHALOTUS (from κεφαλωτος, *kephalotos*, headed; because the filaments of stamens are capitate). Labill. nov. holl. 2. p. 7. t. 145. Brown, gen. rem. p. 68. t. 4. D. C. prod. 2. p. 591.

LIN. SYST. *Dodecándria, Hexagýnia*. Calyx coloured, 6-cleft (f. 78. b.), valvate in aestivation. Petals wanting. Stamens 12 (f. 77. c.), inserted in the calyx. Anthers didymous (f. 77. c.), glandular on the back. Ovaries 6 (f. 78. d. h.), distinct. Styles terminal (f. 78. i.). Akenia 1-seeded. Seed erect.—An almost stemless herb, with the leaves all radical and stalked, some of which are elliptical and flat, and others dilated into the kind of leaves called pitchers (f. 78. e.), which are generally filled with air, which seems as if confined within them by a lid (f. 78. f.), like that of the nepenthes. Scape erect, bearing a panicle of small white flowers at the apex.

1. C. FOLLICULARIS (Labill. l. c.)

2. G. Native of New Holland, on the eastern coast, in marshes. Hook. in bot. mag. vol. 5. new series, with a figure. (f. 78.)

Follicled-leaved Cephalotus or New Holland Pitcher-plant. Fl. June, July. Clt. 1823. Pl. 1 ft.

Cult. This plant grows best in turfy peat soil, either in a box or pot: it should be kept rather moist: for this purpose the pots may be kept in pans of water. If moss is allowed to grow on the surface of the mould it will tend greatly to the health of the plants, or moss may be planted on the surface of the soil around the plants.

There is no known way of increasing the plant except by seed.

IV. MARGYRICARPUS (from μαργαρον, *margaron*, pearl, and καρπος, *karpos*, a fruit; resemblance in white fruit). Ruiz et Pav. fl. per. prod. 7. p. 33. H. B. et Kunth, nov. gen. amer. 6. p. 229.

LIN. SYST. *Decándria, Monogýnia*. Calyx with the tube coracate at the apex, and with a 4-5-parted limb, each segment furnished with a tooth-formed spine on the outside at the base. Petals wanting. Stamens 2. Stigma multifid, feathery. Carpel 1, converted into a roundish 1-seeded drupe. Seed pendulous.—A much branched shrub, with impari-pinnate leaves, subulate leaflets, and axillary sessile flowers.

1. M. SETOSUS (Ruiz et Pav. fl. per. 1. p. 28. t. 8. f. d.) h. G. Native of Brazil, Peru, Chili, Santa Fe de Bogota, Quito, &c. on arid hills. Empetrum pinnatum, Lam. dict. 1. p. 567. Ancistrum barbatum, Lam. ill. 1. p. 77. The leaves are either piliferous or naked at the apex, and therefore *M. setosus* and *M. levis* of Willd. are both referrible to this plant. The fruit is white, with a grateful acid taste. An infusion of the plant is used against hæmorrhages.

Bristly Pearl-fruit. Fl. June, July. Clt. 1829. Sh. 2 to 4 ft.

Cult. This shrub will grow very well in a mixture of sand and peat, and cuttings are easily rooted in the same kind of soil, with a bell-glass over them.

V. POLYLEPIS (from πολυ, *poly*, many, and λεπις, *lepis*, a scale; calyx). Ruiz et Pav. fl. per. prod. p. 34. t. 15. H. B. et Kunth, nov. gen. amer. 6. p. 226. D. C. prod. 2. p. 519.

LIN. SYST. *Penta-Icosándria, Monogýnia*. Calyx permanent, with a turbinate 3-4-angled tube, furnished above with spine-formed teeth; the throat contracted, and the limb 3-4-parted. Petals wanting. Stamens 5-20, inserted in the throat of the calyx. Anthers woolly. Carpel 1. Style filiform. Stigma pencil-formed. Drupe clavate, 3-4-angled, dry, inclosed within the calyx; angles unequal, alternating with the denticulations of the calyx. Seed pendulous.—Shrubs, with compound leaves, and with the stipulas adnate to the petioles. Flowers racemose.

\* *Leaves trifoliate.*

1. P. INCA'NA (H. B. et Kunth, nov. gen. amer. 6. p. 227.) leaflets 3, crenated, clothed with hoary tomentum beneath, as well as the calyx; racemes axillary, few-flowered, about equal in length to the leaves; flowers pentandrous. h. S. Native of South America, on the banks of Rio Blando near Guachual, in the province of De los Pastos.

Hoary Polylepis. Shrub 2 to 3 feet.

2. P. VILLOSA (H. B. et Kunth, l. c. p. 228.) leaflets 3, crenated, clothed with hoary villi beneath, and on the calyxes; racemes many-flowered, exceeding the leaves; flowers usually icosandrous. h. S. Native of Peru, near Caxamarca, where it is called *Quimuar*.

Villous Polylepis. Shrub 12 to 20 feet.

\*\* *Leaves pinnate.*

3. P. LANUGINOSA (H. B. et Kunth, l. c. p. 228.) leaves of 2-4 pairs of nearly entire, rather emarginate leaflets, clothed with silky woolly down beneath, as well as the calyxes; racemes hardly exceeding the leaves. h. S. Native of South America, at the bottom of mount Chimborazo near Calpi. Perhaps sufficiently distinct from the following.

Woolly Polylepis. Shrub 6 to 12 feet.

4. P. RACEMOSA (Ruiz et Pav. syst. 1. p. 139.) leaves impari-pinnate; leaflets obovate or oblong, crenated, emarginate; flowers racemose, icosandrous. h. S. Native of Peru, among broken rocks towards Quimua, Caxamarquilla, and Pillao. De Candolle received a specimen from Bonpland, which he gathered near Caxamarca, and which is referrible to *P. racemosa*, and distinct from *P. lanuginosa* in the leaves bearing 4-6 pairs of distinctly sub-emarginate leaflets, not 2-4, as in that species.

Racemose-flowered Polylepis. Shrub.

Cult. See *Margyricarpus* for culture and propagation.

VI. ACÆNA (from *acava*, *akaina*, a thorn; in reference to the calyx being armed with glochidate bristles). Vahl. enum. 1. p. 273. D. C. prod. 2. p. 592.

LIN. SYST. *Di-Tetrándria, Mono-Digýnia*. Calyx furnished with 2 scales at the base, tubular, usually armed with glochidate bristles; limb 4-parted. Corolla none. Stamens 2-10. Carpels 1-2, dry, 1-seeded, inclosed within the tube of the calyx. Seed pendulous. Styles terminal. Stigma plumose.—Humble evergreen herbs or subshrubs, with impari-pinnate leaves, serrated leaflets, and spicate racemes or heads of small flowers. Anthers large, purple.

SECT. I. EUCÆNA (from *eu*, good, and *acæna*; genuine species). D. C. prod. 2. p. 592.—Acæna, Lin. mant. 200. Jacq. eclog. 1. p. 55. Calyx armed all around with glochidate bristles.

1. A. LAPPA'CEA (Ruiz et Pav. fl. per. 1. p. 66. t. 103. f. a.) flowers racemose, distant, tetrandrous or pentandrous; stem erect; leaflets oblong, serrated. h. F. Native of Peru, on the rocks of Tarma.

Burdock Acæna. Pl.  $\frac{1}{2}$  foot.

leaflets ovate, obtuse, rough above, but soft and hoary beneath; panicle terminal, diffuse; joints of legume small, ovate-globose, pubescent.—Native country unknown. Hedys. asperum, Poir. dict. 6. p. 408.

*Rough Desmodium.* Fl. July, Aug. Clt. 1816. Sh. 1 to 2 ft.

† *Species natives of the same countries, but are not sufficiently known.*

81 D. ? GLABRUM (D. C. prod. 2. p. 338.) stems herbaceous, erect, panicle; leaflets obcordate; legumes lunulate, 1-seeded, glabrous. ☉. H. Native of Campeachy. Hedys. glabrum, Mill. dict. no. 12. Flowers pale purple.

*Glabrous Desmodium.* Pl. 1 foot.

82 D. PORTORICENSIS (Spreng. syst. 3. p. 314. under Hedys.) plant herbaceous, erect; leaflets oblong, obtuse; stipulas subulate, short; panicle terminal, bractless; joints of legume reticulated and pubescent. ♀. S. Native of Porto Rico.

*Porto Rico Desmodium.* Pl. 1 to 2 feet.

83 D. TENELLUM (Spreng. syst. 3. p. 314. under Hedys.) plant herbaceous, procumbent; branches filiform, smooth, as well as the leaves; leaflets ovate, glabrous; stipulas setaceous; racemes terminal. ♀. S. Native of St. Domingo.

*Tender Desmodium.* Pl. procumbent.

84 D. LEOCARPUM; shrubby; leaflets ovate-oblong, obtuse, pubescent beneath; panicle terminal; legumes glabrous, compressed, moniliform. ♀. S. Native of Brazil. Hedys. leio-carpum, Spreng. syst. 3. p. 316.

*Smooth-fruited Desmodium.* Shrub 1 to 2 feet.

85 D. ? VILLOSUM (D. C. prod. 2. p. 338.) stems herbaceous, diffuse, branched, villous; leaflets oval, rather hispid; racemes terminal, rather spicate; calyxes rather villous; joints of legume numerous, usually somewhat 4-horned. ☉. S. Native of Vera Cruz. Hedys. villosum, Mill. dict. no. 9. but not of Willd. Flowers small, pale purple.

*Villous Desmodium.* Pl. diffuse.

86 D. GUIANENSIS (D. C. prod. 2. p. 338.) stem frutescent; leaflets hoary beneath; flowers crowded, racemose; legumes hairy.—Native of French Guiana. Hedys. Guianense, Aubl. guian. 774. without a description.

*Guiana Desmodium.* Pl. 1 to 2 feet.

87 ? D. EMARGINATUM (D. C. prod. 2. p. 338.) stem herbaceous, angular, and rather villous; leaflets ovate, obtuse, glabrous; stipulas ovate-lanceolate; racemes axillary, simple; legumes glabrous, having only one joint, which is emarginate on one side. ♀. S. Native of Martinico. Hedys. emarginatum, Poir. dict. 6. p. 412. Flowers small, yellow.

*Emarginate-jointed Desmodium.* Pl. 1 to 2 feet.

\*\*\*\*\* *Species, native of the Cape of Good Hope.* Hedysarum, Thunb. fl. cap. 594.

88 D. ? CILIATUM (D. C. prod. 2. p. 333.) stem suffrutescent, erect, villous; leaflets ovate, mucronate, pilose on the margins and midrib; stipulas spreading, lanceolate, glabrous; pedicels axillary, 1-flowered, shorter than the leaves; calyx 5-parted. ♀. G. Native of the Cape of Good Hope, in grassy fields. Hedys. ciliatum, Thunb. nov. act. ups. 6. p. 43. t. 2. fl. cap. 594. Perhaps the plant belongs to a different genus: the legume is unknown.

*Ciliated-leafletted Desmodium.* Shrub 1 foot.

89 D. SQUARROSUM (D. C. prod. 2. p. 333.) stem suffrutescent, erect, hairy; leaflets ovate, obtuse, pubescent above, but tomentose and nerved beneath; stipulas lanceolate; flowers disposed in spikes? reflexed; legume 2-jointed, hairy. ♀. G. Native of the Cape of Good Hope, among grass. Hedys. squarrosum, Thunb. l. c.

*Squarrose Desmodium.* Shrub 1 foot.

\*\*\*\*\* *Species natives of Guinea.*

90 D. BULLAMENSIS; stems creeping and rooting; branches

beset with rough villi; leaflets roundish-obovate, pale, and clothed with adpressed pubescence beneath; stipulas subulate; peduncles long, loose-flowered. ♀. S. Native of Sierra Leone, on the Bullam shore. Flowers purple (v. s. herb. Lamb.).

*Bullam Desmodium.* Shrub creeping.

91 D. LINEARIFOLIUM; stem erect, branched; branches very villous; leaflets elliptic-lanceolate, obtuse at both ends, clothed with adpressed villi beneath; peduncles few-flowered, panicle; legumes with 4-6 smooth joints. ♀. S. Native of Sierra Leone. Flowers purple (v. s. herb. Lamb.).

*Linear-leafletted Desmodium.* Shrub 1 foot.

92 D. SIMPLEX; stem erect, simple, clothed with adpressed villi, as well as the under side of the leaves; leaflets of the lower leaves roundish-obovate, emarginate, of the upper ones obovate, mucronate; raceme terminal, on a long naked peduncle. ♀. S. Native of Sierra Leone. Flowers purple (v. s. herb. Lamb.).

*Simple-stemmed Desmodium.* Shrub 2 to 3 feet.

93 D. OXALIDIFOLIUM; plant suffrutescent, branched, prostrate; leaflets obovate-roundish, membranous, glabrous, mucronate, small; stipulas subulate; peduncles elongated, few-flowered; legume with rough joints. ♀. S. Native of the Island of St. Thomas. Flowers small, flesh-coloured.

*Sorrel-leaved Desmodium.* Shrub prostrate.

94 D. RAMOSISSIMUM; plant shrubby, erect, much branched; leaflets obovate, glabrous, rounded at the apex and mucronulate; racemes spiked, terminal, few-flowered; legumes articulated. ♀. S. Native of the Island of St. Thomas. Flowers small, flesh-coloured.

*Much-branched Desmodium.* Shrub 2 feet.

95 D. SPARSIFLORUM; shrubby, branched, erect, pilose; leaflets broad, oblong-lanceolate, acute, rather cordate at the base, pubescent beneath; racemes terminal and axillary, long and slender, few-flowered. ♀. S. Native of the Island of St. Thomas. Flowers flesh-coloured.

*Scattered-flowered Desmodium.* Shrub 1 to 3 feet.

96 D. TENUE; stems shrubby, ascending, simple, weak; leaflets small, obovate, mucronate; racemes spiked, slender. ♀. S. Native of Sierra Leone. Joints of legume hairy. Flowers rose-coloured.

*Slender Desmodium.* Shrub ascending.

\*\*\*\*\* *Species, natives of the Mauritius, Madagascar, and Arabia.*

97 D. CAESPITOSUM (D. C. prod. 2. p. 333.) stems creeping, tufted, and smoothish; stipulas lanceolate, acuminate, scarious; leaflets obovate-roundish; racemes erect, terminating the branches; pedicels solitary; legumes pubescent, with 2-3 semi-ovate joints. ♀. S. Native of the Mauritius. Hedys. caespitosum, Poir. dict. 6. p. 421.

*Tufted Desmodium.* Pl. creeping.

98 D. MAURITIANUM (D. C. prod. 2. p. 334.) stem erect, terete, pubescent; stipulas lanceolate, acuminate, scarious, clothed with adpressed down, as well as the stems, petioles, and pedicels; leaflets obovate-oblong, obtuse; raceme terminal, simple; legumes drooping, with semi-orbicular joints, when young pubescent. ♀. S. Native of the Mauritius. Hedys. Mauritianum, Willd. spec. 3. p. 1185. Aeschynomene arborea, Sieb. pl. maur. exsic. no. 155. and perhaps of Lin. Flowers drooping. Roots creeping.

*Mauritian Desmodium.* Shrub  $\frac{1}{2}$  to 1 foot.

99 D. SCALPE (D. C. prod. 2. p. 334.) stem erect, suffrutescent; stipulas lanceolate-linear, acuminate, glabrous; leaflets ovate or rhomboid, acuminate, mucronate, with sinuately-crenated margins; racemes terminal, elongated; pedicels twin, capillary. ♀. S. Native of the island of Bourbon, and per-

haps of Madagascar. Hedys. Scälpe, Comm. herb. Hedys. repandum, Poir. dict. 6. p. 408. but not of Vahl. Æschynomene remota, Poir. dict. 4. p. 452. Petioles nodose at the base. Stems pubescent at the apex, as well as the under side of the leaves. Legume unknown. Perhaps this and the following species would constitute a new genus. *Scälpe* is the vernacular name of the plant.

*Scälpe* Desmodium. Shrub 1 to 2 feet.

100 *D. REPANDUM* (D. C. prod. 2. p. 334.) stem shrubby, erect; stipulas lanceolate, ciliated; leaflets ovate-rhomboid, obtuse, with repandly-crenated margins; raceme terminal, elongated; pedicels 2-3 together, capillary. *h. G.* Native of Arabia Felix. Hedys. repandum, Vahl. symb. 2. p. 82.

*Repand-leaved* Desmodium. Shrub 1 to 3 feet.

101 *D. OXYBRACTEUM* (D. C. prod. 2. p. 334.) stem frutescent, terete, glabrous; leaflets oblong, acuminate, glabrous; stipulas and bracteas lanceolate, and very much acuminate; racemes axillary and terminal; legumes deflexed, depressed, smoothish, coriaceous. *h. S.* Native of the Mauritius, spontaneous or cultivated. Flowers purple.

*Sharp-bracted* Desmodium. Shrub 1 to 2 feet.

102 *D. DIVERSIFOLIUM* (D. C. prod. 2. p. 334.) stem shrubby, terete, glabrous; leaves simple and trifoliate; leaflets oval, glabrous, but puberulous on the middle nerve beneath, the terminal leaflets always twice or thrice the size of the lateral ones; racemes almost terminal; legumes villous, compressed, nearly linear. *h. S.* Native of Madagascar. Hedys. diversifolium, Poir. dict. 6. p. 403.

*Diverse-leaved* Desmodium. Fl. July, Aug. Clt. 1816. Sh. 1 to 2 feet.

103 *D. ABYSSINICUM* (D. C. prod. 2. p. 338.) stems twining; leaflets ovate, shining, rather pubescent, lateral ones sessile; racemes terminal, loose; stamens monadelphous. *h. S.* Native of Abyssinia. Hedys. Abyssinicum, Hoffmanns. verz. 1824. p. 217. Legumes unknown.

*Abyssinian* Desmodium. Pl. cl.

\*\*\*\*\* *Species natives of the East Indies, Nipaul, &c.*

104 *D. POLYCARPUM* (D. C. prod. 2. p. 334.) stem terete, erect, clothed with adpressed pubescence; leaves trifoliate, with obovate obtuse leaflets, terminal one the largest; racemes terminal and axillary, crowded; legumes with 6-8 semi-orbicular joints. *h. S.* Native of the East Indies. Lam. ill. t. 628. f. 44. Hedys. polycarpum, Poir. dict. 6. p. 413. Flowers purple. Said to be allied to *D. latifolium* and *D. lasiocarpum*.

*Many-fruited* Desmodium. Shrub 2 to 3 feet.

105 *D. PRYONI* (D. C. prod. 2. p. 334.) stem almost terete, smoothish, erect; leaflets oval, acute, glabrous above, but clothed with silky pubescence beneath, the terminal leaflet thrice the size of the lateral ones; racemes axillary, longer than the leaves; legumes hardly puberulous, with 6 semi-orbicular joints. *h. S.* Native of the East Indies. Hedys. viridiflorum, Burm. ind. 167. exclusive of the synonymes. Hedysarum spicatum foliis acuminatis, Pryon in herb. Burm. Hedys. Pryoni, Spreng. syst. append. 292. The legumes are like those of *D. Gangeticum*.

*Pryon's* Desmodium. Shrub 1 to 2 feet.

106 *D. TRIFLORUM* (D. C. prod. 2. p. 334.) stems herbaceous, procumbent, filiform, puberulous; leaflets obcordate, glabrous above, but puberulous on the nerves beneath; pedicels axillary, 1-flowered, 2-3 together; legumes puberulous, with 3-4 semi-orbicular joints. *h. S.* Native of China, Malabar, the Mauritius, also of the West Indies, and Guiana. Hedys. triflorum, Lin. spec. 1057. Swartz, obs. 288. t. 6. f. 1. Hedys. stipulaceum, Burm. ind. t. 54. f. 2. zeyl. t. 54. f. 2. Hedys. biflorum, Willem. maur. 49. Flowers red.

*Three-flowered* Desmodium. Shrub procumbent.

107 *D. HETEROPHYLLUM* (D. C. prod. 2. p. 334.) stem herbaceous, ascending, rather pilose; leaflets obovate, obtuse, glabrous above, and clothed with adpressed pubescence beneath; pedicels axillary, 1-flowered, 2-3 together; legumes ciliated, with the joints semi-orbicular. *h. S.* Native of Ceylon. Burm. zeyl. t. 54. f. 2. Hedys. heterophyllum, Willd. spec. 3. p. 1201. Flowers red.

*Variable-leaved* Desmodium. Fl. July, Aug. Clt. 1820. Pl. 1 foot, ascending.

108 *D. PARVIFOLIUM* (D. C. in ann. sc. nat. 4. 1825. p. 100.) stems procumbent, herbaceous, much branched, weak, and glabrous; leaflets small, obovate or roundish, emarginate or mucronate, covered beneath with adpressed hairs, but glabrous above; racemes panicle, axillary, 5-6-flowered, much longer than the leaves; pedicels capillary, diverging; legumes glabrous, with 3-4 semi-orbicular joints. *h. G.* Native of Nipaul. Hedys. tenellum, D. Don, prod. fl. nep. p. 243. but not of Kunth. Hedys. parviflorum, Spreng. syst. 3. p. 318. Flowers small, purple. Calycine segments lanceolate, awned.

*Small-leaved* Desmodium. Fl. July, Aug. Pl. procumbent.

109 *D. DUBIUM* (Lindl. bot. reg. 967.) leaflets obovate, rather retuse, mucronate, pubescently-pilose, paler beneath; racemes elongated, many-flowered, terminal; bracteas subulate, equal in length to the pedicels; stems angular, and are as well as the pedicels hairy. *h. G.* Native of the Himalaya mountains. Flowers rose-coloured.

*Doubtful* Desmodium. Fl. July. Clt. 1823. Shrub 2 feet.

110 *D. LAXIFLORUM* (D. C. l. c.) stem frutescent, erect, terete, glabrous; branches pubescent; stipulas lanceolate; leaflets elliptic, acuminate, glabrous above, and clothed with adpressed pubescence beneath; racemes terminal, loose; pedicels hairy, filiform, much longer than the calyx; joints of legume oblong, compressed, hardly puberulous, usually 4-5. *h. G.* Native of Nipaul. Flowers purple. Perhaps not distinct from the following.

*Loose-flowered* Desmodium. Shrub 1 to 2 feet.

111 *D. DIFFUSUM* (D. C. l. c.) stem shrubby, nearly erect, terete, glabrous; branches pubescent; stipulas lanceolate; leaflets elliptic, acuminate, glabrous above, but clothed with adpressed pubescence beneath; racemes terminal, elongated; pedicels twice the length of the calyx, in fascicles; young legumes villous. *h. S.* Native of the East Indies. Hedys. diffusum, Roxb. hort. beng. p. 57. but not of Willd. Hedys. Roxburghii, Spreng. syst. append. 292. Flowers purple.

*Diffuse* Desmodium. Fl. July, Aug. Clt. 1818. Sh. 1 to 2 ft.

112 *D. ? ELEGANS* (D. C. l. c.) stem shrubby, branched, terete; branches angular, pubescent; stipulas linear, acuminate; leaflets roundish-ovate, acuminate, pubescent beneath; racemes terminal, panicle; pedicels hispid, filiform; calyx obsoletely 5-toothed. *h. G.* Native of Nipaul, on Shreenagur.

*Elegant* Desmodium. Shrub 3 to 6 feet.

113 *D. NUTANS* (Wall. mss. Graham in edinb. phil. journ. Hook. bot. mag. 2867.) shrubby, branched; racemes compound, terminal, and axillary, and are, as well as the branches, pendulous; flowers twin; bracteas acute; leaves pendulous; leaflets roundish-rhomboid, tomentose on both surfaces; stipulas subulate. *h. S.* Native of the East Indies. Corolla bluish lilac. Stamens monadelphous.

*Nodding-leaved* Desmodium. Fl. July, Aug. Clt. 1823. Shrub 1 to 3 feet.

114 *D. PENDULUM* (Wall. pl. rar. asiat. 1. p. 81. t. 94.) erect, twiggy; branches villous; leaflets cuneate-oblong, obtuse, cuspidate, villous and many-nerved beneath; stipulas and bracteas large and dry, membranous, aristately mucronate; racemes solitary, terminal, pendulous; flowers twin; legumes compressed, moniliform on one side; joints 4, reniform, lower one sti-

pitate. *h. S.* Native of Nipaul, on the mountains on the confines of the valley. Flowers purple.

• *Pendulous-stemmed* *Desmodium*. Shrub 3-4 feet.

115. *D. ? MULTIFLORUM* (D. C. l. c.) stem shrubby, terete, glabrous; branches hairy, trigonal; stipulas lanceolate, subulate; leaflets ovate, mucronate, pubescent above, and villous beneath; racemes axillary and terminal, hairy, longer than the leaves. *h. G.* Native of Nipaul. *Hedys. floribundum*, D. Don, prod. fl. nep. 244. ? Flowers purple. Calyx nearly smooth. Young legume with 5-6 ovate pubescent joints.

*Many-flowered* *Desmodium*. Fl. July, Aug. Clt. 1823. Sh. 3 to 4 feet.

116. *D. ANGULATUM* (D. C. l. c.) stem suffruticose; branches angular, pubescent, but villous along the angles; leaflets ovate, acutish, clothed with adpressed villi on both surfaces; racemes axillary and terminal, almost spicate; bracteas villous, very much acuminate, deciduous, longer than the flowers. *h. G.* Native of Nipaul. *Hedys. retusum*, D. Don, prod. fl. nep. 243. ? *Hedys. Wallichianum*, Spreng. syst. append. 293. Flowers purple.

*Angular-stemmed* *Desmodium*. Shrub 2 feet.

117. *D. PILOSIUSCULUM* (D. C. prod. 2. p. 335.) stem angular, rather pilose; leaflets ovate-lanceolate, acute, glabrous above, and puberulous beneath; racemes terminal, somewhat spicate; bracteas deciduous, villous, somewhat acuminate; legumes a little incurved, with oval scabrous joints. *h. S.* Native of the Philippine islands.

*Pilose* *Desmodium*. Shrub 1 to 2 feet.

118. *D. CONFERTUM* (D. C. in ann. sc. nat. 4. 1825. p. 100.) stem shrubby, nearly terete, villous; leaflets ovate, acutish, rather coriaceous, glabrous above, and villous beneath; racemes crowded, short, terminal; bracteas ovate, acutish, glabrous, ciliated. *h. G.* Native of Nipaul. Flowers purple.

*Crowded* *Desmodium*. Shrub 1 to 2 feet.

119. *D. SUEMBUENSE* (D. C. prod. 2. p. 335.) leaflets roundish-oval, mucronulate, villous, canescent beneath; stipulas lanceolate, mucronate; racemes secund; calycine teeth ovate, acute, upper one broader and emarginate. *h. G.* Native of Upper Nipaul at Suambu. *Hedys. Suambuense*, D. Don, prod. fl. nep. 243. Flowers flesh-coloured. Legume with 5 joints.

*Suambu* *Desmodium*. Fl. July. Shrub 1 to 2 feet.

120. *D. RUFESCENS* (D. C. in ann. sc. nat. 4. 1825. p. 100.) branches and peduncles terete, covered with rufous villi; leaflets ovate-elliptic, obtuse, mucronate, glabrous above, and pubescent beneath; racemes terminal, panicle; bracteas deciduous, villous, very much acuminate. *h. S.* Native of the East Indies. *Hedys. rufescens*, Spreng. syst. append. 292. Upper leaves with one leaflet. Stipulas broad at the base, but elongated and subulate at the apex.

*Rufescent* *Desmodium*. Shrub 1 to 2 feet.

121. *D. CONCIÑNUM* (D. C. l. c.) stem shrubby, branched; branches terete, pubescent; leaflets elliptic-obovate, mucronate, pubescent beneath, with rather prominent nerves; stipulas lanceolate-linear, acuminate; racemes terminal; pedicels twin, hairy; bracteas deciduous, ovate, acuminate, villous. *h. G.* Native of Nipaul. *Hedys. concinnum*, Spreng. syst. append. 292. \* Allied to the preceding species, but differs in the leaflets being  $1\frac{1}{2}$  inch long, not 2-3, and in having fewer nerves. Flowers violaceous.

*Neat* *Desmodium*. Shrub 1 to 2 feet.

122. *D. TRICHOCALYX* (D. C. l. c.) stems procumbent, suffruticose at the base, terete, hairy; leaflets obovate, roundish, obtuse, glabrous above, pubescent beneath; stipulas scarious, lanceolate-linear, acuminate, glabrous; bracteas conforming to the stipulas, ciliated; racemes terminal; pedicels twin. *h. G.* Native of Nipaul. Flowers violaceous.

*Hairy-stemmed* *Desmodium*. Pl. procumbent.

123. *D. VISCIDUM* (D. C. prod. 2. p. 336.) stems suffruticose; branches terete, covered with adpressed villi; leaflets smoothish; terminal one obovate and larger than the lateral ones, which are ovate and acutish; racemes almost terminal, villous; stipulas and bracteas scabrous, ovate-lanceolate, acuminate, striated, glabrous. *h. S.* Native of Java. *Burm. zeyl. t. 84. f. 1.* *Hedys. viscidum*, *Burm. ind. 167.* Flowers blue.

*Viscid* *Desmodium*. Shrub 1 to 2 feet.

124. *D. PAUCINERVIUM* (D. C. l. c.) stem shrubby, erect, branched, terete, smoothish; leaflets elliptic, obtuse, pubescent and veiny beneath; stipulas membranous, acuminate-awned; bracteas conforming to the stipulas, somewhat ciliated; racemes terminal; pedicels solitary or twin. *h. S.* Native of the East Indies. Very like *D. concinnum*. Flowers violaceous.

*Few-nerved* *Desmodium*. Shrub 1 to 2 feet.

125. *D. LESCHENAU'LTII* (D. C. l. c.) stem terete, puberulous, suffruticose; leaflets rhomboid, mucronate, puberulous on both surfaces; racemes axillary, slender; stipulas and bracteas deciduous, acuminate, and rather pilose; pedicels 2-3-together, spreading. *h. S.* Native of the East Indies. Flowers purple.

*Leschenault's* *Desmodium*. Fl. July, Aug. Clt. 1825. Sh. 1 to 2 feet.

126. *D. CAPITATUM* (D. C. prod. 2. p. 336.) stem shrubby, erect; leaflets roundish-obovate, obtuse, tomentose beneath; stipulas lanceolate, dry; racemes axillary, bracteate before the flowers expand, and of a capitate, conical figure; legumes pendulous. *h. S.* Native of Ceylon. *Hedys. capitatum*, *Burm. ind. 167. t. 54. f. 1.* *Hedys. conicum*, *Poir. dict. 6. p. 419.* According to the legume this species belongs to section *Pleurolobium*. Flowers purple.

*Capitate-flowered* *Desmodium*. Fl. July. Clt. ? Sh. 1 to 2 ft.

127. *D. SILIQUOSUM* (D. C. prod. 2. p. 336.) stem shrubby, erect, clothed with adpressed silky pubescence above; stipulas dry, lanceolate-linear, setaceously acuminate; leaflets elliptic-obovate, obtuse, mucronate, glabrous above, but clothed with silky villi beneath; racemes terminal, dense-flowered, bracteate. *h. S.* Native of Java. *Hedys. siliquosum*, *Burm. fl. ind. 169. t. 55. f. 2.* Perhaps a species of *Lespedeza*.

*Siliquose-podded* *Desmodium*. Shrub 1 to 2 feet.

128. *D. RETROFLEXUM* (D. C. prod. 2. p. 336.) stem shrubby, erect; leaflets roundish-ovate, clothed with silky tomentum beneath; racemes axillary, erect, elongated; legumes reflexed. *h. S.* Native of the East Indies. *Hedys. retroflexum*, *Lin. mant. 103.* Allied to *Flemingia lineata*, but the legume is many-jointed. It differs from *D. concinnum* in the leaflets being roundish, not elliptic, and in the racemes being axillary, &c.

*Retroflexed* *Desmodium*. Shrub 1 to 2 feet.

129. *D. BIFLORUM* (D. C. prod. 2. p. 336.) stem twining, terete, pubescent; leaflets ovate, tomentose; peduncles axillary, 2-flowered, length of petioles; legumes hairy, 5-6-jointed. *h. C. S.* Native of the East Indies. *Hedys. biflorum*, *Willd. spec. 3. p. 1200.* but not of Willem.

*Two-flowered* *Desmodium*. Sh. tw.

130. *D. LAXUM* (D. C. in ann. sc. nat. 4. p. 102.) stems twining, trigonal, and are either pilose or glabrous, as well as the petioles; stipulas lanceolate, acuminate; leaflets elliptic, acuminate, glabrous, but pubescent on the nerves beneath, middle one acuminate at the base, lateral ones unequally semicordate at the base; panicle terminal, very loose; pedicels twin. *h. C. G.* Native of Nipaul. *Hedys. laxum*, *Spreng. syst. append. 292.* Young legume smooth and repand.

*Loose-flowered* *Desmodium*. Shrub, tw.

131. *D. WILDENOWII*; stems ascending, triquetrous; stipulas obliquely cordate; leaflets oblong-ovate, obtuse, hoary beneath; racemes erect, panicle; bracteas cordate, deciduous; legumes with 4 roundish, hairy joints. *h. S.* Native of Tranquebar.

Hedys. diffusum, Willd. spec. 3. p. 1180. *D. diffusum*, D. C. prod. 2. p. 336.

*Willdenow's* *Desmodium*. Shrub 2 to 3 feet, diffuse.

132 *D. dichotomum* (D. C. prod. 2. p. 336.) stem erect, triquetrous; pubescent; stipulas and bracteas ovate; leaflets elliptic, obtuse, pubescent, hoary beneath; racemes elongated; legumes hairy, with 6 joints.  $\frac{1}{2}$ . S. Native of Tranquebar. Hedys. dichotomum, Willd. spec. 1180. This species is like the preceding.

*Dichotomous-stemmed* *Desmodium*. Shrub 2 to 3 feet.

133 *D. oxyphyllum* (D. C. in ann. sc. nat. 4. p. 102.) stem erect, terete, branched, and is rather angular and smooth, as well as the branchlets; stipulas subulate; leaflets elliptic, acuminate, glabrous, pale white beneath; panicle terminal, loose; pedicels 2-3-together, in fascicles.  $\frac{1}{2}$ . G. Native of Nipaul. Hedys. oxyphyllum, Spreng. syst. append. 292.

*Sharp-leaved* *Desmodium*. Shrub 1 to 2 feet.

134 *D. podocarpum* (D. C. l. c.) stem ascending, terete; branches rather angular, and are as well as the petioles and peduncles pilose; stipulas subulate; leaflets broad-ovate, rather rhomboid, pale beneath, but rather puberulous above; racemes terminal, elongated, slender; pedicels twin; legume with 1-3 triangular, puberulous, distant joints, lower joint stipitate.  $\frac{1}{2}$ . G. Native of Nipaul. Flowers purple.

*Foot-fruited* *Desmodium*. Shrub 1 to 2 feet.

135 *D. heterocarpum* (D. C. prod. 2. p. 337.) stem shrubby, erect, and is as well as the petioles scabrous; stipulas setaceous; leaflets elliptic, obtuse, glabrous; racemes axillary and terminal; legumes puberulous, erect, lower ones with only 1 joint, the rest having 5-7 orbicular joints.  $\frac{1}{2}$ . S. Native of Ceylon. Burm. zeyl. 117. t. 53. f. 1. Hedys. heterocarpum, Lin. spec. 1054, but not of Thunb. Flowers pale purple.

*Various-fruited* *Desmodium*. Shrub 1 to 2 feet.

136 *D. sequax* (Wall. pl. asiat. rar. 2. p. 46. t. 157.) plant shrubby, erect, twiggy, and branched; branches terete, and are villous, as well as the petioles; leaflets lanceolate, acuminate, clothed with adpressed pili above, and villous beneath, intermediate one double the size of the lateral ones; stipulas linear; racemes axillary, about equal in length to the leaves; flowers usually twin, on villous pedicels; legumes slender, linear, many-jointed, many-toothed on both edges, and covered with hooked pili.  $\frac{1}{2}$ . S. Native of the East Indies, on the mountains of Kamaon. Flowers pale red.

*Sticking* *Desmodium*. Shrub 3 feet.

137 *D. laburnifolium* (D. C. prod. 2. p. 337.) stem shrubby, branched, terete, smoothish; stipulas setaceous; leaflets ovate, acute, glabrous, shining above, clothed with adpressed pubescence beneath; racemes terminal, loose; legumes pendulous, hispid, with oblong compressed joints.  $\frac{1}{2}$ . S. Native of Java. Hedys. laburnifolium, Poir. dict. 6. p. 422. but not of Sieb. This plant probably belongs to section *Eudesmodium*.

*Laburnum-leaved* *Desmodium*. Shrub 2 to 3 feet.

138 *D. salicifolium* (D. C. prod. 2. p. 337.) stem frutescent, branched, terete, glabrous; stipulas and stipels lanceolate-setaceous, elongated; leaflets lanceolate-oblong, acuminate, glabrous; panicle terminal, diffuse; bracteas lanceolate-subulate; legumes arched, hispid.  $\frac{1}{2}$ . S. Native of the East Indies. Hedys. salicifolium, Poir. dict. 6. p. 422.

*Willow-leaved* *Desmodium*. Shrub 1 to 2 feet.

139 *D. Rottleri*; plant herbaceous, erect; leaflets large, oblong-elliptic, acutish, rather strigose beneath; panicle terminal, elongated, diffuse; legumes linear, arched, glabrous.  $\frac{1}{4}$ . S. Native of the East Indies. Hedys. lineare, Rottl. Hedys. Rottleri, Spreng. syst. 3. p. 320.

*Rottler's* *Desmodium*. Pl.  $\frac{1}{2}$  foot.

† *Species, natives of Nipaul, which differ from the other*  
VOL. II.

*species in having a 4-toothed calyx instead of being 5-toothed.*

140 *D. retusum*; leaflets oblong, retuse, mucronulate, villous, canescent beneath; stipulas lanceolate, acuminate; racemes many-flowered; bracteas ovate, mucronate, villous, imbricated; calycine teeth ovate, cuspidate; keel of corolla truncate at the apex.  $\frac{1}{2}$ . G. Native of Nipaul, at Narainhetty. Hedys. retusum, Hamilt. mss. ex D. Don, prod. fl. nep. 243. Leaflets nearly 2 inches long and half an inch broad.

*Retuse-leafletted* *Desmodium*. Fl. July, Aug. Clt. 1820. Sh. 1 to 2 feet.

141 *D. floribundum*; leaflets ovate, mucronate, and are as well as the branches pilosely tomentose; stipulas lanceolate, falcate; racemes many-flowered; pedicels capillary, aggregate; calycine segments ovate, acute, upper one broader and emarginate.  $\frac{1}{2}$ . G. Native of Nipaul, at Gosaingsthan. Hedys. floribundum, D. Don, prod. fl. nep. p. 244. Flowers reddish. Perhaps the same as *D. multiflorum* of D. C.

*Bundle-flowered* *Desmodium*. Shrub 2 to 3 feet.

142 *D. tiliaefolium*; leaflets roundish-ovate, acuminate, pubescent; racemes terminal, panicled; calyx bluntly 4-lobed.  $\frac{1}{2}$ . G. Native of Nipaul, on Shreenagur. Hedys. tiliaefolium, D. Don, l. c. Leaflets almost 3 inches long.

*Line-tree-leaved* *Desmodium*. Shrub 2 to 3 feet.

143 *D. dioicum* (D. C. prod. 2. p. 338.) leaflets oval, obtuse, coriaceous, glaucous, and pilose beneath; stipulas ovate, acute; racemes many-flowered; bracteas ovate, acute, ciliated, imbricated; calycine teeth ovate, acute.  $\frac{1}{2}$ . G. Native of Nipaul, at Narainhetty. Hedys. dioicum, Hamilt. mss. ex D. Don, prod. fl. nep. 244. Leaflets 3-4 inches long and 2 broad. Flowers axillary, dioecious. Vexillum obovate, shorter than the falcate wings. Keel concave, mucronate at the apex. Stamens 10, monadelphous. Style bearded below. Legume 3-jointed. Perhaps a proper genus.

*Dioecious* *Desmodium*. Shrub 3 feet.

† *Doubtful species, natives of the East Indies.*

144 *D. grandifolium* (D. C. prod. 2. p. 338.) stem frutescent, simple, trigonal; stipulas ciliated; petioles triquetrous; leaflets oblong-lanceolate, acute, racemes somewhat spicate.  $\frac{1}{2}$ . S. Native of the East Indies. Hedys. grandifolium, Horn. hort. hafn. cat. 2. p. 700.

*Great-leaved* *Desmodium*. Shrub 2 to 3 feet.

145 *D. ? punctatum* (D. C. prod. 2. p. 338.) stem twining, furrowed, pilose; leaflets ovate, acute, and are as well as the calyxes beset with red dots; racemes axillary, short.  $\frac{1}{2}$ . S. Native of the East Indies. Hedys. punctatum, Rottl. berl. mag. p. 231.

*Dotted* *Desmodium*. Shrub tw.

146 *D. ? hippocrepis* (D. C. prod. 2. p. 338.) stem shrubby, erect; leaflets ovate, glabrous, middle one largest; spikes oblong, dense; legumes straight, bearded, jointed on the upper suture.  $\frac{1}{2}$ . G. Native of Cochinchina. Hippocrepis barbata, Lour. fl. coch. p. 453. Flowers purple.

*Hippocrepis-like* *Desmodium*. Shrub 4 feet.

147 *D. malacophyllum* (D. C. prod. 338.) stem herbaceous, erect, hairy; leaflets oblong, somewhat cordate, pale, and clothed with soft hairs beneath; racemes terminal.  $\frac{1}{4}$ . S. Native of Manilla. Hedys. malacophyllum, Link. enum. 2. p. 247.

*Soft-leaved* *Desmodium*. Fl. July, Aug. Clt. ? Pl. 1 to 2 ft.

\* \* \* \* \* *Species, natives of New Holland and New Caledonia.*

148 *D. spartioides* (D. C. prod. 2. p. 337.) stem slender, terete, dichotomous, glabrous; stipulas acute; leaflets oblong-linear, mucronate, glabrous above, but pale, and pubescent beneath; racemes terminal and opposite the leaves; pedicels from  
• Q q

1-3, in a fascicle, distant, joints of legume 4, semi-orbicular, hardly puberulous. *h. G.* Native of New Holland. The figure in *Burm. ind. t. 51. f. 2.* agrees with this plant, but the description does not.

*Broom-like Desmodium.* Shrub 1 to 2 feet.

149 *D. VARIANUS*; lower leaflets elliptic, upper ones oblong; racemes axillary and terminal, flexuous. *U. G.* Native of New Caledonia. *Hedys. varians*, Labill. cal. p. 71. t. 71.

*Varying Desmodium.* Pl. cl.

150 *D. TUBERCULATUM*; leaves simple and ternate; leaflets obovate, grey beneath; racemes terminal. *h. G.* Native of New Caledonia. *Hedys. tuberculatum*, Labill. cal. p. 71. t. 72.

*Tubercled Desmodium.* Shrub 1 to 2 feet.

\*\*\*\*\* *Species, natives of Japan and China.* *Hedysarum*, with ternate leaves, *Thunb. fl. jap.* 284.

151 *D. MICROPHYLLUM* (*D. C. prod. 2. p. 337.*) stem shrubby, erect, glabrous; stipulas ovate, subulate, almost covering the branches; leaflets ovate, villous; panicle terminal; legumes scabrous, 3-jointed. *h. G.* Native of Japan, near Nagasaki. *Hedys. microphyllum*, *Thunb. l. c.* Flowers purple.

*Small-leaved Desmodium.* Shrub 1 to 2 feet.

152 *D. RACEMOSUM* (*D. C. prod. 2. p. 337.*) stem shrubby, erect; branches angular, glabrous; stipulas setaceous; leaflets ovate-oblong, acute, glabrous, canescent beneath; racemes axillary, erect, very long; legumes glabrous. *h. G.* Native of Japan. *Hedys. racemosum*, *Thunb. fl. jap.* p. 285. Said to be allied to *D. viridiflorum*.

*Racemose-flowered Desmodium.* Shrub 1 to 2 feet.

153 *D. CAUDATUM* (*D. C. l. c.*) stem herbaceous, erect, glabrous; stipulas setaceous; leaflets oblong, acute, glabrous; panicle terminal, contracted, villous; legumes clothed with rusty tomentum. *U. G.* Native of Japan. *Hedys. caudatum*, *Thunb. fl. jap.* 286. Flowers purple.

*Tailed Desmodium.* Pl. 1 foot.

154 *D. TOMENTOSUM* (*D. C. prod. 2. p. 337.*) stem herbaceous, erect, angular, flexuous, tomentose, as well as the petioles, peduncles, and under sides of the leaves; stipulas broadest at the base, setaceous; leaflets ovate-oblong, obtuse, mucronate; racemes axillary. *U. G.* Native of Japan. *Hedys. tomentosum*, *Thunb. fl. jap.* 286.

*Tomentose Desmodium.* Pl. 1 foot.

155 *D. THUNBERGII* (*D. C. l. c.*) stem herbaceous, angular, glabrous; leaflets oblong, acuminate, glabrous; stipulas setaceous; racemes axillary, drooping; legumes puberulous, some with 1 joint and others with 2 joints. *U. G.* Native of Japan. *Hedys. heterocarpum*, *Thunb. fl. jap.* 289. but not of *Lin.* Stems drooping. Flowers flesh-coloured.

*Thunberg's Desmodium.* Pl. 2 feet.

156 *D. PILOSUM* (*D. C. l. c.*) stem herbaceous, decumbent, filiform, hairy; leaflets ovate, obtuse, villous on both surfaces, acuminate; peduncles axillary, usually 4-flowered, length of petioles. *U. G.* Native of Japan. *Hedys. pilosum*, *Thunb. fl. jap.* 288. Perhaps a species of *Lespedeza*. Flowers purple.

*Pilose Desmodium.* Pl. decumbent.

157 *D. STRIATUM* (*D. C. l. c.*) stem herbaceous, angular; racemes erectish, pilose; stipulas ovate, membranous; leaflets obtuse and somewhat retuse, mucronate, glabrous, having a hairy line on the back of each; pedicels axillary, solitary, 1-flowered. *U. G.* Native of Japan. *Hedys. striatum*, *Thunb. fl. jap.* 289. Perhaps a species of *Lespedeza*. Flowers purple.

*Striated Desmodium.* Pl. 1 to 2 feet.

† *A doubtful species, of which the native country is unknown.*

158 *D. VIOLACEUM*; plant shrubby, erect, branched, pubescent; leaves petiolate, ovate-lanceolate, mucronate at the apex, clothed with hoary tomentum beneath; stipulas very villous;

bracteas pubescent, lanceolate, acute. *h. S.* Native of Maranham. Flowers small, violaceous.

*Violaceous-flowered Desmodium.* Fl. Aug. Sept. Sh. 2 ft.

159 *D. NERI* (*D. C. prod. 2. p. 338.*) branches terete, rather angular at the apex, clothed with silky villi; leaflets ovate-lanceolate, acuminate, puberulous above, but clothed with silky villi beneath; racemes axillary and terminal, somewhat spicate; bracteas longer than the flowers; acuminate, rather villous at the apex. *h. S.* Native country unknown.

*Neri's Desmodium.* Shrub 1 to 2 feet.

† *Species only known by name, from Roxburgh's Hortus Bengalensis, p. 57. and p. 98. under Hedysarum, many of which may be identical with some of those described above.*

1 *D. réptans.* 2 *D. orbiculatum.* 3 *D. recurvatum.* 4 *D. divergens.* 5 *D. purpureum.* 6 *D. cephalotes.* 7 *D. patens.* 8 *D. tuberosum.* 9 *D. quinqueangulatum.* 10 *D. arboreum.*

*Cult.* The stove and greenhouse species of this genus grow well in a mixture of loam and peat, and young cuttings will root readily in sand, under a hand-glass in heat. The hardy kinds or those natives of North America succeed well in a light rich soil, and are increased by dividing at the root in spring, or by seeds.

CLVI. DICERMA (from *dis*, twice, and *erma*, a prop; in reference to the calyx being propped by 2 bracteas). *D. C. legum. mem. vii. prod. 2. p. 339.*

*LIN. SYST. Diadelphia, Decandria.* Calyx bilabiate, propped by 2 adpressed bracteas at the base; upper lip entire or hardly bidentate at the apex, lower one trifid, with the middle lobe rather longer than the lateral ones. Vexillum obovate. Carina and wings about equal in length. Keel obtuse, not obliquely truncate at the apex. Stamens diadelphous. Legume constantly of 2, rarely of 3 orbicular, regular, flat, 1-seeded joints, which are not echinated, the ultimate one bearing the permanent style.—Shrubs with trifoliate leaves. Pedicels 1-flowered, numerous, aggregate in the axils of the leaves or bracteas. Flowers yellow or purple.

SECT. I. PHYLLIDIUM (from *φυλλον*, *phyllon*, a leaf; in reference to the leaflets being stipellate). *Desv. journ. bot. 3. p. 123. t. 5. f. 24.* *D. C. prod. 2. p. 339.* Leaves on long petioles, pinnately trifoliate; leaflets stipellate. Floral leaves bifoliate, the odd one being abortive, lateral ones orbicular, lined, formed like bracteas, the petiole ending in a bristle. Flowers numerous in the axils of the floral leaves, on very short pedicels. Stipulas distinct and free from the petioles.

1 *D. PULCHELLUM* (*D. C. prod. 2. p. 339.*) stem erect, shrubby; leaves pinnately trifoliate; leaflets elliptic-oblong, pubescent beneath, glabrous above, terminal one very large; floral leaves bifoliate, with the petiole ending in a bristle; legume straight, 2-jointed. *h. S.* Native of the East Indies, Java, Mindanao, and China. *Hedys. pulchellum*, *Lin. spec. 1053.* *Phyllodium pulchellum*, *Desv. l. c.*—*Burm. zeyl. t. 52.*—*Pluk. alm. t. 433. f. 7.* Flowers purple, 2 to each pair of floral leaves.

*Neat Dicerma.* Fl. July, Aug. Clt. 1798. Sh. 2 to 3 feet.

2 *D. ELEGANS* (*D. C. prod. 2. p. 339.*) stem shrubby, erect; leaves trifoliate; leaflets ovate, obtuse, tomentose on both surfaces; leaflets of floral leaves ovate and pilose; legume arched, pilose, 3-jointed. *h. G.* Native of Chiua, near Canton. *Hedys. elegans*, *Lour. coch. p. 450.* *Zornia elegans*, *Pers. ench. 2. p. 318.* Flowers yellow.

*Elegant Dicerma.* Fl. July, Aug. Clt. 1819. Sh. 2 to 3 ft.

SECT. II. APHYLLIDIUM (from *α*, priv. and *φυλλον*, *phyllon*, a leaf; in reference to the leaflets being without stipels) *D. C. legum. mem. vii. prod. 2. p. 339.* Leaves trifoliate; leaflets about equal in size, exstipellate, rising from the top of the pe-

tiole; floral leaves reduced to stipulas, and therefore the flowers are disposed in an almost naked terminal raceme. Stipulas joined, opposite the leaves. The plant in this section is very different in habit from those species contained in the first section, but the character of the fructification is very similar.

3 *D. BIARTICULATUM* (D. C. prod. 2. p. 339.) leaflets 3, disposed in a palmate manner, obovate-oblong, obtuse, smoothish; branches and legumes clothed with adpressed pubescence.  $\frac{1}{2}$ . S. Native of the East Indies. Hedys. biarticulatum, Lin. spec. 1054.—Burm. zeyl. 114. t. 50. f. 2.

*Two-jointed-podded Dicerma.* Fl. July, Aug. Clt. 1808. Shrub 2 feet.

*Cult.* This is a genus of elegant shrubs; they will grow in a mixture of loam and peat, and they may be increased by young cuttings, planted in sand, with a hand-glass placed over them, or by seeds.

CLVII. TAVERNIERA (in honour of J. B. Tavernier, a traveller in the Levant). D. C. legum. mem. vii. prod. 2. p. 339.

LIN. SYST. *Diadelphia, Décandria*. Calyx bibracteolate at the base, half 5-cleft, and somewhat bilabiate; the segments lanceolate-linear, and acuminate. Corolla papilionaceous; vexillum nearly obovate. Wings shorter than the calyx. Keel obtuse. Stamens diadelphous, straight, or a little inflexed at the apex. Style filiform, long, flexuous, deciduous. Legume constantly of 2 orbicular, compressed, 1-seeded joints.—Shrubs, natives of the Levant, with simple and trifoliate leaves. Stipulas joined together at the base. Flowers rose-coloured or white.

1 *T. NUMMULARIA* (D. C. leg. mem. vii. t. 52.) leaves all simple, on short petioles, orbicular, mucronate, glaucous, pubescent; racemes axillary, few-flowered, much longer than the leaves.  $\frac{1}{2}$ . G. Native of the Levant, between Bagdad and Kermansha. Hedys. nummularifolium, D. C. in ann. sc. nat. 4. p. 102. Hedys. Olivèrii, Spreng. syst. append. p. 290. Stem clothed with velvety-hoary down. Flowers rose-coloured, according to the dried specimen.

*Money-wort Taverniera.* Fl. June, July. Clt. 1826. Sh. 1 to 2 feet.

2 *T. SPARTHEA* (D. C. prod. 2. p. 339.) leaves simple or trifoliate; leaflets oblong; racemes axillary and terminal; pedicels twin, 1-flowered, very short.  $\frac{1}{2}$ . G. Native of Persia. Hedys. sparteum, Burm. fl. ind. 166. t. 51. f. 2. Flowers yellow.

*Broom-like Taverniera.* Shrub 1 to 2 feet.

3 *T. LAPPACEA* (D. C. prod. 2. p. 339.) stems suffruticose, procumbent, branched, divaricate, terete; leaves trifoliate; leaflets fleshy, obovate, villous; flowers 1-2-together, axillary on short pedicels; legume beset with stiff bristles, which are hooked at the apex.  $\frac{1}{2}$ . G. Native of Arabia Felix, at Lohajam. Hedys. lappaceum, Forsk. descr. 136. Vahl. symb. 1. p. 54. Flowers yellow.

*Burdock-podded Taverniera.* Fl. Jul. Aug. Clt. 1820. Sh. pr.

*Cult.* See *Dicerma* for culture and propagation, p. 298.

CLVIII. HEDYSARUM ( $\eta\epsilon\delta\upsilon\sigma\alpha\rho\upsilon\varsigma$ , *hedysaron*, is the name of a plant of Theophrastus and Dioscorides; said to be from  $\eta\epsilon\upsilon\epsilon$ , *hedys*, sweet, and  $\alpha\rho\omega\mu\alpha$ , *aroma*, perfume. The present genus, however, has nothing to do with the plant of Theophrastus, further than belonging to the papilionaceous tribe. His plant being *Trigonella fœnum Græcum*, from which an oil was extracted and mixed with ointments by the Hindoos). Jaum. journ. bot. 3. p. 61. exclusive of some species. D. C. legum. mem. vii. prod. 2. p. 340.—*Echinolobium*, Desv. journ. bot. 3. p. 123. t. 5. f. 20-21.—*Hedysarum* species of Lin. and others.

LIN. SYST. *Diadelphia, Décandria*. Calyx 5-cleft; the segments linear-subulate and nearly equal. Corolla with a large

vexillum and obliquely truncate keel, which is much longer than the wings. Stamens diadelphous, having the stamiferous tube abruptly infracted. Legume constantly of numerous, flat, orbicular or lenticular, regular, 1-seeded joints, which are connected together in the middle, and therefore the sutures are convex on both sides.—Herbs or subshrubs, with impari-pinnate leaves, axillary, simple peduncles, bearing racemose spikes of large, purple, white, or cream-coloured flowers. This genus is nearly allied to *Onobrychis*, but differs in the legumes being of many joints, not of one joint only as in that genus. All the species are very elegant when in blossom.

SECT. I. *ECHINOLOBIMUM* (from  $\epsilon\chi\iota\nu\omicron\varsigma$ , *echinos*, a hedge-hog, and  $\lambda\omicron\beta\omicron\varsigma$ , *lobos*, a pod; in reference to the prickly legumes). D. C. prod. 2. p. 340. Joints of legumes villous, ribbed, mucronated, or glochidate in the disks.

\* *Plants almost stemless. Calycine segments subulate and elongated.*

1 *H. GRANDIFLORUM* (Pall. itin. 2. p. 743. t. Y. ed. gall. append. no. 367. t. 82.) plant nearly stemless: leaflets elliptic, clothed with silky hoary down beneath; wings of flower equal in length to the calyx; keel shorter than the vexillum; legumes jointed, clothed with white villi, wrinkled, having the disks of joints mucronated with spinules, which are glochidate at the apex.  $\frac{1}{2}$ . H. Native of Iberia, the Ukraine, and south of Podolia, on calcareous hills at the Nieper, and at the Irtysh. Bieb. cent. pl. ross. 3. t. 63. ex suppl. no. 1445. H. sericeum, Bieb. fl. taur. 2. p. 176. H. argenteum, Lam. in Pall. l. c. *Astragalus grandiflorus*, Lin. spec. 1071.—Gmel. sib. 4. t. 31. Corolla large, cream-coloured or pale purplish.

*Great-flowered Hedysarum.* Fl. June, Jul. Clt. 1821. Pl.  $\frac{1}{2}$  to 1 foot.

2 *H. ARGENTEUM* (Lin. fil. suppl. 333.) plant almost stemless; leaflets oval or ovate, villous above and clothed with shining silky pubescence beneath; petioles and peduncles clothed with adpressed pubescence; calyx shorter than the corolla; keel twice the length of the wings and about equal in length to the vexillum; legumes articulated, tomentose, rough.  $\frac{1}{2}$ . H. Native of Caucasus and of Siberia, at the river Iacus. Bieb. fl. taur. 2. p. 175.—Gmel. sib. 4. p. 30. t. 13. Flowers purple.

*Silvery Hedysarum.* Fl. July, Aug. Clt. 1796. Pl.  $\frac{1}{2}$  foot.

3 *H. CAENDICUM* (Bieb. fl. taur. 2. p. 176. and suppl. no. 1444.) plant almost stemless; leaflets roundish, ovate, pubescent above and clothed with silky white down beneath; petioles and peduncles covered with spreading pubescence; calyx length of corolla; carina twice the length of the wings, but about equal in length to the vexillum; legumes tomentose, wrinkled, roughish.  $\frac{1}{2}$ . H. Native of Tauria, on calcareous hills. H. argenteum, Willd. spec. 3. p. 1205. exclusive of the synonymes. H. cretaceum, Pall. ined. taur. Flowers pale purplish, but at length changing to a cream colour.

*Var.  $\beta$ , humile* (D. C. prod. 2. p. 40.) scapes declinate; plant more humble than the species.  $\frac{1}{2}$ . H. Native of Tauria, about Sudak. H. supinum, Pall. ined. taur. H. humile, Hablitz, taur. 152.

*White-leaved Hedysarum.* Fl. May, Ju. Clt. 1824. Pl.  $\frac{1}{2}$  ft.

4 *H. SPLENDENS* (Fisch. in litt. D. C. prod. 2. p. 340.) stems short; leaves with 1-3 pairs of ovate leaflets, which are clothed with adpressed silvery-silky pubescence on both surfaces; peduncles or scapes longer than the leaves; spikes racemose, oblong; wings of flowers shorter than the calyx; vexillum striated, almost the length of the carina; legumes clothed with silky pubescence, having 2 reticulately-veined joints.  $\frac{1}{2}$ . H. Native of Siberia, at the river Irtysh. Flowers large, pale red. Leaves sometimes unifoliate. Bractæas longer than the pedicels. Stipulas joined in one, opposite the leaves.

*Splendid Hedysarum.* Fl. July, Aug. Clt. 1819. Pl.  $\frac{1}{2}$  ft.

**\*\* Plants with stems. Calycine segments subulate or linear. Legumes prickly.**

5 *H. PA'LLIDUM* (Desf. fl. atl. 2. p. 177.) stems procumbent; leaves with 6-7 pairs of elliptic-orbicular, pubescent leaflets; spikes or racemes of flowers oblong, crowded; wings of flower thrice the length of the calyx; joints of legume orbicular, prickly.  $\frac{1}{2}$ . H. Native of Barbary, near Mascar. Sims, bot. mag. 1251. ? Flowers pale rose-coloured, about the size of those of *H. coronarium*.

*Pale-flowered Hedysarum.* Fl. Ju. Jul. Clt. 1820. Pl. pr.

6 *H. CORONA'RIMUM* (Lin. spec. 1058.) stems diffuse; leaves with 3-5 pairs of elliptic or roundish leaflets, which are clothed with pubescence beneath, and on the margins; spikes or racemes of flowers ovate, crowded; wings of flower twice the length of the calyx; legumes glabrous, with 2-5 orbicular prickly joints.

$\frac{1}{2}$ . H. Native of Spain and Italy, in fields and meadows. Gærtn. fruct. 2. t. 155. Mart. fl. rust. 115.—Riv. tetr. irr. t. 98. Besl. hort. eyst. 13. t. 2. f. 1. H. clypeatum, Ger. amac. 1235. Park. parad. 339. t. 337. f. 10. Flowers deep red or white. In Calabria this plant grows wild in great luxuriance near 4 feet high, affording excellent nourishment to horses and mules, both green and made into hay; but it does not well bear the spring in the north of Italy, and therefore we may presume that it will not bear our climate well enough to answer the purposes of husbandry. Orbeck mentions that he saw great bundles of it brought to Cadiz as food for cattle. The plant is called in Italian and Spanish *Sulla*. In German it is called *Kronencklee*, *Schildklee*, and *Spanischeklee*. In French *Sainfoin d'Espagne*, and *Sainfoin à bouquets*. In Dutch *Sierlyk haanekop*. Parkinson calls it *Red satin-flower* or *Red-flowered Fitching*, but it is commonly known in British gardens under the name of *French honeysuckle*.

*Garland Hedysarum* or *French honeysuckle.* Fl. June, July. Clt. 1596. Pl. 3 to 4 feet.

7 *H. HU'MILE* (Lin. spec. 1058.) stem erect; leaves with 7-9 pairs of linear-cuneiform, obtuse leaflets; flowers racemose; wings one-half shorter than the carina, and with the vexillum also shorter than the carina; joints of legume 2-3, orbicular, villous, and muricated with tubercles, when in a young state they are tomentose.  $\frac{1}{2}$ . H. Native of the south of France, Sicily, and Spain, on dry sandy hills.—J. Bauh. hist. 2. p. 336. f. 1.—Pluk. alm. t. 50. f. 2. H. coronarium  $\beta$ , Lam. fl. fr. 2. p. 665. Flowers purple, smaller than those of *H. coronarium*.

*Dwarf Hedysarum.* Fl. July, Aug. Clt. 1640. Pl.  $\frac{1}{2}$  to 1 ft.

8 *H. SPINOSISSIMUM* (Lin. spec. 1058. exclusive of the synonyms,) stems diffuse; leaves with 5-7 pairs of obovate or oblong, emarginate, smoothish leaflets; spikes capitate, few-flowered; wings one-half shorter than the carina; vexillum about equal in length to the carina; joints of legume 2-3, orbicular, pubescent, and prickly; the prickles hooked at the apex.  $\odot$ . H. Native of Spain, and the south of Italy.—Pluk. phyt. t. 50. f. 2. Flowers purple, 8 lines long.

*Very-spiny-podded Hedysarum.* Fl. July, Aug. Clt. 1731. Pl. diffuse.

9 *H. CAPITA'TUM* (Desf. atl. 2. p. 177. but not of Burm.) stems decumbent; leaves with 6-7 pairs of obovate-obtuse leaflets; spikes or racemes of flowers ovate, loose; wings of corolla twice the length of the calyx; legumes villous and prickly, with orbicular joints.  $\odot$ . H. Native of Barbary, near Calsa and Lacalle, also of Corsica. Sims, bot. mag. 1251, but the flowers are less erect. H. glomeratum, Dietr. H. Córseum, Balb. cat. hort. taur. 1813. p. 39. append. 1. p. 12. H. decumbens, Denssf. nom. bot. 217. ex Balb. Flowers rose-coloured, about the size of those of *H. coronarium*.

*Capitate-flowered Hedysarum.* Fl. July, Aug. Pl. decumbent 10 *H. CARNOSUM* (Desf. fl. atl. 2. p. 177. t. 200.) stems decumbent; leaves with 5 pairs of obovate, truncate, mucronate, fleshy, glabrous leaflets; spikes of flowers racemose; flowers spreading.  $\frac{1}{2}$ . H. Native of Barbary, in sandy places by the sides of rivulets. Flowers rose-coloured, about the size of those of *H. coronarium*.

*Fleshy-leaved Hedysarum.* Fl. July, Aug. Clt. 1820. Pl. decumbent.

11 *H. FLEXUOSUM* (Lin. spec. 1058.) stems diffuse; leaves with 3-4 pairs of elliptic or oblong leaflets; spikes of flowers ovate; legume jointed, rather undulated, prickly.  $\odot$ . H. Native of Asia. H. siliqua undulata, Riv. tetr. irr. t. 213. Flowers red, tinged with blue, about the size of those of *H. coronarium*, of which it is perhaps only a variety.

*Flexuous-stemmed Hedysarum.* Fl. July, Aug. Clt. 1671. Pl. 1 foot.

12 *H. VA'RIMUM* (Willd. spec. 3. p. 1206.) stem ascending; leaves with 7 pairs of elliptic acute leaflets, which are pubescent above, and tomentose beneath; legumes articulated, rough.  $\frac{1}{2}$ . H. Native of Armenia. Flowers yellowish? ex Vaill. H. orientale incanum floribus variis magnis, siliqua aspera, Tourn. cor. 27.

*Various-flowered Hedysarum.* Fl. July, Aug. Clt. 1820. Pl. 1 foot.

13 *H. ANOMALUM* (D. C. prod. 2. p. 341.) stem suffruticose, diffuse; upper leaves trifoliate, and arc, as well as the branchlets, rather villous; leaflets elliptic, mucronate, terminal one much the largest; spikes few-flowered; legumes with 2 prickly joints.  $\frac{1}{2}$ . H. Native country unknown. According to the legume this species belongs to section *Echinolobium*, but its habit is very distinct from the other species.

*Anomalous Hedysarum.* Shrub 1 foot.

**\*\*\* Plants caulescent. Segments of the calyx subulate. Legumes pilose or pubescent, or crestedly wrinkled, but not prickly.**

14 *H. TRICHOCA'RPUM* (Desv. in herb. mus. par. D. C. prod. 2. p. 341.) stem erect, clothed with adpressed silky down; leaves with 7-8 pairs of oblong-cuneate obtuse leaflets, which are clothed with silky pubescence on both surfaces; legumes with only one oval, compressed, reticulated joint, bearing on the nerves very long hair-like bristles.—Native of Persia. Perhaps the same as *Onobrychis cristata* of Desv.

*Hairy-fruited Hedysarum.* Pl. 1 foot.

15 *H. LASIOCA'RPUM* (Ledeb. in hort. dorp. suppl. 1824. p. 4.) stem erect; leaflets ovate-lanceolate, rather pubescent; racemes elongated, axillary; bractees exceeding the pedicels; teeth of calyx lanceolate, about equal in length to the tube; vexillum length of the wings, but shorter than the carina; legumes pendulous, pilose, with somewhat quadrangular joints.  $\frac{1}{2}$ . H. Native of the Altaian mountains. Flowers purple.

*Woolly-fruited Hedysarum.* Fl. Jul. Aug. Clt. 1816. Pl. 1 ft.

16 *H. RUTIDOCAR'PUM* (D. C. prod. 2. p. 341.) stems ascending; leaves with 8-9 pairs of elliptic obtuse leaflets, which are pubescent beneath; spikes of flowers ovate, pedunculate, crowded; vexillum emarginate, a little longer than the keel; wings twice the length of the calyx; legumes reticulately wrinkled, and clothed with hoary pubescence, with 2-3 orbicular joints.  $\frac{1}{2}$ . H. Native of Siberia, in the desert between the rivers Oby and Irtysh. H. prostratum, Pall. ex herb. Patr. Flowers purple.

*Wrinkled-fruited Hedysarum.* Fl. July, Aug. Clt. 1826. Pl. prostrate.

17 *H. TAURICUM* (Pall. noy. act. petrop. 10. p. 315.) stem erect; leaves with 4-6 pairs of lanceolate-linear leaflets, which are clothed with adpressed pubescence beneath; spikes of flowers

ovate; vexillum emarginate, longer than the wings, but shorter than the keel; joints of legume reticulately veined, hoary. 2. *H.* Native of Tauria, on calcareous mountains. Bieb. cent. 2. p. 85. ex fl. taur. and suppl. no. 1447. *H. fruticòsum*, *Habl. taur.* 121. *H. ròscum*, *Sims, bot. mag.* 996. Flowers rose-coloured. Leaves sometimes with 8-10 pairs of leaflets.

*Taurian Hedysarum.* Fl. July. Clt. 1804. Pl.  $\frac{1}{2}$  to 1 foot.

18 *H. ròscum* (*Steph. ex Fisch. in litt. D. C. prod.* 2. p. 342.) stem erect; leaves with 6-8 pairs of oblong-lanceolate leaflets, which are clothed with adpressed villi on both surfaces, when young they are canescent beneath; spikes of flowers oblong or ovate, pedunculate; vexillum emarginate, shorter than the carina; wings length of the calyx; legumes articulated, pubescent, reticulately veined. 2. *H.* Native of Siberia, and the Altaian mountains. Flowers rose-coloured. This species is very like *H. Tauricum*, but differs in the wings of the corolla being about equal in length to the calycine segments, not longer. Bracteas longer than the pedicels.

*Rose-coloured-flowered Hedysarum.* Fl. July, Aug. Clt. 1803. Pl. 1 foot.

19 *H. ALTAICUM* (*Fisch. in litt. D. C. prod.* 2. p. 342.) stems erect; leaves with 6-8 pairs of elliptic or oblong leaflets, which are clothed with adpressed pubescence beneath; peduncles longer than the leaves; spikes of flowers oblong or ovate; wings longer than the calyx, but about equal in length to the carina; vexillum a little longer than the keel; ovaries pubescent, 2-jointed. 2. *H.* Native of Siberia, on the Altaian mountains. Flowers purple. Bracteas and segments of the calyx subulate. Stipulas concrete, opposite the leaves. Leaflets of the lower leaves oval, of the upper ones oblong, and nearly linear.

*Altaian Hedysarum.* Fl. July, Aug. Clt. 1818. Pl. 1 ft.

20 *H. VENUSTUM* (*Fisch. in litt. D. C. prod.* 2. p. 342.) stem erect; leaves with 5-7 pairs of elliptic leaflets, canescent on both surfaces from adpressed down; peduncles a little longer than the leaves; spikes of flowers oblong; vexillum rather longer than the keel, but the wings are shorter than it, and hardly exceeding the segments of the calyx; legumes villous, with 3 joints. 2. *H.* Native of the Altaian mountains, in the desert of Scythia. Flowers large, purple. Bracteas a little longer than the pedicels. Stipulas concrete, opposite the leaves.

*Shewy Hedysarum.* Pl.  $\frac{3}{4}$  to 1 foot.

21 *H. NITIDUM* (*Willd. spec.* 3. p. 1205.) stems flexuous, clothed with white tomentum; leaflets elliptic, clothed with silky tomentum on both surfaces; wings length of the carina; legumes articulated, smooth. 2. *H.* Native of Armenia. *H. orientale argenteum*, flore luteo, siliquâ glabrâ, *Tourn. cor.* 27. The ovary examined in *Tournefort's* specimen is tomentose, and contains 3 ovula, therefore the legumes must be 3-jointed. Flowers yellow.

*Shining Hedysarum.* Pl.  $\frac{1}{2}$  to 1 foot.

\*\*\*\* *Plants caulescent. Calycine teeth short. Legumes wrinkled or a little crested, pubescent.*

22 *H. FRUTICÒSUM* (*Lin. fil. suppl.* 333.) stem erect, shrubby; leaves with 5-7 pairs of alternate, elliptic, obtuse leaflets, which are clothed with adpressed pubescence on both surfaces; flowers disposed in spikes, few, distant; wings hardly longer than the calyx; vexillum length of keel; joints of legume reticulately wrinkled, with the nerves a little echinate. 2. *H.* Native of Siberia, beyond the Baikal, and of Dahuria, in sandy places. *Pall. itin.* 3. p. 763. t. 5. f. 1. ed. gall. append. no. 358. t. 92. f. 2.—*Gmel. sib.* 4. t. 22. Calyx with 5 short teeth. Corolla pale purple. This is a very handsome plant, very grateful to horses, and extremely useful in fixing sand.

*Shrubby Hedysarum.* Fl. June, July. Clt. 1782. Shrub.

23 *H. IBERICUM* (*Bieb. fl. taur.* 2. p. 177.) stems erect; leaves

with 4-5 pairs of elliptic, mucronate, opposite leaflets, which are pubescent beneath; flowers disposed in spikes, few, rather distant; wings, vexillum, and keel about equal in length; joints of legume hoary, with crenulated margins. 2. *H.* Native of Iberia. Stamens distinctly and abruptly inflected. Flowers purple.

*Iberian Hedysarum.* Fl. July, Aug. Clt. 1818. Pl. 1 ft.

24 *H. RAZOUMOWIANUM* (*Helm, et Fisch. ined. D. C. prod.* 2. p. 342.) stems erect; leaves with 6-7 pairs of oblong-linear, rather pubescent leaflets; spikes of flowers pedunculate, longer than the leaves; wings of flower twice the length of the calyx, and about one-half shorter than the carina; vexillum a little longer than the keel; legumes rather hoary, reticulately wrinkled, not crested. 2. *H.* Native of Siberia, in the desert of Scythia in the region of Orenburg. Flowers purple. Habit of *H. fruticòsum* and *H. Ibéricum*.

*Razoumow's Hedysarum.* Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

25 *H. CRETACEUM* (*Fisch. in litt. 1825. D. C. prod.* 2. p. 342.) stems erect; leaves with 4-7 pairs of oblong-linear, acute, glabrous leaflets; spikes of flowers elongated, slender; wings of flower shorter than the obcordate vexillum, but twice the length of the calyx; keel exceeding the vexillum; joints of legume 2-3, flat, pubescent. 2. *S.* Native of Siberia, at the Don and the Volga, near Serotinsk. *H. Volgense*, *Fisch. in litt.* 1810. Flowers purple.

*Cretaceous Hedysarum.* Fl. July, Aug. Clt. 1819. Pl.  $\frac{1}{2}$  to 1 foot.

SECT. II. LEIOLÒBIUM (from *λεως*, *leios*, smooth, and *λοβος*, *lobos*, a pod; in reference to the smooth pods). *D. C. prod.* 2. p. 343. Joints of legume smooth, not echinate, nor pilose. Calycine segments shorter than the corolla.

26 *H. CONSANGUINEUM* (*D. C. prod.* 2. p. 343.) stems erect; leaves with 6-8 pairs of elliptic leaflets, which are pubescent beneath; peduncles longer than the leaves; spikes of flowers crowded, ovate; wings longer than the calyx, but a little shorter than the carina; vexillum nearly equal to the corolla; ovary linear, glabrous, 5-6-ovulate. 2. *H.* Native of Siberia, on the Altaian mountains. *H. Altaica* var. or species affinis, *Fisch. in litt.* Habit of *H. Altaicum*, but the ovary is like that of *H. subspinosum*. Stipulas membranous, white, concrete in one, which is bidentate at the apex. Flowers purple.

*Kindred Hedysarum.* Fl. July, Aug. Clt. 1820. Pl. 1 ft.

27 *H. OBSCURUM* (*Lin. spec.* 1057.) stems erect; leaves with 5-9 pairs of ovate glabrous leaflets; stipulas concrete, opposite the leaves, sheathing; bracteas longer than the pedicels; vexillum a little shorter than the keel; legumes pendulous, quite smooth. 2. *H.* Native of the Alps of Austria and Provence. *Jacq. austr.* t. 168. *Curt. bot. mag.* 282. *H. alpinum*  $\beta$ , *Lin. spec.* 1057. *H. contraversum*, *Crantz. aust.* 425. t. 2. f. 3. *Hall. enum.* 1. t. 14. hist. 2. t. 12. Flowers beautiful, purple, seldom white. Root creeping.

*Obscure Hedysarum.* Fl. June, Aug. Clt. 1640. Pl.  $\frac{1}{2}$  ft.
